Almost the first picture on the walls is the diploma work of Mr. J. J. SHANNON deposited on his election as an Academician. The title, *Black and Silver*, perhaps suggests the fact that the work is intended primarily as an exercise of skill. The seated half-length figure is clamantly modern, so is the handling, and the whole is undeniably clever. His three other works are portraits, also of women, and all are inspired by the same forceful handling. The portraits this year seem more numerous than ever; indeed, it is sometimes a positive relief to come across a group of pictures which deal with something else. Sir E. J. Poynter has two, Mr. Charles Sims has one; there are three by the late Sir W. Q. Orchardson, six by Sir Luke Fildes, one by Mr. S. J. Solomon, three by Mr. Frank Dicksee, six by Mr. A. S. Cope (including the portrait of Mr. T. E. Collcutt for the Royal Institute), four by Sir H. Von Herkomer, three by Mr. W. W. Ouless, and so on. These are a few of the portrait painters from among the ranks of the Academicians; the list might be extended indefinitely if it was made to include every contributor of a portrait whether under a fanciful title or under the name of the sitter. The majority of the sitters are of no particular interest to the general public, and they do not appear to have inspired the artists. Mr. C. Sims makes a new departure in *Mrs. Hayes Sadler*, and has bravely tried to fit his subject to the typically poetic background; probably his real pleasure lay in the latter, which suggests a "Fête de Nuit." His Majesty the King is perhaps too important for any painter to attempt anything further than a likeness; whatever the reason may be neither of the two large portraits can be regarded as a worthy legacy to future generations.

It is remarkable that not one of Mr. John S. Sargent's four works are portraits. And yet his contribution to this year's exhibition must be accepted as most important and conspicuous. His *Glacier Streams* will be talked of as one of the pictures of the year; others may prefer *Vespers*, which is a delight to the eye in its simple directness and restraint, or *Albanian Olive-gatherers*. Of special interest to our readers must be the two historical pictures by Mr. Edwin A. Abbey for the State Capitol at Harrisburg, Pennsylvania. There is something about *The Camp of the American Army at Valley Forge*, 1778, which at a glance impresses the spectator with its architectural character; this effect being partly due to the straight horizontal and perpendicular lines of the muskets and partly by the admirable grouping. The other picture is less satisfactory; it stands 24 feet high and about 6 feet across. A very considerable portion of the canvas is occupied by an elm tree, at the foot of which stands Penn with a small staff and a large body of Indians—the subject is *Penn's Treaty with the Indians*. In its present position it is not unlike one of the wings in the theatre when the scene is set for a forest. Possibly when placed in position it may prove as satisfactory as the other picture, though it hardly seems so now.

Another large work which suggests that its ultimate destination will be as a panel in a building comes from Professor Gerald Moira. His *London* is a somewhat puzzling composition, for it is neither allegorical, nor historical, nor mythological. The artist has in the past expressed strong opinions on the desirability of present-day artists fearlessly handling contemporary subjects, and here he has practised what he preaches. The standpoint is an imaginary terrace on the south bank of the Thames facing St. Paul's; to the left is a lofty Classic portico, and on the right a variety of people, no doubt types of the citizens, who are not doing anything very definite. In the same gallery is *Flying a Kite*, one of the two much-talked-about works by Mrs. Laura Knight; from its size and almost from its subject it might not be out of place in the town hall of some authority which competed for juvenile holiday makers. The other picture by Mrs. Knight may at first be mistaken for one by Mr. H. S. Tuke, for *Boys* bears great resemblance to the groups of bathers which the Associate has frequently shown; it seems, however, to lack the dignity of the latter's works. The artist who has had real experience in the alliance of architecture with painting is Mr. Frank Brangwyn, A.R.A. His one work *Wine* will loom large in any permanent recollection of the 1910 Royal Academy. It is a fascinating picture although far from a charming one; if it were not so skilfully done it would be repulsive. The whole is so splendidly decorative that it does not seem any great matter that the painter's precise meaning is obscure. How unlike this picture is the charming *Silver Morning* by Mr. Arnesby Brown, which hangs in the same gallery and which is another of the few conspicuous contributions to this year's show! This is one of the Chantrey purchases, and is a wonderful example of the painter's forte.

There are many welcome landscapes and seascapes which make a refreshing contrast to the figure subjects. For example, *The Green Pool* by Mr. Alfred East, or *The Little White Mill*, by Mr. G. D. Leslie, become all the more acceptable from their uninteresting environment. Such familiar contributors as Mr. B. W. Leader, Mr. J. Farquharson, Mr. W. L. Wyllie, Mr. MacWhirter, Mr. David Murray, Mr. Alfred East, Mr. R. Vicat Cole, and Mr. Julius Olsson all help in this way.

## NOTES AND COMMENTS.

His Royal Highness the Prince of Wales has signified his appreciation of the work done by the Royal Institute of British Architects by extending his patronage to the Institute.

Recognition is the strongest asset of any society that purports to represent any section of the community. The Royal Institute is to be congratulated on the recognition it has obtained at the hands of the Heir Apparent to the Throne, who in this, we may venture to say, is bringing to a focus the recognition that the Institute has been steadily endeavouring to achieve, and has in no small measure already achieved, in the mind of the British public as the accredited representative body of architects and the authoritative representative of the art of architecture in this country.

The number of contributors to the work of our Students' Sketching and Measuring Club for April has fallen considerably below the average as regards numbers, but the quality is excellent. We shall give our critique of the drawings and announce the name of the winner of the prize in our next issue. With regard to the subject for June we may say in answer to an inquiry that work now in a museum is not debarred if originally "executed during the fourteenth or fifteenth century, in an ecclesiastical building erected in Great Britain or Ireland."

The struggle at Manchester over the old Infirmary site is far from being ended. It is, as our readers know, coveted by the advocates of an art gallery and free library as a municipal institution, on the one hand, and, on the other, by the Manchester Royal Exchange Subscribers' Association. Art and education *versus* business. The report of the special committee of the City Council was in favour of art and education. The Council, by a small majority, has refused to adopt that report, and referred it back to the committee.

In the *Art Journal* for this month is an illustrated account of the picturesque and typically Swiss town of Gruyères, which being off the main track of the tourist, as marked by the railway, is little known save for its cheese. The architectural student who would get away from the hackneyed work that everyone knows must be motorist, cyclist, or, best of all, pedestrian in the fascinating quest for unspoilt treasures.

The action of G. Gates & Son *v.* Johnson, of which we give a report elsewhere, is useful as upholding the character and efficiency of an architect's certificate, which is not invalidated by an error in the original quantities when these form part of the contract as in this case. Probably if the contract had been made on the plans and specification only, the employer would have had the benefit of the quantities being "short," and the builder would have had to seek his remedy against the person who prepared and supplied the quantities. On the other hand, if the quantities had been too "full," the builder would presumably have had an unmerited advantage, and the employer would have had to make a claim for damages. Hence it is obviously fairest to both employer and builder that the quantities should be made part of, indeed the basis of, the contract. Only, when this comparatively recent innovation in professional practice is adopted, it is obvious that the old-established scale of charges for the preparation of quantities cannot fairly be maintained, as these have always been intended to cover the very imminent risk of a quantity surveyor being liable to compensate either party to the contract who may suffer damage from the frequent accidental inaccuracy of the quantities. We are glad also to note that the contention of the defendant's counsel that an architect's certificate requires a stamp and an appraiser's licence received short shrift at the hands of the judge.

---

The memory of William Etty, the famous Royal Academician, is about to be honoured by the erection of a statue in the city of his birth and death. The Corporation of York have proposed to erect a full-size statue of the painter in Exhibition Square, on a space near the King's Manor, formerly occupied by trees which have recently been demolished. The statue will be 7 feet 6 inches in height, and wrought in Portland stone, standing on a pedestal 8 feet high of Bolton Wood stone. The cost of the work will be about 300*l.*, towards which Mr. W. W. Hargrove has already handed to the Corporation the sum of 263*l.*, representing the balance and accumulated interest from the funds of a former exhibition. The Corporation will be invited to find the balance required to meet the total cost. Etty was not only a remarkable painter, but a zealous advocate for the preservation of the antiquities of York, and successfully opposed many attempts on the part of "restorers" and "improvers" to clear away the relics of the past in his native city. The York School of Design, established in 1842, owed its origin almost entirely to Etty's unsparing efforts on its behalf. He delivered the inaugural lecture, and before leaving York he saw the first cast put up in the school—"a proud day for dear old York and me." He lectured to the students at the school on a subsequent occasion, and was a frequent visitor when he had finally settled in the city. The tardy recognition of Etty is thus well merited both for the lustre that his position has reflected on the city of York and for the good work that he did in the preservation of its ancient art and the advancement of its modern advantages.

---

The *Antiquary* for this month contains an interesting historical sketch of the ancient Cistercian Abbey of Pontigny by Mr. J. Tavenor Perry, who describes it as "a perfect example of the purest Gothic art in France," and points out its especial interest to Englishmen as the refuge of three of the most famous Archbishops of Canterbury in their time of exile—Thomas a Becket, Stephen Langton and Edmund Rich.

---

Bradford Corporation is making a praiseworthy attempt to reduce the nuisance and injury to health caused not only by smoke, but by the emission from chimneys of grit, which frequently follows an attempt to reduce smoke by the use of forced draught when burning cheap coal. Clause 42 of the Bradford Corporation Bill, now before Parliament, is intended to deal with this matter, and has been under the consideration of the Local Legislation Committee of the House of Commons. Sub-section I. provides that every furnace employed in the working of engines by steam, and every furnace employed in any mill, factory, gasworks, waterworks, or other buildings used for the purpose of trade or manufacture, shall in all cases be constructed or altered so as to consume or burn the smoke arising. Sub-section II. provides a penalty on the owner or occupier, or foreman, or other person employed, not exceeding 5*l.*, and on a second conviction 10*l.*, and on each subsequent conviction a fine double the amount of the fine imposed on the last preceding conviction. Sub-section III. extends the provisions to and makes them applicable in respect to the emission from chimneys of grit or gritty particles as if the emission of those particles were smoke arising from furnaces.

---

As the result of the Committee's deliberations the chairman stated that they had carefully considered this clause, and they were prepared to grant the Corporation Sub-sections I. and II., subject to the following stipulation. They had been looking at the Act of 1903, and they thought that Sub-section II. should be amended to provide on a second conviction a fine not exceeding 10*l.* and on each subsequent conviction a fine not exceeding 50*l.* Subject to that, the Committee were prepared to grant these two sub-sections. With regard to Sub-section III., that was an entirely new matter, and as it had never been considered before by any Parliamentary Committee, they had had some difficulty in arriving at a conclusion. The Keighley Corporation Act of 1901, which had been brought to their notice, provided that every owner and occupier should use the best practicable means of preventing a nuisance of this character, or be liable to a penalty, and the Committee thought they could grant the Corporation this Sub-section III., provided there were put into it words to make it clear that it must be proved to the satisfaction of the Court that the manufacturer against whom any proceedings had been taken had not used the best practicable means for avoiding the emission of grit or gritty particles.

---

One might forgive the inflated prices for old masters if they always resulted in such an encouragement to modern art as in the case of the portrait of *Lady Hamilton*, by Romney, formerly owned by the late Canon Philpotts, who on receiving, somewhat unexpectedly, 3,000*l.* for his picture devoted half the money to the erection of the porch at the end of the south transept of Truro Cathedral, according to the story told in the current number of the *Truro Diocesan Magazine.*

---

The first number of *The Town-Planning Review*, the journal of the Department of Civic Design of the School of Architecture in the University of Liverpool, has appeared, and admirably sets forth the view of town planning that is held at Liverpool. Also a fair and unbiassed description is given of town-planning work and schemes in England.

---

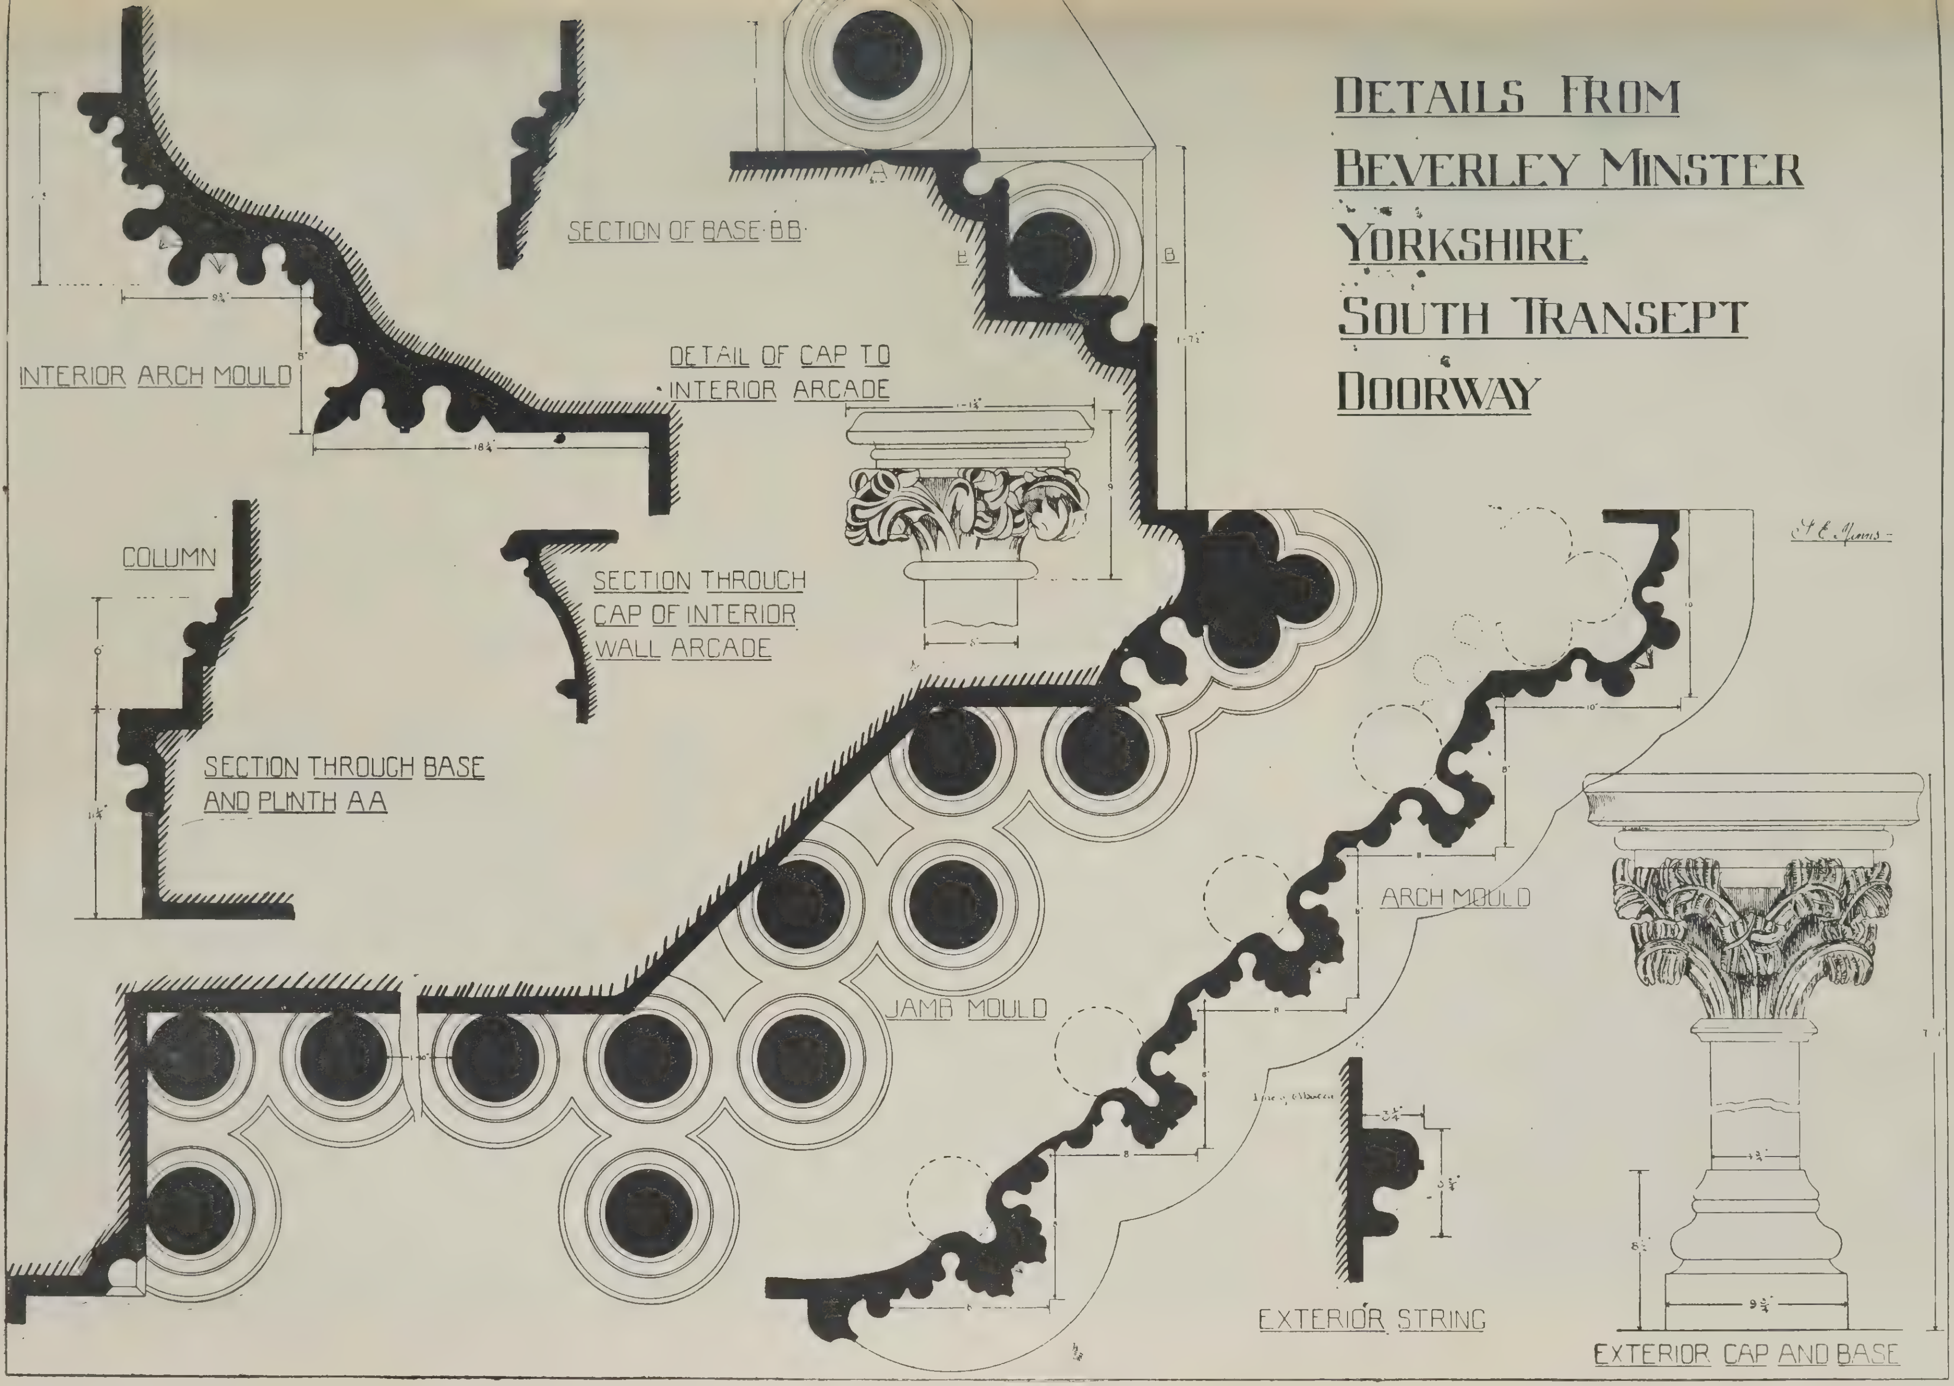
## BEVERLEY MINSTER.

This church may be said to be the result of two great building efforts: the first, which includes the whole eastern arm and transepts was a new design on a grand scale, practically uninfluenced by any previous building; the second was the completion of this same design, after a considerable interval, and was carried out with rare regard for harmony of the whole structure. The building really appears to be larger than some similar structures of greater area, and one of its most pronounced characteristics is its effect of great height obtained by very moderate dimensions.

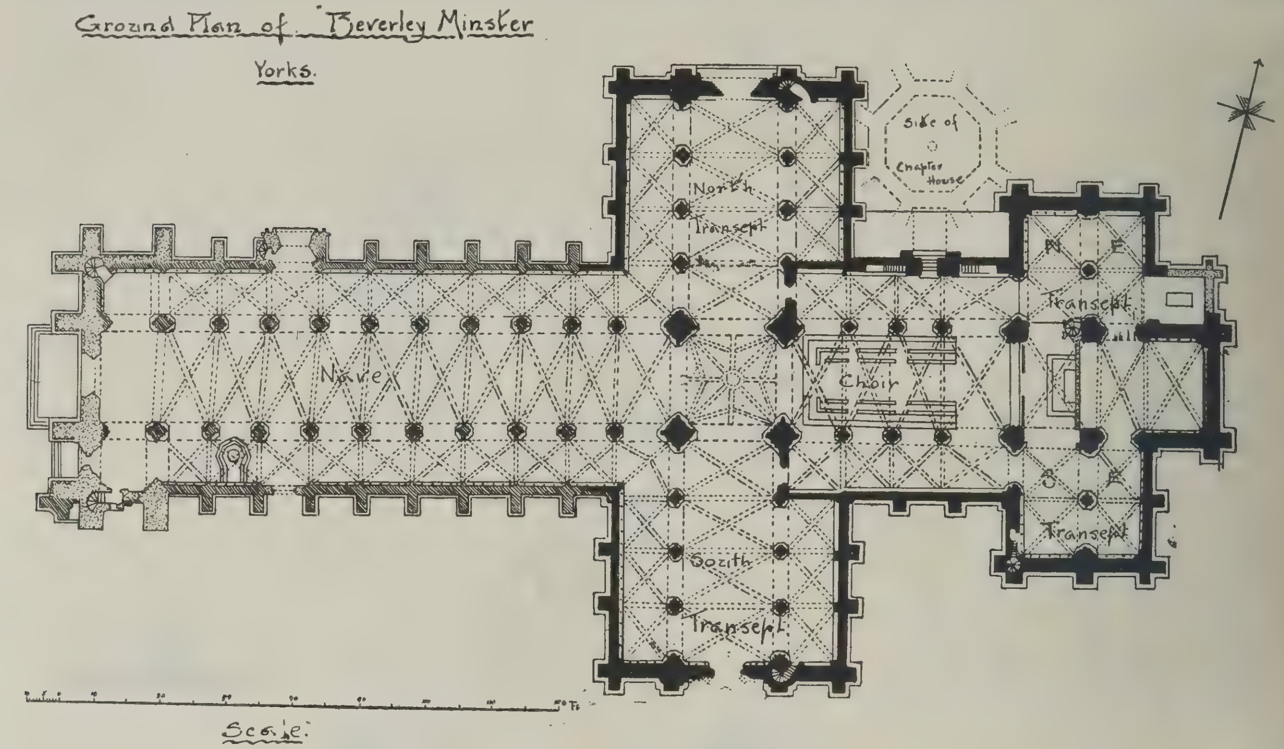
In any general view the absence of a prominent central tower is severely felt, as the actual tower barely rises above the ridges of the roofs, and one longs for a more worthy companion to the two beautiful western towers. Beverley Minster owes its importance to the fact that it contained the tomb and shrine of a famous St. John of Beverley. The Venerable Bede, who received both deacon's and priest's orders from John, tells us how the Bishop founded the Minster, and how in 721 he died and was buried there, his remains being put in a richly-decorated shrine.

The plan of the Minster may be compared with Lincoln and Salisbury, as all three have the double cross, and at Salisbury and Beverley the eastern transepts have an eastern aisle.

The principal dimensions are as follows:—Total interior length, 332 feet 6 inches; extreme breadth,



DETAILS FROM
BEVERLEY MINSTER
YORKSHIRE
SOUTH TRANSEPT
DOORWAY



167 feet 2 inches; width of nave and aisles, 63 feet 1 inch; length of choir between west and east transepts, 67 feet 8½ inches; height of the western towers, 162 feet 6 inches; exterior total length, 365 feet.

The west front is one of the most picturesque and conspicuous features of the whole Minster; it is considered to be one of the finest Perpendicular west fronts in England, and is carried out harmoniously throughout as regards design. The doors in this front are uncommonly rich, and have the hanging feathered ornament. The gable has a real tympanum filled with fine tracery, which is not merely an outside ornamental feature, but contains behind it an extensive room which is at a greater height than the vaulting of the nave.

The exterior of the north side of the nave differs considerably from the south, for the Perpendicular work extends eastwards to and includes the north porch, whilst on the south the Decorated style is seen quite up to the south-west tower.

The nave aisles on both sides are connected with the clerestory by very beautiful flying buttresses.

The great transepts may be compared with those of York and Salisbury, as far as the fronts go, but as far as design goes the fronts of Beverley are by far the most beautiful of the three.

The main features of the design are two triplets of lancets, one above the other, the members of the lower triplets being of equal height; in the upper triplet the centre lancet is taller than the other two. The next stage has a finely-designed wheel-shaped window, and on each side a niche. The upper part of the gable is pierced on the south side by a very narrow shuttle-shaped light. The buttresses are very graceful and terminate in octagonal turret pinnacles. On the ground floor of the south transept is a portal, which is the subject of our illustrations, and consists of a round-headed arch of five members, separated by a clustered column into two doorways, with a blind pointed arch on each side. The windows and other features of the clerestory and aisles of the transepts are pure Early English, dating from before the middle of the thirteenth century. A comparatively long distance separates the great transepts from the eastern transepts, and it is taken up inside by the finely carved choir stalls.

The east transepts have on their end elevations a pair of lancets over which is a beautiful blank arcade. In the next tier is a second pair of lancets with a deep quatrefoil circle above.

In the gables are another pair of lancets, with blank arches on either side, whilst still higher is a single lancet with a blank arch on each side.

On the north side, between the great transept and east transept, in the choir aisle wall, is a door which leads to the modern vestries; these are built on the site of the chapter-house, which was octagonal, and was approached from inside by a double flight of steps in the north choir aisle wall. The east gable was partly reconstructed during the second decade of the fifteenth century, when a vast Perpendicular window of nine lights was inserted, above which is an ogee canopy richly crocketed and terminating in a crown.

The Percy Chapel was built at the N.E. angle by the fourth Earl of Percy at the end of the fifteenth century. In the interior of the Minster the whole of the eastern end, including the transepts is Early English. The north wall of the nave is Early Decorated, and the south wall Late Decorated, but the whole design has been carried out from the first in perfect harmony. The western front and towers are in the Perpendicular style.

The plan of Beverley Minster, with the measured drawings and details of the south transept doorway, form part of the work of Mr. S. E. Minns in "The Architect" Students' Sketching and Measuring Club.

## ACTION ON ARCHITECT'S CERTIFICATE.

In the King's Bench Division, Mr. Justice Walton, sitting without a jury on Tuesday, April 26, heard an action—G. Gates & Son *v.* Johnson—in which the plaintiffs, a firm of builders carrying on business at Rochester, in Kent, sought on an architect's certificate to recover a balance of account for work done amounting to 359*l.* 16*s.* 1*d.*

Mr. Moreton Smith appeared for the plaintiffs and Mr. Schiller for the defendant, who pleaded that the certificate was *ultra vires*, unauthorised, and not binding upon him, and that it did not bear a stamp.

Mr. Smith said that a contract was entered into between the plaintiffs and the defendant to put in the foundations of a factory at Queenborough. Mr. Johnson was a gentleman who carried on business in Germany as a manufacturer of a patent process, and in consequence of a recent Act it became necessary that he should have a factory in this country. With the object of building such factory he bought some three acres of land at Queenborough, and engaged Mr. Boucher, of the firm of Drake & Boucher, as architect. Tenders were invited for putting in the foundations, and in September 1908 the plaintiffs sent in a tender for 1,975*l.*, the tender being made on a bill of quantities. That tender was accepted, but Mr. Johnson wanted a number of alterations made, and therefore a revised tender was sent in, and in the following October a

MANOIR DE LA TRINITE, JERSEY.—Before Alterations and Additions.

contract was signed which included the general conditions of the Royal Institute of British Architects, plans and specifications, and the bill of quantities. The work consisted of excavating and laying in concrete for the building. Amongst the conditions was one to the effect that where alterations were required by the architect the work should be measured and valued. The contract having been signed, the plaintiffs proceeded to peg out the site, but when that was done Mr. Johnson required alterations which were ultimately carried out. The architect, in accordance with the contract, granted his final certificate, which the plaintiffs claimed was binding upon the defendant, who, however, alleged that the architect was wrong in his calculation of what was due under the contract.

Mr. Schiller, in reply to his Lordship, said that his contention was that there was a lump sum contract with certain provisions for variation in the usual form to be paid for by measurement. There had been a mistake in the calculations, and it was sought to make the defendant bear the consequences.

Mr. Smith said that the defendant had altered his mind several times as to the building, and the result was that the architect's measurements were kept of every piece of work which was done. Immediately after the foundations were completed, another contractor came on the scene for the purpose of putting up the building. When the plaintiffs' work was finished the certificate was given, and the plaintiffs forwarded it to the defendant and asked for payment. Then the dispute arose and defendant wanted to re-open the whole question as to measurement. He afterwards, on account of the error in a statement relating to a portion of the work which was carried out, desired to make a deduction up to $10\frac{2}{3}$ per cent. upon the whole amount.

After a discussion as to whether the Court should deal only with the points of law raised as to the validity of the contract or whether the whole merits should be gone into, it was agreed that the latter course should be adopted.

The plaintiff was called and gave evidence as to the transaction confirming the statement of his counsel.

Mr. William Thomas Boucher, the architect, said that finding so many alterations in the original plans he directed measurements to be taken from the beginning. The amount for which he gave his certificate was based upon current prices, and he thought it was fair and reasonable. He did not make any deduction on account of the error in the bill of quantities as to the number of yards of concreting, because he did not think it would have been fair to have done so, the work not having been done.

Mr. Henry Reginald Messenger, quantity surveyor, gave evidence as to the manner in which he had taken the measurements as the work progressed, and the results at which he had arrived.

His Lordship, upon Mr. Schiller proceeding to cross-examine Mr. Messenger as to the charge for certain items, said he was not going to try whether the architect was right or wrong, but only to see what he had done, and try to ascertain whether it was conclusive or not.

Mr. Schiller, for the defence, said that in contracts of this description the usual form was to do work "according to the plans and specifications," but in this particular instance there was the usual provision that the work was to be done "according to the plans, quantities, specifications, &c., prepared by Messrs. Drake & Boucher, architects and surveyors." The whole of the difficulty arose from one error in the bill of quantities. The substantial difference was that there had been a miscalculation of 3,000 yards as the result of an omission by the architect, and the question was who was to suffer the loss.

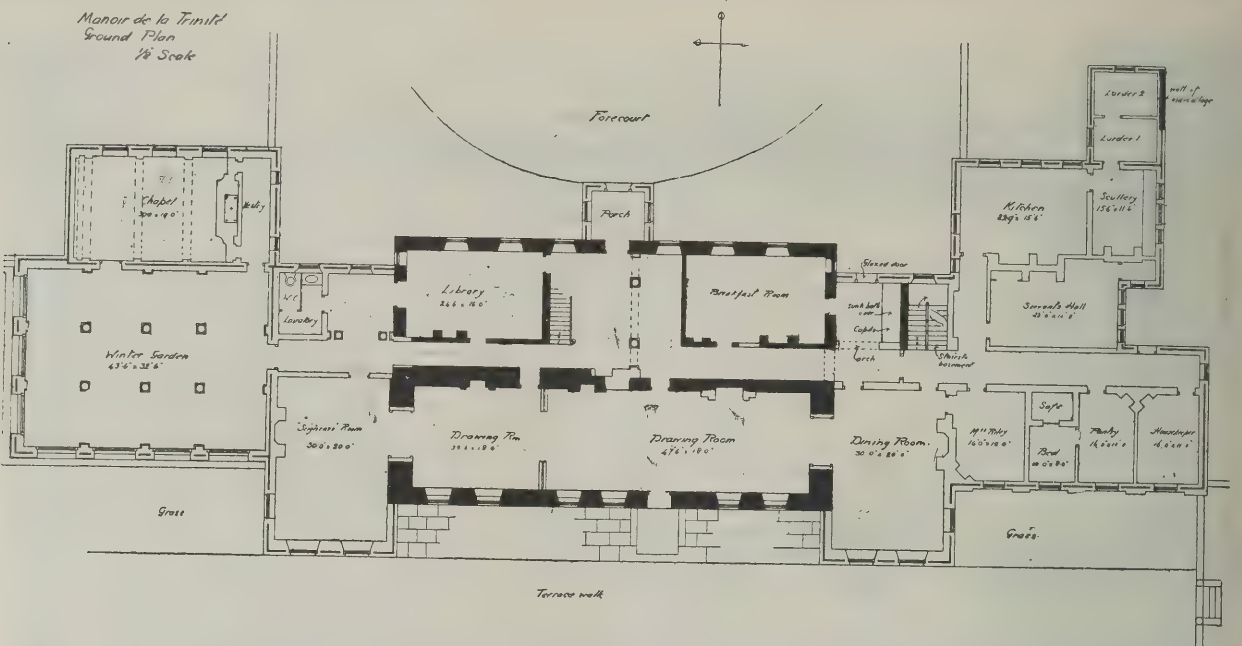
Mr. Justice Walton said he had not yet seen that there had been any loss.

Mr. Schiller said that the contract was that the work was to be done according to specification and quantities, and the plans showed that he was to do 3,441 yards of concreting, while the quantities stated the amount at 441 yards. The tender of the plaintiffs was upon that basis. In the absence of fraud the building owner was not responsible if the builder lost from errors in the quantities according to the plans and specifications prepared by the architect, and it was the duty of the builder when he got his copy of the quantities to compare them with the original document.

Mr. Schiller argued that it was the business of the builder to find out whether the information sent to him was right or not before he tendered for the work.

Mr. Moreton Smith, in reply, said that the tender had been made in good faith upon the assumption that there were only 441 yards of concrete to be provided for, and he had nothing before him to lead him to suppose that the 441 yards was an error.

Mr. Justice Walton, giving judgment on Thursday, said that the first question was whether the certificate of the architect was binding between the parties. The work was done according to specification, and amounts were from time to time paid on the architect's certificates, and in the end the architect issued his final certificate for 815*l.* 4*s.* 2*d.* The question then arose as to whether that certificate was binding upon the defendant. It was said by the defendant that it was not, as the architect did not exercise his jurisdiction properly as to measuring and valuing the omissions and additions. When the work was finished, however, he did measure up the whole of the excavations, and he priced the work according to the bills of quantities. Where the bills of quantities did not apply he priced the work at a fair value. In doing that the architect carried out his duty in a proper way, and his



MANOIR DE LA TRINITE, JERSEY.—Ground Floor Plan, showing Alterations and Additions by Mr. REGINALD BLOMFIELD, A.R.A.

certificate was conclusive evidence that the contractors were entitled to payment of the final balance. It was further said that there had been a misunderstanding owing to the omission of the figure 3 in the copy of the bill of quantities upon which the plaintiff framed his tender, which made it appear that he had to cover an area of 441 yards with concrete instead of 3,441 yards. The defendant argued that although the mistake had been made the plaintiff contracted for the larger area, as he could have discovered the error from the plans and specifications. He (Mr. Justice Walton) did not think that the plaintiff was bound to refer to the other documents in order to discover whether or not the bill of quantities was accurate, and therefore the architect was right in what he had done. Another point raised was under the Stamp Acts, it being alleged that the architect in giving his final certificate was acting as an appraiser, the certificate being an appraisement or valuation and requiring a licence. He did not think so. It was also said that the certificate, being an order to pay, was a bill of exchange and should therefore be stamped; but he was of opinion that there was nothing in either of the points. The result was that judgment must be for the plaintiffs for the amount claimed, with costs.

On the application of Mr. Schiller a stay of execution was granted with a view to an appeal.

# ILLUSTRATIONS.

### MANOIR DE LA TRINITE, JERSEY.

THE Manoir de la Trinité is a granite-built house about three miles from St. Helens in Jersey, the south part of which may date from the early part of the seventeenth century, though the only certain detail of that date is a chimney-piece on the ground floor and possibly the south doorway, with its characteristic Jersey hood mould working out into an ogee. The gables which appear on the photograph are modern. The photograph shows the south side of the house as it is at present. The perspective view is made from the south-west. The property has recently been bought by Mr. ATHELSTAN RILEY, and considerable additions and alterations are to be made to the house, including new dining-room, kitchen, and offices, "Seigneur's" room, winter garden, chapel, &c., with bedrooms over, and a new top storey with new roofs, gables and lantern.

The grounds at present are covered with bushes and trees. A new scheme has been prepared by the architect for a forecourt and approach on the north side and for the entire relaying out of the garden with terraces, pole-hedges, pavilion, and water-garden on south side. These are indicated on the perspective drawing.

The material to be used throughout for all stonework will be Jersey granite with small rough Delabole slates for the roofs.

The part shown in black on plan is existing work, that shown in outline is new.

The architect is Mr. REGINALD BLOMFIELD, A.R.A., of New Court, Temple, E.C.

### REFUGE ASSURANCE COMPANY'S BUILDING, MANCHESTER.—VIEW OF THE COURTYARD.

THE illustration published in this issue of the Refuge Assurance Company's offices in Manchester represents a portion of the courtyard, which is entered by the archway under the central tower. Mr. PAUL WATERHOUSE's work is an addition to the original block, which was designed by the late Mr. ALFRED WATERHOUSE, R.A., some fourteen years ago. The frontage of the new buildings is necessarily in harmony with the earlier block, which is in a very free treatment of Renaissance. In this courtyard, however, Mr. WATERHOUSE has somewhat varied the treatment in favour of a rather severer Classic manner.

### OXFORD COLLEGE SERIES, EXETER.—FELLOWS' LAWN—CARVED SCREEN IN HALL.

WE continue our series of illustrations of Exeter College, which was commenced in our issue of April 22, when a historical account of the College was given. Further views of this College will appear next week.

THE Sheffield Architects' and Surveyors' Society held last week the annual general meeting in the general lecture-room at the University, the President, Mr. W. J. Hale, in the chair. The accounts and annual report of the Council were received and adopted. The ballot for officers resulted as follows:—President, Mr. W. J. Hale; Vice-President, Mr. J. B. Mitchell-Withers; Treasurer, Mr. F. Fowler; Hon. Secretary, Mr. J. R. Wigfull; Council, Messrs. F. E. P. Edwards, C. B. Flockton, J. R. Hall, H. L. Paterson, A. F. Watson, E. Winder, W. G. Buck, C. F. Innocent, and H. I. Potter. The past-presidents are also members of the Council.

THE next Congress of the Royal Institute of Public Health, of which the King is patron and the Prince of Wales vice-patron, will be held at Birkenhead from July 18 to 23 next. Mr. W. H. Lever is the president of the Congress; Sir Alexander R. Binnie, ex-president of the Institute of Civil Engineers, &c., is president of Section IV., "Municipal and County Engineering," and is supported by many distinguished engineers—Mr. Blair, Mr. Brodie, Dr. Cowan, Mr. De Courcey Mead, and others—as vice-presidents. Mr. Henry Vivian, M.P., is president of Section VI., "Town Planning and Municipal Architecture," supported by Professor Adshead and Professor Reilly and others as vice-presidents.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The annual general meeting of the Royal Institute was held on Monday last, when the report of the Council for the official year 1909-10 was submitted and adopted.

Since the publication of the last annual report the Council have held twenty-two meetings, of which the Council elected in June last have held sixteen. The following committees appointed by the Council have met and reported on the matters referred to them:—Competitions, prizes and studentships, finance, sessional papers, premises, professional questions, board of professional defence, board of examiners, fellowship drawings, town planning, school of architecture in Italy, Parliamentary Bill, reinforced concrete, honorary members, Ulster Alliance, Royal Academy Exhibition.

The losses by death have been as follows:—Fellows: Richard Armstrong, Henry Dare Bryan, Alfred B. Burnell, John Archibald Campbell, Thomas William Cutler, Sir Thomas Drew, Henry Bayly Garling, Henry Hall, Jesse Horsfall, George Inskipp, Henry Jarvis, Nathan Solomon Joseph, John Wornham Penfold, Edward Potts, Frederick Hyde Pownall, Thomas Mellard Reade, Frederick Henry Reed, George Campbell Sherrin, Edward Shewbrooks, Henry Stock, Benjamin Tabberer, George Thomas; Retired Fellows: William Owen, Thomas Worthington; Associates: Lionel Gordon Detmar, Walter Edward Mills, Charles Albert Monday, Frederick Henry Williams; Hon. Corr. Members: Auguste Choisy, Baron Henry von Geymüller, Osman Hamdhi Bey, Charles Follen McKim, José Urioste y Velada.

The Royal Gold Medal was awarded last year to Dr. Arthur Evans in recognition of the eminent services he had rendered to the history of architecture by his distinguished work of exploration in Crete. Dr. Evans received the medal in person at the general meeting on November 1, 1909, when he delivered an address illustrated by lantern slides on some aspects of his recent work in Crete. It has been decided to award the medal this year to Mr. T. Graham Jackson, R.A., for his executed works as an architect. His Majesty the King has graciously signified his approval of the award.

The following tabular statement shows the present subscribing membership of the Institute compared with that at the corresponding periods of 1907, 1908 and 1909:—

| Year. | Fellows. | Associates. | Hon. Associates. | Total. |
|---|---|---|---|---|
| 1907 | 862 | 1,254 | 46 | 2,162 |
| 1908 | 906 | 1,288 | 45 | 2,239 |
| 1909 | 888 | 1,344 | 46 | 2,278 |
| 1910 | 874 | 1,431 | 48 | 2,353 |

The number of associates shows a considerable increase, and the Council desire to urge all associates who are eligible to come forward and apply for election as fellows without delay. During the official year since the last annual general meeting seven fellows have been elected, 118 associates, and four honorary associates.

The progressive examinations were held in June and November 1909. The preliminary was held in London, Birmingham, Bristol, Cardiff, Glasgow, Leeds, Liverpool, Manchester and Newcastle-on-Tyne; the intermediate in London, Bristol, Cardiff, Glasgow, Leeds, Manchester and Newcastle-on-Tyne. The Council desire to record their thanks for the valuable services rendered by the hon. secretaries and examination committees of the various allied societies. The final and special examinations were held in London, and special examinations for colonial candidates in Johannesburg, Sydney, and Toronto. The results are shown in the following tabulated form:—

| | Admitted. | Exempted. | Examined. | Passed. | Relegated. |
|---|---|---|---|---|---|
| Preliminary examination | 257 | 85 | 172 | 130 | 42 |
| Intermediate examination | 273 | 21 | 252 | 116 | 136 |
| Final and special examinations | 246 | — | 246 | 119 | 127 |

The Ashpitel prize was awarded to William John Roberts, M.A., who passed the final examination in November 1909.

The statutory examinations qualifying for candidature as district surveyor in London, and for candidature as building surveyor under local authorities, were held in London in October, and certificates of competency to act as district surveyors in London were granted to Messrs. Baxter Greig and John Halton Markham, and a certificate of competency to act as building surveyor under local authorities to Reginald Guy Kirkby.

The deed of award of the various prizes and studentships was presented to the Institute at a general meeting on January 17, 1910. At the presentation of prizes on January 31, 1910, an address to students was delivered by the President, and a criticism of the work submitted was read by Mr. Mervyn Macartney (*F.*). An exhibition of the drawings was held from January 18 to 29, in the gallery of the Alpine Club, and was visited by 1,100 persons. A selection of the prize drawings is now being sent the round of the allied societies.

"At Homes" were given by the President on June 21, 1909, when a selection of water-colour drawings and etchings were exhibited; and on January 10 last, when an exhibition was held of drawings of deceased architects and draughtsmen. A reception in honour of the visit to England of members of the German Garden City Association was held by the President and Council on July 13, 1909, and through the exertions of the Institute town planning committee, who had charge of the arrangements, an interesting collection of drawings illustrating various ideas of town-planning was exhibited on the occasion. An address of welcome was delivered by the President, and acknowledged by Herr Rehorst, architect of the Cologne Town Council.

Some of the most important work of the year has been done by the town planning committee. In the Housing and Town Planning Act of 1909 an amendment was obtained which will enable the Royal Institute to make representations to the Local Government Board before the approval of town-planning schemes. Under the guidance of the committee a number of town planning committees have been formed by the allied societies, and these are working in co-operation in the study of the problems of town planning, and in bringing architectural influence to bear upon the municipal authorities, who will be charged with the important task of preparing town-planning schemes. Acting on the advice of the committee the Council have decided to organise a Town Planning Conference which will be held in the rooms of the Royal Institute between July 11 and 16. His Majesty the King has graciously granted his patronage to the conference, and the executive committees are arranging a programme of papers by authorities on the subject, and an exhibition of town plans, photographs, and other interesting material. During the course of the year a series of papers on town planning has appeared in the Journal.

Since the issue of the last annual report the following sessional papers have been read before the Institute:—May 17, 1909, "Smoke Abatement," by Sir Wm. Richmond, K.C.B., R.A. (*H.A.*); November 15, "The Planning and Laying-out of Public Places, by H. Inigo Triggs (*A.*); December 13, "Architectural Education in America," by Professor A. D. F. Hamlin; January 17, 1910, "Carr of York," by S. D. Kitson, M.A. Cantab. (*F.*); February 14, "George Frederick Bodley," by Edward Warren, F.S.A. (*F.*); March 14, "The Business Side of Architecture," by A. A. Hudson, Barrister-at-Law (*H.A.*); April 4, "Architecture of the Balkan States," by George Hubbard, F.S.A. (*F.*); April 18, "The Architecture of Adventure," by Professor W. R. Lethaby (*F.*). The final paper of the session will be read on May 23 by Mr. E. A. Rickards (*F.*), subject, "Art of the Monument."

The most important event of the year has been the approval of the new by-laws by the Privy Council. These by-laws were the result of long consideration, first by the by-laws revision committee, and then by the Council, and they were discussed and amended at numerous meetings of the general body during the year. They were finally approved by the Privy Council on March 23, 1910, and it then became possible to receive applications for the new class of licentiates. Steps have been taken to lay the advantages of this class before all practising architects and assistants throughout the Empire, and the response already made is very gratifying.

The new charter has also made provision for the appointment of a Board of Architectural Education with extended powers, and this will begin its important work immediately.

In accordance with a resolution passed at the general meeting of March 4, 1907, the Parliamentary Bill committee have been at work upon the draft Bill defined in that resolution, and when it has been approved by the Council it will be laid before the general body for their consideration.

During the course of the year the Council obtained the approval of the general body to a proposal to purchase the lease held by Messrs. Knight, Frank & Rutley, at 9 and 11 Conduit Street. In the terms of this purchase the Conduit Street Galleries, with their entrance in Maddox Street, and several offices and other accommodation, will be taken over by the Royal Institute on June 24. This will improve the library accommodation and enable the Institute to hold its exhibitions, examinations, and receptions under its own roof in future. Improvements in the arrangement and decoration of the new premises will be made.

Thanks to the services rendered to the Institute by its representatives, Mr. John Belcher, R.A., and Mr. John W. Simpson, great progress has been made towards obtaining the protection of copyright for works of architecture. It is hoped that in the near future this right will be secured by means of legislation.

During the course of the year the Council have been compelled to take action in several cases of professional advertisement and breach of professional etiquette.

Many architects have applied for and received advice from the Board of Defence on questions of principle and practice, and in view of several cases of liability for dry rot the Council have issued two circulars on the subject.

The Council appointed the President, Sir Aston Webb, Sir L. Alma-Tadema, Sir George Frampton, Mr. T. E. Collcutt, Mr. H. T. Hare, Mr. John W. Simpson, and Mr. H. V. Lanchester as a deputation to the Bridge House Estates committee of the Corporation to urge upon them the architectural aspects of the important undertaking of St. Paul's Bridge.

The Building Act Amendment clauses of the London County Council (General Powers) Bill, 1909, were the subject of consideration by the Council, who appointed Mr. Edwin T. Hall (vice-president), Mr. J. S. Gibson (vice-president), Mr. John Slater (*F.*), and Mr. Wm. Dunn (*F.*) to attend conferences upon the Bill called by the London County Council, at which representatives of many other institutions and societies affected by the Bill were also present. At these conferences the action of the R.I.B.A. was supported by almost all the other societies. Failing agreement on the matters in dispute, the Bill was opposed by the Royal Institute, in conjunction with the Institution of Civil Engineers, the Surveyors' Institution, and other bodies, before a Committee of the House of Commons, and later on important amendments in the interests of building owners were obtained as a result of the opposition.

The Council report the continued financial prosperity of the Institute. Although the balance of income over expenditure is only 595*l.* 10*s.* 9*d.*, as against 1,841*l.* 14*s.* 4*d.* last year, this is mainly accounted for by exceptional expenditure incurred in connection with the new by-laws and the opposition to the London County Council (General Powers) Bill. The sum of 1,066*l.* has been invested during the year, and in addition to this a sum of 1,000*l.* has already been paid to Messrs. Knight, Frank & Rutley on account of the purchase of their leases. The invested capital is now over 27,000*l.*

Since the issue of the last annual report the Council have appointed the following gentlemen to serve as the Institute representatives in connection with the various bodies indicated:—

| | |
|---|---|
| The British School at Rome | Mr. John W. Simpson. |
| The Conference on Taxation of Land Values | Mr. George Hubbard.<br>Mr. Edwin L. Lutyens.<br>Mr. Ernest Newton. |
| The Departmental Committee on the cost of school buildings | Mr. J. Osborne Smith.<br>Mr. H. W. Burrows.<br>Mr. W. G. Wilson. |
| The Engineering Standards Committee | Mr. Edwin T. Hall. |
| The Garden Cities and Town Planning Association Conference | Mr. Walter Cave.<br>Mr. H. V. Lanchester.<br>Mr. Paul Waterhouse. |
| The General Council for the National Registration of Plumbers | Mr. H. D. Searles-Wood. |
| The International Congress of School Hygiene, Paris, 1910 | Mr. Edwin T. Hall.<br>Mr. J. Osborne Smith. |
| The London Council for the National Registration of Plumbers | Mr. H. D. Searles-Wood. |
| The National Housing and Town Planning Council Conference | Mr. H. V. Lanchester<br>Mr. John W. Simpson.<br>Mr. Raymond Unwin.<br>Prof. Beresford Pite.<br>Sir Aston Webb. |
| The Royal Institute of Public Health Congress, Liverpool, 1910 | Mr. T. E. Eccles. |
| The Royal Sanitary Institute Congress, Brighton, 1910 | Mr. Edwin T. Hall.<br>Mr. Max Clarke. |
| The Sanitary Inspectors' Examination Board | Mr. H. D. Searles-Wood. |
| The University of Sheffield Court of Governors | Mr. J. Alfred Gotch. |
| The University of Bristol Court of Governors | Mr. Mowbray A. Green. |

Since the issue of the last annual report the Council have made the following grants:—Architects' Benevolent Society, 100*l.*; Architectural Association Sketch Book, 25*l.*; Architectural Association, 100*l.*; Artistic Copyright Society, 26*l.* 5*s.*; British School at Rome, 21*l.*; Concrete Aggregates Commission, 25*l.*; Royal Architectural Museum, 21*l.*; Sheffield Society, 12*l.* 10*s.*

The competitions committee have had under their consideration all the conditions issued by various promoters, and in cases where the conditions have been unsatisfactory, letters urging modifications have been sent to the promoters. In the case of the competitions for the Warrington elementary school, the Workington technical school, and the Acton school, the committee's efforts to obtain satisfactory amendment of the conditions having been unavailing, the Council, by publication in the *Journal* and in the professional Press have advised members of the Institute not to take part in them. The following have been the President's appointments to assessorships during the official year:—

| | | |
|---|---|---|
| Aberdare | Fever Hospital | Sir William Emerson. |
| Birkdale | Design for building in glazed brickwork | Mr. Max Clarke. |
| Bloxwich | School | Mr. Edmund Wimperis. |
| Blyth | Secondary School | Mr. J. Alfred Gotch. |
| Cardiff | National Museum of Wales | Mr. Edwin T. Hall, to act in conjunction with Sir Aston Webb and Mr. J. J. Burnet. |
| Chislehurst | Cemetery | Mr. Ernest Newton. |
| Herne Bay | Pier Pavilion | Mr. Edwin T. Hall. |
| Johannesburg | Municipal Buildings | Mr. Leonard Stokes. |
| Kentish Town | Mission Hall | Mr. Andrew N. Prentice. |
| Liverpool | Arts Building | Mr. E. Guy Dawber. |
| London | Medical Examination Hall | Mr. Thomas E. Colleutt. |
| London | Peabody Buildings | Mr. Paul Waterhouse. |
| Peterborough | Girls' Secondary School | Professor F. M. Simpson. |
| St. Annes-on-Sea | Golf Club House | Mr. Ernest Newton. |
| Stockport | Library | Mr. Percy S. Worthington. |
| Watford | Grammar School | Mr. Ernest Newton. |
| Wigan | Elementary School | Mr. John W. Simpson. |
| Wimbledon | Hospital | Mr. William A. Pite. |

Copies of the "Regulations" have been sent to the promoters of the following competitions, together with letters requesting that a copy of the conditions be sent for the Institute Library:—

Aberdare: Fever Hospital.
Aberdeen: Elementary School.
Acton: School.
Ballater: Hospital,
Ballsbridge: Park lay-out.
Bloxwich: Public Elementary School.
Blyth: Secondary School.
Bothwell: Schools.
Brae Head: Academy.
Burslem: Public Buildings.
Cardiff: National Museum.
Coventry: Municipal Buildings.
Cradley Heath: Sunday School.
East Molesey: Isolation Hospital.
Edenderry: Municipal Offices.
Eltham: Parish Hall.
Endcliffe Park: Church.
Harpenden: Public Hall.
Herne Bay: Pier Pavilion.
Huddersfield: Church.
Karachi, India: Municipal Offices.
Kendal: Technical School.
King's Norton: Elementary School.
Larne: Technical School.
Leeds: Business Premises.
Minehead: Shelter.
Newburn: Council Offices.
New Cross, S.E.: Branch Library.
Oldham: Town Hall Extension.
Otley: Grammar School.
Preston: Grammar School.
Renfrew: New Offices.
St. Albans: Library.
Scarborough: Café and Promenade.
Soke: Secondary School for Girls.
Stoke: Council School enlargement.
Stoke-on-Trent: Town Hall.
Tralee: Carnegie Library and Technical School.
Wakefield: Elementary School.
Walsoken: School.
Warrington: Elementary School.
Whitby: Secondary Schools.
Whitley Bay: Elementary School.
Wood Green: Public Baths.
Workington: Technical anl Secondary School.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. Henry Tanner, F.R.I.B.A. (President), in the chair.

Messrs. A. Lowry and F. C. L. Toye were elected members.

The President received the scrutineers' report on the voting papers for the election of officers for the next session. The scrutineers in their report stated that 373 voting papers were received, but four had to be rejected as invalid. The results were as follows:—

### List of Officers, Session 1910-11.

President: Mr. Arthur Keen; Vice-presidents: Mr. G. C. Horsley and Sir A. Brumwell Thomas; Council: Messrs. C. Wontner Smith, F. D. Clapham, W. Curtis Green, Horace Field, F. Winton Newman, Herbert A. Hall, Cecil C. Brewer, W. J. Tapper, P. W. Lovell, and Percy May; Hon. Treasurer: Mr. Henry Tanner; Hon. Editor A.A. Journal: Mr. A. Foxley; Hon. Librarian: Mr. G. G. Wornum; Hon. Secretaries: Messrs. Edwin Gunn and G. Leonard Elkington.

A cordial vote of thanks was passed to the scrutineers (Messrs. F. T. Bush, H. B. Elkington, G. D. G. Hake, R. Lowry, B. F. Matthews, and A. J. Perrin) for their services in connection with the elections.

The President announced the first summer visit fixed for Saturday, May 28, to the piano factory of the Orchestrelle Company at Hayes, by kind permission of the architect, Mr. Walter Cave.

The President said the water-colour class was not properly supported, and unless more members joined the extremely useful and interesting class would cease. If a sufficient number of students gave it their support, the Council proposed to make arrangements for holding six outdoor meetings on Saturday afternoons and to abolish the indoor class.

On the motion of the President a vote of thanks was passed to the School of Design visitors and to the professional Press. A second vote of thanks was unanimously accorded to Mr. S. Pepys Cockerell for presenting to the library a copy of "Travels in Southern Europe and the Levant, 1816-17: The Journal of C. R. Cockerell, R.A."

Mr. F. D. Clapham proposed a vote of thanks to Mr. Tanner for his services as President, and to the retiring members of the Council. The motion was carried by acclamation.

Mr. Mowbray A. Green read the following paper illustrated by numerous lantern views, entitled:—

### The Architecture of Bath.

The end of the seventeenth and the early days of the eighteenth centuries saw great changes both in the life and pursuits of the people of Bath. The value of the healing waters had again impressed itself upon the minds of physicians, and several of them had written treatises upon the waters, with the result that visitors, including Royalty, came to stay in the old city. But it was cramped, dirty, and ill-fitted to receive the gentle and noble ones, who came so willingly to submit themselves to the drastic treatment which the doctors prescribed. The city was scarcely larger than it had been in mediæval days, and was full of interesting houses of the Elizabethan and Jacobean periods, many of which are portrayed on Gilmore's map of 1694. It was surrounded by walls and gates and had an area of about 37 acres. Roughly hexagonal on plan, with a long straight side to the north, it was divided by Cheap Street and Westgate Street, which ran east and west, into two unequal parts. The northernmost portion had three small alleys running north and south, and the southern portion was also divided by Stall Street, which ran due south to the south gate. All these streets are of great interest as being probably on the site of the very streets laid out by the Romans in their early city. The trade of Bath up to this time had been mostly that of woollen manufacture, and the curious T-posts shown in Gilmore's map along the borough walls on the north side probably indicate the drying poles. The only buildings of importance outside the city gates were those of Southgate Street, which ran in a continuous line from the south gate to the old bridge over the river Avon at the end, and Walcot Street and Broad Street, which ran northwards outside the north gate. Within fifty years of this period almost the whole of this charming early work had disappeared, and the later Renaissance had taken possession of the city. At the present time there remains merely a small piece of the city wall on the upper borough walls and the east gate, together with some four or five relics of the sixteenth and seventeenth centuries hidden away in different parts of the city.

Of the builders of the early years of the eighteenth century little is known with the exception of a mason called Greenway, who, with his sons, in later years carried on quite an extensive business in the making of ornamental stone vases and the like, and who in this capacity is favourably mentioned by John Wood.

One of the earliest buildings, which stood until a few years ago on the east side of Orange Grove, was Nassau House, with a façade in the Corinthian manner. The porch was preserved when the house was demolished, and may now be seen rebuilt into the wall that divides the Institution gardens from the basement of the Empire Hotel.

Of about the same date is Marshal Wade's house in the Abbey Yard, a composition of the Ionic order. The openings on the ground floor were originally arched, but the upper storey forms a poor feature and may have been rebuilt at some time. There is nothing of interest inside the house. Between the years 1722 and 1748 Marshal Wade was four times M.P. for Bath.

In 1707 George Trim began to build just outside the north wall of the city, and there still remain in this street several interesting houses. In one of these General Wolfe was staying when he received orders in 1759 to proceed to Quebec. The chief characteristic of the houses of this period is their individual treatment by a marked central feature which contrasts with the later Palladian manner when all the parts are made subservient to the general design, and where the grouping of the window openings frequently does not indicate the internal arrangements.

In 1716 Green Street was begun, and here is perhaps one of the best examples left in Bath of this period. The sashes are divided by heavy glazing bars, and though the rooms are not large, they are panelled throughout, and the ceiling is kept on a line with the underside of the window head, producing a far more cheerful and comfortable interior than was possible under the exigencies of Classic architecture.

About 1720 the south side of Westgate Street was taken down and rebuilt, and at this same period Thomas Greenway had in hand a group of houses called St. John's Court, on a piece of ground known as the Town Mixen or Rubbish Heap, and facing on the old Timber Green, known now as the Sawclose. The large house now absorbed into the theatre was at one time occupied by Beau Nash. It has projecting rusticated quoins, with a main cornice above the first floor and a high attic storey over. The lower portion of the entablature is broken above each window, but the mouldings are on the whole poor and ineffective. Adjoining it is the house where Nash died. This has a fine doorway of the Corinthian order nearly 14 feet high from the ground to the top of the cornice, and surmounted by two dies with crouching eagles above them, all the work of Greenway, and full of interest. One word as to Nash. Of a roving disposition in his youth, he came to Bath at the age of thirty and settled down to take up the post of M.C., when the opportunity offered, on the death of Captain Webster. Although it must be admitted that he greatly encouraged gaming, yet he was able to keep in check the coarse and vulgar manners of the society of his day. His end was sad, for poverty came upon him, his friends forsook him, and during his latter days the Corporation granted him a pension, and when he died buried him at the public expense.

Another work which may probably be attributed to Greenway is Widcombe House, which was built in 1727 for Phillip Bennet the younger, who afterwards represented Bath in Parliament; it is referred to as a "new mansion" in an indenture made between Bennet and Ralph Allen in 1730. The coupled Ionic pilasters have foliated caps and stand on a plinth, the capping of which also forms the top moulding of the balustrade in the garden. On the whole the elevation appears too large in the scale of its details and is set down too closely to the ground to be quite satisfactory. The interior of this house has a good staircase, and that is all.

In the kitchen-garden on the other side of the road is a little garden house with a frontage of 18 feet 6 inches, much altered, but in good preservation. The original house had three openings on the front with three corresponding alcove seats at the back and with one opening at each end. These openings are flanked by three-quarter Doric columns, and on the first floor over the two outer ones is an Ionic column. The broken entablature is a feature scarcely known in Bath. The interior of the lower room is entirely of stone, even to the cornice, and the whole of the mouldings in this little building are executed with great refinement, though internally they have never been entirely cleaned down. It is probably an earlier building than Widcombe House. Near the stables is the old dovecote, rapidly going to decay.

Among the builders of this time should be mentioned William Killigrew, who built the chapel at St. John's Hospital and a group of houses at the back of St. James's Church, two of which still remain.

We are now at the period when John Wood began his work in Bath. He was born in 1704, but little is known of his early life and training; he was a Yorkshireman, but the influence which attracted him to Bath, unless it was the chance meeting of Ralph Allen in his own county, is not apparent. Certain it is that at the early age of twenty-one he had large ideas as to the rebuilding of Bath, but he was not successful in bringing it about in the way he then intended. One of his first definite works in the city was the building of the upper part of St. John's Hospital for the Duke of Chandos in 1727, a hospital founded for the reception of six poor men and six poor women. The two sides facing the courtyard are treated without ornament, and are finished with a crowning cornice of the usual modillion type. Quite close to this is another group of houses known as Chandos Buildings, erected by Wood in 1727 for the Duke of Chandos.

In the early part of this same year Wood was also engaged upon the rebuilding and enlargement of a house in Lilliput Alley, or North Parade Passage. The house was probably a seventeenth century one, and was owned by Ralph Allen, the pioneer of the cross post system of letter carrying. The well-proportioned front, with its rusticated basement, Corinthian order, and pedimented roof, was an addition to the old portion of the house, which latter he refronted. There are features and details here very unlike Wood's later work, but it may be that he had not entirely settled in Bath, for he had been living on and off in London for two or three years between the time of his leaving Yorkshire and his finally coming to

Bath, and it was evidently the custom of the period to allow the builders a fairly free hand in the execution of their work.

In spite of many disappointments he at last succeeded in starting, in the year 1729, a square just outside the north-west boundary of the city, and this he called Queen Square in honour of Queen Caroline, wife of George II. The land he leased from Mr. Gay, a surgeon in Hatton Garden, on a tenure of ninety-nine years, and he let it out again to builders on leases of ninety-eight years. Starting on the east side, the buildings gradually crept round by the north or principal front, and, including St. Mary's Chapel, were finally completed on the south side in a period of seven years.

The scheme as originally planned shows Wood Street, named after himself, as 90 feet wide, but this was afterwards reduced by one-half, and the square, as completed, measured 316 feet from north to south and 306 feet from east to west, reckoning from house to house. The gardens in the centre of the square, as well as the areas of the houses, were surrounded by a stone balustrading, with either openings or gates in the centre of each side of the gardens, but by 1790 the balustrading seems to have disappeared and iron railings have taken its place. Some of it may, however, still be seen on a wall in Lyncombe Vale, where it was put up at the beginning of the nineteenth century. Part of that round the houses existed, however, as late as 1819.

The principal side of the square is that on the north, where a rusticated ground-floor storey supports a Corinthian order, which runs through the first and second storeys, the centre and two ends being slightly projected and having three-quarter columns, while the intervening parts have pilasters. The sills of the first-floor windows have all been cut down and their proportion thereby marred. The level of the original sills is shown by the flat course on either side of the windows. The centre and end blocks had quite a super-abundance of rich detail even up to the attic course, but this could only have been seen when it was newly carved. It certainly points to the fact that the builders had at their command a large amount of skilled artisan labour. The façade was very ably designed to accord with the internal planning, though there have been many alterations in later days, either by turning doors into windows or windows into doors. The plans of the centre house give us some idea of the manner of life at that time, for we see that it was customary not only to have bedrooms on the ground floor, but to plan the houses with rooms so entirely *en suite* as to make them quite unsuitable for the customs of a later generation. In this case the interesting doorways which have been cut through into the back bedrooms on the first floor will show that that storey was evidently designed largely with a view to providing reception rather than bedroom accommodation. The attendants' rooms at the further end of the garden were probably used as waiting-rooms by the chairmen, who brought their fares to call at the house, and the under-part of the room on the right side of the house seems to have been constructed to take the Sedan-chairs, while the staircase itself was specially contrived with a circular end so that patients who came from the baths might be carried straight up to their rooms before getting out of the chairs.

Many of the ceilings at this time were panelled in plaster, but the decorative low relief enrichments of foliage and other conventionalised natural forms had not yet come into general use. The charm of the house is the staircase, and the finest one in Bath is to be found in the house on the west side of this square. The handrails, newels, balusters, and dado are all of Spanish mahogany; the newels are worked as fluted Corinthian columns, and the baluster caps are partially enriched. There are, as usual, three balusters to each tread, and the stairs themselves are formed of pieces of oak dowelled together so as to form solid steps; these are moulded underneath and enriched on their outer ends, and there is a double strip of mahogany inlaid on the treads. The quarter space landings are also inlaid. At the bottom of the stairs is a lazy-tongs gate of mahogany, to be used if necessary to prevent dogs from going upstairs.

The west side of the square was originally completed with three detached piles of buildings, the centre one being set back a considerable distance with a large forecourt in front.

(*To be concluded.*)

The Birmingham education committee last week approved the sketch plans submitted for the proposed Council school to be erected in Cherrywood Road, Bordesley Green. The school will consist of two self-contained blocks and accommodate 500 each in the junior and senior departments. The estimated cost is 10,379*l*. for the school buildings, 1,000*l*. for the manual room, and 450*l*. for the caretaker's house.

## BUILDING BY-LAWS.*

(*Concluded from last week.*)

But though dwelling-house walls may be thus slighted there is one wall over which, as far as I know, all by-laws exercise most scrupulous care—the wall of the ashpit. Numerous by-laws that allow human beings to shelter themselves in dwellings of nothing more substantial than corrugated iron, weather-boarding, or lath and plaster, insist upon ashpits being enclosed by nine-inch brick walls. The solicitude of rural district councillors for other men's ashes—I mean the ashes of the domestic hearth—is quite touching. To complete the absurdity of such provisions, surely there should also be rules as to party-walls of ashpits, bay windows of ashpits, and ashpits of two or more storeys.

This small domestic appurtenance, whose functions with general advantage and economy are usually usurped by a movable tin box, is a subject upon which the official mind dwells lovingly but hardly consistently. In South Stoneham an ashpit may be as near as 6 feet to a dwelling-house, but it must be 30 feet from a well. In Southampton Borough, 6 feet from a house and 50 feet from a well. In Godstone, 10 feet from a house and 50 feet from a well, and so on.

Ashes, perhaps, have earned this respect by a hitherto unsuspected and mysterious quality of elasticity. In the Winchester Rural District a month's ashes are credited with a bulk of 20 cubic feet, but in the Farnham district, almost adjoining, a fortnight's ashes have the same, according to the official estimate. Ashpits of a capacity sufficient to contain this amount of refuse do not seem any too spacious—5 feet long, 2 feet wide, and 2 feet deep; but they are considerably more roomy than those allowed in Bodmin and other places where their capacity is limited to 6 cubic feet—24 inches long, 24 inches wide, and 18 inches deep. But in Bodmin, ashpits are evidently valued for other qualities than mere size. No less than eight paragraphs deal with the fascinating subject of their construction, requiring not only 9-inch walls (which, with their footings, would exceed in bulk the ashes they enclose), but also a roof, a floor, a ventilator, and a door. As to the last I quote here the actual words:—"A door in such a position and so constructed and fitted as to admit of the convenient removal of the contents of such ashpit, and to admit of being securely closed and fastened for the effectual prevention of the escape of any of the contents of such ashpit."

One might almost suppose it to be the custom in Bodmin to use the coal-cellar as a crematorium.

In Knight's "Annotated By-laws" there is a delicate note of unconscious sarcasm, after critical examination of these regulations:—"The ashpit will be reasonably substantial."

The rules as to cesspools, &c., have just the same haphazard inconsistencies. In one district they must be 70 feet from a house, while in another 40 feet is far enough. Why in Southampton may they not be within 100 feet of a well if in West Ham it is safe for them to be as near as 40 feet? If a distance of 50 feet is safe in Petersfield, why is less than 60 feet unsafe in Godalming? Differences of subsoil do not account for these discrepancies, for most districts have various kinds.

Air-spaces and paved areas vary, too, just at the whim of the person who is responsible for the by-laws of a district. Why should an air-space of 300 feet be required in Clare, 250 feet in Alresford, and 200 feet in Alton, while 150 feet will suffice in Guildford and most other places?

A peculiarly absurd by-law is one which in some districts prohibits rooms with sloped ceilings of a less height than 9 feet over half their floor area. In most districts 8 feet is allowed, and even that requirement defeats its own end if we may assume that to be the prevention of cramped attic bedrooms, for ingenious builders, when threatened with fines for having constructed less than half the attic of the required height, get out of the difficulty by partitioning off enough of that part of the room over which the roof slopes to reduce it to less than half the total area, thus actually decreasing the cubic air-space of the apartment. In Tynemouth an average height of 6½ feet is specified as sufficient.

In a German code of by-laws, however, I find a more grotesque piece of legislation with regard to the height of rooms than any English code can boast. It is this. In towns with a population exceeding 10,000 rooms must be at least 8 feet 9 inches high, but in towns of less than 10,000 they need only be 8 feet 1 inch. A very superficial view might find an apparent reason for this in the presumable crowding of buildings in the larger towns. But how about the growth of towns? Towns expand by streets radiating more or less from a centre; and in a growing town it would suddenly be found that the population having reached 10,000, all the new houses, although less likely to be crowded the further the street extensions progressed, must have higher rooms than those in the older part of the town, so that eventually all new towns that attained a population of over 10,000 would have a central area of low-roomed buildings surrounded by a ring of higher ones. And possibly even a precise German official would find it difficult to decide exactly when the population of a town reached the stated figure and new ceilings were to be put up 8 inches accordingly. Besides, populations fluctuate, and one can imagine builders in a town of about 10,000 inhabitants would have an anxious time.

---

* A paper read before the British Constitution Association on April 25 by Mr. R. M. Lucas, F.R.I.B.A.

Compliance with the demand for a height of 9 feet in the bedrooms of small cottages—bedrooms on the ground floor may be 8 feet, by the way—besides leading to a reduction of the floor area and cubic contents, also either weakens the roof and walls or increases the cost. At the same time there is nothing, as far as I know, in the by-laws to protect the public against the dangers likely to be caused by the spreading tendency of a roof, nor, for the matter of that, is there anything about the thrust of arches except those over fire-places. It is hard to see how, in the face of such omissions, it can be argued that by-laws are necessary to ensure good building or even to prevent dangerous building.

Many districts have rules specifying windows of a certain size, or rather of an uncertain size, seeing that different districts do not always agree; but these well-meant attempts will hardly achieve much success without the prohibition of blinds, curtains, and sash-fasteners. One by-law minutely specifies the precise length of slate-nails, but has nothing to say about the thickness of the battens the nails are to be driven into.

It would be easy to collect many more cases in which the by-laws are not only inconsistent with common sense but with each other, and also to show how their administrators differ in the interpretation of them, as, for instance, with regard to cement concrete, which one surveyor has wisely used in place of brick footings, while in an adjoining district it is disallowed upon the advice of an official who actually told his committee in my hearing that cement concrete must not be used instead of ordinary footings of bricks laid in mortar, because, he asserted, it had not sufficient crushing strength until twelve months had elapsed to support a cottage wall! But having, I think, shown how the by-laws discredit each other by their inconsistencies and absurdities, I want also to show that it cannot be claimed for them that they are necessary to improve building.

One illustration will suffice, though many could be given. It is that of the hollow wall.

Anyone who has lived in a district where the local clay produces absorbent bricks will agree with me that no greater improvement in house building has taken place for many years than that of building the external walls with a vertical cavity of about two inches across which damp cannot pass. The inner half of a wall so built is dry, for it is connected to the outer rain-soaked half only by iron wall ties which are shaped with a bend to prevent water passing; whereas a solid external wall, unless protected, is anything but rainproof if the bricks are porous, as on the south coast even the best bricks are, they being very heavy drinkers, quite different to those used in London. Now, no by-law would meet with more thorough approval, would inflict less hardship, and would be more in the public interest, than one requiring all dwelling-houses faced with porous bricks to be built with hollow external walls. Yet no such by-law exists, and though some codes have references to hollow walls they are only for cellars or merely permissive, while in at least one district the absence of such references used even to be put forward as a hindrance to those who desired to build dry houses in this simple way. Surely only one deduction can be drawn from the fact that a by-law which certainly would be as little open to objection as any has never been made, while even the most abandoned jerry-builders act as if it were in force. This undoubted improvement has come about quite naturally without any help from the by-laws; and although the hollow wall costs a little more to build, and is an improvement that does not show when the building is completed, it is now invariable even in the cheapest cottages in the south of Hampshire and elsewhere. Besides being drier than a solid wall it is also warmer, owing to the non-conductivity of the air in the cavity, and quite as strong, for though having a weaker bond it has a wider base.

When public officials assert that by-laws are necessary, it never seems to occur to them that, allowing for the advance of science and general knowledge, no better building is done now than that which was done before the by-laws came into vogue. Nor can they explain why if by-laws are necessary in some districts, in other similar districts there should be none—an omission for which nobody seems a penny the worse; nor why, if worthy to be upheld, they should present such amazing contradictions in distinguishing between things to be approved or disapproved; nor why, again, the winning design in the Letchworth Garden City Cottage Competition should be prohibited by the regulations enforced by scores of rural district councils.

The building by-law system is in reality bound up with the great townward movement, with the congestion of hurry and rush. It was so in London when the Great Fire reduced the City suddenly to a vacant building estate—to an estate so "ripe" and so "eligible" that without a regulating code of by-laws the scramble of builders would have resulted in utter confusion. Jerry-building, by which term I understand not temporary building, nor economic building, nor speculative building necessarily, all of which may be quite good and desirable in their way, but building in which dishonest economy is the leading motive. Jerry-building is a fraudulent act and should be treated as such, but the by-laws aimed against it have struck down one not very widespread evil to raise up others, permitting favouritism, corruption and bribery, and giving opportunities to petty officials to indulge personal spite. Even where honestly and intelligently administered the rural by-laws are admitted to have discouraged the building of new cottages, thus indirectly driving men from the fields to the towns. The mere fact that in some districts a man finds he has to obtain and part with two complete duplicate sets of plans, sections, &c., of a proposed building; two plans showing the site and neighbouring properties (which may mean paying for quite a large survey); sections of land and drainage details, before his application for permission to put up a cottage will even be considered, must act as a deterrent—and it does.

This demand for duplicate detailed plans in advance of the work is hardly consistent with the principle of English law, according to which a man is regarded as innocent until proved guilty.

But although, as we have seen, the building by-laws, or, at any rate, those in force in some villages are anything but advantageous to the community generally, there is one class of individuals to whom they are the very staff of life. I refer not to the honest and properly qualified surveyors, but to others who, with little or no training, have secured their snug permanent berths by trading upon the good nature, the laxity or the cupidity of newly-elected councillors elated at finding themselves for the first time able to dispense favours at the expense of the public. Surveyors of this type see the red light in any suggestion of reform. They have no desire to return to their former occupations—to become again road-menders, lawyers' clerks, bootmakers, &c. In the view of officials of this class the more by-laws there are the better. They find in each vaguely-worded regulation a handy weapon with which to browbeat bewildered builders. They like to have the exercise of discretionary powers which can be made so useful in favour of their friends and against their enemies, not to say so profitable to themselves.

Even among public officials of the best class a tendency to support the system that supports them is almost inevitable. They all float together as timbers of one bureaucratic raft. Though they may be conscious of having honestly earned their positions, they know full well that others to whom they wish no ill would have a hard time if cast adrift. Consequently one must expect by-laws to be accepted as necessary by those whose administration of them is their means of livelihood. Against this view, however, we have not only the two main facts—namely, that building was as good before as after the adoption of the by-laws, and that there are still districts that neither have them nor want them; but other facts, equally clear but of less argumentative importance, such as the restriction upon building enterprise and employment, the preliminary expenses and delays confronting those who wish to build, the restrictions upon justifiable experiments with new methods of construction—an asphalte roof, for instance, being forbidden in one district upon the excuse that the by-laws did not mention it; the power placed in the hands of officials sometimes grossly ignorant of the A B C of their duties, to persecute or favour, to share profits with some and to levy blackmail on others, and the absence of any means of deciding if a building may be erected in a certain way except by taking the bold course of erecting it at the risk of having it pulled down.

Reviewing the by-laws, however, as for the time being a fixed institution in many urban and rural districts, we find

## MODERN EUROPEAN ARCHITECTURE.

HALL IN A TOWN HOUSE.

numerous points on which they might be improved. The public have at least a right to expect a good system of arrangement and publication and a uniform charge, if any. Rules of one district should not contradict those of the next, for the credit of their makers if nothing else; the administration should be strictly controlled; no unnecessary discretionary powers permitted; and a builder should be granted some means of proving his right to build in a certain way without having actually to build.

But it appears to me that there is some hope for the evolution of a better state of affairs if it can be found possible for the more open-minded of the urban and rural surveyors to co-operate with landowners, architects, builders, and all who are alive to the evil of the continued migration from the fields to the towns. First, however, we must be in agreement upon one point—namely, that a man has the right to the same liberty in building that is allowed to him in other matters, liberty restrained only by regard for the public welfare and equal liberty for all. This is emphatically not the case at present, and a radical change is needed before it can be brought about.

The complete abolition of all building restrictions would not produce it, for, though they are only a small minority, the unscrupulous builders—the jerry-builders, in fact—would be able to injure the honest by dishonest competition. Nor would one simplified uniform code of by-laws for all urban and one for all rural districts, though an improvement on the confusion of existing codes, suffice to bring it about, for, apart from the many indefensible differences there are a few local considerations which, if unobserved, would cause hardship. Nor would the issue of fixed sanitary rules, with discretionary building rules, be satisfactory, for this would increase an evil, that of discretionary power—quite serious enough in some districts as it is.

The radical change which I hope may be seen is this. To replace the present punitive character of the by-law administration by an educative one; to give the officials more power to instruct and less to punish.

It is an easier thing to suggest a psychic reform than to state it in practical terms. No one is more aware than I of the hopelessness of trying to make useful public servants out of hardened officials who have lived in their grooves for years—and they know it too, but at least they would be comparatively harmless under changed conditions. Nor do I fail to see that for a time the want of intelligent co-operation amongst the officials, the builders, and the public might cause partial failure. But, nevertheless, I believe a change for the general benefit is possible.

Some years ago I put forward a few suggestions of the lines on which a reform of the building by-law administration might be worked out by those who are skilled in such matters. The scheme is outlined in reference only to rural building, for the present system acts most harshly in country districts, and it does not refer to the sanitary by-laws which would remain in force, being, of course, revised as knowledge advanced.

The first suggestion is that instead of having to submit plans to district councils, to observe their building regulations, to await their delays, to submit to their decisions, and to pay their fees, fines, &c., all persons desirous of building (whom for brevity I will call builders) should merely have to notify their intention to build, describing the site, and to apply for a schedule of building instructions. This schedule might be kept up to date by being issued in the form of leaflets similar to those admirable ones supplied by the Board of Agriculture to farmers. Compliance with these instructions would be, while optional, obviously desirable, and any class of building might be erected in any way that the sanitary by-laws, the Public Health Acts, and the Common Law of the land would allow. The district surveyor should be accessible to builders to explain and to advise upon the

## MODERN EUROPEAN ARCHITECTURE.

AN INGLE IN A DINING-ROOM.

instructions, and he should examine the site and the foundations and drains ; he should also be free at all times to inspect work, but not to interfere with it.

Upon completion, and before the building could be occupied, the surveyor should make a report upon it, and his report, favourable or otherwise, should be displayed to intending tenants, purchasers, or mortgagees. As regards essentials, a house can be very easily described—in matters where certainty is possible, that is, for no one can absolutely guarantee against the blistering and cracking of plaster, the shrinkage of joinery, or the dry-rot of timber, as these defects sometimes do not show for months after a perfectly honest completion of the work. The certificate of merit or demerit need not therefore extend to more than a few lines, for example :—"This house is equal to the average of its class in being built with good bricks, mortar, tiles, and timber, with other things in character, except that the eaves-gutters are unduly light and fixed with weak screws, thus being likely to require early renewal."

A right of appeal against the surveyor's report, on reasonable conditions, should of course be granted to the builder.

Only work actually unsafe or liable to become so without warning should be pulled down.

I believe that under a scheme of this kind it would be possible to encourage honest builders, to checkmate dishonest ones, and to instruct both classes and the public at the same time, without interfering with the experimental adoption of newly-invented materials and methods of construction.

It is too much perhaps to expect that any district council within whose area a code of by-laws is already in force will be found willing to put this scheme to a test ; but might it not be tentatively adopted by one which is still unfettered? The experiment would not be difficult to make nor costly, and it would be quite non-committal. Much, of course, would depend upon the surveyor ; but I do not think an intelligent and well-trained man could fail to appreciate the more worthy field laid open to his knowledge and skill.

As things are now, a builder has to make expensive and irksome applications to obtain the permission of persons who generally have no interest in his affairs to do what he has a born right to do, for who will assert that if a man possess the right to plant a tree or dig a well, to paint a picture, or write a book, even to make inflammatory speeches in Hyde Park, he has not an equal right to build a house provided that in doing so he injure no one? A reform on the lines I have suggested would restore that right which statutory law has encroached upon, and at the same time would assist in making a sensible use of it. For that right I feel it a privilege as well as a duty to plead.

Sir William Chance, the Chairman, in opening the discussion, said that a certain amount of evasion of the by-laws was possible. For instance, according to the plans submitted for approval, a room must have a certain amount of window space. In some cases this might be extremely inconvenient. The difficulty could be surmounted by putting on the plan the window of a size desired by the owner, and in addition a small additional window which would bring up the area to the compulsory limit. After the building has been passed the second window can be filled in. Such a course was bound to be taken when building by-laws interfere improperly as at present. He did not suggest that all district councils were unreasonable, and some were anxious to get out of existing regulations; but they found the greatest difficulty in doing so. Sir W. Chance dealt at some length with a Bill which had been drawn up by an association specially for reforming the by-laws. It was called the Public Health Act (Building By-laws) Amendment Bill, and had been passed by the House of Lords in 1906, with the concurrence of Lord Carrington, but it was stopped by the House of Commons. It was believed that if the Bill were passed it would render existing by-laws less unjust, and without interfering in the least with sanitary requirements. It was proposed that an owner should be allowed to erect a detached building just as he liked so long as he did not infringe any of the Public Health Act clauses.

Another thing which they hoped would make things easier than at present was the provision by which any matters in dispute could be brought in a friendly action on the plans, instead of the sanitary authority waiting until the building is complete. In the latter event there is an enormous expense and money wasted, no matter which side may win. The suggested measure appeared to meet the rights of all sides, but, as already said, it had been stopped by the Commons, which fact should be remembered when they heard so much about the House of Lords stopping all good legislation.

Mr. Geo. Hubbard, F.R.I.B.A., said that he had very much pleasure in proposing a vote of thanks to Mr. Lucas for a really clever, interesting, and amusing lecture. He had shown many absurdities and incongruities in the by-laws of various urban districts. The absence of common sense, which inspired certain by-laws, had been brought home to him on various occasions, and as an instance he would mention the experience of his firm (Hubbard & Moore) in connection with a house built for a client who afterwards wished to have a billiard-room. Plans for the house were prepared and submitted to the Urban District Council. Subsequently plans for the billiard-room were sent in and shown to project 18 inches in front of the house. The client was in a hurry, and the works were begun before the plans had been approved by the Council. The urban district surveyor viewed the trenches, footings, and walls, and approved of the work from time to time. When the walls had been carried up to the wall-plate of the room the Urban District Council notified the architects, for the first time, that they objected to the billiard-room as it projected in front of the building line, and they ordered it to be set back.* Seeing that the work had been passed by their surveyor from time to time, the architects did not feel justified in pulling it down. In due course a summons was served, and the magistrate ordered a fine of 20*l*. This fine was paid, the works continued, and again the architects received notice to set back the billiard-room. Solicitors were consulted and counsel's opinion obtained; the opinion was that no Court could upset the order of the District Council, and in the end the billiard-room was pulled down and re-erected in the required position. The technical objection was that the building interfered with the current of air down the road. The road was 40 feet wide, and the building line was some 30 feet away from the road, and there was not another house on the billiard-room side of the house for a quarter of a mile or more; the technical objection was vexatious to the architects, expensive for the client, and of no advantage to the public. Mr. Hubbard pointed out that the London Building Act provides that the area at the back of a house must be of the full width of the site.† In the case of terrace houses round a crescent road it is impossible to have the radiating sites as wide at the back as at the front, and where this regulation is enforced it is impossible to build terrace houses on more than one side of the crescent road. There appeared to be a passionate desire on the part of some to be allowed to do exactly as they pleased and to achieve a state of independence which was not subject to any controlling power. On all matters which affected the welfare of the community there could be no question other than that the individual had to bear certain obligations so that he might share in the common advantage. For the benefit of the community every house should be constructed so that it conformed to a certain standard in respect to its sanitation and also in its construction, so that it should not be a source of danger to others in case of fire and in many other matters which conduced to health.

Mr. Mark H. Judge, A.R.I.B.A., seconded the vote of thanks to Mr. Lucas. He thought the lecturer had shown to what an extent the superstition of State control had got possession of the public mind. It was interesting and instructive to be told that building by-laws were introduced as far back as the Fire of London. This showed what an old thing State interference was. The tendency of the time in favour of State regulation was in fact a retrogression and not an advance. We need only such regulations as are necessary to make clear the common law as to construction and sanitation. Personal responsibility should be brought home to the architect, the builder, and their client. It is no more the business of the local authority to provide an architect than it is to provide a lawyer in the matter of title, or a doctor in case of illness. It is to increased individual responsibility that we must look for improvement in building, rather than to increased interference on the part of public authorities.

The Hon. Ernest Pomeroy said that, judging from an experience of his own, Mr. Hubbard's client need not have pulled down the billiard-room to which objection had been taken by the Urban District Council. His own case was of a somewhat similar nature, and he took it on appeal to the High Court, where it was decided that although the building by-laws might be reasonable in themselves, yet they were unreasonable for that particular building. It was probable that if Mr. Hubbard had taken the matter to the High Court the Judge would have referred it back to the magistrate. On another occasion the local authorities took objection to a wooden lodge erected by Mr. Pomeroy, and, after due notice, sent men to pull it down. But these all ran when he appeared with a shot gun to defend his property, and the wooden building still remains. He failed to see why there should be any by-laws at all, or why people should be prohibited from using their own discretion. Supposing that a man's health became affected by living in a house that had been erected of such materials as to cost only 100*l*., he would have money to spare from his economy in building which he could spend for food, clothing and in other ways, while he might have been half starved by extra cost in building. As a matter of principle it was wrong that the State should interfere except by means of the common law of the land. There was no need for any by-laws.

Mr. Thackeray Turner, F.R.I.B.A., pointed out that the moment you make a building by-law you are inducing a house owner to take your minimum and not your maximum, so that in time the former becomes the latter.

Sir William Chance doubted whether a good Public Health Act would not settle all the difficulties. Many people think that the present law is sufficient without any further additions being made to it by means of by-laws. He himself did not feel prepared to go as far as Mr. Pomeroy in asking for by-laws to be abolished. In a town, for instance, one could not allow every person to drain their house just as they pleased. It was, however, absolutely absurd and ludicrous to have like by-laws in the country, but there must be by-laws of some sort and some authority to decide questions that arise out of them.

Mr. Russ thought that there was a great deal too much interference with the liberty of those who want to build. By-laws are necessary in so far as they take steps to prevent the spread of fire from one building to another and to insure hygienic conditions. This could be done under the Public Health Act. The smaller class of houses are at present overrun with sanitary inspectors who become a perfect nuisance to everybody.

The vote of thanks to Mr. Lucas was passed with acclamation, and after he had replied to the discussion the meeting closed with a vote of thanks to Sir William Chance for presiding.

## OUR CONTEMPORARIES FROM OVER-SEAS.

"La Construction Moderne" (Paris) commences a series of illustrations of the big stores "Magasins au Printemps" in Paris, of which M. René Binet is the architect, and which is chiefly remarkable for the architect's internal treatment of the constructional ironwork combined with decorative balustrades, &c.

*Arkitektur og Dekorativ Kunst* (Christiania) describes and illustrates the Natural History Museum at Töien and the Norwegian Bank at Christianssund, and illustrates a number of students' designs for a music pavilion or bandstand.

*Der Architekt* (Vienna) has a descriptive article with illustrations of the town of Rattenberg on the Inn, where there is much quaint old architecture. Amongst the illustrations are a school and burgermaster's offices at Mauerbach, by Herr Josef Hofbauer; the first premiated design for a new Rathaus at Mährisch-Schönberg, by Herren Karl Badstieber and Eduard Thumb, rational and picturesque; and a weird new-art design for a small theatre, by Herr Stwertnik.

*Zodtchy* (St. Petersburg) has some excellent illustrations of work by MM. V. & G. Cossjacoff, which, if a little mixed archæologically, contains some charming detail.

*Engineering Record* (New York) gives a paper read by Mr. C. R. Young before the Convention of the Canadian Cement and Concrete Association, describing the results of his investigation of certain failures of concrete bridges.

The Exeter city surveyor has been instructed to prepare plans for erecting a refuse destructor at the St. Thomas sewage works.

## KING EDWARD VII.

PEACE is of all things the most vital and important condition for the development and even existence of art, and of all arts architecture is more dependent than any other on peaceful times; hence the memory of EDWARD THE PEACEMAKER must ever be revered by artists generally, and by the followers of the art of architecture particularly, as that of the man who, despite the limitations of a British constitutional monarch, has done more to promote the cause of peace than any other individual of our time or of any time.

His late Most Gracious Majesty King EDWARD VII. was an artist. As an architect from the rude and raw material of clay in the pit, stone in the quarry, and timber in the tree, constructs an abiding and beautiful edifice, so did he from the unpromising material of racial differences, traditional mistrust and mutual jealousies build up a temple in Europe of goodwill, friendship and respect.

The secret of HIS MAJESTY'S success as an artist in peace-making was founded on the truth expressed in the words of MILLET, adopted by our Royal Academy as its motto for this year :—"Le fond de tout est toujours ceci : qu'il faut qu'un homme soit touché d'abord pour pouvoir toucher les autres." Full himself of good-fellowship, courtesy, kindliness, he modelled the hearts of nations to a similitude of the goodness of his own. As a sculptor sees within the shapeless block of marble the beautiful form that only needs the discriminating work of the chisel to reveal its charm, so did EDWARD THE PEACEMAKER discern within the mass of a continent in arms the potentiality of a brotherhood of peoples.

During the all too short reign of EDWARD VII. architecture has made visible advance in the extended manifestation of artistic power amongst the general body of those who are its practitioners in Great Britain. There is a higher general level of achievement, a wider spread of ability and knowledge.

His late MAJESTY was an earnest patron of architecture, as of every other art or activity in which his subjects engaged, and whilst he did not unduly exalt our art beyond its due share of Royal favour—for a just sense of proportion was one of the characteristic traits of HIS MAJESTY'S mind—he took a prominent part in at least two great national memorials, the ceremonial processional way in the Mall and the Victoria and Albert Museum, whilst the King's Sanatorium will stand as evidence of his interest not only in architecture, but in what was most dear to his heart, the cause of the hospitals.

The art of architecture has during King EDWARD'S reign received more frequent recognition than previously in the honours bestowed upon architects, and if we must credit the knighthoods of Sir HENRY TANNER and Sir CASPAR PURDON CLARKE as partly due to their official positions, we can fairly claim the titles of Sir ASTON WEBB, Sir WILLIAM EMERSON, Sir R. ROWAND ANDERSON, and Sir A. BRUMWELL THOMAS as rewards for their work as architects.

Architects, therefore, not only as Britons, but as artists, must feel as poignantly as any of their fellow-subjects the overwhelming loss of His Most Gracious Majesty King EDWARD VII.

an architectural and decorative arts exhibition, including executed works, students' designs, and an arts and crafts exhibits, or else have a similar exhibition in the R.I.B.A. galleries?

This is a point upon which we should like to have the opinion of our readers, as it is assuredly one which vitally affects the future of architecture in this country.

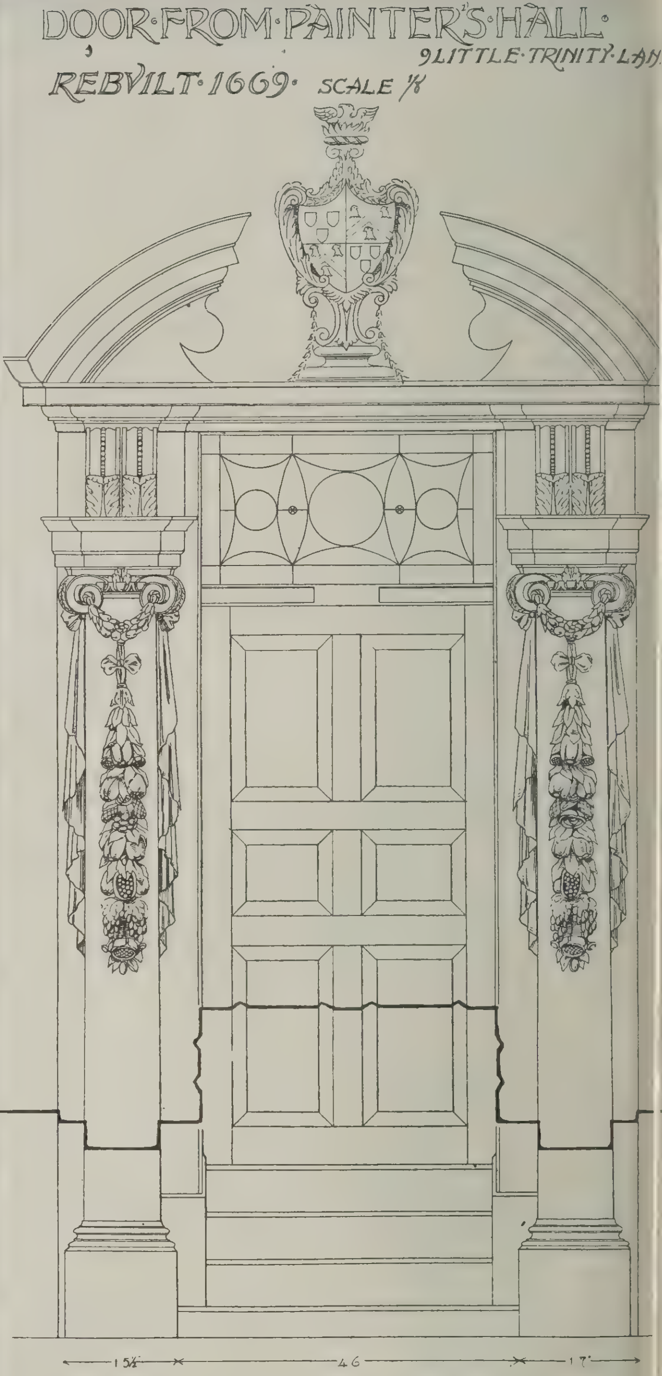
## ARCHITECTURE AT THE ROYAL ACADEMY.

It is remarkable that in this year's exhibition, though there are a goodly number of examples of domestic work, there are few if any houses of large size or of great importance, and in this we think that the exhibition is symptomatic of the position of present day architecture in respect of house building. It is doubtless good ground for satisfaction that the 1,000*l.*, or even the 500*l.*, house should be architecturally and artistically designed, as showing that the appreciation of beauty in the home is permeating a wider circle than in the days when anything above the mediocre or vulgar was only to be found in the house of the man who could afford 20,000*l.* for its erection, and who possibly did so not because he appreciated what he got, but because he thought it good form to own a place designed by Norman Shaw or Ernest George.

Now, instead of a few stars of the first magnitude we find our domestic architecture produced in excellent fashion by hundreds of artists of quite equal ability, even if favoured with less opportunity than the famous men of the latter half of the nineteenth century.

Mr. J. Francis Doyle, in his "Standon Hall, Staffs," has a respectable Tudor manor house, apparently L-shaped, but with no plan given. A stone building with windows large enough for modern ideas, and not free from other anachronisms. Mr. Herbert A. Welch shows "Two houses on the Hampstead garden suburb," a pleasant composition in brick with a small amount of diaper and tile roofs with the now fashionable shorn off verges that rather suggest a face without eyebrows. "No. 65 Harley Street," by Mr. Claude W. Ferrier, is a plain red-brick building with a stone ground floor storey and a circular portico with a stone pedimented window over as the central feature. Mr. R. Douglas Wells, in his "Timber House, Grand Falls, Newfoundland," has transplanted to the far off Dominion a Norman Shaw type of Surrey house. "Recess in Hall," by Mr. H. Davis Richter, is the modest title of a sumptuous fireplace and mantel in a recess between Corinthian columns and forming part of an elaborate and costly hall in a big mansion.

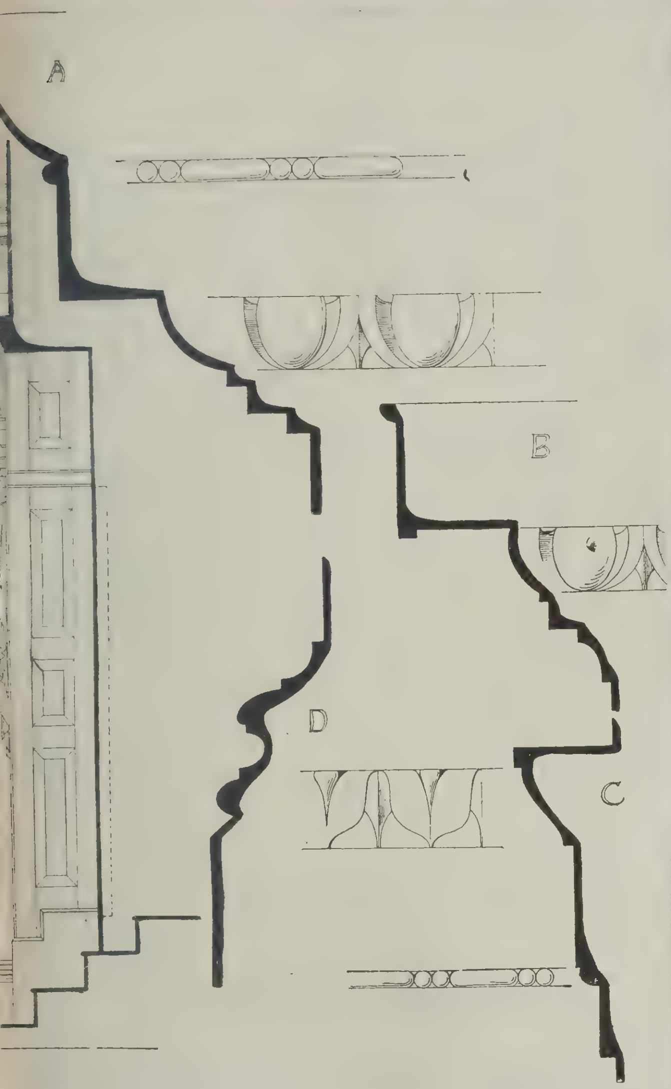
Mr. Ernest Newton's "House at Church Stretton, Salop," is a three-gabled front, E-shaped on plan, projecting bays under the two outer gables being hung with copper, presumably, from the green tint that they are already supposed by the artist to have assumed. "Marrowells, Walton-on-Thames," by Mr. A. Winter Rose, is a study of a lily pond in front of a house with big quoins, possibly of brick. Mr. J. Herbert Somerset's "Cornerlot, Hardelot, France," is a modest-sized house which some might call a bungalow for His Grace the Duke of Argyll; simple rough-cast in treatment, E-shaped plan, with two-hipped ends and a central gable over the entrance. "No. 4 Wimpole Street" is one of Mr. W. Henry White's usual type of houses in the doctors' quarter, a brick front with a stone bay and a stone ground floor doorway at the side of the bay. "Olantigh, Wye, Kent," by Messrs. A. Burnett Brown & Ernest R. Barrow, shows a traditional eighteenth century "pediment and portico" of two storeys in Lord Burlington's manner to a plain brick house with stone window dressings and quoins, a tile roof, and banded chimneys of stone and brick.



Measured and Drawn by Miss Victoria Williamson.

Mr. C. E. Bateman has thoroughly well caught the genius loci in "Aber Atro, Llanbear, Merioneth," a stone and stone-slated group of buildings, free from modernity of feeling. "Räthen, Hindhead," by Mr. Henry A. Saul, is a plastered house with stone quoins and window dressings, and tile roofs with red-brick chimneys. A refreshing variant on the usual E-shaped front is supplied by Mr. Lionel F. Crane's "Highfields, Marlow," in which circular porticos in either stone or wood between the projecting arms form pleasant verandahs. There is perhaps a little clash between the feeling of the half-timbered fronts with herring-bone filling and the Classic regularity of the colonnaded porticos. The entrance front is shown in another drawing of plain red brick with a porte cochère and square tower. "Bicton Hall, Devon," by Mr. Walter Tapper, is a big red-brick house with a stone ground storey and projecting stone loggia and portico.

Mr. Edwin L. Lutyens's single exhibit this year is "Great Maytham, Rolvenden, Kent," a plain red-brick house in a big expanse of formal but simply-treated garden. "The Common-room at Rounton Grange, Northallerton," by Mr. George Jack, has a barrel ceiling over panelled walls, and the windows are, somewhat peculiarly, high up above the panelling, in fact interpenetrating the ceiling.



DETAILS OF DOOR FROM PAINTERS' COMPANY'S HALL.]

Mr. E. Guy Dawber's "House at Deeside, Cheshire," has a plastered centre block with a curious Dutch-like gable and red-brick wings. Mr. Dawber's second exhibit, "House at Headley, Surrey," is a symmetrical brick house with bays apparently of wood on brick plinths. "The Croft, Woodchurch," by Messrs. John W. Fair & Val Myer, is a house built around an internal court, in which the authors have introduced a variety of treatment, as one looks through a stone arcade on to one side of the court with half timbering and plaster panels, and another adjoining in brick and tile hanging with a half-timbered bay. Mr. R. Stephen Ayling's "Proposed New Residential Club, Bolsover Street," is a quite utilitarian, almost barrack-like structure in purple brick with red dressings, a stone entrance and a Mansard slate roof.

Mr. Ernest Newton again illustrates "Ardenrun Place" with a general view of the entrance front and the accessories. "Stoatley Hall, Haslemere," by Messrs. Read & MacDonald, is a study of Jacobean Gothic in stone with red-tile roof and red-brick chimneys, and apparently, no plan being given, shows the hall. Mr. W. Courtenay le Maitre's "Interior of Entrance Hall, Horton Hall, Northampton," is a florid and rather overdone interior with marble floor and columns, costly and gorgeous but devoid of homeliness. "House at Northwood, Middlesex," by Mr. Thomas H. Rhodes, is as well as can be seen in its elevated position near the ceiling a pleasing composition of gables and chimneys over a brick ground storey and plastered first floor. Messrs. J. W. Simpson & M. Ayrton in two clever drawings show a "House at Hertford Heath," long and low with a flat pitched roof and plastered and stone walls.

## DOOR OF PAINTERS' COMPANY'S HALL.

THE Halls of the various City companies are famous in many instances for their art treasures, and that of the Painter Stainers' Company is no exception, for the entrance to the Hall (in Little Trinity Lane) is through one of the most beautiful of the carved doorways of the Renaissance period now left to us in London.

The Hall was rebuilt in 1669, and the carving is, therefore, contemporary with Gibbons, although the refined detail of the mouldings and the pendant masses of fruit and flowers are now sadly marred by numerous coats of paint. The whole conception contains many typical features of later Renaissance work, and is worthy the attention of those of our readers who may be studying that period.

## "THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

IT would seem that the members of our Sketching and Measuring Club have for the most part not as yet devoted much attention to the study of Renaissance, as the number of examples of eighteenth century work contributed falls considerably below that of the earlier periods.

Mr. Reginald Pywell has measured the so-called Temple of the Sun, Kew Gardens, designed by Sir William Chambers, and one of the most satisfactory in design of the many garden pavilions to be found at Kew. Mr. Pywell's work is carefully measured and fairly drawn, but would have been more complete with details of the rather interesting frieze decoration.

"Dubline" has also made a very careful study of one of Sir William Chambers's works, the Casino building at Marino, Clontarf, co. Dublin, Ireland. This is an excellent instance of Sir William's use of the Doric order, and has been very thoroughly measured and ably drawn by our contributor.

"Esek" sends drawings of the principal entrance doorway to No. 8 Park Square, Leeds, adorned with columns and entablature, carrying a circular pediment. The design shows distinct evidence of the influence of the Brothers Adam. "Esek's" drawing this time is not quite up to his usual standard.

"Sans Peur" shows us an interesting building in the Old Hall of the Shipwrights above the Sally-port tower, Newcastle-on-Tyne. The building has many good points in its design, besides much quaintness and a nice feeling in the mouldings. The author's work is well done both in measurement and drawing.

"G. H. F." has drawn part of the façade of a house formerly at Enfield, now in the Victoria and Albert Museum at South Kensington, an excellent typical example of eighteenth century English cut brickwork with good detail and carving, which is well expressed by "G. H. F." We may say that there is no objection to students selecting for study as part of the work of the Sketching and Measuring Club examples in museums. The fact that they are to be there found is presumptive evidence of their value for study.

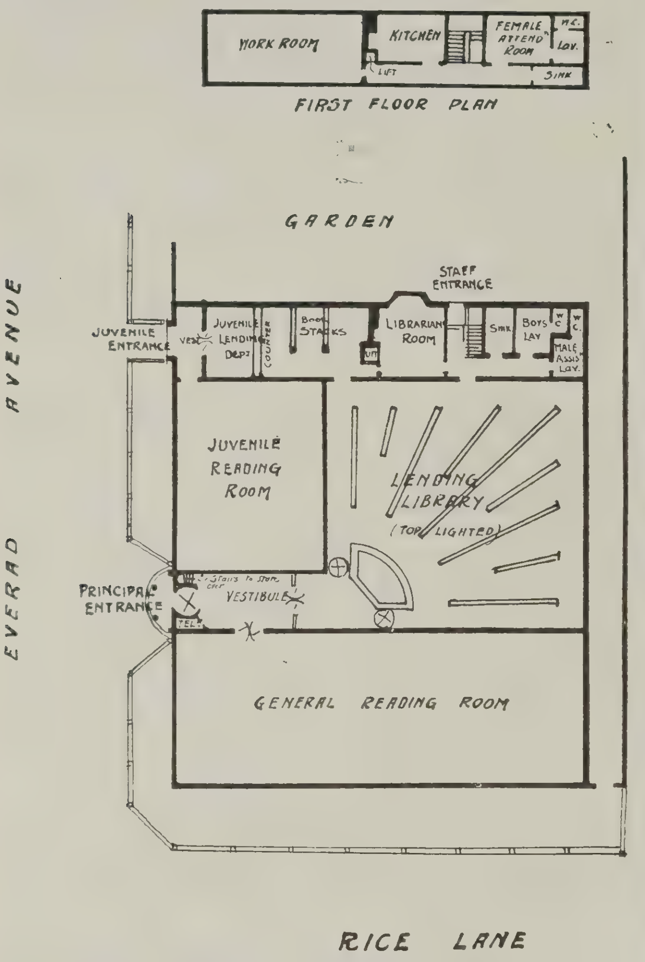
We have awarded the prize for April to "Dubline."

## COMPETITION FOR LIBRARY AT WALTON AND FAZAKERLEY, LIVERPOOL.

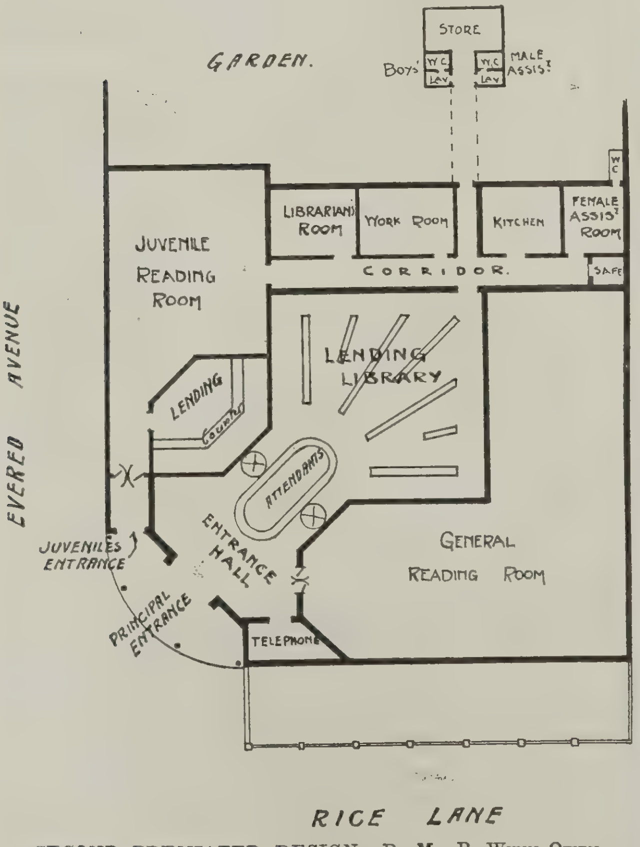
THE Library, Museum and Arts Committee recently invited architects practising in Liverpool to submit competitive designs for the above, and appointed Mr. W. E. Willink, F.R.I.B.A., assessor.

In response to the invitation twenty-five designs were submitted. The accommodation required is as follows:—

Open access lending library with accommodation for 20,000 volumes. General reading-room, about 76 feet by 28 feet, with open access shelving for volumes. Juvenile reading-room, with separate entrance, 50 feet by 28 feet, with lending library partitioned off. Librarian's-room, kitchen, female assistants' room, lavatories for boys, male and female assistants, and work-room, &c. In lieu of verbal description the three premiated designs are shown by the accompanying sketches of the plans. The principal road is Rice Lane.

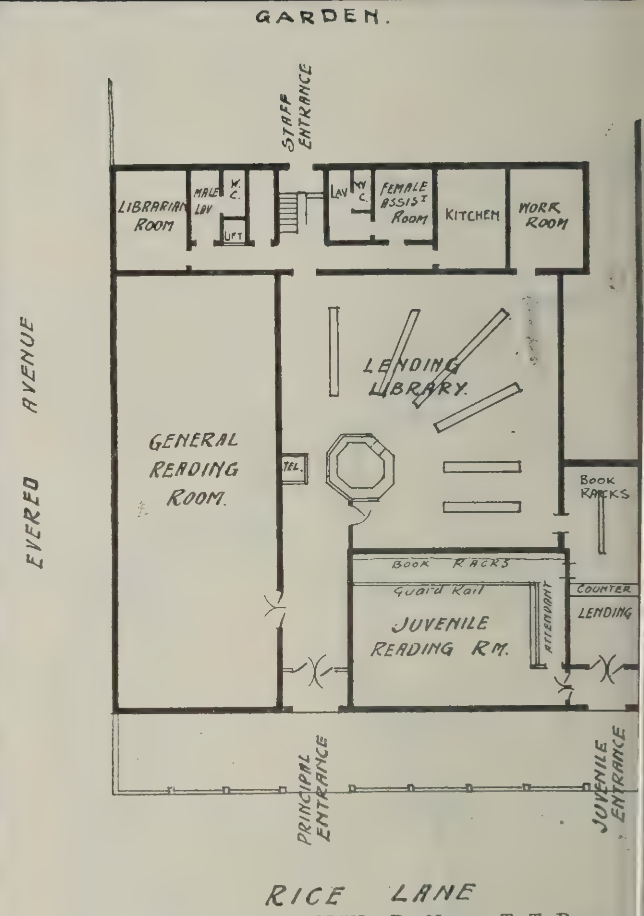


FIRST PREMIATED DESIGN.—By Messrs. BRIGGS, WOLSTENHOLME & THORNLEY.



SECOND PREMIATED DESIGN.—By Mr. R. WYNN OWEN.

The cost of the building, including furnishing, was not to exceed 7,000*l*.



THIRD PREMIATED DESIGN.—By Messrs. T. T. REES & F. B. HOBBS.

## THE ARCHITECTURAL ASSOCIATION ANNUAL DINNER.

THE annual dinner of the Association was held on Thur day evening, May 5, at the Trocadéro Restauran Piccadilly Circus, Mr. HENRY TANNER, F.R.I.B.A. (president), in the chair.

Among the numerous guests were:—Messrs. Ernes George, A.R.A., A. R. Stenning, H. Greville Montgomer John Murray, David Murray, A.R.A., B. Mackenna A.R.A., John W. Simpson, Walter Cave, A. Stone Gerald C. Horsley, A. G. Temple, Paul Montford, R.B.A G. E. Bond, J. Williams, F. H. Atkinson, Baxter Greig, W Paul, Percy May, A. J. Perrin, F. R. Yerbury, A. Spencer, A. C. Dickie, J. H. Squire, C. G. Boutcher, Horsley, F. Winton Newman, C. Wontner Smith, W. Scott-Moncrieff, P. L. Forbes, W. G. B. Lewis, Stanle Towse, F. R. Betenson, C. Tanner, G. E. Hutchinso Stanley Hamp, F. R. Farrow, H. V. Ashley, H. A. Hal R. Dircks, Edwin Gunn, S. A. Green, C. Anderson, A. Nightingale, William Johnson, A. E. Maxwell, Alan Potte H. B. Elkington, D. J. Campkin, H. C. Corlette, S. Warwic A. N. Prentice, Maurice B. Adams, Arthur Keen, E. Tanner, L. Mumford, J. Dudley Forsyth, A. Lowry, H. Samson, H. B. Symons Jeune, L. M. Yetts, G. Filde G. Leonard Elkington, Allen Foxley, G. Northover, Ell Marsland, Max Clarke, W. Dewes, J. F. Bull, F. W. Mark A. Dixon, H. G. Tayler, J. Pirie, Alec Smithers, S. M. Spoo Gervase Bailey, F. W. Pomeroy, A.R.A., F. Dare Clapha C. McArthur Butler, R. B. Pilcher, A. O. Collard, S. Arding, E. Carless, G. Hubbard, A. W. Moore, W. Tapper, H. P. G. Maule, Theodore Fyfe, J. B. Scott, A. Bentham, Lorne Wallet, W. H. Ward, Horace Field, Aubr Jamieson, G. M. Nicholson, F. J. Saffery, H. E. Moore, J. Cheston, C. C. Sealy, M. Day, W. G. Newton, P. E. Web Prof. E. C. Alston, P. W. Lovell, Maurice E. Webb, I MacAlister, W. H. Jamieson, Maxwell Ayrton, Herbe Batsford, J. Starkie Gardner, H. J. Leaning, A. E. Vey, Vey, H. G. Satchell, E. J. T. Lutyens, S. A. Stang R. Frank Atkinson, G. Corderoy, and D. G. Driver (sec tary).

After the loyal toasts had been honoured,

Mr. JOHN W. SIMPSON proposed "The Architectu Association." They all knew, he said, the glorious past the Association, and they were assured of its still m glorious future. He would not, however, inflict upon them statistical or retrospective review of their affairs—he was never enamoured of figures, and after dinner he thought them abhorrent. He wished to say a word for the Philistine, since he believed they were all getting too "arty," he did not use the word "artistic." The official paper of the Association was decorated with a dainty device showing two strong men, in what were technically called "shorts," he assumed them to be Mr. Tanner and Mr. Alan Potter. Beside them were the inspiring if somewhat irrelevant words "Design with beauty—build in truth," a motto which they would observe very neatly indicated the two great processes of all creative art, the conception (design) and the execution (building), their ultimate purpose being even more happily crystallised in the device of the Royal Institute *Usui civium decori urbium.* So they enunciated their creed that the architect must have a double qualification and architecture a twin purpose. It followed then that the designer who failed on the executive side was an incomplete artist, just as the executant was an incomplete artist if he were weak in design. He would relate to them a fable, it was not to be found in the "Arabian Nights Entertainments," "The History of the Two Butchers and the Naked Truth." Once upon a time there were two butchers, and the first butcher, who was a common man chose Smith, who was a Licentiate to build his shop; and artists said "What rotten detail!" But the sirloins and the saddles looked tempting and the common butcher sold tons of meat, and said "Smith is a good architect." As the Council turned down Smith for the Fellowship he called himself registered architect, or, for short "R.A." The second butcher, who was a man of taste, had his shop designed by Kensington Percy, who made him a study in white of 1750 with swags, and the butcher said, for he had read it in books, "Art should colour our daily life," and he despised his neighbours, for the drawing was in the Academy. When the bailiffs took possession, he reproached the architect because he had persuaded him to be Georgian, though his commerce was with contemporaries. "You are quite wrong, I assure you," said Percy, "meat should always be seen behind small sash-panes, they give it such character." "Though I respect art," replied the second butcher, "I have no use at all for a fool!" and he beat in the architect's head with his cleaver. And the moral, which was the only place where anything was said about the naked truth, was "St. Paul's is a good cathedral but a bad master." The plain truth was then that our first duty was not to work out our own artistic salvation and to erect perennial monuments to ourselves, but to give our clients what they wanted, so that they might pay us cheerfully and enable us to keep a home and defy the Budget. But it was equally true that we had another duty. We might not rest content only to solve the problems given us in the easiest way; we were professors of the beautiful, and though we might not ignore or even vary the conditions given us, we must clothe our solution with beauty or forfeit our claims to be artistic, and it was to this end that the Architectural Association existed.

The President in his response said he heartily endorsed Mr. Simpson's remarks about the two butchers, for he had tried by the fable to teach them their duty towards their neighbour. Surely their first duty was to give clients what they wanted. If they failed in that, though they might clothe their work artistically and get a passable result, they had not fulfilled the first duties of an architect. Even more than that, they were bound in their client's interests to take advantage of every modern system of construction, or any improvement, and be up to date. They had a double duty laid upon them, they had to be artists and scientists as well. It was possible to be both, and in the training of students at their school (which he believed to be among the best in the kingdom), Mr. Maule, the headmaster, endeavoured to bring out that dual capacity. Some people, he said, had accused him of undue pessimism when he referred to the affairs of the Association in his Presidential address, but he had no feelings of pessimism, all he wished to do was to call attention to what he considered were its weak points. He knew his men, and it sufficed to merely suggest innovations towards improvement, and they loyally supported him. In his concluding words the President said he wished to thank the Council and Mr. Clapham (vice-president), who had been more than a right hand man, and Mr. Arthur Keen. A more hardworking and more conscientious member of Council than Mr. Keen could not be found, and it augured well for the Association to have him as its new president. His thanks were also due to Mr. Elkington. He would leave the presidential chair, he said, with regret not unmixed with relief in the freedom from responsibility, but he would never forget his year of office at the Association, and the many good friends he found there.

"The Royal Institute of British Architects" was proposed by Mr. Arthur Keen. The Association, he said, appreciated the kindness and support which the Institute extended to them. They had undertaken great responsibilities of late years, and the help of the Institute became increasingly valuable and necessary. To an extent the help was reciprocal, for while the Institute gave them its support, it looked to them for a constant supply of new members, and nowadays it required a very high standard of proficiency and knowledge such as they gave to their students at Tufton Street. They showed their loyalty to the Institute by adhering closely to the syllabus drawn up by the Board of Architectural Education and issued by the Institute for the guidance of educational bodies, and if that syllabus should at any time be withdrawn, he had very little doubt that the Association would deal with the new conditions, whatever they might be. Those two bodies had existed side by side more than sixty years, he believed, and harmonious working was natural and almost spontaneous when the members of one were members generally of both bodies. Co-operation was therefore right and proper. A phase most worthy of remark in connection with the Institute was the great change which had come over it in recent years, and from being distinctively a professional body it had become now an artistic body. It was well known that there was a time when a large section of the architectural profession held itself aloof from the Institute on the ground that it represented the professional and business side of architecture rather than the artistic, but that attitude was now a phase of the past, and the speaker thought the Institute might today very fairly claim to represent the best interests of architecture as a great and leading art; at any rate, that was the aspect in which the Institute appealed to them as an educational and professional body.

Mr. Ernest George, A.R.A., in responding to the toast, said the Institute had always shown the kindest feeling towards the Association, a body full of vigour and the best elements of their profession. The Institute was at one time regarded as a set of old fogeys, but he thought the minority of its members now only had that distinction. The governing body tried to move with the times and represent the wishes of the greater number of architects. Under their new powers they had, he supposed, the guidance of architectural education, a matter in which they took the keenest interest. The education of the future architect was the question they all ought to have most at heart. He claimed as friends various students of the Association's school, and he was delighted to find so much earnestness among them. It must be gratifying to the members of the Association to know that one of their past presidents, Mr. Leonard Stokes, was to succeed him when he retired from the chair at the Institute.

Mr. Maurice Webb gladly surprised the company, submitting a bumper toast to their President, leading the refrain "For he's a jolly good fellow."

Mr. Tanner briefly replied.

Mr. Walter Cave proposed "The Guests," Mr. David Murray, A.R.A., and Mr. Scott-Moncrieff responded.

Musical items arranged by Mr. Lorne Wallet were rendered between the speeches.

## THE NATIONAL GALLERY IN 1909.

THE report of the Director of the National Gallery for the year 1909 has recently been issued. In the course of it reference is made to the extension of the Gallery.

The construction of five new rooms on the site of St. George's Barracks, at the back of the rooms devoted to the British School, has made good progress, and it is hoped that they will be completed by the autumn of 1910. The site will leave room for a further extension of two large rooms and for a small extension of the National Portrait Gallery. Plans showing this allotment of space were submitted to the Trustees by H.M. Office of Works and were approved by the Board.

A special Committee under the chairmanship of Earl Plymouth, assisted by Mr. John Belcher, R.A., and the Hon. Sir Schomberg McDonnell, K.C.B., with Mr. Ernest Bright as Secretary, was appointed to inquire into the state of the building with regard to fire risks. After an exhaustive inquiry the Committee reported that certain alterations for the protection against fire were necessary. These alterations involved the reconstruction of the roofs and floors of part of the older portion of the edifice, and they are now being carried out. Five rooms, Nos. 12, 13, 14, 16, and 17, and the offices below them are closed for this purpose. The pictures they contained have been temporarily placed on screens and on the walls of other rooms, as far as possible; but many large pictures have for a time been withdrawn from exhibition. It is hoped that the reconstruction and fire-proofing of this section will be completed by the autumn of 1910, and the pictures replaced upon the walls.

The most important event of the year has been the acquisition by the Gallery of the portrait of Christina of Denmark, Duchess of Milan, by Hans Holbein the younger. This work was purchased and presented to the Nation by the National Art Collections Fund with the aid of a grant from H.M. Treasury of 10,000*l.*, and the gift of a sum of 40,000*l.* from an anonymous donor who supplied a large deficit in the purchase money at the last moment. This masterpiece had been on loan at the National Gallery for a period of twenty-nine years by the generosity of its former owner, the Duke of Norfolk. It was painted by the master from a sketch made at Brussels on March 12, 1538, for Henry VIII. It has an unbroken history from the time of its ownership by Henry VIII., through the Lumley, Pembroke and Arundel collections, into that of the Duke of Norfolk. His Grace, the present duke, generously lent the picture to the National Gallery for a period of twenty-nine years. The picture is on oak, 5 feet 10 inches high by 2 feet 8 inches wide, and is in room 15, No. 2,475.

The difficulty of raising a large sum of money at short notice for the purchase of masterpieces that ought to come to the National Gallery when offered for sale, or when a large offer is made for them from abroad, is very great. His Majesty the King graciously made, through the National Art Collections Fund, the suggestion that a reserve fund should be formed by subscription for this purpose. It is hoped "that the example set by His Majesty and their Royal Highnesses the Prince and Princess of Wales as first subscribers to this fund may be largely followed, and result in a substantial provision against sudden calls."

The two other works purchased during the year were *April Love*, by Mr. Arthur Hughes, and *Scene from the Beggar's Opera*, by William Hogarth. *April Love* (Room 3) was painted in 1856 and exhibited at the Royal Academy. Mr. Hughes sold it to William Morris. It was purchased by the Trustees for 350*l.*

Ruskin, in his "Academy Notes" for 1856, wrote:—"Exquisite in every way, lovely in colour, most subtle in the quivering expression of the lips and the sweetness of the tender face, shaken like a leaf by winds upon its dew, and hesitating back into peace."

The example of Hogarth's work was purchased from Mr. John Murray, the publisher, for 1,750*l.* It stands in Room 19.

*A Favourite Custom*, by Sir Lawrence Alma-Tadema, O.M., R.A., was purchased under the Chantrey Bequest.

Sir Hubert von Herkomer, C.V.O., R.A., presented his *Council of the Royal Academy*, 1907.

Mr. A. J. Finberg has completed his chronological inventory of the drawings in the Turner Bequest with extraordinary care and skill, and the result of his labours has been published by order of the Trustees in two volumes of 1,300 pages, at the price of 15*s.* This catalogue will facilitate the future exhibition of these drawings to the public when that is possible, with due regard to their preservation, and is the first complete inventory of this portion of the Turner Bequest.

The new Turner Gallery at Millbank, the gift of the late Sir Joseph Duveen, is nearing completion, and the Turner Bequest will be properly seen in the ten exhibition galleries so provided. A certain number of the master's works will be retained at Trafalgar Square so that he may be duly represented in the Gallery of European Art. The building of the new wing has made it necessary to alter the accommodation for refreshments. A new refreshment-room and a larger kitchen have accordingly been provided in the basement underneath rooms 1 and 2.

The Gallery in Trafalgar Square was visited by 607,952 persons on the free days during the year, showing a daily average attendance on such days (206 in number) of 2,951. In addition to the above number, 67,452 persons visited the Gallery on Sunday afternoons throughout the whole year, showing a daily average attendance of 1,297.

On students' days (Thursdays and Fridays) 63,391 persons were admitted between January 1 and December 31, 1909; the admission fees (at 6*d.* each) amounting to 1,584*l.* 15*s.* 6*d.*, as compared with 1,592*l.* 5*s.* 6*d.* received in 1908.

The National Gallery, British Art, at Millbank, has been visited by 249,110 persons on the free days during the year, showing a daily average attendance on such days (206 in number) of 1,209. In addition to the above number, 56,986 persons visited the Gallery on Sunday afternoons throughout the whole year, showing a daily average attendance of 1,096.

On students' days (Tuesdays and Wednesdays) 36,463 persons were admitted between January 1 and December 31, 1909; the admission fees (at 6*d.* each) amounting to 911*l.* 11*s.* 6*d.*, as compared with 1,003*l.* 1*s.* 6*d.* received in 1908.

The amount annually realised by admission fees at both establishments is devoted as an "Appropriation in Aid" of the Parliamentary Vote to the National Gallery.

The total number of students' attendances for copying pictures at the Gallery in Trafalgar Square on Thursdays and Fridays throughout the year was 17,345. Independently of partial studies, 661 oil-colour copies of pictures have been made, viz., 333 from the works of 91 old masters and 328 from the works of 24 modern painters.

Two hundred new students have been entered on the books during the year.

The total number of students' attendances at the Gallery of British Art on Tuesdays and Wednesdays throughout the year was 6,139; and 306 completed copies of the pictures have been made in oil-colours, 95 in water-colours, and 23 in pastel.

## ILLUSTRATIONS.

### ST. PHILIP'S PARISH INSTITUTE, CAMBERWELL.

THIS is a Church Room and Institute proposed to be built in the place of an existing small room standing on the same site and close to the church and parsonage house. Both the church and the present room are of Kentish ragstone, and as this small room will be demolished it is proposed to re-use the material from its structure in the base of the new building.

The Institute comprises a hall with an end gallery to accommodate 400, with class-rooms, kitchen, and the usual accessories to meet the needs of various parochia organisations, including Sunday schools, and the estimated cost is about 2,500*l.*

The architect is Mr. H. P. Burke Downing F.R.I.B.A., and his original drawing is now exhibited a the Royal Academy.

### COMPETITION DESIGN FOR NEW CLUB, SHANGHAI.

THE design which we publish to-day was sent in i competition for the above. It contained all the usua accommodation for a first-class residential club. Th frontage shown in the perspective is to the "Bund overlooking the river, a frontage similar to the Thame Embankment. The climate is in many respects simila to the English climate, so that broad, open verandah generally associated with architecture in the East wer not suitable here. The front was to be faced with re brick and local granite, a granite similar to grey Aberdeen and the roof covered with local black tiles.

The cost was not to exceed 200,000 taels. Ther being no drainage system in this part of the town, th soil pipes arranged on the latest English principle di charged into iron "boilers" of sufficient capacity for three-days' accumulation, which was then to be run o into night-soil carts and deposited on the surroundin country. The designs were by Messrs. Lovegrove Papworth.

### HOUSE AT WIMBLEDON.

THIS house has been built for Colonel Seton-Churchi in Clifton Road, adjoining Wimbledon Commo The walls are rough-casted externally, with a plinth red facings 3 feet 6 inches high, and the roofs are co ered with mixed tiles which have the very pleasing effe of old ones. The windows are glazed with stout diamo leaded plate glass. The work has been carried out Messrs. J. Burges & Sons, of Wycliffe Road, Wimbl don, from the designs and under the superintendence Messrs. Thomson & Pomeroy, F.R.I.B.A.

### OXFORD COLLEGE SERIES, EXETER.—HALL—FIREPLACE IN HALL

FURTHER illustrations of Exeter College are giv this week, showing some of the interior treatme and detail in continuation of our series of views of th college. Our readers will remember that a historic account of Exeter was included in our issue of April

## THE ARCHITECTURE OF BATH.

*(Continued from last week.)*

THE last house of Gay Street, which faces diagonally across Queen Square, forms part of the Queen Square scheme of building, and was in later years the residence of the younger Wood. The circular bay window has very fine detail at the first floor, where the coupled Ionic columns in the Venetian window are divided by blocks, and the arch in the centre is similarly treated. The unique plan of the interior shows the principal rooms formed of a rectangle with an apse at each end, and with this the rest of the house has to conform. On the ground floor the angles of the apses are marked by Ionic pilasters, and on the first floor by three-quarter Corinthian columns. The interior is panelled in wood, and the carving is very freely done. The embossed brass finger-plates are of the same date as the house.

The staircase is of oak and Spanish mahogany, and the quarter spaces are inlaid.

Eagle House, Batheaston, though reputed to have been the work of the elder Wood, was certainly not built by him, and it has been altered at least twice since its erection. In a recess upon the side facing the road the date, 1729, is cut upon a shield under the eagle, and it was about this time that Wood is said to have gone there. Perhaps he added this excellent porch, but even here the moulding round the door is quite unlike his usual work, though a common one in the neighbourhood. At any rate, the columns and entablature have been applied to the wall, and do not form part of its original construction. The younger Wood died here in 1781.

One of Wood's best works in the neighbourhood of Bath is Belcombe Brook, Bradford-on-Avon. It was merely an addition made in 1734 to the older clothworks of Francis Yerbury, and was intended as a residence for the owner. At this time there was a very flourishing cloth trade in Bradford-on-Avon. The buildings on the right are a dovecote and stabling, and the forecourt which lies between them and the house is paved with local Bradford stone set on edge, the centre being in circular courses. Upon the dial of the clock in the gable end of the stables is the date, 1770, and the initials J. Y. (one of the Yerburys). The house contains a hall, a drawing-room 20 feet square, and an octangular study with a coved ceiling and fine enrichments in plasterwork. The grounds of this house were laid out without formality, but a stone balustrade runs diagonally from the two angles of the house to the lawn. The little domed building of stone was erected by a working mason whom Wood praises for his ability. Close to the river bank is an octagonal structure about the same size, which was used by the owner for mixing his dyes in.

In 1735 Wood made a survey of the city, which was published by J. Leake in the following year. This map shows the connection of the new buildings on the north with the city by way of Trim Bridge and John Street, leading into Wood Street and Queen Square, the latter being also connected with the main London road by means of Quiet Street, which thus joins up Wood Street and Green Street. Thus far Wood's scheme was intended to be not only complete in itself, but to have proper and definite connections with the older work.

Beyond the west gate another scheme of building was in progress, planned by John Strahan, who was the builder of Redland Court in 1730 and Redland Chapel in 1740-43, both in Bristol. It is to be regretted that perhaps through jealousy Strahan comes in for some disparagement from Wood. Strahan's work is chiefly found in Kingsmead Square, Avon Street, Kingsmead Street, and Beaufort Buildings, the best fronts being those on the south side of Kingsmead Square. All this work was going on from 1727-36. Rosewell, or Londonderry House, built for T. Rosewell, whose rebus, a rose and a well, is under the circular pediment with the date 1736, is reputed to be by Strahan, but it is not at all in his manner. Internally it has a wide, handsome staircase, and the rooms were mostly panelled. Not the least interesting of the houses in this neighbourhood is Keene's *Bath Journal* Office, where a newspaper was established in 1742 which flourishes at the present day. Both inside and out this house has suffered scarcely any alteration since the day it was built.

In Avon Street and Beaufort Buildings, Strahan adopted a more definitely Classic manner with a Doric entablature, though the houses are quite small two-storey buildings.

Wood's chief work was Prior Park. Ralph Allen, whose country seat this was to be, desired to advertise his stone, and nobly he did it. The scheme, as first designed, placed the house in the centre with a pavilion and groups of offices at intervals on either side, all united by a colonnade. The outbuildings were to have been set at a wide angle with the mansion itself, but in the execution they formed two curved wings. The pavilion on the west gave way in 1844 to a Roman Catholic Chapel (by J. Scoles), and the best part of the stables now remaining is that which is vaulted in stone with small saucer domes. The stables were very large and sumptuous and had a frontage of 170 feet, with stabling for twenty-four horses. The south front of the mansion, which faces up the hill towards Combe Down, is much more simply treated than the other side, which is the principal front. But the work was conceived on a fine scale suitable to the surroundings, and the house measured 147 feet long by 55 feet wide. It was built in 1737. The long façade is relieved by an attached portico of six Ionic columns, and all the openings, ranging to fifteen in number, are kept quite plain.

The north front looking towards the city has dressings round the window openings and a projecting Corinthian portico. The portico has six columns on the front with one full column and one three-quarter column on the return. These are 3 feet in diameter and 32 feet high, and the stone is in wonderful preservation, with a beautiful colouring from the growth of lichens upon it. Wood had intended to have flights of steps on each side, but they seem never to have been carried out. The basement of the house is all vaulted and paved in stone.

The sweeping flights of steps which lead down to the lower ground were the work of Henry E. Goodridge, M.R.I.B.A., for Bishop Baines, and were executed about 1830-6.

I do not propose to show you any views of the interior as it at present exists, because there were many alterations after the fire of 1836, but I give here the plans from Wood's original drawings on the left and the same, roughly, at the present time on the right. The draughtsmanship is very fine, and it seems incredible to us how such drawings could be made with the naked eye. They are finished with a simple monochrome wash, and the ceilings and vaulting are dotted in with fine lines. The balustrades between the columns in the portico were omitted for access to the garden steps. The large hall did not run up through the floor as at present, and at the first storey there was a long gallery leading from Allen's business room to the private pew in the gallery of the chapel.

The sections are also from Wood's original drawings. All the walls were originally finished in stone, including the ornamental parts, though some of these latter were afterwards cut off and the walls of the rooms lined with wood.

At the foot of the slope below the mansion lies the Palladian bridge; it is almost a copy of the one built by Robert Morris at Wilton House in 1736. The architect is not known, since at the time it was built (in 1756) Wood was no longer in Allen's employ. The balusters are of a type scarcely known in Bath. Allen died in 1764, aged seventy-one years, and was buried in Claverton Churchyard.

Up to the year 1714 there was a law entitling the poor of England to travel to Bath and use the baths there. This law then ceased, but as the poor continued to come a scheme was started to find accommodation for them. In 1723 a subscription list was opened, and amongst those who worked hard for the proposed scheme was Richard Nash. Wood was employed to draft plans, and at first a site in the Ambry was proposed for a building to hold sixty beds. This all fell through, however, and it was not till 1737 that definite drawings were made by Wood for a site at the north-east corner of Parsonage Lane. The front extended 99 feet along the borough walls. In the old days, before Union Street was made, the east side faced the stableyard of the Bear Inn, and this was the only thoroughfare between the borough walls and Westgate Street, and was ordinarily used by visitors to and from Queen Square and the baths. The hospital was built to take 108 beds, exclusive of those for the nurses. The building was opened in 1742, and in the following year it was resolved that the inhabitants of Bath should be excluded from admission, but this was rescinded in 1835. Nearly the whole of the cost of management from the commencement to the completion was defrayed gratuitously. Subscriptions amounted to over 8,000*l*., in addition to there being considerable gifts in kind. Ralph Allen gave all the wrought freestone, paving stones, wall stones, and lime, in addition to large sums of money, and Wood gave his plans and supervision free. In 1795 John Palmer added two wards over the north front.

When the thoroughfare on the south side of Queen Square, which had been planned by Wood as 93 feet wide, was reduced to its present width, and the idea of making it into a Grand Parade was abandoned, Wood found a site just outside the city boundary on the south-east that would answer his purpose. He therefore, in 1740, commenced building. Near here on the east of Terrace Walk were Harrison's Rooms, and on the west Lindsay's Assembly Rooms. The Grand Parade is now the North Parade, and the Royal Forum became the South Parade. This thoroughfare is now 70 feet wide. The land originally lay at a low level and was the site of the Abbey orchard, and so, leaving the triangular piece of ground between Harrison's walks and the river at the old level, he raised the houses to approximately the same height as those on the Terrace Walk, and planned out the piece of waste ground into public gardens called St. James's Triangle, and approached from the Parade by a stone staircase. The retaining wall of the Grand Parade was finished at the top with a stone balustrade, as shown in the aquatint by Malton and Gandon in 1779. The length of the walk was over 500 feet by 42 feet broad. The blocks of houses, as usual with Wood, were placed north and south, and on the extreme east the basement of the houses had an exit on to a lower walk and the riverside. The first stone of this building scheme was laid on March 10, 1740, and the whole of the works were completed in about eight years' time. The central block of twenty-seven houses, which formed a square of 210 feet each way, were originally to have been treated with columns and pilasters, but this was afterwards abandoned. An engraving from an old fan shows the treatment of the South Parade as it was completed, and in this may also be seen the balustrading round the areas of the houses. This part of Bath soon became fashionable, and, amongst others, Edmund Burke, Oliver Goldsmith, William Wilberforce, and Miss Linley resided or stayed here. There are two houses on the Terrace Walk which still retain much of their old character, both of which seem to have been designed for shops or the like purpose. No. 1, Terrace Walk, has three large openings separated by Ionic columns with ornamental spandril pieces, all executed in stone. Almost adjoining this is an Ionic doorway with the original glazing, and this is believed to have been one of the coffee-houses where the upper classes were wont to assemble to read the papers and to discuss the news.

---

* A paper read before the Architectural Association on April 29 by Mr. Mowbray A. Green, A.R.I.B.A.

Close to these buildings is a fine court of houses known as North Parade Buildings. Although they adjoin the North Parade they are probably not Wood's work. Nearly all the doorways have Corinthian porticoes, and the houses are well finished internally. The top house on the right was once the residence of John Palmer, Controller of the General Post Office and the introducer of the mail-coach system. But these days are passed, and the buildings are now for the most part let out as tenement houses. The last house on the west side has a wide hall vaulted in plaster, a very ample staircase, and many good rooms.

At Bathford in 1748 a house was built by Wood for a Mr. Southwell Pigott, and was called Titan Barrow Loggia. The north front, which stands on the top of a considerable slope, has been treated without a sufficient basement storey, so that it loses considerably in dignity. An interesting comparison may be made between this and the house at Belcombe Brook, the façade of which is treated with flat Ionic pilasters, and which is quite satisfactory in its proportions. There can be no doubt that when columns or three-quarter columns are used, especially if it be with the Corinthian order, they should stand on a storey or sub-base of some height. The front of Titan Barrow was very ornate, and the mouldings were enriched. Unfortunately, the ground-floor windows have been cut down. The elevation and plan are copied from Wood's drawings, and exhibit, together with the contract, the conditions under which the employer, architect, and contractor worked in those days. As usual, there is no scale on the elevation or on the plan, but the dimensions are figured and the specification is written within the walls of each room, the contract containing what else was necessary as to supply of plant, &c., to insure the carrying out of the work. The ground-floor plan has the signature of the employer, Southwell Pigott, together with those of John Ford (the mason), George Hatherell (the carpenter), and Robert Parsons (the carver), the contract alone mentioning the name of John Wood as the architect. The contract states that Ford contracted to dig the foundations, and to do all the mason's, plumber's, tiler's, plasterer's, and painter's work for 396*l*. 12*s*. 2*d*., with an additional 16*l*. for making two cellars; that Hatherell estimated all the carpenter's, joiner's, glazier's, smith's, and ironmonger's work at 283*l*. 18*s*. 6*d*.; and Parsons, the carving of the Corinthian capitals, the pineapple ornaments, with the heads and festoons in the west front, the enriching of the mouldings in the same front, in the architrave chimneys, in the Corinthian entablature round the drawing-room and staircase, and in the cornice round the hall, the cutting the trusses for the front-door case, and all the other carver's work necessary, at 55*l*. 19*s*. 4*d*.; making a total of 752*l*. 10*s*., with penalty of 100*l*. apiece for each of the three contractors if tl work were not finished to the time. A curious method is show in the payments, where the odd sums are included in tl first payment, leaving clear balances to be paid at the en showing that extras were not considered. The work had be completed in just over nine months. The cost of such building to-day would be not less than 2,500*l*.

The plan of Bath, dated 1750-1, shows the condition of tl city after Wood and others had been at work upon it, tl greater part of the newer schemes having been executed with twenty-five years.

In 1742 Wood had been engaged by the Corporation prepare plans for a new King Edward Grammar Schoo which was then being held in a disused school of St. Mar *intra muros*, in High Street. In the first edition of his bo he gives an account of the building and the money to be spen but this description is not to be found in the succeedi editions, and the present school is not his work. He sa that the site which was first chosen was in the Town Ac It would have covered about two-thirds of the present site Edgar Buildings. The present school is on the site of t Black Swan in Broad Street, and was begun ten years lat in 1752. It, too, has undergone some changes since it w first built.

Gay Street and the Circus were evidently part of the gre scheme of the elder Wood, and the whole of the laying-ou from Queen Square to the Crescent, expresses so much t thought of one mind that it seems not unlikely that his s carried it out in conformity with the lines laid down by h father. Gay Street itself rises quickly, the Circus is lev with a slight rise in Brock Street, especially just at the e on entering the Crescent, and the Crescent itself is also lev Gay Street was in building between 1750 and 1760, and he the houses have much smaller frontages. In 1753 Wood h engaged to build a house in the Circus, now No. 7, for t Right Hon. William Pitt, and in the following year, February 18, 1754, Wood himself laid the first stone of t new buildings, then known as the King's Circus. Just ov three months afterwards, however, he died, on May 23, 17 He had been a busy man, commercially successful, and n forgetful of his interests, but leaving behind such a reco of buildings as few could boast of.

Twenty-seven years before he had found Bath emergi from the squalor of a mediæval city, and far from being wh it should have been as an important inland watering-pla and during this period he had seen erected some of the m palatial groups of dwelling-houses which any city can bo of. The planning of this part of Bath marks the genius o man who laid out his schemes with a sense of nobleness a fine effect, adjusting every part to the whole and the wh to the surroundings—surroundings which had to be consider both in relation to their present aspect and their futu development. Masterly and bold in design, he grouped up t façades of his buildings in such a manner as to produce h mony and a feeling of proportion, and he added to the interi that ingenuity of planning and decorative design which h made them so full of interest to ourselves. Wood was a m who took a very capable insight into the turn events mig be likely to take, and he tried to persuade others to see wi him, but did not succeed far in this respect. Thwarted ti after time, he pushed ahead and insisted on the people of h day accepting what they certainly did not always understan He was, as was customary, frequently his own contract but though the building was speculative, it was, at this pa ticular time at any rate, not shoddy. The method of p cedure was this. The builder, who leased the plot on perpetual fee farm, or ground rent, secured a tenant for t house which he proposed to build, and as the tenants we wealthy or responsible people and the lease was for a lo term of years, it was not difficult for the builder to get h banker to finance him, and in this way most of the hous were built. For much of the good interior detail we are i debted not only to the talent of Wood, but to those build who worked under him, and who seemed to know no detail th was not correct. The Circus was divided into three instead the more usual four groups, a point which does not seem have been caused by the exigencies of the levels or other c cumstances, as the ground beyond seems to have been nothi but fields. The particular value in this arrangement evident to anyone who will compare the Circus in Bath wi Oxford Circus in London, for from whatever point you ent it an unbroken line of buildings faces you and insures t continuity of the circular form which is lost in the case the quadrants. The best-planned group of houses is th first built between Gay Street and Brock Street, where t adjustment to the radiating lines is well contrived, with a further diversity of planning to suit the tastes of the prospective tenants. Wood must have fully appreciated that the range of vision in the Circus would be small, and he has therefore with justice elaborated the work in it. The three orders —Doric, Ionic, and Corinthian—are all treated with coupled columns, and the circular lines are admirably sustained by the three unbroken cornices. The height of the façade is about 42 feet, and the parapet was originally plain, but elliptical openings and some balusters have been added here and there. The diameter of the Circus from house to house is 318 feet, or slightly larger than Queen Square. The buildings were completed in fifteen years.

(*To be concluded.*)

## COAL SMOKE ABATEMENT SOCIETY.

THE eleventh annual general meeting of the Coal Smoke Abatement Society was held at the Royal United Service Institution, Whitehall, on Wednesday, May 4, when Sir William B. Richmond, K.C.B., R.A., occupied the chair. Amongst others present were Lord Frederick Brudenell Bruce, Lady Richmond, Lady Dalrymple White, Lady Alice Des Vœux, Lady Troup, the Very Rev. the Dean of Westminster, D.D., Commander Caborne, C.B., R.N.R., Sir Lionel Spencer, C.B., Lieut.-Colonel Arthur Leetham, Col. W. A. Hill, C.B., Colonel Wild, Captain P. Wright, R.N., Dr. H. A. Des Vœux (Hon. Treasurer), Dr. Rideal, D.Sc., F.I.C., Dr. and Mrs. Owens, Miss Burnett, Mr. Thackeray Turner, Mr. Lawrence Green, Mr. William Greatheed, Mr. Alexander Ritchie, J.P., Mr. A. P. Main, Mr. Sherard Cowper-Coles, Mr. Alfred Tate, Mr. William Clifton, Mrs. Granville Smith, Miss Douglas, Miss Wilson, Mr. Henry Clarke, J.P., Mr. A. J. Martin, M.I.C.E., Mr. H. T. Smith, Miss Hollins, Miss Lucy Hollins, Mr. N. Lidstone, Mr. Bartlett Judd, Mr. A. L. Griffith, and Mr. Lawrence W. Chubb (Secretary).

Letters of apology for non-attendance were read from the Rt. Hon. the Earl of Meath, K.P., the Rt. Hon. the Lord Northcliffe, the Rt. Hon. the Lord Eversley, the Hon. Rollo Russell, the Rev. Canon Horsley, the Rev. Canon Wilberforce, Mr. N. L. Cohen, L.C.C., Mr. Henry J. Wilson, M.P., Mr. George Goodwin, Mr. White Wallis, Mrs. Fothergill Robinson, Mr. John B. C. Kershaw, F.I.C., Professor Meldola, F.R.S., and others.

The CHAIRMAN, in proposing the adoption of the report, said:—It is over ten years since the Coal Smoke Abatement Society was initiated. Year by year it has acquired greater local influence, which now is being extended to many provincial towns, and in the manufacturing centres of Scotland. We have to recognise, and at once, the loyalty of our subscribers, whose trust in our exertions has enabled the officers and Committee of the Society to work often against odds.

When we started to work everything was against us. The public for the most part called us faddists, the county and borough councils were wound with red tape and supine, the clauses relating to smoke nuisances in the Public Health Act (London) of 1891 were practically in abeyance. "Put down 'smoke,' and you injure trade; interfere with the rights of the Englishman to commit as many nuisances as he pleases, so his pocket thrives, is anti-English. What does a little smoke matter? it is wholesome." These and many other excuses were rife, and they were believed to be real and fundamental. Things have changed, and are more and more changing; the County Council is alert, and for the most part the borough councils are considering their ways, and are really beginning to view the smoke nuisance as an unnecessary evil. In consequence of this change of opinion you will all admit that each year "the London particular" is rarer. Rarer in occasion as well as density. The old blinding poison of smoke-laden fogs is becoming a thing of the past; indeed, though we have passed through the dampest summer and winter almost on record, fogs have been rare, and smoke fogs next to none during the past year. Public opinion, instead of being against us, is with us; and we may promise to Londoners that smoke from factories, and all other enterprises which come under the purview of the Act of 1891, will in time be practically eradicated. Whether it is to be so depends a good deal now upon the success of the London County Council in obtaining the deletion of the word "black" from the clause; if that energetic body is authorised to deal with all smoke which is injurious and unnecessary, prosecutions will be rendered easy, quibbles as to what is black, brown, or grey will cease, and manufacturers, seeing that their door of exit from the terror of the law is closed to them, will very promptly accept the situation, act accordingly, and finally thank the Council for reducing their annual coal bills. Because all smoke, grey, brown, or black, is waste fuel; they will find it cheaper in the long run to burn all their fuel than to let a large percentage pass into the air as waste. There is another and very important alteration of the law which the County Council is endeavouring to obtain. All premises belonging to the Crown are at present immune from proceedings for nuisances. The County Council seeks power to deal with this and other anomalies. One would have thought that Crown property should be the first to be productive of obedience to laws made under the sanction of the Crown. Surely a Government is a pretty powerless one, any how morally, which sets itself above the laws it has put in motion and raised into being. The London County Council also seeks power to take up important smoke prosecutions at the invitation of borough councils and apply the law. This will have a very far-reaching effect, for the borough councils have already more work than they can do efficiently; besides, it will release councillors from the unpleasant duty of prosecuting each other; however stern a duty it may be to do so, it is against human nature to do it willingly.

Perhaps the time may come when duty towards the whole community is a command of greater importance than to one's acquaintances or even friends.

I hope you will all read our report for this year, which not only sets out what we are doing, but also testifies to the strong action proposed by the London County Council, and, moreover, not only read it, but give support directly or indirectly to the London County Council.

Probably in no city in the world are there contained more valuable works of arts and crafts than London possesses. We, in a measure, are owners of these valuables; they are as trusts to pass on unsoiled to future generations, and we are bound, if we value them, to use individual and collective energy towards their preservation. Coal smoke contains acids which destroy stone—even marble—injure metals, eat into fabrics, burn their way into painted surfaces, and where they do not destroy they leave a stain which no solvent can remove, save one of a strength and character that would destroy the surface of a fabric or material. This fact, and it is a fact, and not a fancy, was an almost entirely concealed truth from by far the majority of even intelligent people, who imagined, as some do still, that smuts are just as any other dust is, which may be removed by a brush or a little friction. Nothing can be further removed from the truth than this idea. In every "smut," however small, there is strong sulphuric acid, sharp to the taste, burning to the tongue, which is left as a deposit or a kind of grease when the dry particles of the smut have been brushed or wiped away. The sulphuric acid remains as a corrosive element, perhaps invisible, but still there, performing its destructive functions. This action in time becomes cumulative, slowly disintegrating surfaces until the poison, eating in deeper and deeper, finally arrives at the heart of any material, as I have said, even of stone.

You will hear to-day from the Dean of Westminster how precarious the condition of the stone of our Abbey is, and I think you will all agree that, miserable as it is, years have been permitted to pass by when the evil might have been remedied by firm legislation. Now, living as we presume we do in a highly scientific and enlightened age, we, being morally guardians of irreplaceable treasures, should set ourselves to preserve what remains, and see that the mischief which has occurred—though it be irrevocable—shall not continue. So insidious is this coal dust, so penetrating also, that objects of art are only partially protected from it by glass. Unless a picture, or a glass case, is hermetically sealed at the sides, and in the case of a picture at the back of it, only a few months will prove the persistent energy displayed by the enemy, for on removing a glass from a picture improperly sealed, the inside of it will be found to be covered with a thin greasy film, which is an oleaginous product from sulphuric acid.

Upon this subject the general public is becoming slowly but surely enlightened. Let us take advantage of that fact by, instead of relaxing our efforts, redoubling them; then when we have effected the powers which are granted by the law touching upon smoke generated in public works, and private and commercial enterprises, we can urge the public to consider if the present system of burning coal for warming purposes in our households is either the most efficient, the most cleanly, or the most economical which can be devised. Better than all the words is the evidence of an admirable map made by our inspector, Mr. Petty, who has prepared this map of London and its environs to show the chimnies which have been brought to book under the jurisdiction of the London County Council and borough councils. Central London has been well dealt with, and is now practically immune from smoke from factories. We have sent in thousands of reports both to the London County Council and the borough councils which, especially in the case of the former authority, have been treated with respect and sympathy; indeed, it may be said that we are working with the London County Council, and we wish we could claim such allegiance and help from all the borough councils.

Difficulties have arisen in regard to their action from a decision by Mr. Curtis Bennett *re* smoke from the huge generating station of the District Railway at Lots Road, Chelsea. Mr. Curtis Bennett insisted upon being satisfied that in a literal and technical sense "black" smoke was emitted. "Black smoke" is almost impossible to prove, its appearance in colour and tone depending largely on the brightness, or the reverse, of the sky; the time of day, morning, mid-day, evening, or night. What is in reality black smoke may look pale against a thunder cloud; the same may look black against a grey sky, or brown-grey against white cumuli clouds. With the rays of the setting sun it may become almost red. Indeed, black is ever varying in intensity and appearance of substance under each fresh condition of light. So that though every particle contained within the volume of smoke is, in fact, "black," it may not appear to the eye to be so. The deletion of the word "black" will overcome this difficulty, and we hope that the London County Council will secure the passage of the clause, when its members will indeed be more than local, they will be national benefactors. The map also indicates the manufactories which are situated in West Ham, Chiswick, and on other parts of the banks of the Thames, not under the jurisdiction of the London County Council, but under the councils of their neighbourhood, whose control is finally subject to the Local Government Board, hitherto entirely neglectful of its duty under the Act. Hence you will find that the main factory smoke from which London suffers proceeds from these quarters.

If the London County Council gains its case, all these environs will be subject to its control, and, being taken from the hands of local and Government boards, there is every hope they will be efficiently and promptly dealt with. Anent the proposals of the County Council which are receiving active support from your Committee, I refer you to the statement in the report, from which you will conclude that the Council is in earnest and means to do its best to put down a serious nuisance.

Alas! it is always a necessity, as well as an unpleasant task, to beg, but we must do so. We are solvent—that is almost all we can say; and it is wonderful how much influence is maintained and work accomplished with a very small income. Yet, had we more money we could double our facilities of operation; we could add another inspector, a much-needed item, which we are not in a position to afford; for though our single inspector is all that could be desired, he has too much to do to cover all the ground single-handed. Had we another as efficient as Mr. Petty we could double our observations and reports, thus giving us greater power to assist the London County Council in its meritorious efforts for reform.

I think it cannot be denied that, however warmly responsible bodies have been drawn to give grave attention to the smoke nuisance, our little Society has been the originator of all subsequent interest and action. It may be reasonably advanced that if the Coal Smoke Abatement Society were to have to die out, the chances are that the old state of apathy would be renewed. An independent society is a free lance—it has no red-tape restrictions on its power to act; no one belongs to it because there is an axe to grind; it is composed of enthusiastic and practical men who, seeing a very grave evil, attempt to combat it by perseverance and hard work.

This being so, I must dismiss false modesty and frankly ask you to use your influence to obtain more subscribers, giving you the assurance that the Committee of the Coal Smoke Abatement Society will use the money subscribed with care, wasting none of it, applying all of it scrupulously to the attainment of the objects of the Society and of all good citizens—a cleaner, healthier, and brighter London.

Dr. H. A. Des Vœux, M.D. (Hon. Treasurer), in seconding the resolution that the report and statement of accounts should be adopted, spoke of the difficulties which beset the path of the Society. There was the difficulty of getting local authorities to take action against manufacturers for smoke nuisance. Again, when a conviction was secured the fine was so small that it became little more than a cheap advertisement for the culprits proclaiming that the works were busy. All this, however, is to be put an end to at Bradford, where the Corporation have just succeeded in obtaining powers by which a penalty of 5*l*. will be levied for the first offence, 10*l*. for the second, and for each subsequent conviction a fine double the amount of that imposed in the preceding conviction, providing that the maximum amount does not exceed 50*l*. The Coal Smoke Abatement Society had been called a prosecuting society and a persecuting society: but it was neither the one nor the other. They believed that smoke was harmful not only to the public but to the manufacturers themselves. Dr. Des Vœux mentioned the case of the Central London Railway, which had two large chimnies at their power station from which black smoke was vomited all day long. The Hammersmith Borough Council served a statutory notice; and, as the nuisance continued, the company were prosecuted in the police court, where a conviction was obtained. The Railway Company took the case to the Court of Appeal on the argument that they were bound under statute to run trains, and that this could not be done without the emission of smoke. The Court of Appeal, in confirming the previous decision, said that the company should have thought of that before they obtained their special Act. The result has been that steps were taken to abate the smoke, and by so doing the consumption of coal was reduced from 1,100 tons per week to 600 tons, and in addition they are now able to use a much cheaper quality of fuel. Dr. Des Vœux, continuing, said he had been living in a house near Oxford, and he had been able to study the question of the decay of the stonework in all the various colleges. The conclusion he had arrived at was that it was almost entirely due to black smoke. The decay caused by that agency was to be seen in all its stages; first, there was a preliminary blackening, which continued getting darker and darker, then blisters were formed over the surface, and ultimately these burst, showing the decayed stone underneath. Dr. Des Vœux concluded by making an earnest appeal for more funds. From the audited balance-sheet it would appear as if the Society had a substantial surplus; as a matter of fact, they were in debt.

The resolution, "That the report and statement of accounts, as submitted, be adopted," was then carried unanimously.

Lieut.-Colonel Arthur Leetham proposed, and Colonel W. A. Hill, C.B., seconded, the resolution, "That the present elected President, Vice-Presidents, Council, and Officers of the Coal Smoke Abatement Society be re-elected." This was also carried.

The Very Rev. the Dean of Westminster, D.D., then proposed:—"That this meeting, recognising the harmful effects of coal smoke on life and property, pledges itself to support the efforts of the Coal Smoke Abatement Society in diminishing the evil." He said he had attended the meeting because he thought it was desirable that attention should be called to the effect of coal smoke upon the great buildings in London, and more especially upon Westminster Abbey. He had come to express his own desire to see the Society prosper, and to recognise gratefully the interest which they had taken in the Abbey and in the efforts of its custodians to counteract the evil being done there. It was to them a very old story; the nuisance was far from being a recent thing. At the time when Sir Christopher Wren had been hard at work on the rebuilding of St. Paul's he was called in to deal with the practically ruinous condition of the Abbey Church of Westminster. It was no doubt due to his timely aid that they owed the present stability of the fabric. It appeared that Dr. South spoke to him of the condition of the fabric, and asked what it would cost to put right. Wren replied that if they did not take care one of the great columns would fall, and they would then have to pay a very great deal more than they expected. The result was that he was called in to advise and to repair the building. It was interesting to find that in a book published in 1683, and entitled "Monumenta Westmonasteriensia," the writer, H. Keepe, describes the exterior as follows:—"On the north porch you rather behold a skeleton of a church than any great comeliness in her appearance, being so shrivelled and parcht by the continual blasts of the northern winds to which she stands exposed, as also the continual smoaks of sea cole, which are of a corroding and fretting quality, which have added more furrows to her declining years so that little of her former beauty now remains." The Dean said that he always recalled that passage when thinking of the great debt of gratitude they owed to Sir Christopher Wren. It also showed that the evil of which they now complained grew with growing London. The nation had thought it right that the church in which its kings were crowned and buried, and the ashes of its great men lay, should be maintained to some extent out of national funds. Parliament voted considerable sums, appropriately enough out of the coal duties; and by means of this subsidy the Abbey was put into thoroughly sound repair. When, in 1855, the City Coal Tax was proposed to be extended for one more year to enable the Corporation to purchase a vacant piece of ground near St. Paul's, *Punch* remarked that would only be fair, as it would be "so much conscience money from the chimney-pots of London." At another time *Punch* referred week after week to the destruction of the new Houses of Parliament by the atmosphere almost immediately after erection. What was happening at the present day was that almost every kind of stone in the Abbey Church was showing constant and increasing signs of deterioration, and there could be no doubt that this is due to the products of burning coal. For the last fifteen years they had been fighting the evil as best they could with the aid of scientific advice. They had tried almost everything suggested to them. Not in every case upon the stones—but in out-of-the-way corners experiments have been constantly made on a small and sometimes on a large scale. It sometimes happened that they coated two, three, or more stones which were near one another and under the same conditions with different preparations, and then, after an interval, compared the results. Of course, no experiment was fully satisfactory until the effects have lasted thirty years; but some failed within six months. He was sorry to say the Baryta treatment, which was tried at considerable expense again and again, proved a failure, although many many coats were applied, indeed, as many as were asked for. Yet at the Bell Tower, Chichester, this treatment had proved a complete success; but in London it was otherwise, for the results have been as disappointing here as they have been satisfactory there. However, they hoped eventually, partly by experiment and partly by scientific advice, to discover something that will help to stop the stones from peeling. The Dean said that some years ago he went with the late Mr. J. T. Micklethwaite, their architect and surveyor, on to the outside of the roof over the south transept. Mr. Micklethwaite picked up a piece of carved stone; this proved to be the arm of a statue of St. Peter, which had been put up twenty or twenty-five years previous, and which had been so eaten away by the corroding influence of the air in that brief period as to have fallen. The great north front was in a terrible condition, although its repair was commenced by Sir Gilbert Scott and continued by Mr. J. L. Pearson. This was not due to bad building nor carelessness in choosing the stones, for both these two architects did everything possible. At present wherever they put in a new stone they are obliged to use the grim Portland stone, as it stands the insidious atmosphere better than anything else. It is, however, no stone for carving, though good for many purposes. It seemed almost cruel to coat the Abbey with a substance so different from that which the early builders loved to employ; but strength they must have. Happily the interior of the Abbey is safe. If the Society could devise a remedy, say in the way of the discovery of a smokeless coal, they would gladly stop their costly experiments. All interested in the Abbey ought to recognise that the efforts of the Society should be supported. The Dean said he had to confess that in their little way those living in the precincts were themselves doing daily mischief. In 1606 sea coal was first used in the great kitchen of the College Hall; it was to be presumed that ever since the harm has been continuing. He asked, "Can we do anything not merely to stop the nuisance which comes from manufacturing chimnies, but the still more persistent and numerous outbursts which come from the chimney-pots of London?" If the Society can help in that they will have done much.

Dr. S. Rideal, D.Sc., F.I.C., in seconding the resolution, said the blackness of the smoke was not the evil to which they objected, for it was simply an indication of the hidden dangers to which not only people's lives but their buildings also were subjected. It would be good if the word "black" were removed from the Act of Parliament, and smoke generally was looked upon as a nuisance. Many people thought that by the adoption of electric heating they would be contributing to a diminution of the smoke pall. But against this it must be remembered that electric generating stations were among the worst offenders. Heating by gas was a different matter, for the gas companies were prohibited by law from using coal which contains more than a certain percentage of sulphur. If all heating in London were effected by gas he was confident that 90 per cent. of the harm wrought by the sulphurous acids cast out with smoke would be obviated.

Dr. J. Owens, M.D., A.M.I.C.E., exhibited a sample of the deposit which he had removed from a factory chimney where measures had been taken to ensure the perfect combustion of the fuel without the emission of smoke. The deposit was ash and not soot, showing that the nuisance could be avoided. There was, he maintained, a very great necessity for an official Research Department, to fix definitely the irreducible minimum of smoke which might fairly be allowed to be emitted from factory chimnies, and it was equally necessary that some simple but effective standard of smoke measurement should be devised. In such matters there ought not to be dependence on the work of societies.

The thanks of the meeting to Sir William Richmond, K.C.B., R.A., for his Presidential address were expressed in a motion moved by Commander Caborne, C.B., and seconded by Sir Lionel Spencer, C.B., and in replying the Chairman referred with gratitude to the help which the Dean of Westminster had given the Society by his eloquent speech.

## TOWN PLANNING REGULATIONS.

THE Local Government Board have forwarded to the London County Council, Town Councils, and Urban and Rural District Councils copies of Regulations which have been issued for regulating generally the procedure to be adopted with respect to the preparation or adoption of town planning schemes, and for making provision in regard to certain other matters in accordance with Section 56 of the Housing, Town Planning, &c., Act, 1909. A provision is also included prescribing the manner in which any objection should be made to the approval of the Board being given to a scheme. The following covering letter accompanies the Regulations:—

The Regulations are drawn so as to be of general application. They will extend on the one hand to schemes which relate to small areas or contain only proposals of a simple character and affecting few interests, and on the other hand to schemes which may deal with extensive areas and affect numerous ownerships and other interests and involve serious considerations of expense. It is probable that the circumstances of particular cases will be such as to require or justify some relaxation or alteration of the Regulations in their application to the case, and the Board have, with a view to meeting any such case, included in Article 34 provisions which will enable them, subject to the proviso to that Article, to dispense with or vary any requirement of the Regulations where reasonable cause is shown.

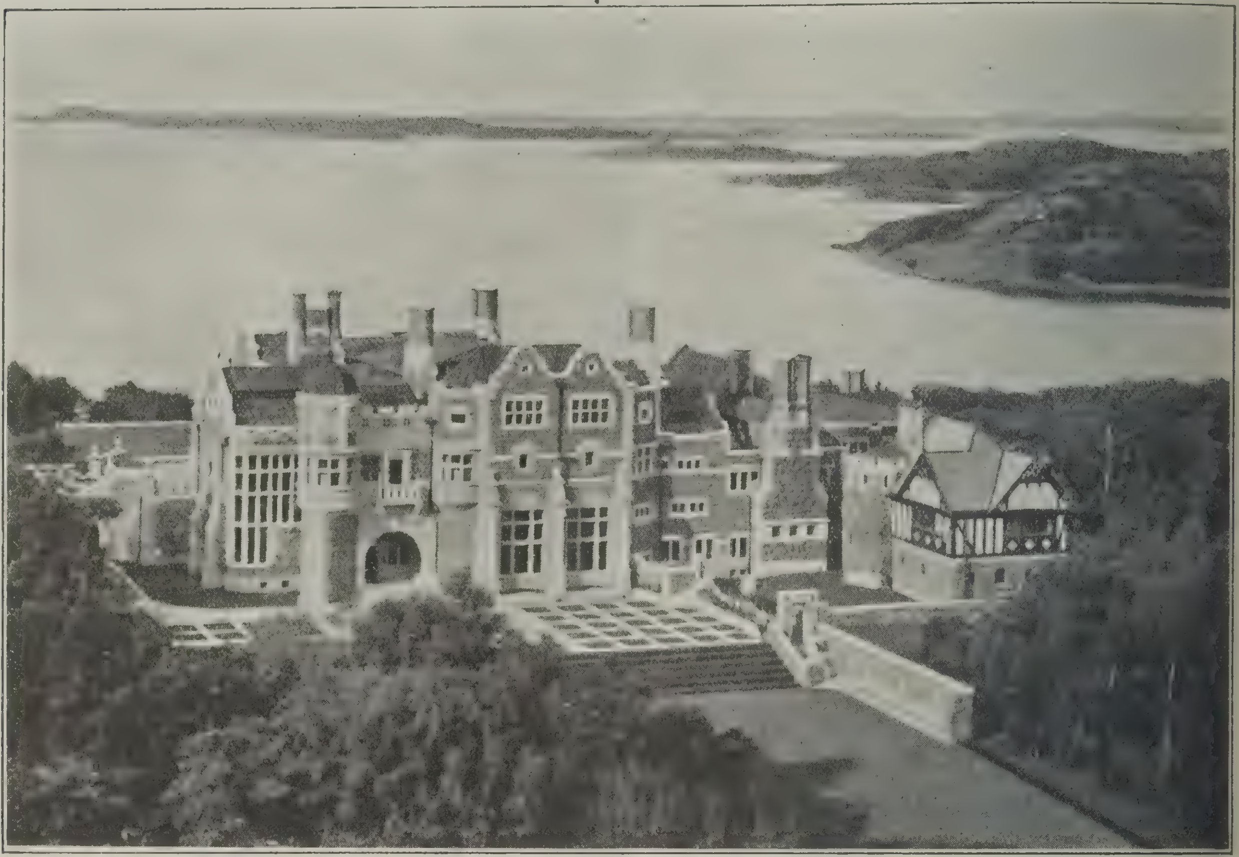
In the absence of authority for departure from any provisions of the Regulations, great care should be taken to comply strictly with them, as any failure in this respect might involve considerable delay and expense.

In the circular letter which they addressed to town councils and urban and rural district councils on December 31, 1909, the Board drew attention to the importance of co-operation on the part of the local authority with the owners and other persons interested in the land proposed to be included in a town planning scheme. The Board desire again to emphasise this point. Sub-section (2) of Section 56 of the Act enacts that provision shall be made by the Regulations "for securing co-operation on the part of the local authority with the owners and other persons interested in the land proposed to be included in the scheme at every stage of the proceedings, by means of conferences and such other means as may be provided by the Regulations." The Board have included provisions on this subject in the Regulations, which also contain provisions requiring notices to be given at various stages of the procedure to owners and other persons, including local authorities or companies, interested or affected, and facilities to be afforded to all such persons to place their views or objections before the local authority, or, at the later stage, the Board.

In a case in which the owners of land propose a scheme for the adoption of the local authority, the Board consider it very desirable that the local authority should, before applying to the Board for authority to adopt the scheme, obtain from the owners definite information or undertakings on the question of any compensation which might become payable in respect of property injuriously affected by the scheme in the event of its becoming operative, whether in respect of property of the owners proposing the scheme or of the property of any other person. Under Section 58 (1) of the Act any compensation payable in accordance with the provisions of that section and Section 59 would be payable by "the responsible authority" referred to in Section 55 (2), that is to say, the authority who are to be responsible for enforcing the observance of the scheme and for the execution of any works which under the scheme or Part II. of the Act are to be executed by a local authority. In regard also to a scheme proposed to be prepared by a local authority, it appears to be a matter of the greatest importance that these provisions as to compensation should be carefully borne in mind from the earliest stage of the proceedings and that, as in the case of the proposed adoption of a scheme, the local

## MODERN EUROPEAN ARCHITECTURE.

### DENMARK.



[From *Moderne Bauformen.*

SCHLOSS TJOLÖHOLM, COPENHAGEN.—Herr L. J. Wahlmann, Architect.

authority should endeavour to secure definite agreements with any person who may be affected by the proposals.

In regard to the provisions of Section 58 above-mentioned the Board are aware that questions have arisen as to the meaning to be attached to the words "by the making of any [or a] town planning scheme" in Sub-Sections (1) and (3) of the section. The Board have no authority to determine the interpretation to be placed upon provisions in the Act, but they are advised that, in giving effect to the section, no loss in value or gain in value of the property affected which is not due solely to the making of the scheme can be taken into account. There will no doubt be exceptional cases, but as a general rule the loss or gain in value would seem to depend upon a comparison of the full value of the property immediately prior to and irrespective of the making of the scheme with the full value of the property immediately after the making of the scheme, regard being had to the provisions of Section 59 of the Act.

In preparing the Regulations the Board have been desirous of limiting as far as possible the specific requirements to be complied with for the purpose of an application to the Board for authority to prepare or adopt a town planning scheme, and it does not appear to them that as a general rule it should be necessary for a local authority to incur much expense at this stage of the proceedings.

The full development of the details of a scheme might, the Board consider, be reserved until after the preliminary stage is passed, at all events in the case of a scheme which is being prepared by the local authority. In ordinary circumstances the Board would probably find it necessary or desirable to direct a local inquiry before giving the necessary authority to prepare or adopt a scheme, and the Board may here repeat what was stated in their circular letter of December 31, 1909, viz., that if it is thought that at any stage prior to the submission of a scheme for their approval the assistance or advice of any of the Board's experts might tend to facilitate agreements with owners concerned or to save labour or expense, the Board will be quite ready to arrange for such assistance or advice being given.

It will be observed that the Regulations require the preparation of maps at various stages of the proceedings in connection with a scheme. In Article 18 of the Regulations express provision is made under which the maps prepared in accordance with Article 14 or Article 15 may be used for the purposes of Article 18 and be marked as required by that Article, but such user would only be permissible if the maps required under the later Article would be identical in every respect with those previously prepared for the purposes of Article 14 or Article 15. This provision has been inserted with the view of saving the expense of preparing further maps, and the Board would not offer any objection to a similar course being followed, subject to similar conditions, as regards the use of Map No. 1 (required by Article 1 of the Regulations) in lieu of preparing a further map (Map No. 2) for the purpose of Article 4. It should be clearly understood, however, that a map which has been prepared and deposited to meet specific requirements of an Article of the Regulations should not be subsequently altered to meet the requirements of a subsequent Article.

It was suggested to the Board that provision should be made in the Regulations for definite schemes of colouring being adopted in the preparation of the maps required by the Regulations, so as to provide for uniformity of practice in regard to the colouring of all maps relating to town planning schemes under the Act. The Board have not regarded it as practicable to carry out this suggestion, but they think it would be desirable that, in preparing the maps required at the several stages of a scheme, the local authority should as far as possible follow the same scheme of colouring throughout all the maps, so that, *e.g.*, if a particular colour is used to indicate some special feature on Map No. 1, the same colour should be used to indicate the same feature on any map at a later stage of the proceedings.

Suggestions have been made that contour models of the areas proposed to be included in town planning schemes should be prepared. The Board have not considered it desirable to include any provision on this matter in the Regulations, and they are disposed to think that it would not as a general rule be expedient to incur the expense of preparing such models, and that it would be found in practice that plans with contour lines drawn or coloured thereon so as to show the variations in the levels of the land would meet adequately the necessities of the case.

Under Section 54 (1) of the Act, read with Section 55 and the Fourth Schedule and Section 59 (2), it would be practicable to include in a town planning scheme provisions

SCHLOSS TJOLÖHOLM, COPENHAGEN.—Herr L. J. WAHLMANN, Architect

restricting the use of certain areas of land to specified purposes, and it will be seen that the Regulations recognise the possibility of provisions of this character. To what extent the power should be used will be a matter for very careful consideration in each case, and the provisions of Sections 58 and 59 of the Act in regard to compensation should be borne in mind in connection with the matter. The Board refer to this point at the present time as they understand that some doubt has been expressed whether the Act authorises the inclusion in a scheme of provisions such as are here referred to.

It will be observed that the present Regulations do not include provisions "in relation to the carrying out of the scheme or enforcing the observance of the provisions thereof" (Section 56 (1) of the Act), or as to "inquiries and reports as to the beginning and the progress and completion of works, and other action under the scheme" (Fifth Schedule, 3 (*b*) ). The Board propose to defer the making of any Regulations under these heads until they are in a better position for determining the precise Regulations which may be desirable.

The Board think it desirable that local authorities and others concerned in the making of a town planning scheme should realise at the outset that a considerable period must of necessity elapse between the time of the inception of a scheme and its final approval. The necessity of giving effect to the clearly expressed intention of the Act in regard to affording persons interested or affected full opportunity of considering the proposals at all stages involves considerable delay, but the Board in settling the Regulations have made the periods for notices as short as possible, having due regard to the objects to be attained. So far as administrative action upon the part of the Board is concerned, they will endeavour to expedite as much as is practicable the dealing with applications to them in regard to town planning schemes, but the careful consideration of a case in all its aspects and the arrangements for the holding of the necessary local inquiries must necessarily take a substantial amount of time.

## TOWN PLANNING IN GREATER LONDON.

UNDER the auspices of the National Housing and Town Planning Council a conference was held on Friday, May 6, at the Caxton Hall, Westminster, S.W., to consider the powers and duties of local authorities in regard to town planning in Greater London under the Housing and Town Planning Act, 1909. The area involved was taken to be that lying within a 15-mile radius of Charing Cross; and this is under the control of ninety authorities.

Alderman William Thompson (Richmond, Surrey), in opening the proceedings as chairman, said that the sooner the relation was discussed of Greater London to town planning the better. The advantages of town planning were too obvious to require to be set forth. Extreme importance must be attached to a proper co-operation between the various authorities charged with carrying out the Act. If they do not co-operate it will be to their own individual disadvantage as well as to the disadvantage of the general public. Under the Act land owners also must be brought into co-operation with the local authorities; if this is not done either party can involve the other in a considerable amount of trouble and expense. The area to be dealt with by the conference was firstly that of the London County Council—the borough councils having no town planning powers. Outside that area the urban district and rural district councils exercise power. By arranging among themselves the authorities would be able to deal with those estates which overlap. In the many problems which lie ahead it was essential that no one authority should be predominant. London was great; but they on the outside called themselves Greater London. In settling what was to be done under the Act everybody should be considered. The urban councils are empowered to prepare a town plan not merely for their own areas, but also within the borders of another authority. The London County Council, which is the authority for London itself, can do the same for areas on its fringes. There was therefore absolute necessity for unison. The urban authorities are anxious to co-operate with the London County Council, though they are nervous of doing anything which might result in their being over-ridden by the central body. With regard to the amenity of Greater London under this Act it was to be hoped that it would be possible for the local authorities to link up the parks as has been done in Vienna, and to form a kind of ring of open spaces around London. The people of Frankfort have decided to create all round the town an agricultural belt, i.e., a wide space of open land, of forest land and of agricultural land. Future development will continue on the outer side of that ring. The people of London ought to have in view the protection of the outer areas against the untrammelled expansion of bricks and mortar.

Mr. Raymond Unwin proposed the first resolution:—"This conference desires to draw the attention of all local authorities in the area of Greater London possessing statutory powers under the town planning sections of the Housing and Town Planning Act to the great importance of these new powers as a means of securing the wise development of the areas under their control. Further, this conference strongly urges each local authority to appoint a town planning committee to consider these new powers and duties." The time had gone by, he said, to say much as to the advantages of town planning. Local authorities in the past had learnt how helpless they were to adequately supervise the development of their suburbs. They were often forced to give their approval to plans which just squeezed into the four corners of the by-laws, although the buildings would, when erected, constitute a disgrace which would sooner or later have to be cleared away. The Town Planning Act for the first time gives local authorities power to prevent schemes which arranged for forty or so houses to the acre. It affords an opportunity to take a great step towards the proper development of towns in England, and more especially towards the development of the largest and wealthiest city the world has ever known. No authority could afford to sit still and do nothing towards the development of their area, if for no other reason than that should they remain passive, they would find the London County Council trying to arrange their affairs for them. Then again the local owners will perhaps be coming forward with schemes, and the authority would find themselves unprepared to deal with them. The Town Planning Procedure Regulations just issued by the Local Government Board provided ample opportunities for consultation between the local authorities. The latter should bear in mind that it was only by their taking into their confidence the architects, surveyors and builders in their district and making up their minds to pull together with them, and by working in sympathy with adjacent authorities that the Act can be made a complete success.

Mr. W. P. Harding, town clerk, Wood Green, said that this important Act would serve as a monument of one of the most illustrious ministers who ever presided over the Local Government Board. Hitherto estates have been developed with sole regard to their own amenities, and with no regard to the interest or amenities of the district as a whole. Local authorities in preparing a scheme for their own areas must for the future take into consideration what will be necessary and desirable in a comprehensive scheme for Greater London. As an instance of the advantage of co-operation Mr. Harding mentioned Alexandra Park, which had been bought by ten or twelve local authorities.

Mr. G. L. Pepler, F.S.I., said that the first thing a town planning committee should consider is what good property in the town or district is threatened by bad development in the proximity, and the best way generally in which good development can be encouraged, and existing good development preserved. The second thing was to bring the plan of the town or district up to date, marking all the new roads, finished or commenced. The third was to review the plans deposited but not approved, and also the plans approved but not yet carried out; and to see if there is no urgency to apply for powers in order to check undesirable development. The fourth was to consider the trend of development, the land likely to be next developed, and the most desirable way in which it should be developed. The fifth to consider the needs of communication and also as to road improvements that might not now be too extensive under the new powers the Act gives as to betterment, &c. In some districts it might be of great value to have traffic charts prepared in order to show the trend of traffic, and if any relief roads had already been carried out in the district, to consider whether they answered their purpose. The committee would have to consider the very important question of open spaces, seeing how existing ones answer their purpose and what are likely to be required in the future. Lastly, they would consider on what lines the development of the town or district has so far proceeded and as to what districts are therefore most easily to be retained and improved for various classes of property.

Mr. Henry R. Aldridge, the secretary to the Town Planning Council, in alluding to the Act, remarked that the clauses seem to discourage town planning; they must be read carefully three or four times before even a glimmer of their meaning becomes apparent. They are a remarkable contrast to the lucid French regulations.

Alderman Thompson, the chairman, said that when the Richmond town planning committee met for the first time there was much awkwardness, as each member wondered how they were to begin. But they finally came to the decision that they should commence by giving the surveyor a job. He was therefore instructed to draw up a preliminary report showing (*a*) land immediately in course of development; (*b*) land likely to be used; (*c*) land that might eventually perhaps be used; (*d*) land adjacent to all these; (*e*) land in other districts which might be affected by their own scheme.

Mr. R. Brown, surveyor, Southall-Norwood, complained that many of the ordnance maps, which it was suggested they should utilise, were twenty years old, and show green fields where are now bricks and mortar. These ought to be brought up to date by the Government at their own expense. The surveyors have already plenty to do without embarking on that extra work.

Professor S. D. Adshead said he had searched in the regulations for some reference as to the method of making a town plan and the extent of the area to be dealt with, but there did not seem to be anything about either point. It would be necessary, he thought, to go a good way outside the hard and fast lines of the Act. Those spots which are being developed on wrong lines would have to be treated at once, and, so as to avoid making a wrong plan, they would have to be made as small as possible. In the second stage it will be necessary to go outside the Act in considering the whole of the town in relation to authorities outside its area. In his opinion skeleton plans should be made after the small areas have been dealt with, showing the main traffic routes, and the delegation of certain portions for specific purposes. The part not likely to be developed at once could be left for later. The most natural way of grouping authorities was by their connection with the great traffic centres.

Mr. A. Steele Sheldon, town clerk, Wimbledon, alluded to the valuable help received in such questions as were under consideration from their John Evelyn Society, which had for its object the making of the more beautiful. Many of its members did not take part in the ordinary public work. Such societies should be encouraged by other local authorities and their help enlisted in the carrying out of the Town Planning Bill.

The first resolution was carried, as also was the following: "In view of the great need for securing harmonious action between all the Town Planning Authorities in the area of Greater London this Conference is of opinion that, when sufficient time has elapsed to enable these Local Authorities to appoint Town Planning Committees and to consider the reports of these committees, the President of the Local Government Board should be asked to convene a conference of these Local Authorities to consider joint action in regard to those features of town planning which affect the development and amenities of Greater London as a whole."

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* (New York) deals chiefly with the domestic work to be found in the exhibition of the T-square Club, in the Academy of Fine Arts Building in Philadelphia, as to which our contemporary claims "that in at least one branch of our architecture we have outstripped all other countries, viz. in our domestic work." Although our present Royal Academy exhibition is not as a whole superlatively strong in domestic work, and does not contain the best work of some of our best men, we are prepared to advance that the examples of United States domestic architecture, illustrated by our contemporary, would not, in the opinion of an impartial and competent critic, be found to outstrip the specimens of British design now to be seen on the walls of Burlington House. We do not claim superiority, but admit that modern American domestic design is refreshing, original and piquant, and that some excellent illustrations thereof are before us.

*La Construction Moderne* (Paris) gives further illustrations of the new Magasins au Printemps, Paris, with more details and views of its remarkable display of constructive and ornamental ironwork. In its description of old Paris, our contemporary now deals with the locality of *le Marais*.

*Engineering Record* (New York) contains an interesting paper by George W. Fuller "Concerning the corrosion of metals by water." A curiosity is a combination roof truss of wood and iron for a skating rink, 90 feet across.

## ARCHITECTURE AT THE ROYAL ACADEMY.—II.

RESUMING our examination of designs for domestic buildings, we come to Mr. P. MORLEY HORDER'S "St. Peter's Vicarage, Ealing," a picturesque composition with plastered walls and tile roofs. "The Doone, Byfleet, Surrey," by Messrs. CASTLE & WARREN, assumes the guise of a cottage with plastered walls, a bit of half-timbering and thatched roof, turned into a house by an added red brick entrance porch in a re-entering angle. Mr. CHARLES R. ASHBEE sends a set of drawings showing the lay-out of garden and "Reconstruction and Additions, Woolstaplers' Hall, Chipping Campden," his own residence and an interesting house. Mr. FRANK B. DUNKERLEY'S "Cragwood, Windermere," seems a fairly big house of irregular and rather strained composition. "Beechlaw, Puttenham, Surrey," by Messrs. FORSYTH & MAULE, is a good drawing of a brick house with tile roof, modernly picturesque. Messrs. HART & WATERHOUSE exhibit the entrance of a block of flats in "The Pryors, Hampstead," which is stately without undue striving. Mr. JAMES J. S. NAYLOR in his "House in Portland Place" as in the "House in Upper Brook Street" shows stone fronts of rather elaborate detail, too much of the character of modern municipal building Renaissance.

Mr. CHARLES E. MALLOWS in a "House and Garden at Sunningdale" makes a feature of a pleasant approach of steps and lily pond to a long house of two storeys and oof with projecting wings of one storey and gabled roofs which enclose a courtyard, an idea we remember seeing in a design at the first Ideal Home Exhibition. Mr GEOFFRY LUCAS in "Proposed House near Godalming, Surrey," has a simple plain brick design with a pedimented stone doorway in the centre flanked by slight projections at the ends of the façade with hipped tile roofs. Mr. COURTNEY M. CRICKMER'S "Three Houses, Hampstead Garden Suburb," is a picturesque and skilful treatment of small house design in brick and rough-cast, being the hree centre houses of a group forming part of a hexagon of eighteen houses. Mr. A. VIVIAN JACKSON'S "House at Weybridge" adopts an old-fashioned rendering of sparse timbers and brick filling combined with tile hanging hat is a little affected.

Mr. ERNEST W. MARSHALL in a "House near Oxted, Surrey," shows a pleasing composition of plastered walls with red brick quoining and red brick dressings to windows, tile hanging, and tile roofs. In "Hanger Hill, Sussex," Mr. EDWARD T. POWELL has rather laboured to produce an effect of accidental mingling of stone base, red brick, and half-timber, but has quite caught the south country type, even to the stone slate roofs. "Proposed House at Esher, Surrey," by Mr. JOHN N. R. VINING, is a truthfully-treated half-timbered building with a brick ground storey relieved by a projecting plastered bay.

Mr. ARTHUR T. BOLTON makes a bid for originality in "The Villa in the Warren, Ewhurst, Surrey," which has an Italian cachet in its loggie and arcades, whilst the simplicity of his semicircular arches and a quaint corbelled out upper storey suggests that his thought was tinctured by reminiscences of Romanesque work. Mr. CHARLES A. BATTIE'S "House at Guildford, Surrey," has a two-gabled symmetrical front in half-timber over a stone ground storey, relieved from tameness and rendered picturesque by a cleverly introduced gable on the flank return.

Mr. ERNEST NEWTON sends a sketch of the detail of part of the front of "Upton Grey, Hants," a study of a half-timber bay to a brick and tile hung façade. Messrs. T. O. FOSTER & P. W. LOVELL also send a detail of part of the "Xavierian College Sanatorium, Mayfield, Sussex," showing the entrance and a study in red brick and plaster. Mr. EDWARD F. C. BUCKLEY'S "New Hall at 67 Queen's Gate" is rather tame and hackneyed in detail, and scarcely attains a moderate degree of excellence by the use of green marble columns. "Proposed London House," by Mr. L. MACDONALD GILL, appears to be a mansion in Carrara ware, with blue bands to the two top storeys and a green tile roof, rather a striking conception; but why mar the whole thing by introducing three commonplace red brick arches?

Mr. C. WONTNER SMITH shows in his "Small Houses at Barnet" how even the suburban villa can be made beautiful by picturesque grouping, combination of Mansard and normal roofing, brick and half-timber, and an occasional moderate expanse of plaster. In "No. 84 Harley Street" Mr. CLAUDE W. FERRIER has cleverly obtained an agreeable effect in a necessarily flat-fronted house by recessing the centre and connecting the recess to the quasi-projections with circular curves.

Mr. WALTER CAVE in "Ewelme Down, near Wallingford," gives us a charming old manor house with square tower and many gables, quite expressive of seventeenth-century feeling. Mr. H. STANTON WEBBER'S "House at Ripon, Yorks.," was published in *The Architect* of March 11. The "Tower and Garden House at Roynton Cottage, Rivington," by Mr. THOMAS H. MAWSON, looks like a tower on a city wall, say at Rothenburg, a quite mediæval effect being attained by the skilful use of varied levels in the garden and its accessories. "Extensions to House in Northumberland," by Messrs. OLIVER, LEESON & WOOD, is a study of a plastered house with stone bays and square stone dressings to windows and a slated roof.

"Great Roke, Witley, Surrey : the Entrance Front," by Messrs. H. T. BUCKLAND & E. H. FARMER, is a picturesque house, somewhat severe in tone, which would show to better advantage if the drawing were less hard. "The Moorings, Sunningdale," by Messrs. T. E. Collcutt & S. Hamp, is an exceedingly picturesque stone house with rubble walling and a quaint overhanging timber gallery. Mr. Walter Tapper in "Eastham Grange" has contrived to make a comparatively small house look big by long and narrow blocks at right angles. "Staplefield Place, Sussex," by Messrs. C. E. Clayton & E. Black, is a regular Norman Shaw type of house, with brick and stone mixture on the ground storey and half-timber and hung tiling above, with plenty of gables. A plastered house in brick plinth with red-brick arches and sills to windows and outside green shutters is made quite satisfactory by Mr. D. G. Round in "Baskets, Colchester," with projecting bays and loggia between, the whole surmounted by a yellow tile roof of simple and quiet form, effective by the use of wide overhanging eaves.

Mr. Andrew N. Prentice is not at his best in "The Manor House, Motgrove, Gloucestershire," although this is a big stone house of true Gloucestershire type. The bird's-eye view, although it shows the bigness of the house, does not favour the design. "East Weald, Bishop's Avenue, Hampstead," by Messrs. H. V. Ashley & W. Newman, is an excellent study in brickwork, symmetrical yet picturesque. Mr. Arthur P. Starkey has given much effort to the production of a symmetrical plan in his "House, North Bedfordshire," and at the same time has achieved piquancy by the introduction of flanking loggie as outdoor parlours, one opening from the drawing-room and the other from the dining-room. The scheme of the garden is well worked out in alignment with the house. "Alterations and Additions to Shirenewton Hall, Chepstow," by Mr. Norman Evill, has quite a Scots flavour about it, with the dourness relieved by a Jacobean arcaded loggia.

Mr. Arthur Keen's "Wildshaw, Limpsfield," is a picturesque moderate-sized house with a gabled oriel in hung tiling for its central feature—if we may use the term central in an unsymmetrical composition—in which an octagonal bay on one side makes a further note of interest. Asymmetry, however, is not in this case destructive of balance. "Graythwaite Hall, Cheshire," by Mr. Frank B. Dunkerley, is a study in half-timber with a multiplicity of gables, but does not conform rigidly to the usual Cheshire type. Mr. George L. Sutcliffe's "North-west View of a House" shows two wings in plaster with brick plinth meeting at right angles, with two gables hobnobbing in the re-entry angle and an entrance on splay, a piquant bit of composition. Mr. John Greaves in his "House at Sidmouth, Devon," presents a pretty little drawing in coloured chalks of simple plastered walls and much roof, studiously irregular, a glorified cottage.

"Hill Close, Braunton, North Devon," by Mr. G. A. E. Schwabe, shows how a severe and even plain building may be relieved and saved in character, in this case by carrying up a bay and high parapets to the foot of a gable. Mr. George Hornblower's "Cottages, North Wales: Frontage to Street," is a tiny coloured drawing of the elevation of a row of two-storey cottages, and is a lesson to those who are ambitious of finding a place on the crowded Academy walls.

## NOTES AND COMMENTS.

In His Most Gracious Majesty King George V. we have a monarch who has already as Prince of Wales given proof of not only interest but critical appreciation of architecture. The last two Building Trades Exhibitions, held at Olympia under the management of Mr. H. Greville Montgomery, were visited by our present King and Queen Mary, when it was remarked by those who had the honour of coming in contact with their Royal Highnesses that the visit was not simply due to the gracious condescension that we have become accustomed to expect from members of our Royal Family, but was a genuine pleasure to competent and qualified observers of whatever good or beautiful things were to b found in modern architecture. With such experience a this, coupled with the remembrance of the recent hono of patronage bestowed upon the Royal Institute of Britis Architects, we may be certain that the art of architectu will receive due recognition and encouragement at th hands of our present Sovereign, and that the loyalt and affection of all who practise that art will be unhes tatingly given to King George and Queen Mary.

The Incorporated Church Building Society has pu lished as a reprint from the *Church Builder* the valuab series of recommendations made by Mr. W. D. Caroe to the causes and evidences of decay in church building The purport of Mr. Caroe's articles is expressed in th title of the reprint, "A Manual of First Aid for Arch diaconal and other Inspections," and this is admirab adapted for primary instruction not only for archdeacon but for all clergy and churchwardens who have a ancient edifice in their care and keeping.

The valuable work that has been done since its form tion by the Hellenic Society has prompted the foundatic of a similar Society for the Promotion of Roman Studie the object of which is to deal with the archæology, ar and history of Italy and the Roman Empire down about A.D. 700 by publishing a journal, forming a librar holding meetings, assisting (as soon as funds allow) th British School at Rome, and generally promoting th better knowledge and understanding of the Roman worl A rich field is open to the new Society, and we doubt n that its success will be immediate, for spite of all th has been done by many independent investigators the are many gaps to be filled between the plots that ha been worked, which co-ordinated efforts such as may expected from a well-organised association can alo unite into a well-explored field and render complete o knowledge of the art and archæology of the Roma Republic and Empire.

Liverpool is, of all the cities of England, the mo closely in touch with the United States, and according the most strongly-coloured by American thought ar manners; hence it is natural that in Liverpool there shou be rising the first genuine sky-scraper in England, th new building for the Royal Liver Society. The ci building surveyor, Mr. John Alexander, is wise enoug in his annual report, to direct the attention of Liverpool citizens to the desirability of powers being taken, as the could be by the adoption of the Public Health Act Amen ment Act, 1907, to control the heights of buildings. we have said before, the man who erects a sky-scrap "jumps the claim," and his fellow-townsmen have suffer, for his benefit, the loss of air and light to whic they are entitled.

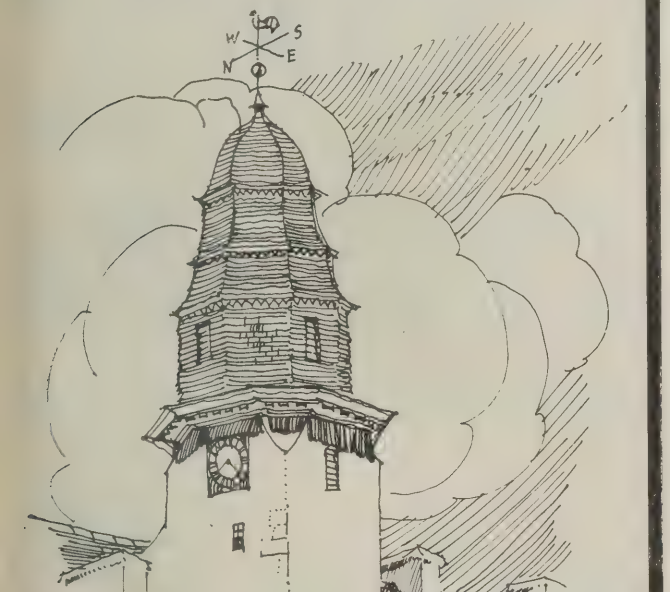
Another unpleasant result of the multiplication sky-scrapers, which is now causing serious uneasiness the minds of New Yorkers, is the terribly congested sta of such important thoroughfares as Broadway and Fif Avenue when the mammoth buildings simultaneous disgorge their thousands of occupants at certain hours the day, rendering locomotion almost impossible. Th city of Liverpool will therefore be well advised to nip the bud the rapid growth skyward of future buildings.

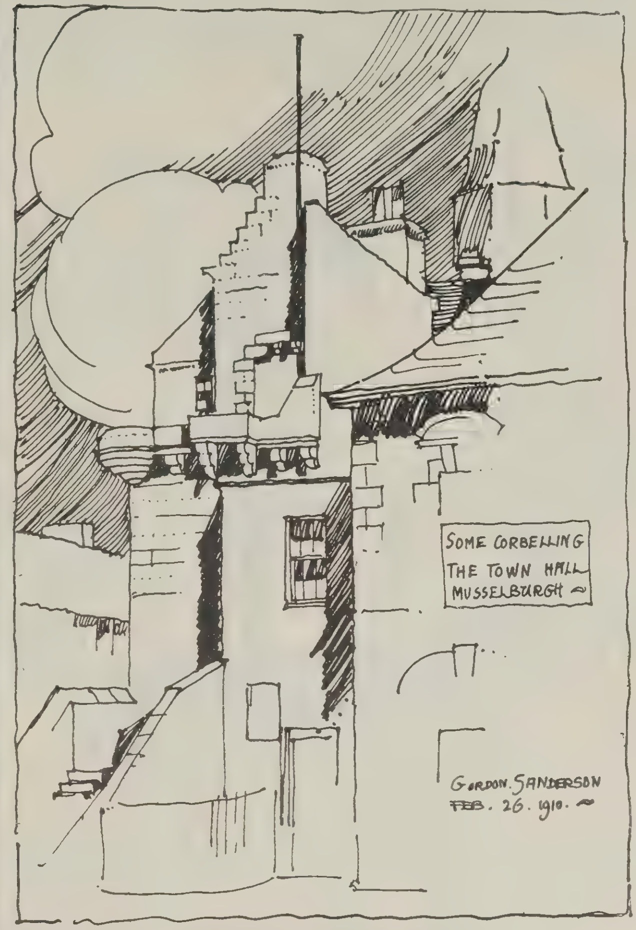
The case of Measures Bros. Ltd. *v.* Measures not only interesting to the building trade as affecting well-known firm of engineers, but lays down an importa point of law in respect of service with limited companie Briefly, the defendant was a director of the company f a term of years, with an extension at his option for further term. Before the term expired the compa came into the hands of a receiver, and an order was ma for compulsory winding up. Hence the defendant w automatically dismissed and then started in business f himself. The company applied for an injunction restrain him from so doing, and Mr. Justice Joy refused the application. On appeal, the Master of the Rolls and Lord Justice KENNEDY upheld the decision of Mr. Justice JOYCE and Lord Justice BUCKLEY dissented. Accordingly the appeal failed.

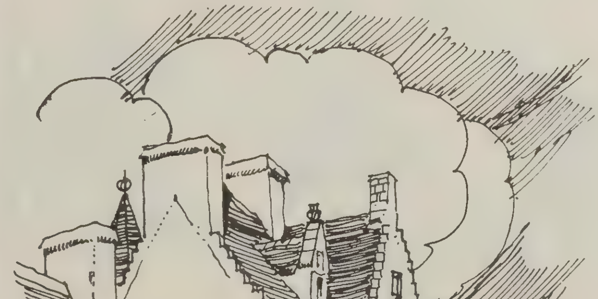
WE regret to have to announce the death of Mr. GEORGE AITCHISON, R.A., on Monday last, in his eighty-fifth year. His practice as an architect was in his early years largely shaped by the inheritance from his father of the position of architect to the St. Katharine's Dock Company, and it was not till the erection of Sir FREDERICK LEIGHTON's house that he had an opportunity of showing his ability as an artist. He was an example of the learned student, particularly of Classical architecture, which fitted him eminently for the position he held for many years of Professor of Architecture at the Royal Academy. He was President of the Royal Institute of British Architects for the years 1896-9.

## NOTES AND SKETCHES ON ARCHITECTURE ROUND EDINBURGH.

THESE sketches were made in the immediate neighbourhood of Edinburgh, which is, like the city itself, singularly rich in excellent examples of old architecture. Those that form the subject of this article are by no means the only ones, but they will serve to show the individuality and charm of Scotch work. They may also give an added interest to anyone visiting the locality who has hitherto been ignorant of the existence of such interesting instances of architecture.

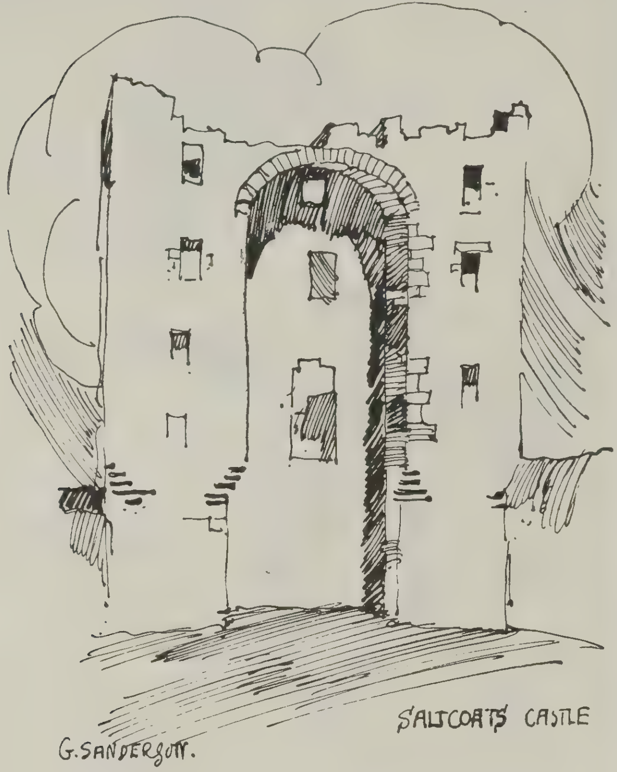


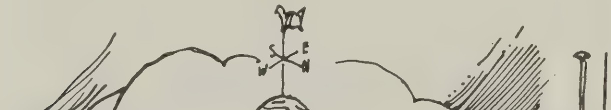




AT PINKIE HOUSE
GORDON. SANDERSON.
FEB. 26. 1910.

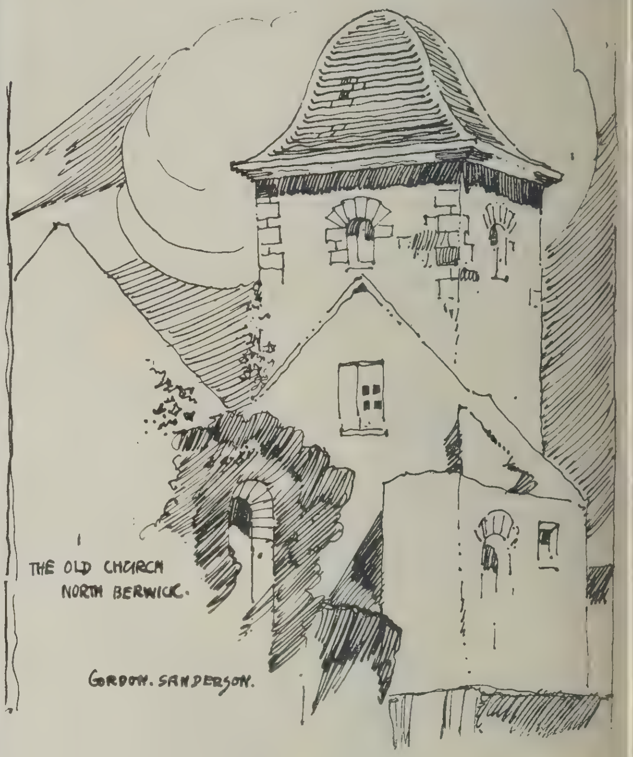
*Musselburgh.*—Besides being historically most interesting owing to its close connection with Scottish national history, Musselburgh is also of great interest architecturally. The town hall, the spire of which is perhaps the town's most striking feature, is the work of Dutch fishermen who had settled there in the fifteenth century. The municipal buildings form a charming group and are quite continental in their general appearance. There are also many old tile-roofed houses in the town, which give it a pleasing touch of colour.





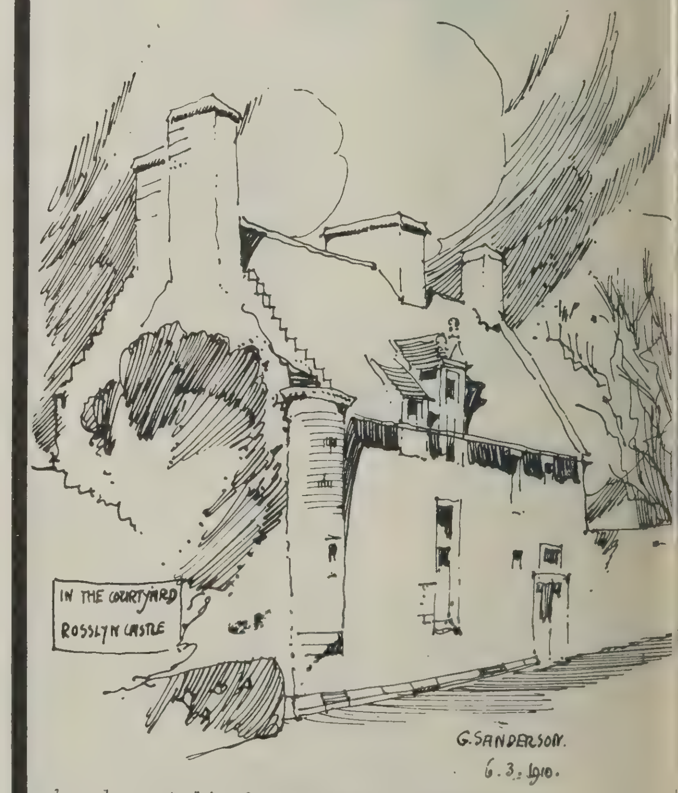
THE TOWN HALL
NORTH BERWICK
G. SANDERSON.
MAR. 4. 10.

*Pinkie House, Musselburgh.*—Scotland owes a debt of gratitude to the Seton family for endowing her with many fine specimens of architecture. Alexander Seton, Earl of Dunfermline and Chancellor of Scotland, erected the principal parts of Pinkie House in 1613, to which various additions have taken place at later dates. His original design appears never to have been completed, as the mansion was evidently intended to form a square with a central court. Especially noteworthy are the square turrets to the lower part of the building, which are happily contrasted with the slender angle turrets of the tower. This tower dates back before Seton's time, an was probably one of those simple square towers which give us in these peaceful days a very good idea of th different state of things prevalent in Scotland in th fifteenth century. Protection was essential to the Scottish baron, and he sought it in height and narrowness; but in the seventeenth century increasing prosperity and public safety led to an expansion in architectural development which prompted him to make ornamental additions to his ancestral halls. This phase is admirably illustrated in Pinkie House.



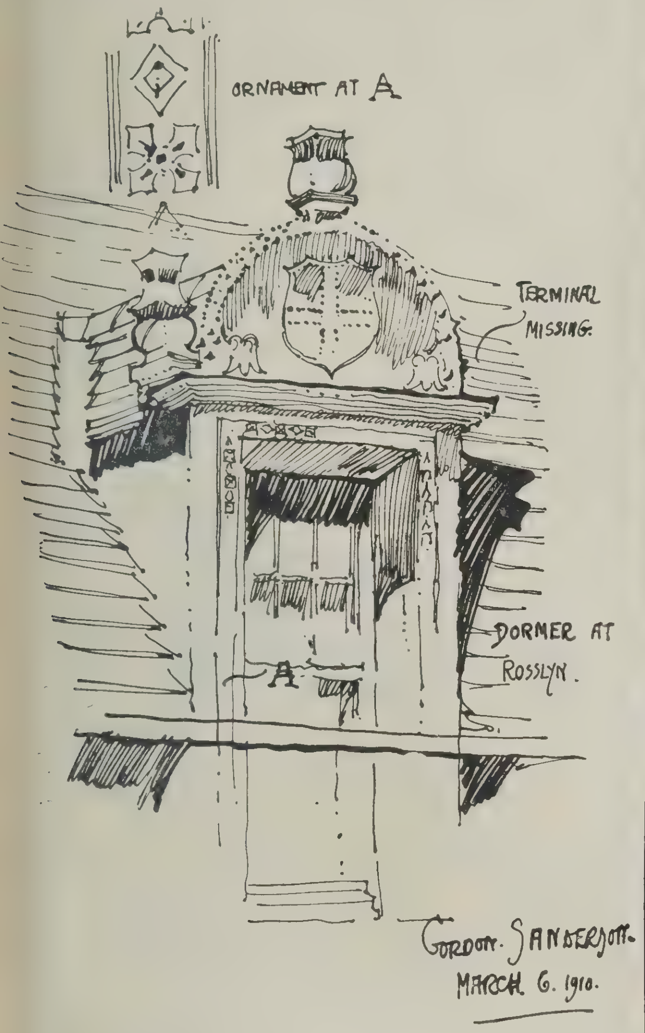
THE OLD CHURCH
NORTH BERWICK.
GORDON. SANDERSON.

*North Berwick.*—At North Berwick the municipal buildings again claim one's interest. The old parish church erected in the seventeenth century is now in ruins, the tower being practically all that remains. Within a little distance of North Berwick are several old castles. Saltcoats Castle shows well the high arched recess into which the drawbridge would be drawn up in time of siege.



IN THE COURTYARD
ROSSLYN CASTLE
G. SANDERSON.
6. 3. 1910.

Much of the building was used as a quarry some 100 years ago, and the demolition of it seems to have given some trouble, as the walls were said to be "seathed in steel." Fenton Tower was erected in 1575 by Sir John Carmichael, a Scottish worthy who was generally occupied in Border raids. The site is a well-chosen one, as from its walls the surrounding country can be surveyed for a considerable distance.



ORNAMENT AT A
TERMINAL MISSING.
DORMER AT ROSSLYN.

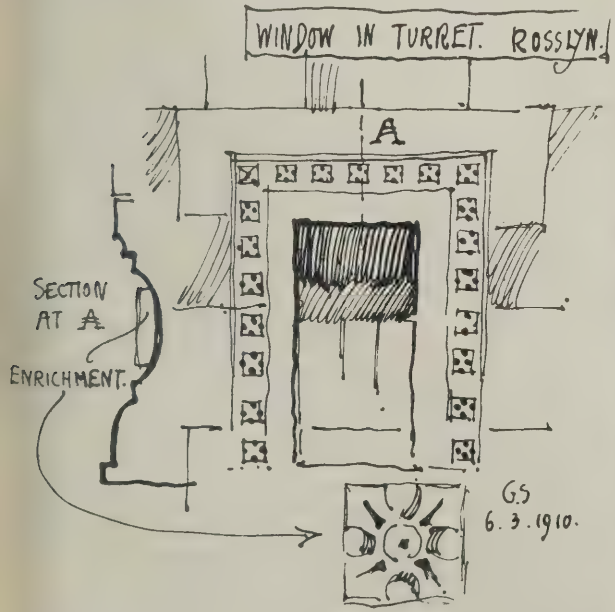
GORDON. SANDERSON.
MARCH 6. 1910.

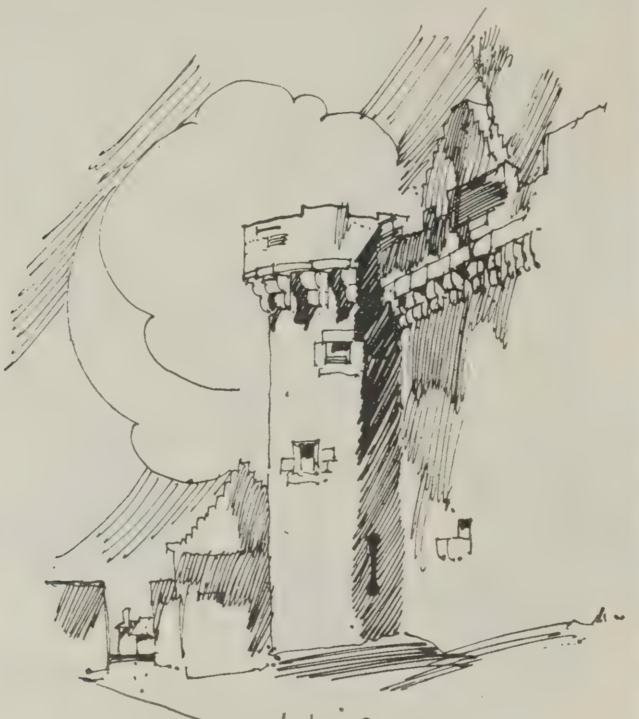


*Peffer Mill*, quite close to Edinburgh, is well worth a visit from anyone who, having little time to spare, would wish to see a typical old Scotch mansion-house. Its present surroundings do not do it credit, and it is no longer a country gentleman's residence, but its charm still remains and it is well worthy of study, and would be an excellent example from which to make measured drawings.

*Rosslyn Chapel.*—It must be admitted that, architecturally, Rosslyn Chapel is a little disappointing. The elaboration of its detail and the variety of its parts go far, it is true, to make this building full of interest, but its lack of symmetry and proportion give one a bad impression from the first. The builders of Rosslyn wished to make a big show for their money, and were also determined to put no ornament where it would not be seen. A fine building is undoubtedly the outcome of a lofty ideal, and buildings like Melrose Abbey, even where the darkened crypt is richly ornamented in the belief that with God there is neither light nor darkness, produce a more favourable impression on the beholder, and are undoubtedly finer examples of art. The Gothic architecture of Rosslyn cannot be assigned to any particular period. Mouldings and ornament of all kinds and types are to be found, and throughout the flying buttresses, pinnacles, tracery, and other members of this building an endless variety and profusion of detail predominate. Time and weather have somewhat subdued the superabundance of detail, and although Rosslyn Chapel cannot be put forward as a good example of Gothic architecture, it is well worth a visit.

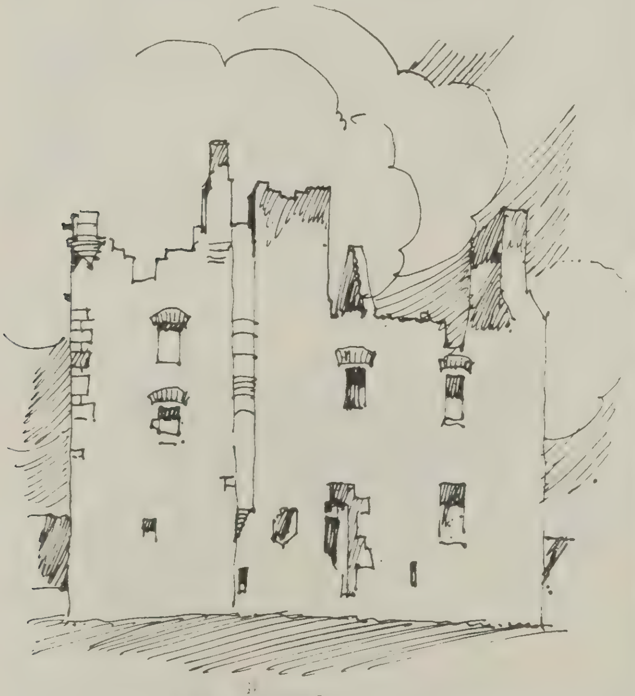
*Rosslyn Castle.*—Situated in a thickly-wooded glen, and accessible only from a bridge, Rosslyn Castle must have been admirably adapted for a siege, provided that plenty of the necessaries of life were to hand. Patrolling enemies would not notice it as they rode through the surrounding country, and no doubt this reason had much to do with the choice of this site, but it seems that the castle could have been easily beleaguered from the rising ground to the north.

*Craigmillar Castle.*—A more ideal site for a fortified building could not have been chosen than the ridge some three miles to the south of Edinburgh on which Craigmillar Castle stands. From its elevated position a good look-out could be kept, while its healthy surroundings have recommended it as a country retreat for Sovereigns desiring a change of air and rest after the gay Court life of Holyrood. As usual with Scotch castles, a square keep forms the centre and is surrounded by a high external wall, the angles of which terminate in circular bastions which command the intervening curtain wall. One of these bastions is shown in the sketch. These fine old Scotch castles, rising like watchful sentinels over the surrounding country, give Scotland a type of architecture which no other country can show. Built in days when every man's hand was against his neighbour, and when the ever-dreaded English hovered like a storm-cloud on the Border, their narrow, windowless keeps, crowned by corbelled turrets and crow-stepped gables, are the embodiment of strength and security.



CRAIGMILLAR CASTLE EDINBURGH.

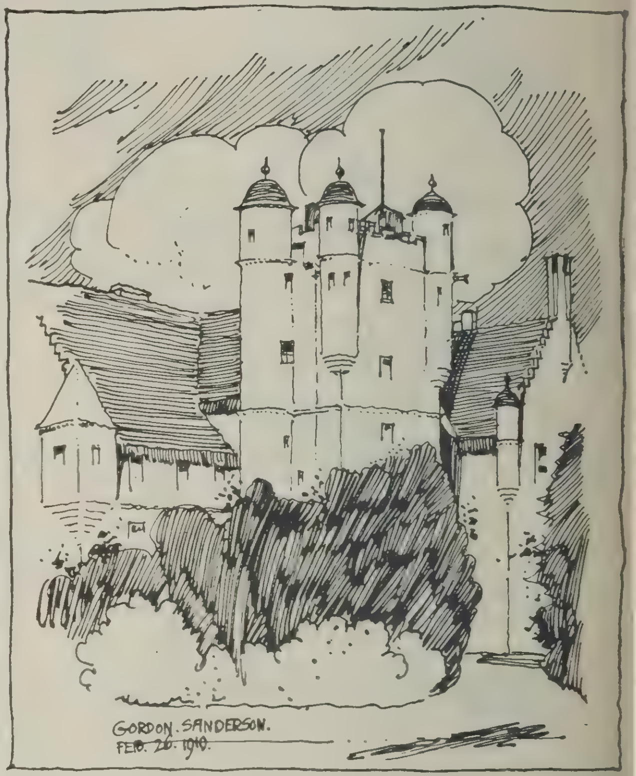
G. Sanderson Feb 1910.



FENTON TOWER.

G. SANDERSON

*Corstorphine Church.*—Founded in the fifteenth century by a Sir JOHN FORRESTER, this little church some three miles out of Edinburgh well repays a visit. It cannot be said that it is a good example of any particular style, and the pinnacles to the buttresses are heavy and out of keeping; but there is an air of unobtrusiveness and modesty about this little church which goes far to recommend it. The roof is of particular interest, being covered with old grey flagstone. The church was thoroughly and conscientiously restored in 1905. The roof may be compared to that at St. Mary's, Scarborough, Yorkshire.



GORDON. SANDERSON. FEB. 26. 1910.

## THE ARCHITECTURE OF BATH.

*(Concluded from last week.)*

AT the end of Brock Street stands the stately Crescent, with its ample and beautiful surroundings of lawn and park. The work was begun in 1767 and finished in about eight years' time. It was carried out by the younger Wood. The Crescent is elliptical on plan, and is 538 feet across its major axis. The central and two end houses are emphasised by the coupling of the Ionic columns. A plain basement storey supports a large Ionic order 2 feet 6 inches in diameter and 22 feet 6 inches high, running through two storeys over, with an entablature 5 feet high, the total height from pavement to parapet being 47 feet, or 5 feet higher than the Circus. Over this is an open balustrade, and originally the roof was covered with stone tiles, as were all the other houses in Bath. In the elevation I have shown the window openings with the original bars, and it is to be noticed that neither here nor in the Circus are there any mouldings round the openings. The face of the masonry between the columns is worked square and not to the sweep of the curve, as might be supposed; the effect of the flat face is, however, scarcely noticeable, and an enormous saving of labour is effected. The same principle is applied to the Circus, where it cannot be detected at all.

In the interior the increased height of the rooms produces a much colder and less comfortable appearance, and the window-heads are generally 2 feet below the ceilings, which causes the upper part of the room to be dark. About twenty-seven years before this plasterwork had begun to take the place of wood panelling upon the walls, the panels being generally divided by a cable moulding, and the oak staircases were fast disappearing, giving place to those of iron and stone.

---

* A paper read before the Architectural Association on April 2 by Mr. Mowbray A. Green, A.R.I.B.A.

The ornament of the internal finishings and decorations became most elaborate, though the cornices occasionally degenerated into meaningless compositions. The ceilings are the most beautiful features, and vary from strictly geometrical patterns to a quite naturalesque treatment.

The fireplaces are often entirely of marble, statuary and Sienna being most frequently used.

About the year 1762 Milsom Street was begun, and soon became the principal shopping centre of the city and noted for many miles round. The ground floor, especially on the west side, had at first segmental bow windows. The central windows of the first floor have pedimented or other ornamental heads. The most important group of houses, and probably that first built, is on the east side, and was called Somersetshire Buildings. In this group of five houses the centre and two end ones are projected forward from the main line of street sufficiently to take a three-quarter column of the Corinthian order, and the middle house has, in addition, a segmental projection. In this house there is a magnificent ceiling, one of the finest in Bath.

Behind the houses just below this group stood the Octagon Chapel, built by T. Lightholder, or Lightoler, as he is styled on the engraved plans, which are copied from those in the British Museum. It was opened in 1767. The interior is planned as an octagon of about 53 feet in diameter, with four semi-circular recesses, the whole being contained within a square. The gallery was supported on eight stone Ionic columns, some 10 feet high, with finely-carved caps, and the cove above the octagon springs at about 29 feet from the floor, with a smaller cove, a drum and a semi-circular roof on the top, but the roof was not executed exactly as shown in the original section. The plaster decoration is in the Adams manner. In Old Bond Street near here there is another good ceiling.

The younger Wood's chief work was the Assembly Rooms, built in a dignified and simple style, and with the chimneys more carefully designed than in the earlier buildings of the century. They were begun on May 4, 1769, and finished in October, 1771, being built with a capital of seventy shares of the value of 300*l.* apiece on the Tontine principle, the building thus costing over 20,000*l.*, which was a large sum for that day. The plan is an admirable one, with an outer portico, an inner hall flanked by retiring-rooms on either side leading into an octagonal vestibule beyond, from which the large ball-room is entered on one side, the tea-room on the other, and the octagon-room on the third, all these rooms being *en suite*.

The ball-room, 104 feet long by 41 feet wide and 42 feet high, is divided into three parts. The substructure and the order over are hollow behind to allow of the raising and lowering of vertical sliding shutters for darkening the room in the daytime. The great cove is 11 feet 6 inches high, and from each of the five flat panels in the ceiling are hung magnificent cut-glass chandeliers. The three divisions of this room are too nearly alike to be satisfactory, and the order is dwarfed by the immense cove at the top.

The tea- or concert-room is 66 feet long, and of the same width and height as the ball-room, with an orchestral gallery at one end running the whole width of the room, where there is a fine ironwork grille of the period.

Alfred Street was built by Wood about the year 1768, and there is an interesting doorway here known as King Alfred's Doorway, from the bust of the monarch over, who is supposed to have surrounded the city of Bath with walls and gates. The ironwork shows the stand for the oil-lamp at the top and the extinguishers on either side, in which the link boys might "do out" their torches. The delicate treatment of the stone carving round the doorway shows quite a new departure from what we have seen up to the present.

Pulteney Bridge seems to have been the only work of the famous Robert Adam in Bath. It was erected about 1770 for the purpose of giving access from the city to the Bathwick Estate, which belonged to William Pulteney, and for the laying out of which Robert Adam got out many designs which are now in the Soane Museum. The present Pulteney Street is upon the very line laid down by him. It is probable that political reasons influenced Pulteney in favour of local talent, for he was at this time standing as a Member for Bath. The drawings before you are from Robert Adam's collection in the Soane Museum. Three segmental arches span the river, and are turned in single rings of stone. The upper part is occupied by a range of shops. The porticoes at the ends, long since taken down, must have formed a fine approach to the bridge. Fortunately, one of Malton's drawings remains to show us what it was like. There have been many alterations, both on the river and street side of this bridge.

About 1765 the Corporation had determined to build a new town hall and markets in High Street in place of Inigo Jones's hall, which stood in the middle of the Market Place, and amongst those who were asked to prepare plans were Lightoler, John Wood, Jones, the city surveyor, and Thomas Attwood. That Attwood had considerable capacity is shown by a building which he erected in 1772 as a prison in Grove Street, and in which he follows an earlier manner. The building must be judged of as a three-storey building only, for it was intended that a road should lead up to the central opening in the rusticated portion, which was designed not as a window opening, but as the main entrance to the building. Attwood was by trade a plumber, and amongst his other works he carried out the Paragon, Oxford Row, and the City Waterworks. There was considerable discussion about the plans for the Guildhall, but on February 11, 1768, the foundation-stone of the new building, which had been designed by him, was laid by William Chapman, Mayor. The cost was to be 6,500*l.* After this work went on slowly for six or seven years, because some of the tenants on the site were unwilling to give up their leases. In addition to this a question was raised as to the advisability of proceeding with the plans in hand. All this was, however, ended by the unhappy death of Attwood, who was crushed by falling timbers while some of the old houses on the site were being pulled down. Shortly afterwards Thomas Baldwin, who appears to have been a clerk in Attwood's office, offered a new plan. This was accepted, and the building was completed about 1778. Baldwin's work is strongly influenced by that of Robert Adam, but its detail is debased and it lacks the strength and vigour of that of the two Woods. Still, as a whole it is a distinctly fine building, on almost entirely new lines, and with excellent proportions. The basement is rusticated, with the central portion vermiculated as well, and the order over this part is a blending of the Ionic and Composite styles. A good feature is the recessing of the two outer windows. The figure of Justice at the top is of lead. The width of the façade is 85 feet.

Although the mouldings are attenuated and poor, they lend themselves satisfactorily to the internal treatment. Here there is much fine plasterwork, well preserved, and there is a very characteristic iron baluster in the staircase, which is of oak.

The banqueting-hall is treated with a low sub-plinth, 3 feet 5 inches high, and the engaged columns, which are of the Corinthian order and exhibit a Greek feeling in the capitals, are set on pedestals which stand forward from the rest of the wall. There are quarter columns in the four angles, and all the columns are widely spaced, with arched recesses and large plaster discs set alternately in the spaces over. Above is a cove which is ornamented in parts by a group of sunk lines, and the ornamentation in the large circular panels on the ceiling is very elaborate. The proportions of the wall treatment are exceptionally good.

In 1775 Wood rebuilt the hot bath at the end of Bath Street, and two years later published a small monograph on it. In 1779 he built Hardenhuish Church, near Chippenham. It is square on plan with an apse at the east end and a steeple at the west end. Neither the elder nor the younger Wood were, however, much employed in ecclesiastical work.

Reverting to the buildings in Bathwick, Argyle Street was in building in 1789, and here there still remain two good shop fronts executed in woodwork, and in one is a fine wooden fireplace, together with an original basket grate. Of the same character is one in Nelson Place East.

Laura Place was begun in 1788, and Pulteney Street about the same time. The former was by Baldwin, and on the latter both he and Eveleigh were engaged. The street is imposing in general effect, but poor in detail. It is 100 feet wide from house to house and 1,100 feet long, and is terminated at the end by the Sydney Hotel, which was built by Harcourt Masters in 1796, when the Sydney Gardens were also laid out by him.

Among other works by Eveleigh were Grosvenor Hotel and Bailbrook House. The former was built in 1790 and had immense gardens attached. It cost upwards of 10,000*l.*, but lay unfinished for many years.

The history of the Pump-room is too long to be given in detail. In 1785 Baldwin erected the northern colonnade at a cost of 130 guineas, and in May 1788 the foundation-stone of the new private, or King's baths, was laid by the Mayor, and the building begun by Baldwin. The original drawing, which shows the façade facing Stall Street, is done in line, with the masonry tinted in light stone colour and the shadows washed in with blue black. The scale is an arbitrary one, and the drawing is undated, but the name of T. Baldwin appears on the back.

It is not known who designed the west end of the Pump-room. William Reveley, a pupil of Sir William Chambers, gave drawings to the Corporation between 1791 and 1793, and the sum of 27*l*. 9*s*. 6*d*. was paid to him for these, but he probably did nothing further. It is more than likely that the general scheme is Baldwin's, but that after his dispute with the Corporation, John Palmer finished it, and so says a guide of 1823. Palmer almost certainly added the portico on the north side.

The interior of the Pump-room has a Corinthian order with segmental recesses at each end and elliptical lights at the top of the room between the columns. This room would have shown a better proportion had the columns been less heavy and set upon a sub-plinth.

Under the great scheme for rebuilding this portion of the city by the Act of 1789 Bath Street, Cheap Street, and Union Street were all built by Baldwin. Of these Bath Street is the most interesting piece of work, with its Ionic colonnades forming a covered walk from one end of the street to the other.

The Cross Bath at the west end is also by him.

Among some of the latest buildings of the century were Camden Crescent, built on an elevated piece of ground overlooking the London Road, and a great deal of work on the northern slopes above the Royal Crescent, where John Palmer built St. James's Square, Lansdown Crescent, and All Saints Chapel. He also designed the façade of Kensington Chapel on the London Road. Some years earlier he had, together with his partner Jelly, rebuilt St. James's Church

The styles of the eighteenth century may be divided into three groups—that of the first twenty-five years, when the houses had gabled roofs and façades with large sash windows surrounded by bolection mouldings, and when the interiors were panelled with wood and the rooms small and comfortable ; the next fifty years, when the work was modelled on the Classic Palladian manner, with a rusticated basement, a two-storeyed order, a crowning cornice and parapet, and a Mansard or curb roof over, while the interior became spacious and dignified, and plasterwork was brought into general use ; and the last twenty-five years, when the free manner of Robert Adam came into vogue, and the strong methods of the earlier times gave way to detailed and abundant decoration.

Mr. Mervyn Macartney, proposing a vote of thanks to the author for his paper, said one point he would like to ask about was with reference to the original lay-out of Bath. Had the lecturer a contour map by any chance ?

Mr. Mowbray Green : No, I have not one here.

Mr. Macartney, continuing, said one of the most interesting points to him was how Wood took advantage of the shape of the ground on which Bath was placed. Wood started with Queen Square, and then he went straight along the adjoining tongue of land until he came to a fairly level site. He planned his work according to the contour of the ground, a precedent which should be borne in mind when we were considering modern schemes for town-planning. If the improvements Wood carried out in Bath were the architect's own speculation, he thought the lecturer might be able to give them some particulars as to their origin. He wished also to ask Mr. Green about the old buildings near the Cross Baths ; he thought they were older than those shown on the screen.

Mr. Green said he would have liked to have shown some of the old buildings built about 1690 and 1710 ; they were older than Wood's work, but he did not possess illustrations of them. He did not know by whom they were built, and it was difficult to say that an architect was responsible for them.

Mr. C. H. B. Quennell seconded the vote of thanks, and alluded to the late Mr. Brydon, who was, he said, wholly in sympathy with the work of the eighteenth century in Bath. The city was interesting to the speaker because it represented the first examples of houses built in terraces and blocks, and it always recalled to him Sheridan's plays. As houses to live in, he thought the buildings in Bath were about as uncomfortable as one could find, and as models exhibited to students of architecture they exposed what should be seriously and sincerely avoided, and he hoped the A.A. student would not design Wood houses.

Mr. H. A. Hall agreed with the last speaker, and said the buildings in Bath seemed suitable only as a background to the life and fashions of Georgian days. The city was a gloomy one, and seemed to need such accessories as Sedan chairs and men and women dressed in colours. As a retrospect it was very charming, as a reality he did not appreciate it.

The President, in putting the vote of thanks to the meeting, said that although he did not think the architecture of Bath merited serious attention, yet they were grateful to Mr. Green for having given them such an interesting paper, and he felt during the reading of it that if they had men like the author who would study as carefully the architecture of other towns what a wonderful collection of architectural and archæological knowledge would be gained for them.

Mr. Green, in his reply, said Wood was a genius in so far as he represents in his houses the manners of the period. He failed to see the dull monotony of those houses. He had lived in Bath for twenty-five years, and he appreciated the city more and more every year. Nor did he agree that the houses were impossible or hopeless to live in, for he knew many which had most cheerful rooms.

The President moved the adjournment of the meeting until Tuesday, May 31 (5.30 p.m.), to receive the report of the scrutineers on the result of the voting on the proposed amendment to the constitution and by-laws of the Association.

## OUR CONTEMPORARIES FROM OVER-SEAS.

"THE AMERICAN ARCHITECT" (New York) has apparently determined for once to give us examples of how bad modern American architecture can be on occasion. Bethany Memorial Church, New York, is a horror, but to show that it is not unique we have also Van Nest Chapel and a shop building on Fulton Street, both in New York, and equally dreadful.

*La Construction Moderne* (Paris) shows an example of the infelicity, as we think, of modern French country house design in a villa at Bois-le-Roi, of which M. Cuinat is the architect.

*Het Huis* (Amsterdam) fills most of its current number with a historical and descriptive account, well illustrated, of St. Walburg's Church at Zutphen. Some details of a modern house at Dordrecht are interesting.

*The Architectural Record* (New York) gives an account of the work of Messrs. N. Le Brun & Sons, the architects of the Metropolitan Life Insurance Building, New York, the cathedral of SS. Peter and Paul, Philadelphia, and many other buildings, varied in the eclecticism of their style as in their purpose. No. 1 East 75th Street or Fifth Avenue Mansion, by Jas. Gamble Rogers, dignified and sedate externally, contains a plethora of luxurious and costly detail internally. "The Wild Men of Paris" is a sketch of the latest revolt amongst French painters, who want to do something as different as possible from anything that has been done before by acknowledged artists. The results so far are ludicrous, but so at one time was pre-Raphaelitism.

*The Architectural Review* (New York) has a description, well illustrated, of a charming "unknown Maryland manor," Montebello, built at the close of the eighteenth century. Illustrations, including geometrical drawings and details, are given of one of Messrs. Carrere & Hastings's buildings, the Carnegie Institution of Washington ; also of a relief station of the Boston City Hospital, by Mr. Edward Percy Dana.

*Berliner Architekturvelt* (Berlin) gives this month some examples of buildings for the housing of several official bureaucratic departments, such as the City Gas Department of Berlin and Land-banks at Posen and Brandenburg, also a German "Rowton House," "Ledigenheim" at Charlottenburg, and some more of the designs submitted in the competition for the extension of A. Wertheim's stores.

# MODERN COLD STORAGE AND REFRIGERATION.

By W. S. Douglas, B.Sc.

## IX.—INSULATION (*continued*).

FLOORS which are to stand rough usage or to carry heavy weights must be of stronger construction than the walls. This extra strength will in most cases be quite sufficiently obtained by using, say, 9-inch by 3-inch bearers, instead of making these 6 inches by 2 inches, like the studding round the walls. The sheeting would at the same time be stiffened up by putting in strong T. and G. flooring boards in place of the ordinary matching. This method has the double advantage of giving the necessary increased strength and simultaneously bringing up the insulation efficiency at the point where it is most required.

The construction, assuming an existing floor of good concrete, would now be as follows:—First, battens about 3 inches by 1 inch would be laid on the rough floor. On these would be fixed a layer of 1 inch or $1\frac{1}{4}$-inch T. and G. matching, and on top of the matching, at the same centres as the battens, would be laid the bearers. The filling material would then be packed in between these, and they would finally be covered in with black paper and $1\frac{1}{2}$-inch T. and G. flooring, instead of, as on the walls, two layers of $\frac{3}{4}$-inch T. G. and V. matching. Some authorities recommend using ordinary flooring boards instead of the tongued and grooved, and caulking the joints, as in a ship's deck, with oakum and pitch. Very little extra advantage is gained, however, by so doing, and the cost of building is considerably increased.

An extra strong construction is that which was adopted in the large stores at St. Katharine's Dock, London. Here the concrete floor of the vault in which the stores are built was covered first with $1\frac{1}{4}$-inch rough boards. On these were laid transversely $4\frac{1}{2}$-inch by 3-inch bearers at 21-inch centres, between which well-dried wood charcoal was packed as filling. Finally, $2\frac{1}{2}$-inch tongued and grooved flooring was nailed to the bearers to ensure great stiffness. In the writer's opinion the thickness of this insulation is inadequate, but, owing to the heavy flooring boards and broad joists great strength is obtained, and heavy loads may be handled with impunity.

In up-to-date meat stores all trouble about great floor strength is superfluous, as the handling of the carcases, sides and quarters is effected entirely by overhead runways, switches and running wheel hooks. The strength of the ceiling is then of more importance, and the construction in this case, with the arrangement of the tracking, will be fully described in its place.

There is yet another kind of floor, which is used where liquids are liable to be spilt inside the store, or where frequent cleansing must be effected. Timber is unsuitable for this purpose, as the continued dampness would set up decomposition, and we must therefore resort to concrete. Concrete by itself is to a certain extent porous. Hence a layer of pitch, bitumen, or asphalte is set underneath, and the insulating efficiency is brought up to the proper standard by a substantial thickness of engine ashes. This arrangement is illustrated in fig. 26, where the hollow dwarf wall, which, with this type of construction, should always be carried round the sides, is also shown. From the top of the dwarf wall upwards insulation is carried out in the ordinary way, but as the timber work in connection therewith is well clear of the parts where splashing, &c., takes place, no danger of dampness need be feared. For the best results the dwarf walls should be built of Staffordshire bricks, and all joints made of good cement instead of mortar.

Outer Walls.—The majority of existing cold stores are built of brick, the insulation being affixed as an inside lining, although latterly, in buildings of any size, reinforced concrete has come more into favour. But, in the writer's opinion, the best outer wall possible is that made from hollow concrete blocks, reinforced at intervals by iron stanchions to carry the wall plate. Walls of this type are not only excellent aids to the insulation proper, owing to the dead air-spaces inside the concrete, but are also far less expensive than might be thought. In fact, a building of this type is considerably cheaper than one built of ordinary bricks. The finished appearance is decidedly handsome, and the whole effect is of a solid well-built structure.

Whatever form of outer wall be adopted, it is always an improvement to paint it both inside and out. Both coatings should be air-proof, and that on the outside should in addition be capable of resisting the action of inclement weather. For this purpose whitewash will be found to be cheap and suitable, and, according to Mr. Williams, can be rendered weather-proof by mixing 50 lbs. of salt to every 40 gallons of the liquid. Another formula, due to the same authority, is to mix six parts of lime in warm water to the required strength, add three parts of salt when solution has taken place, and, just before use, mix in one pint of Portland cement. For the inside coating bitumastic tar or paint does admirably.

Partitions.—The divisions between the neighbouring cold stores, provided the difference in temperature is not very great, need not be so thickly insulated as the walls. In most cases four inches of filling material, with corresponding studding, and $\frac{3}{4}$-inch T. G. and V. matching on either side, will be found to be ample.

Where there are two stores one above the other the same rule applies theoretically, but in practice the ceiling joists must be sufficiently deep for the necessary strength. In some stores these will be 6 inches by 3 inches, in others 9 inches by 2 inches, or even 9 inches by 3 inches, depending, of course, on the load, span and distribution. In any case only four inches of filling need be used, the remainder of the ceiling depth being left as an air-space. The filling is simply laid in, and no trouble need be taken to sheet it down.

General Arrangement.—In arranging cold stores, there are several points which deserve attention. It is important, for instance, that the shape of the whole insulated space should approximate to a perfect cube, as the radiating surface for a given volume is then at its minimum. Unfortunately, this is an ideal which in practice is seldom attained. With very small stores there is, of course, no difficulty, but in larger buildings, unless there are two or more storeys, the height necessary would be impracticable. The next best arrangement is to make the plan view of the insulated rooms a perfect square, and this can often quite easily be done. The height can then be adjusted to the particular requirements in view.

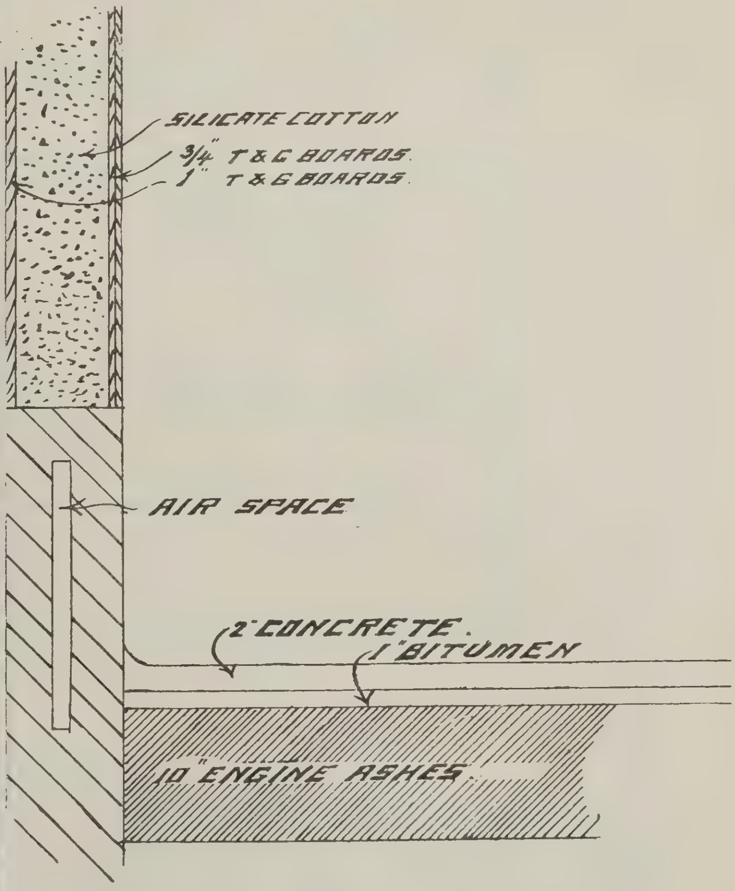

Fig. 26.

In many cases lately the cooling machinery has been erected in a separate building. This is an excellent idea, and makes an arrangement much superior to that ordinarily adopted. Should it be impossible, however, care should be taken that the machinery is always to the south and the cold rooms to the north of the building (if the plant, that is to say, is located in the northern hemisphere). Similarly, if the machinery is in a separate building, the rooms, where the lowest temperature is to be maintained, should always be situated to the northwards, and the southerly aspect given to those where higher temperatures will prevail.

Our ideal, then, of a cold store is a thickly insulated cube, divided into compartments by thinner partitions and floors, and having near it a smaller building containing the refrigerating plant. Usually this theoretically perfect arrangement is unattainable, chiefly owing to difficulties connected with the site; but it can always be, and has frequently been, closely approximated to by careful designers.

Air Locks.—The space inside the cube or square should not be entirely devoted to rooms. Part of it should be used to form a corridor or air lock. The idea of this is to save the great leakage of cold air which is caused by opening a door direct from the store to the outer air. Instead, the door from the store is made to open into an intermediate space or lock, and, being closed, another door is then opened from the lock to the atmosphere. In this way leakage is much reduced.

This arrangement is shown in figs. 27 and 28. Fig. 27 shows two cold rooms, total capacity 10,000 cubic feet, which were designed to suit a curious circular building already in existence. The plan view of the rooms, as will be seen, bears very little resemblance to a square, and their general shape bears still less to a cube. The plan, however, has been brought as near to the former as the design of the existing building would permit.

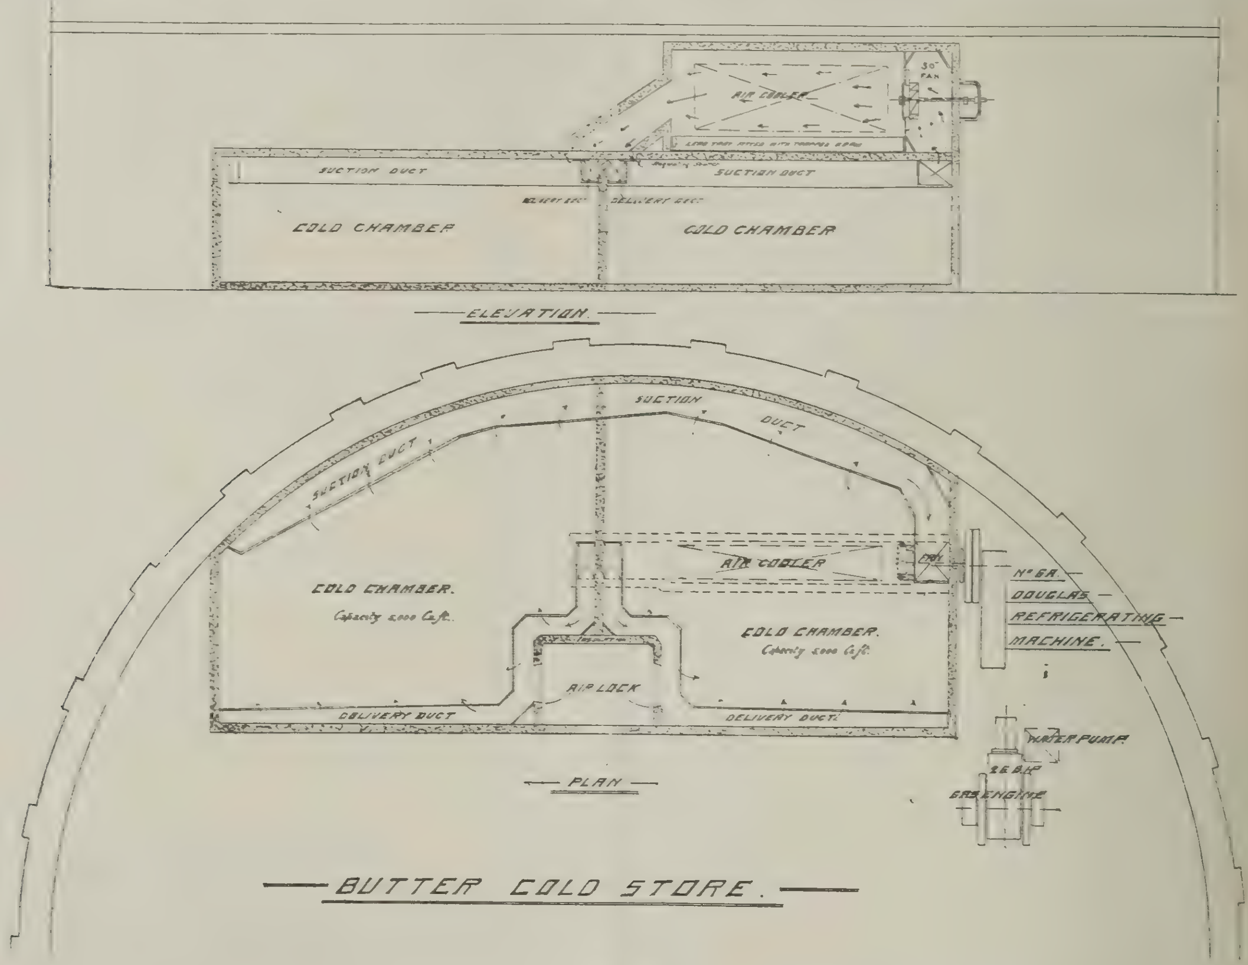

Fig. 27.

The air lock, with its three doors, is seen in front. One door is provided for each room and one at the entrance to the lock, and, from inspection, the method of manipulation when entering a given chamber will easily be followed. A man bringing in goods first lets himself into the air lock, then shuts the outer door behind him, and finally opens the door leading to the room in which he must deposit the goods. On coming out his actions would be exactly reversed.

The cooling in this case is effected by a separate air-cooler on the direct expansion principle, which is placed in a well insulated chamber on the roof of the stores. Insulated passages communicate from it to each room, where they are continued as cased-in ducts, formed of T. and G. boarding nailed on suitable runners. The air is circulated through the ducts and passages by a fan, and the amount which enters or leaves a room at a given spot is regulated by teak slides. The air cooler itself is connected directly to the horizontal compressor seen on the right-hand side, which is driven by a gas engine. Its condenser, of the atmospheric type, is not shown.

In fig. 28 the air lock is extended to serve four separate rooms, and might more properly be termed a corridor. It has now five doors. Cooling here is effected by direct expansion air-coolers in the left-hand rooms and by direct expansion pipes in those to the right. In the first case the coolers are partitioned off, and air is distributed to all parts of the rooms by ducts, through which it is blown by fans. Connection in all cases is made direct to the horizontal compressor seen on the left, and each room, by means of suitable valves in the piping, can be independently controlled. A gas engine drives the fans and the compressor, and for the latter a condenser of the submerged variety is provided.

Doors.—The most important fittings in a cold store are the doors. It is very essential that these should be carefully constructed, and that at the same time, when closed, they should be absolutely air-tight. No difficulty should be experienced in either opening or closing, as both operations must be quickly done, and the door, although heavy, must always swing freely on its hinges.

The door is heavy because it is always made to the same thickness as the walls, and if these are insulated with silicate cotton its weight on the hinges will average, for ordinary sizes, some 2½ cwt. To meet the extra stresses, the hinges must always be of very heavy construction and have spherical joints. In extreme cases, if the door, for example, is four feet wide in the clear, part of the weight should be taken on a caster, moving over a metal quadrant, which is fixed to the floor. This will considerably ease the great stress on the sockets of the hinges.

To ensure tightness when closed the door is splayed, more bevel being given at the side opposite the hinges to allow of clearance when the door is swinging. Felt is also nailed round all the edges to form a joint, and pressure is applied by specially designed lever fasteners. Many forms of these are on the market, but perhaps the most useful are those shown in figs. 29 and 30. The construction cannot clearly be seen from the illustrations, but is really extremely compact. The fastener proper is simply made to slide over a wedge, and as it nears the raised part of the said wedge forces the door hard against the framing. Immense force is obtained owing to the shape of the wedge, and no fear need be entertained of air escaping.

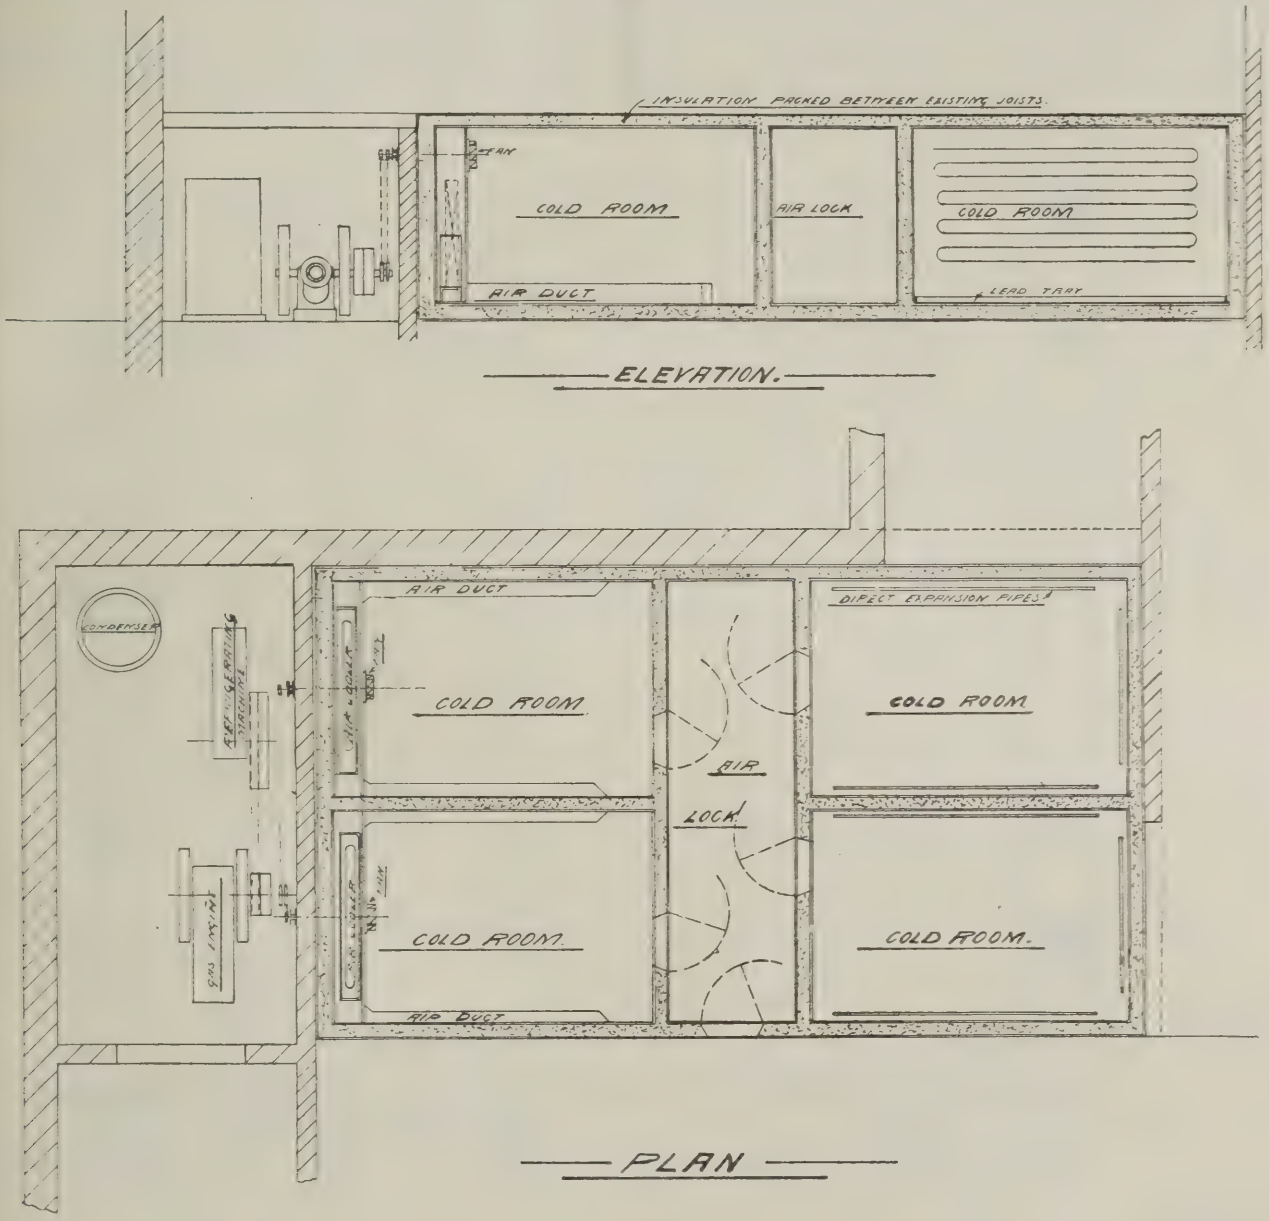
Fig. 29 shows a double door, 7 feet wide in the clear, such as has to be used if goods must be wheeled into the stores on trucks or vans. This particular door was designed for a bacon factory. Special note should be taken of the arrangement adopted in obtaining the correct bevel on each half. By closing first one of the halves and then the other three air-tight joints are made.

It is very often necessary to take a track bar right into the chill room. This is found in a large number of meat stores, in all bacon factories, and in all abattoirs. Wheel hooks run on the bar, and from these are hung the carcases, sides, or quarters, as the case may be. Naturally complications must always ensue when we come to a door, but many devices have been invented to surmount the difficulties. One of the best of these is shown above the door in fig. 30. The door opens below the bar, and two slides are then shot back, one on either side of the runway. Easy admission is thus obtained. When all the loaded wheel hooks have entered the door is shut, and the closing of the slides checks most of the leakage of air. At the same time there is bound to be a certain amount of loss, as there can be no insulation immediately round the bar.

The problem of the loss due to exit and entry of cold stores has always been quite a serious one. There is no doubt that the leakage of heat into the rooms where there is much traffic is very considerable, and well worth saving if possible. One simple way of partially effecting this, in small stores, is to build them in a basement, which can quite conveniently be done in the case of a shop, for instance. Entry is then obtained through a trap-door in the roof, and only the heated air at the top is allowed to escape. This arrangement, however, is unsuitable for large stores, as the handling of the goods is rendered by far too complicated. We must then devise other means.

Sometimes door checks or buffers, such as those made by Messrs. Nettlefold or by Messrs. Newman, have been tried; but as a general rule, owing to the very great weight of the insulated door, have been found to be unsuitable. Springs can be used, however, by fixing inside the door proper a pair of light flaps. These are hinged to a simple frame, which carries them at about four inches from the inside of the door, and the hinges are of the spring variety, many of which are on the market. The flaps then always tend to come to the closed condition, no matter in which direction they are opened, and a man with, say, a quarter of beef on his shoulder simply pushes through them.

This scheme is effective and reduces the loss considerably, but is far from perfect, as the flaps cannot be insulated. The nearest approach to perfection we can obtain is the arrangement which involves the greatest trouble in practice—namely, the air lock. There is no doubt that by its use a great saving is effected, where many deposits and removals of goods are frequently made. At the same time, as the traffic through the lock increases so does the inconvenience of working it.



ELEVATION.

PLAN

Fig. 28.

---

The Bournemouth Town Council have decided on the erection of a central library on the vacant portion of the site at Lansdowne purchased in connection with the scheme for the Central Art and Technical School. The expenditure is estimated at 7,000*l*. The borough surveyor has prepared a sketch, plans and estimates for the construction of the continuation of the Undercliff drive to Boscombe Pier.

## TOWN PLANNING IN GREATER LONDON.*

For the London County Council area the London County Council is the statutory authority, as will be seen from the following part of Sub-section (3) of Section 55 of the Act:—

"Provided that, except with the consent of the London County Council, no other local authority shall, as respects any land in the County of London, prepare or be responsible for enforcing the observance of a town planning scheme under this part of this Act, or for the execution of any works which under the scheme or this part of this Act are to be executed by a local authority."

For those areas beyond the London County Council area the Councils of any borough or urban or rural district are the statutory authorities.

For the area comprised within a fifteen mile radius of Charing Cross the town planning authorities are therefore the London County Council and the various borough, urban district and rural district councils named in the notice convening the conference.

With the permission of the Local Government Board a local authority may prepare a town plan dealing not only with the land within its area, but beyond such area and within the area of another local authority.

Town planning in Greater London is so obviously a matter for joint action that the following paragraph of Sub-section (3) of Section 55 may be given in full:—

"Where land included in a town planning scheme is in the area of more than one local authority, or is in the area of a local authority by whom the scheme was not prepared, the responsible authority may be one of those local authorities, or for certain purposes of the scheme one local authority, and for certain purposes another local authority, or a joint body constituted specially for the purpose by the scheme, and all necessary provisions may be made by the scheme for constituting the joint body and giving them the necessary powers and duties."

A joint body undertaking the preparation of a plan for Greater London may thus be composed of all the local authorities possessing statutory town planning powers in the area dealt with in the plan.

Town plans may be made by town planning authorities as defined above, as respects any land which appears likely to be used for building purposes within their areas.

In the House of Commons Committee stage attention was drawn to the fact that in the event of a narrow interpretation being given to the words "in course of development," or to the words "likely to be used for building purposes," the town planning scheme would be limited to areas of land actually "ripe for building," and the greater part of the value of a town planning scheme would thus be lost.

The President of the Local Government Board urged, in reply, that the words used instead of limiting the scope of a scheme would have the opposite effect, especially as the Local Government Board take power to authorise the preparation of such a scheme with reference to any land within or in the neighbourhood of the area of a local authority.

It may be added that in Germany the practical inter-

[From *Berliner Architekturwelt.*

STABLES, &c., OF THE VILLA LEMM.—Herr MAX WERNER, Architect.

pretation of the Town Planning Act, 1875, in regard to the scope of a town planning scheme, has been to regard land likely to be used for housing and similar purposes during the next thirty years as coming within the scope of a scheme.

The following definition of "land likely to be used for building purposes" is given in the Act (Section 54, Subsection 7):—

"The expression 'land likely to be used for building purposes' shall include any land likely to be used as or for the purpose of providing open spaces, roads, streets, parks, pleasure or recreation grounds, or for the purpose of executing any work upon or under the land incidental to a town planning scheme, whether in the nature of a building work or not, and the decision of the Local Government Board, whether land is likely to be used for building purposes or not, shall be final."

The procedure to be followed in the preparation of such town plans has been thus outlined by the President of the Local Government Board, Mr. John Burns:—

(*a*) The placing by a local authority of a prima-facie case for the preparation of a town plan before the Local Government Board.

(*b*) The holding of a preliminary inquiry concerning the need for action.

(*c*) The authorisation of the local authority to prepare a detailed plan; the issue of provisions relating to co-operation on the part of the local authority with the owners and other persons interested in the land, and the formation if necessary of a joint body of local authorities where the land to be planned is in the area of more than one local authority.

(*d*) The holding of a local and public inquiry to fully consider the plan when prepared; and

(*e*) The formal authorisation and publication of the plan which will then be in operation until superseded by another plan.

The Local Government Board are about to issue, under Section 56 of the Act, regulations governing the procedure to be adopted with respect to applications for authority to prepare or adopt a town planning scheme.

When a town plan has been prepared and adopted and all the various stages have been passed through, the definite lines of ordered growth should have been clearly laid down for the area which has been made the subject of the town plan.

These lines of growth include:—

(1) The limitation of the number of houses per acre.

Speaking in the House of Lords on behalf of the Government, Earl Crewe described this power to restrict the number of houses per acre as one of great value, and the President of the Local Government Board has also stated that this power is one of the most vital of the new powers contained in the Act.

This restriction is not to be made the subject of compensation by the local authority, for under Section 59 (Sub-section 2) it is provided that:—

"Property shall not be deemed injuriously affected by reason of any provisions inserted in a town planning scheme, which, with a view to securing the amenity of the area included in the scheme, or any part thereof, prescribe the space about buildings, or limit the number of buildings to be erected or prescribe the height or character of buildings, and which the Local Government Board, having regard to the nature and situation of the land affected by the provisions, consider reasonable for the purpose."

(2) The planning of the main arteries and subsidiary roads, the provision of open spaces—private and public—the preservation of objects of historical interest or natural beauty, &c.

The object of a town plan in this respect is thus defined (Section 54, Sub-section 1):—"The general object of securing proper sanitary conditions, amenity, and convenience in connection with the laying-out and use of land, and of any neighbouring lands."

When once these main arteries, roads, open spaces, &c., have been defined in a town plan all developments in the estates included in the plan must be along these lines. Hitherto so long as roads have been not less than a minimum width, and have conformed to certain conditions as to access to adjoining roads, authorities have been powerless to shape the development of their areas. With the adoption of a town plan this helplessness of authorities will cease and all developments must take place on the ordered lines laid down in the town plan.

For the purposes of a town planning scheme any existing bye-laws may be suspended. Under Sub-section (2) of Section 55 the Local Government Board are, for the purpose of a town planning scheme, given power to suspend so far as is necessary for the purpose of carrying out the scheme, any bye-laws relating to width of road, character, and method of roadmaking, &c., governing the present methods of dealing with the areas concerned. This power is of extremely great

THE VILLA LEMM, AT GATOW.—Herr Max Werner, Architect.

importance and will enable local authorities, whilst requiring greater garden space about dwellings, and more open spaces, to relax conditions as to road-making, and thus render possible valuable economies in estate development.

## AN ARCHITECTURAL WALK FROM WESTMINSTER TO CHARING CROSS.

By Percy Fitzgerald, M.A.

(*Concluded from page* 264.)

It is curious that the great work of Inigo Jones—the Banqueting Hall—seems scarcely to impress as much as we might expect. It has even an uninteresting look, and the details seem a little coarse. I believe this effect is owing to its being a mere fragment, for it was intended to have run for a long way down the street in the same style, thus making a great, long façade. The result is the details are over-emphasised and magnified. The addition made by the United Service Institution has a feeble air. It was, indeed, stipulated that it should not attempt to simulate the style of the great building, but it might have harmonised without imitating. I suppose there is not in the front a single stone of Inigo's original building—which must have been renewed once or twice. It is a fact that the whole of the outside of King Henry VII.'s Chapel has been thus renewed three times. Hollar's plate of Charles I.'s execution, with its view of Whitehall Palace, does not at all correspond with its present aspect.

One of the most curious prodigies is an equestrian statue of the Duke of Cambridge set down in the middle of a narrow street, leaving hardly room for the traffic to pass by it. Utterly unknown in London seems the rule that a statue should be the centre of something—should be approached—and have a demesne of its own. Here it is "squeezed in" as it were.

On the new War Office, that Temple of Many Columns, there will be noticed a spreading porch with a door in the centre. It really seems an afterthought and as if fitted of a sudden on to the rest. One might be all but certain that when the building was completed with an unobtrusive doorway the Powers that be came along:—"Here must be a porch with a porter's lodge and side office." And so it was supplied. But it is in a different style and does not match. The reason may have been that the architect was dead and someone else gave a design of his own. When both the architects had died the supreme officials refused to appoint others, declaring that they had clerks of talent in the office quite able to carry out the designs, and so they did.

At the bottom of a little lane hard by to Cox's Bank there is an old Charles II. or Williamite mansion, a fine old-fashioned house that has been unaccountably preserved. How strange to think that many of us have walked past Northumberland House and its lion, with its fair gardens and fine quadrangle—500,000*l*. was the price. The interest of this sum was 25,000*l*. a year. A single house built on the ground—the Grand Hotel—was charged at 10,000*l*. a year rent. So it was really a good bargain for the purchasers.

One of the best statues in London—that of Sidney Herbert, by Foley—used to give pleasure in Pall Mall. It is now in a "back square" of the War Office and is practically lost. This presses hardly on the reputation of a really notable man—thousands had grown acquainted with him through passing him every day, and something of his character was learned from this amiable and tranquil presentment. Of a sudden comes this demolition of all things in Pall Mall, and lo! he is swept out of existence and will never be seen again.

That noble Thane, "the bold Buccleuch," who had to fight for his spoliated access to the Thames had actually, through lack of space, to place his stabling, coach-houses, and offices right in front of his pseudo-Gallic castle. This seems to furnish painful, disagreeable associations; but there they are. They form the "arms" of the enclosure in front, like Bernini's arcade before St. Peter's. Possibly this side of the château is intended for the rear, the front may be to the river.

I well recall among other lost relics of London an old tattered group of buildings which stood about here, and which could be identified as one of Sir John Vanbrugh's works—the "Goose pie" it was called. I used to pass it with great interest, but nobody noticed it, or cared for it, or indeed knew of it. But in truth this is the "coming down" age. I can look back to a time when everything was standing and no one cared to pull down anything. I used to pass the old Tabard

Inn in the Borough and the White Hart, with its Pickwick memories, also a wonderful old inn near Stationers' Hall, a palace somewhere, Sion College, Christ's Hospital, &c. There were the Bishop of Winchester's Palace and old inns galore. Now everything is being cleared away, and greedy eyes are upon the Charter House even.

Who could credit nowadays that the colonnade in front of the old Admiralty was once considered a chef-d'œuvre of the Brothers Adam? It has been engraved in very costly style over and over again. I call it colonnade, though it now does not seem like one. It was intended to screen the hideous building behind it, but it met with truly barbarous treatment, which accounts for its present degradation. It occurred to some Sea Lords when they were giving their receptions that it would be a great convenience if there were several entrances for the carriages, and they proceeded to make them. In its original form the screen was a graceful elegant thing—a row of columns through which the courtyard was seen with a charming portal in the centre. The Sea Lords knocked out and carried away a column on each side and thus opened two fresh entrances—they also ran a wall behind the columns to hide the court!

For the student the whole of Parliament Street offers an interesting subject. There are so many contrasted specimens. We can even study the old French pattern of the high steep roofs and the two wings and many windows, for we pass the Duke of Buccleuch's palace, which, by the way, has supplied a sort of keynote for many buildings behind and near it. The Government office at the corner was the work of the Scotch Mr. Brydon, who was a favourite architect at Bath, and whose style is somewhat reminiscent of that city and of the scenic woods. But the Caledonian nature prevailed, though it did not mate well with the picturesque architect who drew some of his inspiration from Robert Adam. He made an addition to one of Wood's buildings, the town hall at Bath, copying strictly all details, measurements, &c., and yet strange to say, the graceful refined touch could not be reproduced.

The War Office when it made its first appearance seemed very ungainly with its extravagant corner towers, but now that it has been duly "weathered" and the fierce new glare toned down, it has become very tolerable, and fills its place respectably.

One can always admire the robust, honest and plain spoken style of the Horse Guards. For here is the very good sense of architecture; and how pleasantly varied and broken up is the design. There is a healthiness about it, but also an absence of grace. But one day a couple of "storeys" is sure to be added.

Just touching the old and hideous Admiralty, whose four giant columns are said to be out of all proportion, is a well-grimed venerable dwelling house, yet its disfigured grace and beautiful proportion should be noted. It is Adam's work whose exquisite sense of proportion is ever instructive. He "laid out" the front of his house so that it could not be bettered. This will soon disappear.

The architect of to-day would find genuine entertainment in contrasting the different shifting styles to be found in Victoria Street. He can be even taken back to the early Victorian days when the traditions of Nash were still preserved, and he was thought Classical. This is shown in the Westminster Palace Hotel, and the long strip of mansions that face it. The strange double line of balls meant as ornamental are truly curious and prehistoric.

Victoria Street, now some fifty years old, offers a curious and suggestive mixture of treatment. It is curious to compare the different styles. The Palace Hotel and the buildings facing it seem after Nash. Then there is the Albert Mansions, rather rich Palladian; and abundance of terra-cotta treatment. The fine massive stone block facing Strutton Ground, the strange Army and Navy Stores, and the profuse "compo" then all but universal. Where do we see "compo" now? In those old days real "compo" was indispensable. It was thought indecent to display the naked brick. Now brick and terra-cotta are quite out of fashion. We are tired of it; stone is the correct material.

Trafalgar Square has been always spoken of as the finest site in Europe—a strange illusion. But whether this be so or not, there can be no doubt it could have been treated far more artistically. Everything seems astray; the great Nelson Column with its spreading base and lions covers too much ground, dwarfs it, and has not room to display itself. The basins are far too large for the site, and the fountains are not large enough for the basins. Were the latter of half the size and made level with the ground the Square would seem much more spacious, and were a flight of steps made to descend from the National Gallery, and the balustrade removed, a fine prospect would be gained. The poor National Gallery has been a stock subject for ridicule for years with its dome and pepper casters; yet, judged impartially, it is a really Classical bit of work, even of a scholarly kind. Let anyone stand opposite the United Service Club by Graves's shop and look along towards the Gallery, he will see and admit this truth. It will then appear as a fine perspective of Grecian work. Even the front view from Parliament Street has a sort of commanding dignity. The dome, though bare and unadorned, offers a plain business-like aspect. This left wing has been oddly bent back by stages, the first block next the portico being so much, the next so much more. The effect is painful to the nice eye. Poor Wilkins, as is well known, was given by a Board of Works of his day a batch of Corinthian columns which he was directed to fit into his building, rather than make his building fit them. And so he did with good effect. But he had serious trouble and vexations, for the line of his building ran straight to join the line leading to Charing Cross beside the outside wall of St. Martin's Church. The side of the Gallery therefore faced the portico, and the church would be hidden away, being put in a side street as it were. A perfect storm and clamour arose. The poor architect was called ignorant and incompetent, and so the extraordinary step was adopted of bending back the wing so as to leave clear the portico of the church, which was thus brought into the Square. The sloping roads from the terrace are very ugly. The descent is indeed so slight that one might speculate whether a good effect could not have been obtained by not altering the level of the Square. The asphalted area encroached on by the basins is further diminished by the unnecessary row of massive posts set down in a long line, and thus cutting off a substantial portion. The idea, I suppose, was to show that the latter belonged strictly to the street.

In Trafalgar Square are some wondrous specimens of the statuary art. Here is illustrated the heavily official doctrine that statues may be put wherever there is sufficient space to carry them, and be grouped conveniently together as a family party. Here are two extraordinary warriors standing in line. No regard to the different scales is considered. For a little behind is shown Gordon's rather graceful image; in size he might be considered a boy, as compared with the others. But the horse in Chantrey's George IV. is well worth study, for it has an air of life and proper anatomy; we at once recognise the presence of a true artist. What shall be said of Landseer's lions? Clever sketches certainly, but sketches do not do in works of such a size.

The eye ranging along the roofs of the National Gallery will be arrested by various projections and intrusions which certainly show architectural wantonness. One of these is a sort of lantern, such as is seen at the top of a campanile, and wholly Italian in character, and discordant with the pure Greek façade below. This it seems is one of the decorative ornaments of the new portion of the Gallery within. It might have been omitted for the present, being quite open and serving no purpose. There is also an ugly bell covering which projects obtrusively, a sort of glass dome for one of the new chambers below.

## COMPETITION.

THE competition opened by a committee of glazed brick manufacturers produced several designs of considerable merit. None, however, displayed such a combination of artistic quality with practical suitability to the material as, in the opinion of Mr. Max Clarke, F.R.I.B.A., the assessor appointed by the President of the Royal Institute of British Architects, would justify the award of the first premium to any individual designer. Several of the essays submitted have also been admirable, but in no case did a set of drawings and the essay sent with it attain anything like corresponding excellence. The assessor has awarded prizes as follows:—50 guineas to John Greaves and L. MacDonald Gill, 16 Old Buildings, Lincoln's Inn, W.C.; 50 guineas to Alexander Peacock, Elmswell, Longton Bridge, Preston; 25 guineas to F. Van Baars, 5 Clive Road, Colliers Wood, Surrey; and two guineas to each of the following:—A. Troyte Griffiths, The Priory Gateway, Malvern; J. M. W. Halloy and H. A. McQueen, 55 Lincoln's Inn Fields, W.C.; J. Algernon Hallam, 18 St. Mark's Crescent, Regent's Park; W. Henry Jowett, 38 North Road, Highgate, N.; and Leonard W. Tracey, 49 Rann Street, Ladywood, Birmingham. The glazed brick manufacturers intend to circulate from time to time reproductions of the drawings and also selections from the various essays.

THE Knaresborough education committee advise the County Council to erect a new school to accommodate 200 scholars in place of the condemned Council school.

## FORTHCOMING EVENTS.

*Monday, May 30.*

Royal Institute of British Architects : President's "At Home."

*Wednesday, June 1.*

Royal Society of Arts : Paper on "The Restoration and Discoveries at the Guildhall, London," by Mr. Sydney Perks, F.R.I.B.A., F.S.A., City Surveyor.

Royal Archæological Institute : Paper on "Excavations at Tortington Priory, Sussex," by Mr. P. M. Johnston, F.S.A., F.R.I.B.A.

Carpenters' Hall : Exhibition of Works in Wood and Wood Carving. Exhibition closes on June 11.

*Thursday, June 2.*

Edinburgh Architectural Association : Annual Excursion, Floors Castle and Kelso Abbey.

*Monday, June 6.*

Royal Institute of British Architects : Business Meeting ; Annual Elections.

Society of Engineers : Paper on "The Inspection and Testing of Engineering Materials and Machinery," by Mr. C. V. Biggs.

## SOME WEST COUNTRY SANDSTONES.

FOREST OF DEAN and Blue Pennant are names known to a good many architects from their early studentship days, but possibly few realise what these names imply. Blue Pennant, for example, is only one variety of what is more correctly known as Bristol Pennant, the quarries for Pennant stone being situated on the immediate outskirts of the city of Bristol.

Although the bulk of the Pennant stone is a beautiful even grey-blue in colour, and in consequence has been largely used for altar and chancel steps in the interior of churches, it is pre-eminently a hard-wearing and weather-resisting stone, and possesses with equal durability to granite the great advantage of never becoming slippery in wear by reason of its fine grain and uniformity of composition.

The blue colour, although predominant, is not universal. There is a pink variety, locally known as Red Pennant, which is even harder than the blue and like it even in tint and fine in grain. Then there are occasional mixtures of colour and gradations between blue and red, particularly in the Huckford quarry at Winterbourne.

Whilst the Pennant quarries afford stones of any reasonable size, and "scantling lengths," so valuable for steps and landings, are readily obtainable, there are naturally many stones produced which do not come up to the quarryman's ideal and hence are contemptuously styled "shoddies." But there is nothing shoddy about them from either a constructional or artistic point of view. They may be too small or too much varied in colour—a blemish in the eyes of the quarryman—to serve as steps, but they are just the thing for building walls when texture is desired.

Another charming red stone obtained from near Bristol is that known as Red Wilderness, quarried exclusively at Mitcheldean. It is a wonderful and fearsome sight to see the quarrymen here at work. By some vast upheaval the original strata of deposition have been tilted up till they run at an angle of some 40° or 45°, and whilst getting the stone or clearing away the rubbish or débris—"ridding," as it is called—the men have to be held up by ropes, as if they were working on the roof of a house.

The stone thus obtained is of a brighter and more pleasant colour than other red stones in the country that approach it in fineness of texture, whilst those that may rank with it in colour are for the most part coarse-grained or soft. In durability Red Wilderness stone is unsurpassed by any other red stone, and its hardness and fine grain fit it for use in steps and paving, although it is rather as a building stone that its beauty of appearance leads one to desire to use it for dressings or for walling either with a rubbed or hammer-dressed face. As with other sandstones, though large blocks are readily obtained, there are also thinner beds and smaller stones which produce the so-called "shoddies" so useful and admirable for walling.

Still in Gloucestershire we have the Forest of Dean, that weird and wild expanse of country which in Nelson's time was planted with oak trees so that material might not be lacking for the future supply of the wooden walls of old England. The timber has grown to maturity, but the wooden walls are superseded. The Forest of Dean is still a forest, but its economic value is rather as a store-house of stone and coal than of timber. For in the Forest of Dean the sandstones that are used for building lie immediately above the coal-beds, and a worked-out quarry becomes a coal mine.

Forest of Dean stone has had a high reputation for very many years, more particularly the blue variety, inasmuch as reliable stones with a distinctly blue tint are not numerous. The popularity of blue Forest of Dean stone has rather overshadowed the merits of the lighter or warm grey-coloured stone, which has also to stand in competition with many other sandstones of similar colour in other parts of the kingdom.

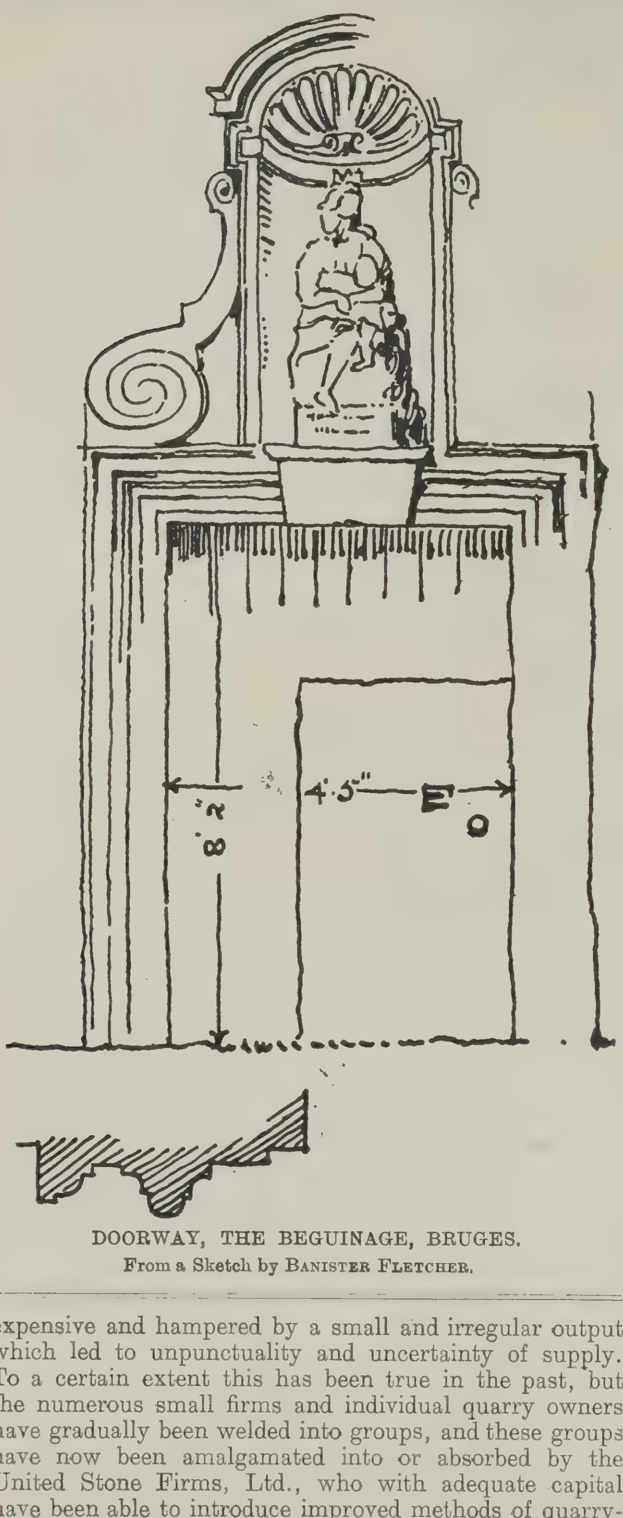
This grey stone from the Forest of Dean is, however, able to hold its own as regards quality with any other sandstone of similar character, strong and durable, very fine in grain, and remarkably uniform in texture and colour, the latter of which it retains well.

The strength and reliability of Forest of Dean stone is proved by its successful use for engineering work, particularly for engine-bed blocks, in which uniformity and freedom from hidden faults is a primary essential.

The blue stone from the Forest of Dean is easier to work than Blue Pennant, and hence the popularity it has attained, for combined with this good point it nevertheless weathers well and keeps its colour, which is rather brighter than that of Blue Pennant. In this latter, by the way, we personally prefer the effect of a rubbed surface, which, to our mind, brings out the depth of colour in the stone without accentuation of the sombre effect to be seen in a hammer-dressed face.

Some of the blue beds in the Forest of Dean are harder than others, and these are especially suitable and frequently used for staircases and landings, where good-wearing qualities without slipperiness are desirable.

We have thus in the West of England a remarkable group of excellent sandstones whose merits as stone have indeed been admitted and recognised for generations, but which, as far as our experience goes, have not been very generally used by architects, from a feeling that they were



DOORWAY, THE BEGUINAGE, BRUGES.
From a Sketch by Banister Fletcher.

expensive and hampered by a small and irregular output which led to unpunctuality and uncertainty of supply. To a certain extent this has been true in the past, but the numerous small firms and individual quarry owners have gradually been welded into groups, and these groups have now been amalgamated into or absorbed by the United Stone Firms, Ltd., who with adequate capital have been able to introduce improved methods of quarrying, the most efficient machinery for working, and a well-organised system of delivery.

The stones of which we have been speaking are all obtained from open quarries, not mines, which means that powerful cranes and engines can be advantageously employed in getting the stone. This is one point in which a strongly capitalised company has a great advantage over the small man who is owner of a single quarry. There is a reduction of cost in the primary business of getting the stone.

Again, the resources of a single quarry in the supply of a particular size or quality of stone are limited, and in the past one frequently had to wait because the stone wanted was not immediately available. With a company owning a large number of quarries this difficulty is removed. Then the wealthy company can keep the best machinery and workmen always ready for working the stone. And here we may strongly urge as a feature of these West Country stones the advantages of quarry-worked material. The cost of carriage is lessened, the stone is worked by masons who know its peculiarities,
there is less temptation to use unsound or unsuitab
blocks. The objection to possible damage in transit
obviated by the employment of men who do nothing el
but pack stone and are experts at the business.

The net result of the amalgamation of ownership
numerous quarries and works by the United Stone Firm
Ltd., is that some of the most excellent building ston
in the kingdom can now be supplied with promptitu
and certainty at lower cost than that of inferior stone
which have successfully competed with and kept the
out of the market in the past.

## NOTES AND COMMENTS.

Some feeling seems to have arisen at Liverpool becau
the name of Lady Chapel has been applied to the si
chapel which is the first portion of Liverpool Cathedr
to be built, and which, it is expected, will shortly be co
secrated and used for service. Strictly speaking,
course, there is no such thing in a modern Anglic
cathedral as a "Lady Chapel," but everyone who h
studied our ancient large churches has become so accu-
tomed to the term that it is often used loosely and witho
any such implied approval of doctrines and ritual that a
not now recognised in the Church of England as son
purists would seem to fear. One might as well obje
to the name "Minster" or "Abbey" being given to a
ecclesiastical edifice now used by the Church of Engla
because in that Church the monastic system is no long
in full vogue.

Southampton has for many years past been in urge
need of a real municipal building or town hall for t
accommodation of the numerous officials and their st
that the modern development of municipal services h
brought into being, and it is rather amusing to find th
a proposal to acquire freehold premises at the cost
6,300*l.* for the accommodation of the Tramways Depa
ment has been the occasion of a lengthy discussion by t
Town Council, in which it was urged that it was real
time for the town to consider the advisability of looki
into the question of the necessity or wisdom of erecti
municipal offices instead of renting more or less inco
venient offices in various parts of the town.

The value of the Board of Trade Labour Exchang
is difficult to assess from the figures that have been pu
lished. At the end of April there were 81,523 applic
tions on the register of persons unemployed, which, co
pared with 90,627 at the end of March, might be taken
show that there were fewer unemployed. But when
read that the total number of applications received duri
April was 116,523, and the number of vacancies filled w
23,858, it is possible that the hard fact that Labo
Exchanges cannot make work has impressed itself
the hearts of applicants, and that their lessened numb
is but the result of hopeless despair at the inability of t
Labour Exchanges to find employment for the thousan
whose services are not required because there is n
enough work to go round.

By the decision of Mr. Justice Parker in the case
the Hopton Wood Stone Firms, Ltd., *v.* Gething it
established that Hopton Wood is Hopton Wood wheth
it comes from the Hopton Wood quarry, Killer's quarr
or the Manystones quarry, and whether it is obtain
above the Toadstone or below it. The defendants are n
to be prevented from carrying on business under the sty
of the "New Hopton Stone and Marble Quarrying Co
pany" or from selling the particular brand of stone th
is so well known to architects as "Hopton stone"
"Hopton Wood stone," names of a particular kind
stone between which the learned Judge was unable to di
tinguish. Hopton Wood stone is of a character that
so peculiar to itself that it can hardly be mistaken for a
other stone, and it appears from the evidence given in t
case that this character is maintained by stone fro
several distinct quarries and does not at all depend up
the relation of the beds to the Toadstone.

The Town Council of Doncaster has, we think, acted wisely in rejecting a scheme for the Corporation to build houses themselves on the Marsh Gate land instead of selling in lots to suit purchasers for the erection of cottage houses or shops. It is rarely indeed that a municipal authority can develop a building estate successfully. Either the houses do not let or they can only be occupied at rents that throw a burden upon the rates.

---

The Annual Meeting of the Royal Archæological Institute will this year be held at Oxford from Tuesday, July 19, to Thursday, July 28. The preliminary programme includes, in addition to the various places of interest in Oxford itself, visits to Dorchester, Wallingford, Ewelme, Stanton Harcourt, Yarnton, Youlbury, Rycote, Thame, Iffley, Abingdon, Sutton Courtenay, Banbury, Broughton, Bloxham, Adderbury, Witney, Minster Lovell, Burford.

---

It is proposed that the Urban District Council of Hexham shall agree to purchase the beutifully-wooded and park-like grounds of Hexham Abbey from Lord Allendale at the price of 6,000*l.*, of which, subject to the approval of the Local Government Board, 5,500*l.* is to be raised as a loan by the Council and 500*l.* is to be sought from public subscription.

---

The Society of Antiquaries propose this summer to commence the excavation of Verulamium, which lies a short distance to the south-west of St. Albans. Verulamium is mentioned in a passage in the *Annals* of Tacitus as one of the Roman towns destroyed during the disorder that followed the sack of Colchester and the rout of the Ninth Legion, when "the barbarians, omitting to attack forts and garrisons, directed their attempts to whatever afforded ample booty to the spoiler and was difficult of preservation to those who guarded it." Further interest attaches to the site from the fact that it is supposed to be the "town of Cassivellaunus" mentioned by Cæsar. The walls of the restored Verulamium, which would appear to be as strong as those of Colchester (*i.e.* some ten feet thick), enclose a space of about 190 acres, and not only does the city appear to resemble Pompeii both in size and shape, but the dimensions of the theatres at the two places are almost exactly the same. The great Roman road running from London to Chester, now known as the Watling Street, traversed Verulamium from south to north.

---

A notable addition to the attractions that Florence holds out to the lover of architecture and other arts has been made in the opening of the restored Davanzati Palace, in the Via Porta Rossa. Built early in the fourteenth century by the Davizzi family, it at the close of the sixteenth century became the property of Bernardo Davanzati, a man of wealth, learning and ancient lineage. Like many other old Italian families, the Davanzati declined in wealth and influence, and came to an end with the suicide of the last representative, Carlo di Giuseppe. The house, already suffering from the poverty of its owners, fell into the abysm of a tenement dwelling. In 1904 Signor Volpi, the well-known art expert and dealer, bought the palace, and has since been steadily carrying out its rescue from desolation and restoration to a close approach to its former beauty. Frescoes and old woodwork have been brought to light, and Signor Volpi has furnished the palace again with unrestored furniture of its own date.

Cinder and coke breeze concrete is now somewhat out of favour, largely from the bad name given to it by German authorities as being prejudicial to steel. It is well, therefore, to know that its value as a fire-resistant is still to be credited. At Columbia University, U.S.A., the walls of huts prepared for fire-tests have been constructed of cinder concrete, and after repeated use for four-hour tests at 1,700° F. have remained in good condition except for surface damage from a 60-lb. nozzle pressure stream of water applied in each case when the walls were red-hot.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute was held on Monday, the 23rd inst., when Mr. Ernest George, A.R.A., the President, occupied the chair. The President at the commencement of the proceedings referred to the very great loss the Institute had sustained in the lamented death of their royal patron. The following address was then read by the Secretary:—

The Humble and Loyal Address of the Royal Institute of British Architects.

*To His Most Gracious Majesty the King.*

May it please Your Majesty.—We, your dutiful subjects, the President and Council, on behalf of the Members of the Royal Institute of British Architects, and of the Societies both in the United Kingdom and in the Dominions beyond the Seas in alliance therewith, beg leave humbly and respectfully to approach your Majesty, and to offer our deep and heartfelt sympathy in the loss your Majesty, the members of the Royal Family, and the Nation have sustained by the death of your Royal Father, our late Most Gracious Sovereign King Edward VII. His late revered Majesty encouraged with his Royal and generous patronage the art that is so dear to us, and we mourn with deepest sorrow not only, in common with the rest of the British Empire, our beloved Ruler, but also the gracious and beneficent Patron of the Royal Institute. We most respectfully and dutifully tender to your Majesty our sincere devotion and loyalty on your Accession to the Throne, and earnestly pray that the Almighty will grant your Majesty and your Royal Consort Queen Mary a long, happy, and glorious reign, during which the Nation may prosper, the arts flourish, and your Empire enjoy all the blessings of peace.

Given under the common seal of the Institute.

Mr. E. T. Hall said that in dealing with such a subject as that address it was difficult to say anything new having regard to the fact that during the past fortnight so much has been said with regard to his Gracious Majesty. But the Institute were in a special position and could strike a different note to that struck outside in that they were mourning the loss of their patron. There had been in the past, said Mr. Hall, many emperors and kings who were great patrons of the arts; but their demise had usually been received with equanimity by their own subjects and with joy by alien peoples. Whereas we have seen in the last few days the entire world pay homage to our great King. That alone will differentiate him from the other royal patrons of art. Another characteristic is that he never specialised in his treatment of any one of the arts. King Edward appealed to his peoples in a way that was absolutely unique because each individual and each community has been touched by the warmth of his personality. In the three minutes silence on Friday last when all traffic was suspended there was a more striking tribute than in the music from all the massed bands in the world. It was only left for them to express the deep sorrow felt at losing their great ruler, and, while doing this, to also tender their loyal devotion to His Majesty King George V. Under his wise guidance they looked forward to a day of great things for the art in which they all took so much interest. It was their prayer that His Majesty may be blessed with health and strength long to reign over them.

At Mr. Hall's suggestion the meeting rose and stood in silence. Mr. Ernest George announced that the Council had decided to postpone the Town Planning Conference and the date of their annual dinner.

Mr. Henry T. Hare, hon. secretary, announced the death of Mr. H. L. Fedden, F.R.I.B.A., and of Professor George Aitchison, R.A., elected Fellow 1862, vice-president 1889-93, and president 1896-9, Royal Gold Medallist 1898. They would, he said, all feel that they had lost in Mr. Aitchison one of their most distinguished presidents and a most distinguished architect. His tenure of the chair was marked by extreme ability and the greatest geniality. The Institute felt they had lost a very good friend. A vote of condolence was passed to the relatives of Mr. Aitchison.

Mr. E. A. Rickards, F.R.I.B.A., then read a paper entitled

### The Art of the Monument.

The word "monument" here stands for any sort of erection of a purely ornamental, commemorative, or even abstract purpose, as distinct from that of a utilitarian nature. In short, the art of the former is the art of expressing and imparting an idea; the latter that of embodying a definite and material purpose. In most cases of the former sort some presentment of the human figure is included; and it is the relation which the human element with its association of a practical and tangible world bears to the abstract with which the artist is concerned. It is this blend of the living idea with that of the serene or spiritual atmosphere which has given the successful examples their continued attraction, and the quality of immutability. Watteau and his school had this idea of a half-way world in their fêtes champêtres, and it has been kept alive by French painters until the present day. Mr. Sims likewise continually recalls this point of view with infinite suggestion to those interested in securing some element of freedom in the smaller monument. No better plea for the semi-realistic treatment of the smaller subject in the matter of a monument could be advanced than his picture in the Tate Gallery entitled "The Fountain." In the small gardens of Paris, which occur so frequently in some of the busiest neighbourhoods, and in the delightful creations of Vienna, the same note is struck.

The intimate nature of the smaller monument demands that it should be easy of approach, and yet have nothing of the vulgar display of the shop-window. Its subtle appeal should be heard above the din of the noisier world. The very quality of its realism necessitates a small oasis in which we can come to terms with it; and, besides, the ensemble of any small composition is neither to be observed in the crowd nor appreciated in the full glare of the open, where it is lost in space.

Public monuments should be allotted to positions prepared in advance. If they do not actually form an integral part of our buildings, at least they should be in the shadow of such as have that dignity and breadth that might enhance the more plastic art of sculpture. Moreover, the buildings would suggest material for the architectural portions of each monument, so that its harmony with immediate surroundings would be secured and a resultant scale of detail adopted in all its parts.

The time may not be so far distant when those who carry out work of a large and public character will be allowed some jurisdiction over those things which should really be necessary to the general or dominating composition; but the fact remains that once the building line is crossed this is very rarely allowed. Yet architects are more and more embodying sculpture, often as a literal advertisement of the purpose of the building itself, and in some cases the chance of including an almost detached monument or a series of monuments does occur. It would be taken advantage of much more frequently if architects had not such a cold and aloof attitude towards sculpture. The great display of this art on so many modern London buildings does not always show a real understanding of how to exploit it. Just as in a façade the design is scarcely or not at all affected if niches remain unadorned, so certain portions and spaces might be allowed for future possibilities in the way of accessory monuments or decorative features.

When the smaller monument which embodies a single figure is placed in such an atmosphere as a large park or garden or expanse, multiplication certainly enhances the value of each individual design. Some standardisation in the matter of the pedestal and accessory foundations, as in the Tuileries gardens (of course, with every variety of detail suitable to each separate case), would result in a great development of this art of exploiting and enhancing the work. The sculptor would then have something of a definite scale to which to attune his creation, and though free within limits, would be led, as were the Greeks, to a consistency of treatment of portrait figures which might lead to great perfection in style, or at least some parallel methods which might be commonly developed.

When the monument is of any considerable size and includes several figures, symbolical and otherwise, it becomes a question whether the effigy of the person commemorated should surmount the whole composition. The architectural details of the containing and supporting parts of this should bear some relation to the neighbouring architecture which dominates it; but this should be, like the sculpture itself, somewhat more delicate if more free in treatment than that which has to be merged into a larger mass of design and definitely linked to the continuous rhythm of a façade. This delicacy, or rather the smaller scale of its features, would allow of far more plasticity in blending the sculpture with the architectural lines; and it should be borne in mind that it is to be more intimately approached than the decorative features of a building of any size, if the literal message to be conveyed is to be apprehended.

With all this nearness of approach, the monument has still to be of very small proportions if the portrait figure is to dominate. Even with any accessories which it is possible to group with it, it is difficult to compose a mass of adequate weight to do this unless the scale is increased to coarse proportions. More legitimate means might be found to surmount the monument, perhaps by a graceful form of some
allegory or purely decorative feature, and the portrait figı
introduced rather as a salient feature, within the range
intimate approach, but not necessarily to be seen and rec
nised from any distant view.

Like any other branch of design, it is the experiment whi
keeps this art of the monument alive, and we are far
content in this country to continue on the lines of establish
precedent, very often without a real understanding of t
subtle qualities of the examples emulated. Take as
instance the famous Colleoni statue at Venice, which has be
the type affected by so many modern creations. In the origir
the horse is placed so that it appears to be walking right
the pedestal, in which this effect is accentuated by the ve
strongly emphasised vertical lines formed by the columns a
decorations worked into it. The resulting effect is no loss
balance in the design, but rather that of extreme vitality a
force, especially when it is viewed from the front with the ho
coming towards the spectator. Yet in an example not f
away this effect of vitality is qualified by the horse being rais
on a crude sloping mound of a base, merging the whole co
position into a pyramidal form which has no relation to t
plane of the ground in its crudity and lack of any horizon
forms, nor any insistence of a division between the c
ventional support and the sculpture above. Yet this cru
ensemble of a monument is placed in one of the few form
vistas of our most fashionable town garden. The art of t
monument has been too little studied, and outside Paris a
Vienna there seems to be no school of this design or no jurisd
tion over such instances of the placing of works of art. Arcl
tects are introducing sculpture into architecture to an exte
which bids fair to become vulgar, but in the case of the pub
monument, architecture has but a modest record.

We are always hearing that the sculptor must be educat
in the principles of architecture, so that he may be able
introduce this into the works entrusted to him; but it is f
more important that architects should train themselves m
to the appreciation and therefore the knowledge of how
embody sculpture in their own conceptions, and then th
would be justified in claiming to be more concerned in t
erection and design of monuments. In the case of t
elements so distinct in character as architecture and sculptu
being employed in a design, it stands to reason that one or t
other must predominate or no balance of effect is anyh
possible.

In the South Kensington Museum there is the mo
originally made by Stevens for the Wellington Memori
in St. Paul's. In it unquestionably sculpture is t
dominating feature. The architecture is reduced to t
merest support for the display of the figures. Its reticen
is remarkable, although it is delicately elaborate and in
harmony with the more plastic forms it seems to tie togeth
It frankly asserts its position as furniture of a large interi
where these forms can be treated on an adequate scale, a
attempts no display of imitation beyond the fine simpl
treated and more delicate mouldings necessary to secure t
balance of the parts and bring the whole design gracefully
the horizontal rest at its base. The memorial lost much
execution. The introduction of the arbitrary forms of t
curved pediment to the arch, the little pediments under t
side figures which destroy the beautiful resolution of the sw
of the sculpture into the cornice line beneath, and a gener
feeling of tightness which is augmented by the harshness
contrast between materials, all go to support the argume
that here was a case in which the sculpture was the p
dominating of the two elements and the insistence of t
architectural forms uncalled for.

For a monument in which the sculpture to predomina
would pass all bounds of due relation to the life and surroun
ings in the midst of which the memorial might be set, the on
satisfactory way would seem to be to treat it as a unit of t
whole. That is to say, conceive it either as the focal point
interest in a scheme of abstract or architectural forms
design or let it be repeated as a point of emphasis and sub
dinate to the general composition. An effective illustrati
of the former idea is the memorial to the Empress Elizabe
at Vienna which occupies a corner of the Volksgarten a
joining the Hofburg Theatre. In the case of a monume
placed in an open square under the shadow of buildings of
certain scale and in close relation to the life and huma
interest of a city, a repetition of interest spread over the who
monument, or rather, what might be called a composite desig
might solve the question of scale and relation to the neighbou
hood of its setting.

Any isolated structure of this nature, however beautiful
carried out and composed in itself, is doomed to failure, a
even to an appearance of the ridiculous, if it be on a scale
compete with the sovereign element of architecture itself; f

it is understood that the effect of buildings is not due to mere vulgar bulk of masonry, but rather to their other qualities of proportion and fitness of material and design. These are not to be threatened if the general friendly relations are to be maintained. The small state is to be repressed unless the suzerainty be augmented in power.

The art of the monument consists chiefly of understanding and expressing its relation to our life in the widest sense as embodied in ideals, purposes, and material effects, and if our future attempts in this art are to have any success when prompted by these considerations, others here may assist in suggesting how this may be best achieved.

Mr. **Howard Ince**, in proposing a vote of thanks, said that Mr. Rickards had addressed the meeting not as a mere theorist, but as one who had given particular attention to his subject and with splendid results. The sympathetic way in which the subject had been treated would serve as evidence to their sculptor friends that there is a very sincere desire to improve the art of the monument. After all this art of the monument was making history, and the nation will be judged as to their character and state of civilisation by those results which will be attained by a combination of the sculptor and architect. The attainment of success demands on the part of sculptors a sense of reciprocity. The example of their French compeers who associate themselves from the beginning with architects in the arrangement of their designs should be followed by sculptors in this country. Mr. Rickards had rightly alluded to the importance of the setting of a monument, for just as no one would think of hanging a picture without a frame so a work of sculpture wants a frame. It follows that we must be wrong in following our almost invariable custom of placing our public monuments on refuges which are usually the by-products of the surveyor's plans. Most of those present would have noticed the monument to Cardinal Newman near the Brompton Oratory; in his opinion it was a most pleasing one. It possessed the additional attraction that there was no back view, which was so often an unsatisfactory feature and like the back of a painter's canvas. The question of setting had even a political importance. In India and other dependencies where ideas were different to our own a statue of a ruler placed in the open without any canopy or protection is a subject of ridicule and a great delight to the disaffected sections. This fact raises the question of the treatment of public statues. Anyone who has tried to solve this problem even in an elementary way will look with respect on the Albert Memorial. The canopy has a quiet restful appearance of shelter and security. In placing a statue in combination with a building a lesson might be learnt from the statue to the late Duke of Cambridge in Whitehall; for a soldier it seems to be in a most unstrategic position. It would have been better placed in the Admiralty or new War Office. There are in existence sites like the open screen at Hyde Park Corner which might be used without any very serious call on the Exchequer. Mr. Ince concluded by expressing a hope that Mr. Rickards, who had already had a considerable influence on painting and sculpture, would in the future have an opportunity of associating himself with some important national memorial.

Mr. **Bertram Mackennal**, in seconding the vote, expressed a strong protest against the general impression that a portrait statue was the only possible form of monument. To his mind there was no feeling in such a statue; whereas the monument ought to be reminiscent of a man's life and work and personality. For instance, suppose a monument has to be put up to some great horticulturist. To erect a statue would be ridiculous; what more suitable than a well-arranged open green sward, with perhaps an urn containing the flowers that he loved so well. Equally unsuitable would be the conventional style of monument to the memory of a man like Darwin.

Mr. H. H. **Statham** expressed a wish to support the vote of thanks for the very clever and interesting paper. He pointed out that the statement by a previous speaker that French sculptors and architects work together on monuments might be qualified by the fact this was scarcely a native virtue inasmuch as most of their monuments are Government commissions, and the Government take good care that the two do collaborate. With regard to the Wellington Memorial in St. Paul's it had always seemed to him that the upper storey of the architect's design and of the actual structure was rather too high and out of proportion to the lower storey. The question of monuments to contemporaries had been raised. To him nothing was more depressing than the ghastly figures of frock-coated men, and custom only emphasises a materialism which artists wanted to get rid of. The French never, or at least very seldom, make a complete portrait statue of a man; they increase the interest of a portrait bust by adding something with reference to his life and work. With regard to the desirability of placing monuments on fitting sites there was, he thought, a very good example in Paris of how not to do it in the monument to Alfred de Musset. The memorial itself is all that could be desired, but it has been placed in a position that is little less than absurd; it stands in the middle of the pavement in the Rue de Rivoli. Reference had been made to the probable demand for monuments to the late King. Mr. Statham said he would like to draw attention to an admirable suggestion which appeared in the *Times* recently from an anonymous correspondent; probably many had not noticed it as it appeared in an obscure part of the paper and in small type. This was that the best memorial to King Edward would be to make a new façade to Buckingham Palace. Unless this is done there will be the great sculptured group of the Victoria Memorial in front with a very commonplace façade behind it.

A vote of thanks having been passed, Mr. E. A. **Rickards** replied to some of the points raised.

## NOTES ON BOOKS.

"The Principles of Architectural Design." By Percy L. Marks. (London: Swan Sonnenschein & Co.)

Though, perhaps, scarcely so successful a work as the author's earlier book on "The Principles of Planning," the young student of architecture will find at the reduced price at which Mr. Marks's "Principles of Architectural Design" is now being offered that he will obtain material for profitable thought in one of the most important and most difficult of all the varied branches of study that go to make the complete architect. All art must be founded on principles, and architecture no less than any other art. Doubtless the thorough artist is largely independent of analytical investigation of the principles on which he works. But the principles exist all the same, and every aspirant to ability in architectural design may not be able to apply those principles sub-consciously, and so will be helped by some guide to their conscious recognition. Hence a work such as this which points out some of the vital principles is of value to the student. But to be of the fullest value he should take nothing in Mr. Marks's dicta for gospel, but rather as material for thought and criticism. We do not ourselves by any means agree with all that Mr. Marks says, but if he induces thought in the architectural student, he achieves a valuable result.

"Buildings for Small Holdings. Materials, Cost and Methods of Construction." By Thomas Potter. (London: B. T. Batsford. 3*s*. net.)

In small holdings, farm buildings and a residence are necessary, and too often their capital cost is a severe handicap on the financial success of the occupier. It is imperative therefore that this cost should be kept down to the minimum, and this is the problem Mr. Potter sets himself to help his readers to solve. To do this "it is generally understood that local building by-laws will not be rigidly enforced," and concrete and timber are to be largely used. The author goes very thoroughly into the consideration of cost and advantages of various materials and methods of construction, and has produced a concise little handbook that should prove most valuable for those for whom it is intended, the occupiers of small holdings of fifty acres or less.

"Practical Housing." By J. S. Nettlefold. With a Preface by the Right Hon. Alfred Lyttelton, K.C., M.P. Popular edition. (London: T. Fisher Unwin. 1*s*. net, paper; 2*s*. net, cloth.)

This book may be said to deal with the question of the housing of the people from the point of view of the practical philanthropist, of the man who realises that housing schemes ought and can be made to pay a moderate return on the capital expended, without perpetrating the folly of building houses so expensive that the people for whom they are intended can only afford to live in them when they don't pay the rent.

The author recognises that in practical housing there are two main divisions of the subject, the cure of existing evils and the prevention of future evils. In the first division the author treats of the effects of the Housing of the Working Classes Act, 1890, and shows how as a general rule it is advisable to proceed under Part II. rather than Part I. Practical examples as well as theoretical show how the provisions of the Act of 1890 have been and can be put into force to remedy existing evils.

It is, however, the second division of the subject that affords the author the best opportunity of showing how economy of health is to be gained from intelligent town planning, and in this direction he does not omit to point out how our usual local by-laws, rigidly enforced, are prejudicial to the well being of the community. Illustrations are drawn from the various garden-city developments that have already exemplified the gain in healthy conditions and amenities that may be obtained by wise and rational town planning.

The book is one that should be carefully studied by every member of any local authority that may be called upon to deal with the actual working of the Housing and Town Planning Act, 1909.

---

"Housing and Town Planning in Great Britain, being a statement of the Statutory Provisions relating to the housing of the working classes and to town planning, including the Housing, Town Planning, &c., Act, 1909." By W. Addington Willis, LL.B. (Lond.), of the Inner Temple, barrister-at-law. (London: Butterworth & Co.)

This book treats of the subject of housing and town planning from a legal point of view. The Housing, Town Planning, &c., Act, 1909, does not stand alone, but is largely composed of cross-references to the provisions of previous statutes and a copious contribution to the already numerous amendments of the Housing of the Working Classes Act, 1890. Such a handbook as we now have before us is therefore vitally necessary for a fair comprehension of the present state of the statute law as regards Housing, and the author has clearly combined under various subject heads the co-related provisions of the several Acts. Thus all the stipulations concerning any particular point are brought together, and by means of an excellent synopsis and good index are easily capable of reference.

---

"Handbook to the Housing and Town Planning Act, 1909." By W. Thompson (Richmond, Surrey). (London: National Housing Reform Council. 1*s.* net, paper; 2*s.* net, cloth.)

This book by Alderman W. Thompson, of Richmond, Surrey, deals with the subject of housing and town planning from the point of view of a practical administrator, who has already shown his competent grasp of the subject in his previous works, "The Housing Handbook" and "Housing up to Date," which, in conjunction with the present volume form a valuable vade-mecum for members of the various local authorities that have to deal with the subject, and for architects who have to work with the authorities.

The book contains the text of the Housing and Town Planning Act, 1909, with explanatory summary and notes, and a special index to the various sections to facilitate easy reference on a given subject to the Act itself.

The rules and forms issued by the Local Government Board up to the present time with reference to appeals, and to closing and demolition orders under the new procedure, are also given. There is in addition a useful statement showing what sections in previous Acts are affected by the new Act, and to what subjects the alterations relate.

The summary shows in separate articles what authorities will administer the Act; how to get land and money for new dwellings; what may be done with the land; how to make a local authority carry out its housing duties; how to make neglectful landlords keep their houses clean and in good repair; how to get large slum areas cleared; how to deal with obstructive buildings and cellar dwellings; the procedure for closing and demolition orders, and a number of minor matters that are dealt with by the Act.

The town planning portion of the summary explains who will make the town plans; what lands may be the subject of a town plan; what are the objects of a town plan; the general provisions and special provisions that must be made; how to make a town plan; what compensation is payable; how the town plan will be carried out; and concludes with practical suggestions for municipal action. There is also a special chapter dealing with the new powers and duties of County Councils under the Act.

The method of showing in bold type the more important enactments in the text which characterised the previous publications of the same author has been followed in the present book, so as to show at a glance the main object of any section. The A.B.C. to the Housing and Town Planning Act is a useful compilation for purposes of reference.

---

"The Craftsman's Plant Book." By Richard G. Hutton How, A.R.C.A. (London: Chapman & Hall. 25*s.* net.)

The sub-title of this book explains its locus standi, "Figures of plants selected from the herbals of the sixteenth century,
and exhibiting the finest examples of plant-drawing found
those rare works, whether executed in woodcuts or in coppe
plate engravings, arranged for the use of the decorator, wi
supplementary illustrations and some remarks on the use
plant-form in design."

The value of the drawings in the old herbals to t
decorator or designer of decoration lies in the approximati
to conventional rendering which, whilst it is primarily i
tended to give a clear key for the recognition of herbs, at t
same time indicates much of the character of each plan
and suggests the application of its form to decorative us
With over 1,000 illustrations the decorator has here to ha
an invaluable store of suggestion in plant form, and indeed
some cases, rather more than suggestion, where the o
herbalist has rather let his instinct for convention and decor
tion carry him away from truthful and literal portraiture
the plants with which he is dealing.

---

"How to Plan a House: a Book for all about to Build."
By George Gordon Samson, architect. (London
Crosby Lockwood & Son. 3*s.* 6*d.* net.)

The title of this book needs but two words to make it co
plete—"to avoid." The author starts with diatribes again
other architects in general, and F.R.I.B.A.'s in particula
Judging from the sample plans which the author shows
evidence of what he thinks ought to be built, there is not mu
chance of his becoming F.R.I.B.A., or being recognised
superior to the other architects whom he condemns. It
needless to criticise in detail the dicta of the author, or t
plans he offers as showing how to plan a house.

---

"Bungalow Residences: a Handbook for all interest
in Building." By Percival T. Harriso
A.M.I.C.E., M.R.S.I., borough engineer and su
veyor, Dorchester. (London: Crosby Lockwo
& Son. 3*s.* 6*d.* net.)

"The object of this little book is to assist the layman w
may be contemplating the erection of a bungalow," and
show how excellently—or otherwise—the "layman" may fa
when he is assisted by a borough engineer, rather than
regular architect, who wastes his time in studying the pla
ning and construction of residences, instead of devoting h
best energies presumably to sewers and roads. Generally, t
principles advocated in the text are sound, indeed they a
largely in the nature of platitudes, except to the "layman,
but as the author seems to have designed two or three bu
galows for Lancing beach, we are surprised that he glosses ov
the question of water supply in a single page. The author
plans for bungalows, by the way, seem rather influenced
the normal Lancing type—two old railway coach bodies and
shed between. We do not think the "layman" will get ve
far with his bungalow unless he supplements this book wi
expert advice, and possibly that of an experienced archite
might be better than that of a borough engineer.

---

"House Painting, Glazing, Paperhanging, and Whit
washing. A Book for the Householder." B
Alvah Horton Sabin, M.S. (New York: Joh
Wiley & Sons; London: Chapman & Hall. $1.)

For the householder this book may be useful as giving hi
some idea of what is comprehended in the painter's trade, b
it seems that the author expects his householder to do his ow
work. From a British point of view we do not think t
author's teaching makes for good and durable work. There
too much shellac. For instance, knotting "is done by coverin
them (the knots) with a coat of heavy shellac varnish." Tr
the author says "the shellac is supposed to stop" (the exud
tion of resin from a knot) "but it does so only very impe
fectly; however, there is nothing else to do." Has the auth
who claims "an experience of many years" never heard
red lead and size, or of tinfoil? Again, his idea of a primin
coat is to "add a gallon of raw oil to a gallon of ordinar
paint," which is not the way in which a competent Britis
decorator prepares a priming coat. In discussing the base
paint, the author expresses his "belief that a mixture of t
two" (white lead and zinc white) "is better than eith
alone." This belief is not shared by British decorators
experience. A good recommendation is that plenty of tim
should be allowed between successive coats of paint. Thu
although there are some pieces of sound advice, the book
not what we consider a reliable guide for the novice or t
amateur.

## THE SOCIETY OF ARCHITECTS' TRAVELLING STUDENTSHIP, 1910.

SIXTEEN sets of designs have been received in competition for the Travelling Studentship, which is of the value of 25*l*. and carries with it the silver medal of the Society.

The problem set this year was to design a golf club to accommodate 175 members, at a cost not exceeding 4,000*l*.

The Council has awarded the Studentship to Mr. D. W. Coombs, 25 Portman Road, Boscombe, an assistant in the office of Mr. J. J. Shepherd, 115 Old Christchurch Road, Bournemouth.

The work of Mr. Frank Brown of Crumpsall, Mr. E. J. Williams of Leicester, Mr. J. F. Dove of Eastbourne, and Mr. A. J. Turner of Tonbridge has been commended.

The drawings will be on view at the Society's premises, Staple Inn Buildings, Holborn, W.C., for one week commencing June 6, from 10 A.M. to 8 P.M., when admission will be free.

They will afterwards be exhibited in various provincial centres.

## EARLY CHINESE POTTERY.

THERE has been opened by the Burlington Fine Arts Club an extremely important exhibition of Early Chinese pottery and porcelain at their premises in No. 17 Savile Row, W. The mere fact that this society have organised an exhibition is a sufficient assurance that it will be worth serious attention; but on the present occasion the promoters say that "in the several series gathered together it is thought that a large proportion will be of a character novel to members of the club." Such a diffident statement may inspire high expectations, and they will not be disappointed.

The value of this exhibition is first and foremost historical. Most especially is this true of Case A, which contains specimens of Han pottery. The Han dynasty extended from B.C. 206 to A.D. 220, and during that period porcelain was first mentioned under the name of t'zu. It was defined as a hard compact fine grained pottery, the surface of which could not be scratched and which when struck gave out a clear ringing sound.

Until within the last decade the knowledge of this period was most fragmentary. It was not until the researches of the student into Chinese books and of the connoisseur were reinforced by the steam shovel that it became a well-defined commencement of the chain linking the contemporary Chinese work with their earliest known pottery. That is to say, the recent construction of railways in Northern China opened up numerous tombs and caves which have yielded a rich harvest. The greater number of the objects recall the finds of prehistoric pottery made by archæologists in Egypt and elsewhere. Thus there were buried with the dead wine jars, flasks, dishes, bowls, and vases. In Case A there are representations of a cock, farm shed, ram, granary urn, and an ox and two-wheeled cart. As Mr. R. L. Hobson says in the Introduction to the elaborate catalogue:—"One cannot but marvel at the skill with which the potter has idealised the commonplace forms of daily use, and at the force and truth with which he has rendered the forms of living creatures. The same power and skill pervades the ornamental vases, the impressive forms of the wine jars, and the vigorous movement of the hunting and hunted animals on the bas-reliefs. Time has invested the green glazes with the posthumous glory of iridescent tints, but the true virtue of the ware lies in the skilful touch of the Han potter, which was able to convert the simplest materials into noble and artistic forms."

After the Han dynasty there is a break of nearly four centuries until the T'ang dynasty is reached, and even of this latter not much is known, the specimens being only tentatively assigned to the period. Firmer ground is reached with the Sung dynasty which reigned from 960 to 1280, and with the Yuan dynasty which succeeded it; the ceramic productions of these two are generally classed together. The examples shown are chiefly to be found in Cases B and C. Next came the Ming Period, which was supreme between 1368 and 1643. This is the most fully represented at the present exhibition, which practically closes with it. In Case E is the celebrated Warham Bowl lent from New College, Oxford. It was bequeathed to that College by Archbishop Warham in 1530. In the same case are a few other curious pieces similarly mounted in silver-gilt, all probably by English craftsmen of the sixteenth century. Of more architectural interest are the few roof and ridge tiles and the finial on Case K. In another part of the room there are also a couple of figures of mounted warriors which are described as architectural ornaments.

It is not easy to suggest the real interest of this exhibition on both historical and artistic grounds. The very many pieces can only be appreciated by a personal and careful inspection. It may be well to try and picture, while looking at them, what kind of pottery was being produced in this country at about the same dates.

## ILLUSTRATIONS.

### OXFORD COLLEGE SERIES, EXETER.—INTERIOR OF CHAPEL.

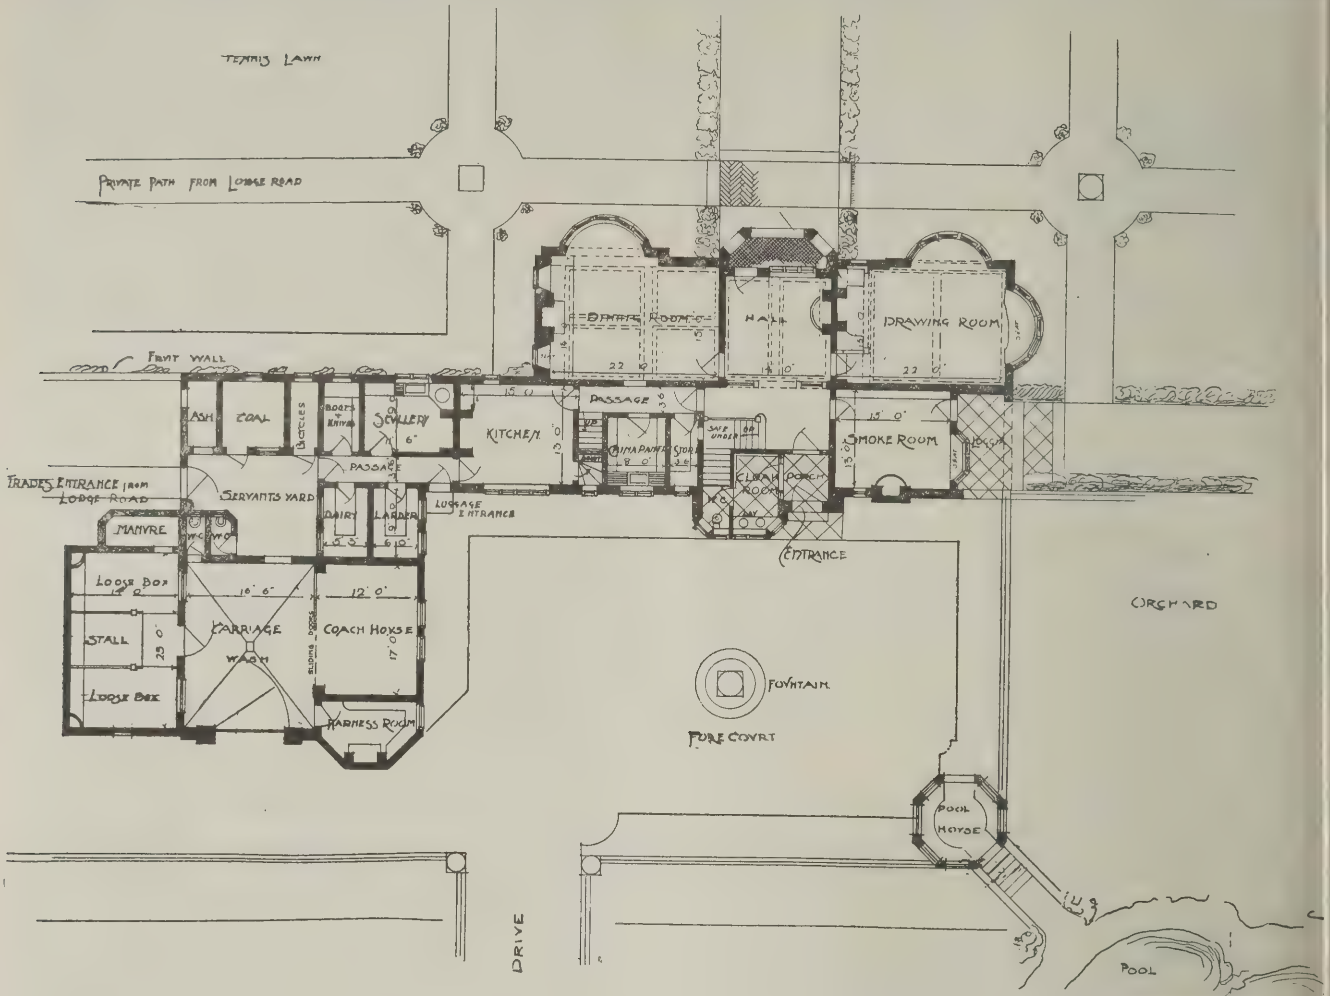
WITH the view we give this week we complete the illustrations of Exeter College in our Oxford series. The first of these, with a historical account, appeared in our issue of April 22.

### THE DIVINITY SCHOOL, OXFORD.

THE Divinity School was commenced in 1445. It was not, however, until 1480 that the School together with the first University Library was removed from the Old Congregation House to the present building. The reason for this long interval was that the men were taken away to complete the works being carried out at Eton and Windsor under WILLIAM OF WAYNFLETE, Bishop of Winchester, Provost of Eton, founder of Magdalen College, and Lord Chancellor. The Divinity School occupies the ground floor of the building erected by HUMPHREY, Duke of Gloucester, son of HENRY IV., to accommodate his handsome donation of 600 books to the University. It was this generosity on the part of the Royal patron of letters that resulted in Oxford's most cherished possession, the Bodleian Library. At the time of its completion the School was conspicuous for its stained glass as well as for the splendid groined roof. The large and beautiful Late Perpendicular windows were chiefly filled by representations of the Holy Fathers of the Church and the armorial bearings of about a hundred benefactors. These a short half-century later shared the fate of HUMPHREY's precious MSS., and were ordered by the Commissioners of EDWARD VI. to be destroyed as partaking of the specious and superstitious doctrines of Rome. The fittings of the interior were broken up and the lead from the roof was pillaged. Nettles and brambles flourished in crevices in the walls, while a cattle pen and a timber yard were set up close by. On September 30, 1555, Bishops RIDLEY and LATIMER were tried with CRANMER by special commissioners, and were convicted of heresy. In the same year Convocation determined to sell the remaining statues and fittings. Fortunately the groined roof was preserved more or less unharmed.

In 1598 Sir THOMAS BODLEY tired of the wiles of diplomacy, and sought for and obtained permission to rebuild Duke HUMPHREY's library. In 1625 Oxford was once again honoured by Parliament meeting in the Royal city for a few days, though on this occasion it was only on account of the third outbreak of plague in London, when there were 35,417 deaths. The House of Lords sat in the north end of the picture gallery in the Bodleian Library, the Privy Council assembled in Christ Church Hall, and the Commons in the Divinity School. During the Civil War and siege of Oxford the school was used in common with other collegiate buildings as a storehouse for corn and provisions for the troops. The upper room of the tower was filled with muskets.

In 1699 WREN prepared a report of the necessary repairs, and the document is now—or at any rate was—in the Bodleian Library. It appears that there was a crack in the roof, the south wall bulged, and the floor was rotten. He advised that the building should be braced with iron after the style he had carried out on the spire of Salisbury Cathedral when that edifice was struck by lightning. Additional buttresses of great strength and depth were erected on the south side. This work was completed in 1700-2, and the building was successfully restored.



JOB'S CLOSE, KNOWLE, FOR HAROLD HASLUCK, ESQ.—Messrs. HICKTON & FARMER, Architects.

Mr. FRANCIS BOND, speaking in his "Gothic Architecture in England" of the timidity shown by some of the pioneers in fan vaulting, points out that one of the signs of distrust was the construction of massive transverse arches passing up the centre of each half conoid and spanning the nave. "The suggestion of these transverse arches," continues Mr. BOND, "seems to have come from Oxford, where they were employed in two superb lierne vaults of novel character. The first is that of the Divinity School, begun *c.* 1445 and finished *c.* 1480. It is a long and very broad room. The obvious way to vault it was to divide it into nave and aisles and then to ceil these with three vaults, *e.g.* as in the choir of the Temple Church. But the eight piers would have been obstructive; moreover, there would have been no credit to be got for merely repeating what had been done before in scores of churches. Imagine, however, that it had actually been vaulted in three divisions of nearly equal height, and that each of the piers carried a capital. Would it be possible to retain the capitals, while withdrawing the piers, without bringing the three vaults down? What would a modern contractor do if he were asked to leave the vaults of the Temple choir standing while withdrawing the supports? Obviously, from a point in one wall to a point in the opposite wall he would insert an iron girder, and if this (transverse) girder passed under the capitals of the two piers he could then take away the piers. So with the other piers. What a modern contractor would do with iron girders, that the Oxford builder did with strong transverse arches of stone. The pendants of each transverse arch, which represent the imaginary capitals, are but two of the voussoirs of the arch greatly elongated. This beautiful novelty was imitated soon after in the vault of the cathedral choir."

### ROMSEY, FARNHAM ROYAL.

THIS house was erected in 1906 from designs by Mr. A. E. BULLOCK, A.R.I.B.A., on a triangular field having an axis of the lower road running centrally through the house. The centres of each room will be seen to meet in the hall. The hall chimney-piece and ingle was made by Messrs. HOFLER & Co. in oak. The builder was Mr. BOWYER, of Slough. The materials are local red bricks and tiles with rough-cast to first floor. The verandah was added before completion and has materially added to the effect. The axial system of garden planning was not adopted. This radial form of plan was suggested by the very difficult aspect, and sunlight could not have been obtained adequately by other means.

### HOUSE IN EDGBASTON—INTERIOR VIEWS.

THESE illustrations are characteristic of the simple and effective treatment of interiors to be found in the designs of Messrs. FORBES & TATE.

### JOB'S CLOSE, KNOWLE.—GARDEN FRONT—ENTRANCE FRONT.

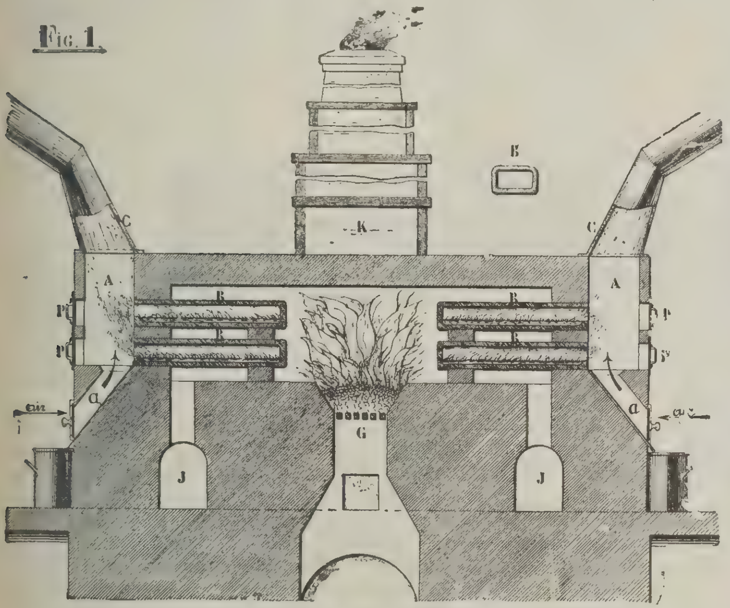
THIS house has been built for HAROLD HASLUCK, Esq., at a cost of about 4,000*l.*, from the designs of Messrs. HICKTON & FARMER. As will be seen from the illustrations and plan, the lay-out of the grounds has formed an integral part of the architects' designs.

THE Glasgow School of Architecture began six years ago, when the separate architectural courses of the Technical College and the School of Art were amalgamated, a joint diploma course, which is the highest in the school. Its final stage is the submitting of an original design and relative details with proof of full qualification for professional practice. Four of these diplomas—Dip. Arch. Glasgow—the first in Scotland, have just been granted to Mr. Alex. Adam, Churchill House, Paisley; Mr. Walter Alexander, 29 Westbourne Gardens, Glasgow; Mr. Thomas A. Macadam, 6 Knowe Terrace, Cathcart; and Mr. Charles A. Harding, 46 Kersland Street, Glasgow.

## ZINC OXIDE.[*]

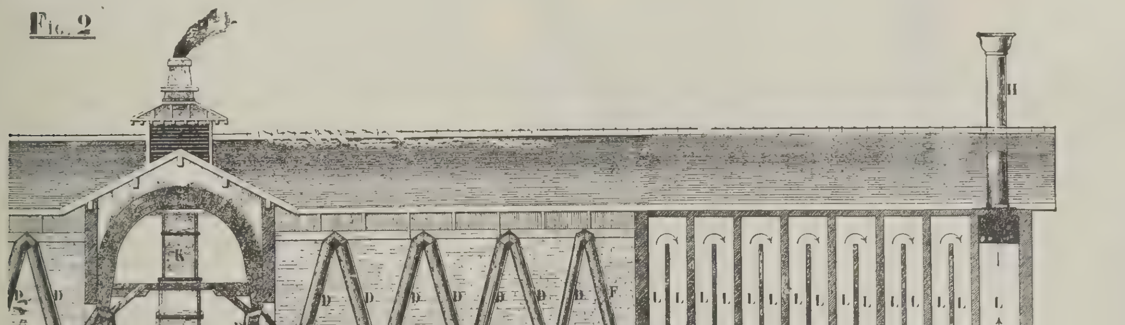
Amongst the many pigments used in the manufacture of paint few—if any perhaps—are at the present time more interesting than zinc oxide (ZnO). We have to look back nearly a century and a half to find the first attempt to discover a white pigment capable of taking the place of the poisonous white lead. It was in 1750 that the French chemist Courtois and his collaborator, Guyton de Morveau, stimulated solely by philanthropic motives, attempted to introduce ZnO as a substitute for white lead, which already in those days was admtted to be a scourge amongst lead workers and painters. The first successful use of ZnO as a paint pigment must, however, be attributed to the persistent efforts of Jean Leclaire, who began to manufacture and use ZnO in a small way in 1785. Since then steady progress has been made, and to-day I may say that zinc oxide is regarded with widespread interest, not only amongst paint manufacturers, but also amongst paint users and painters.

Fig. 1.



The output of ZnO factories is yearly increasing, and I have no hesitation in saying that it will very soon surpass—in fact, leave a very long way behind—that of the white lead factories, especially if, following the good example of France and other countries, the manufacture and use of white lead is prohibited by other Governments having at heart the health of the workers.

Fig. 2



*Processes for the Manufacture of Zinc Oxide.*

I am distinguishing the processes which are now actually in use from those which are still in the experimental stage. Process in actual use:—

### 1.—*The Indirect Process.*

This method consists essentially in burning the vapours of zinc in a current of air. The particles of oxide formed are carried in this current of air and collected in depositing chambers or tubes. This process I call "indirect" because it is necessary first of all to extract the metallic zinc from the ore, and then transform the metal into oxide. The "raw material" consists of zinc ingots weighing approximately 10 kilos., equals 22 lbs. (see specimen). These ingots are obtained by the mixture of various qualities of the metal, hard spelter, No. 2 zinc, residues obtained from galvanising liquors (see specimen), old zinc, &c. Naturally the proportions of the different constituents vary according to the quality of zinc oxide which it is desired to obtain.

*Description of the Apparatus* (see Plans 1 and 2).—The metal in blocks is introduced into retorts made of refractory earth B (plan 1), having the shape of very flat semi-cylinders ending on the side of the opening with a salient return intended to prevent the overflowing of the molten zinc. These retorts are heated in a grated oven which can accommodate twenty retorts, placed right and left on two rows, one above the other. The same furnace (G) heats the two series of ten retorts, and the gases from this process are liberated in the chimney (K) by the opening JJ. When the retorts are carried to a red white heat, the zinc oxide distils and the vapours are given off in the little chamber A. The loading of the retorts is done by means of two doors, which are found in the inner walls of these chambers. A current of air is forced by a fan (not shown here) into the chamber A through a slightly inclined conduit *a*. The zinc vapours burn in contact with the air and the oxide is carried away by the air-current in the condensing apparatus, to which I will refer later. The metal which has escaped oxidation falls back in small drops into the conduit *a*, at the extremity of which it is collected mixed with a certain quantity of oxide of zinc.

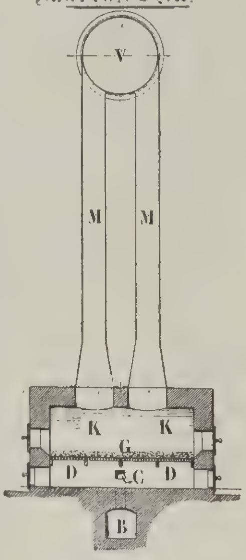
The chamber (A) is covered by a large tube (C) which constitutes the first elements of the condensation apparatus (C). In the conduit *a* is to be found metallic zinc, zinc oxide pure and agglomerated, and pulverulent oxide. From it a greyish white is obtained, which is sold under the name of "grey zinc." The zinc oxide carried away in the tube C (plan 2) goes into a series of iron cooling tubes (DDD) turned down syphon shape, terminating into hoppers (EEE), lengthened by a sheet-iron tube, ending in a linen bag which can be opened at will, and is used to collect the deposited oxide. The zinc oxide then arrives at tube (F) and penetrates into the condensation chamber (L). These chambers are divided into vertical partitions covered with fluffy cotton in a series of compartments terminating in a hopper (T) with a linen bag extension. Each compartment is itself subdivided by a vertical partition so arranged as to force the gases to go up and down before entering the neighbouring compartment. After having travelled through these compartments the gases pass through a metallic cloth, and practically freed from every particle of zinc oxide pass into the large chimney (H). The zinc white collected in the first part of the cooling chambers is pulverulent and of a higher density than the oxide deposited further on, which is light, flaky, and impalpable. The first constitutes the blue and red seals, the second the green and white seal, the lightest and whitest being collected near the draught chimney, the density increasing and the whiteness decreasing in proportion as they recede further from the draught chimney. This system of collection is called "collection by deposition," and is characterised by the absence of the large filtering sacks, of which I will make mention later on. Concerning this process, I propose to give a few figures which will, no doubt, prove of interest. The temperature at which zinc oxide volatilises being 1,900° Fahr., the temperature of the furnaces often exceeds 2,375° Fahr. The inside dimensions of the retorts are 1,060 mm. long, 320 mm. wide and 100 mm. high. The opening which is used for the introduction of the zinc ingot, as well as for the escape of the zinc vapours, is 240 mm. wide and 40 mm. high. The returns of this process theoretically calculated amount to 125 per cent., i.e. one ton of pure zinc gives in theory $1\frac{1}{4}$ tons of zinc oxide, but in practice, in consequence of inevitable loss and unavoidable impurities in the raw products, the returns vary from 110 to 115 per cent. A double furnace containing 40 retorts burns 12 tons of zinc in twenty-four hours and produces 13 to 14 tons of zinc oxide, the consumption in coals being approximately 40 to 45 kilos. per 100 kilos. of zinc. Consequently the retort will burn 300 kilos. of zinc in twenty-four hours, each loading being 20 kilos., showing an average of fifteen loads in twenty-four hours.

---

[*] A paper read on May 12 before the Paint and Varnish Society by Mr. Gaston Depièrres.

Fig. 4.

SECTION - Q.R.



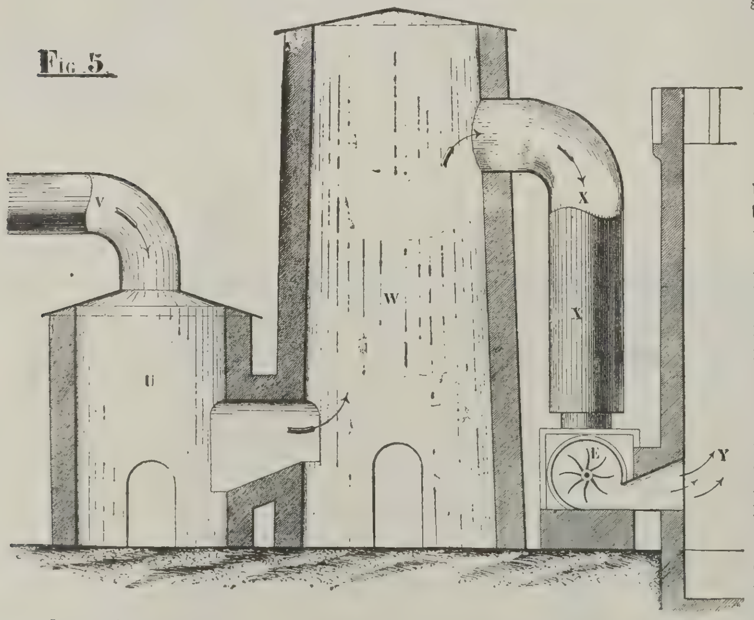
As you will see this operation is a continuous one, and when the zinc of any one retort is used, a fresh quantity is introduced without having to put out the furnace, which remains alight for several months. The retorts last from eight to ten days according to quality, taking into consideration the composition of the zinc, and the way in which the stoking of the furnace is carried out.

The zinc oxide manufactured by this method undoubtedly varies according to the raw material employed and the oxides obtained are composed on an average as follows:—

ZnO, 98 to 99.50 per cent.

Pb (as oxide, carbonate sulphate or sulphite), 0 to 1 per cent. The rest is composed of very small traces of other metals, such as Cd, Fe, Sb, moisture, carbon, anhydride, chloride, foreign matters, &c.

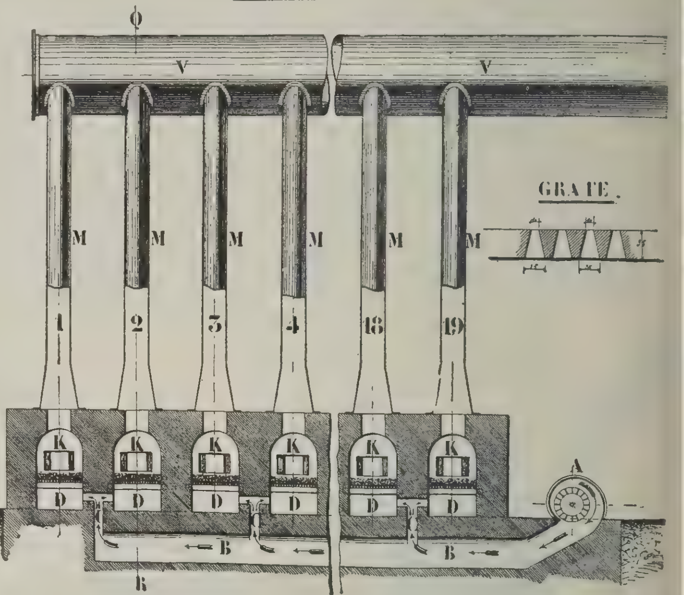
Fig. 5.



2.—*Direct Process.*

I call this process "direct" because the ZnO is obtained straight from the ore without passing through the metal stage. The ores suitable for this method—of which I will speak later on—are oxidised zinc ores which answer more or less, theoretically speaking, to the chemical formula ZnO containing certain proportions of iron, manganese, lime, silicate, &c. Plan 3 and 4 represents in its "ensemble" a succession of nineteen furnaces. The furnace used is composed of an arched channel (K) with doors (PP), at each end of which there is a grate of special design (G) (see plan 3 and 4). This grate consists of a cast-iron plate 35 mm. thick, perforated with conical holes having the narrowest extremity (10 mm. in diameter) turned upwards, whereas the wider opening of the cone is turned downwards. It will readily be seen that owing to this disposition of the grate the obstruction of the holes is impossible.

Fig. 3.



As I will explain to you later, the ore and coals are thrown on the grate (G) through doors (PP); below the grate is a closed cinder box (D) into which a current of air is forced through the passage (B) by means of a fan (A). This forced current of air penetrates the cinder box, through the small conduit (CC), which can be closed by means of registers to shut off the current when the work is finished. From the channel (K) the gases pass into ascending tubes (M), and then into collector (V). The width of the oven is 900 mm. on a level with the grate length, 4,600 mm. height from the highest point of the arch above the grate 900 mm. The doors are mounted in frames 300 mm. high and 800 mm. wide; these dimensions are only approximate, as I know they vary from one factory to another. From the collector (V) the gases, which are charged with white dust and various vapours, pass successively into two brick towers (U and W), plan 5, where the zinc fumes which are not thoroughly oxidated continue to burn, and the particles of cinder and coal are carried away and fall to the bottom. The gases are then taken away through the conduit (X) by means of a fan (E) from the tower (W), and forced into the cooling chamber (Y), plan 6. From the chamber (Y), the gases pass into the sack chamber (SS), plan 7. There the oxide of zinc remains in the sacks, whereas the gases go through the meshes of the tissues and escape through the side. The great tower (W) is 21 metres high and 24 metres in circumference at its widest point. The refrigerating chamber (W) is 30 metres long, 6 metres wide, and 13 metres to the top of the arched roof. The bottom is divided into differently arranged compartments (RR), which serve to collect the zinc oxide which has been precipitated.

In certain factories the compartments (RR) are composed of large metal sieves with registers used to collect the product. The sack chamber (SS) is a large building at the upper extremity of which is the metal collector (T); this is 1,800 mm. in diameter. From this collector (T) a series of sheet iron perpendicular tubes form ramifications, to which are attached the long linen tubes, otherwise called sacks. The diameter of the tube is half as much again as that of the sacks, which are 600 mm. in diameter, and from 8 to 10 metres high. The lower extremity of these sacks is shaped like a funnel (see plan 7). From time to time the sacks are beaten to force the zinc oxide through them; these sacks are generally made of coarse cotton or woollen material, which last longer, especially if the gases to be filtered are at a high temperature. It is essential that the building containing these sacks be well ventilated, as an accumulation of gas might cause slight asphyxia to the workmen. As you will see, the system of condensation is very different to the one I described before, the "indirect method." The "direct method" is characterised by the use of filtering sacks, which are becoming of more general use. Some years ago these sacks were not known, and in many factories a very fine spray of water was introduced into the chambers (UVY), which caused the immediate condensation of the oxide. It is generally acknowledged that this process resulted in products of inferior quality called "chamber oxides," and I do not think it is still in vogue in any factory.

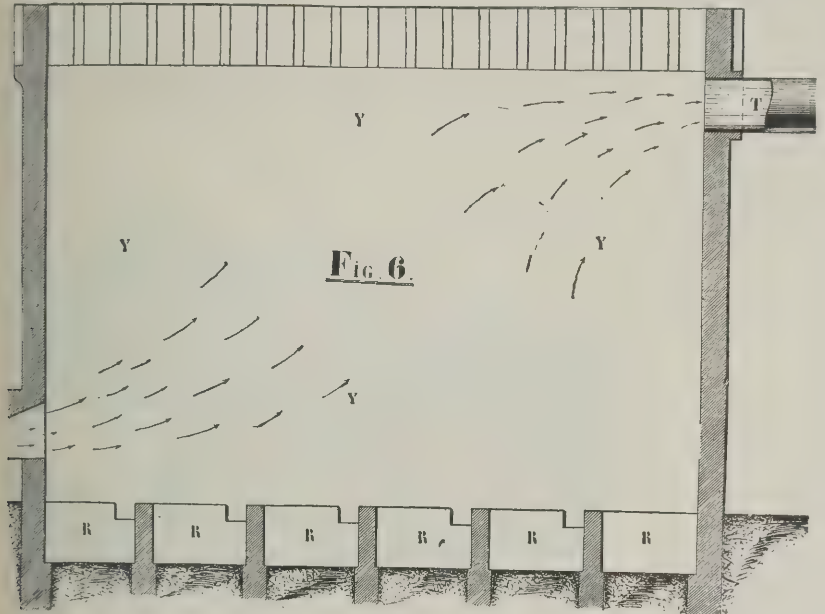


Fig. 6.

*Chemical Examination of the "Direct" Process.*

The manufacture by this method can be divided into three phases:—(1) Reduction and volatilisation of the metal Zn at a high temperature. (2) Re-oxidation of the metal in the form of gas at a slightly lower temperature. (3) Cooling of the gases and condensation of the ZnO. We need now only consider the first and second phases or reactions, the third being known by the description of the apparatus. The two first reactions take place in the channel K (plan 3 and 4), and cannot be very clearly divided. The work is done as follows. The grate (G) is covered with a layer of anthracite, the load weighing from 75 to 90 kilos., the forced draught is then started. When the coal is in full combustion, a layer of a mixture of zinc ore and anthracite is spread upon it. For a furnace, the charge is approximately 225 kilos. of ore mixed with 90 kilos. of anthracite. It will be readily understood that these quantities vary with the composition of the ore. When in full working, a furnace is hot enough after the removal of the first residue to start the combustion of a fresh charge. As will be seen, the process is intermittent, the furnace being emptied after each operation. The air forced in the cinder box (CC), plan 3 and 4, goes through the grate and burns the anthracite, transforming it into carbonite anhydride $CO_2$, which in going through the layer of anthracite is partially reduced to oxide of carbon CO. This gas, as well as the carbon from the coals mixed with the ore, cause the reduction of the ZnO into Zn. Then the vapours of the metal Zn are transformed into ZnO by the oxygen of the air, which is in excess as well as by the carbonic acid gas. The ZnO thus formed is carried away by the air current in the apparatus which I have described before, and is collected in the sacks mentioned above.

(*To be continued.*)

---

The Executive Masons' Society of Cape Town have issued a notice advising masons who intend coming to South Africa not to agree with any agent to work for less than 2*s.* 6*d.* per hour, that being the wage in the Transvaal.

## FISHMONGERS' HALL AND ST. MAGNUS THE MARTYR CHURCH.[*]

The Fishmongers' Company existed from very early times indeed. The religious customs of the day rendered the consumption of fish, particularly in Lent, to be far greater per head than it is to-day, emphasising the need for the proper control and regulation of the trade.

The first Charter known is dated 1364, and was granted by Edward III. It confirms the grants immemorially made to the Guild by his progenitors, so that it may be quite reasonably supposed that the Fishmongers' Company dates from the twelfth or thirteenth century. There were numerous confirmatory charters granted by the monarchs subsequent to the one above referred to, and the one upon which the Company at present acts was granted by James I. in 1605.

Originally there were two guilds—one embracing salt fishmongers and the other stock or dried fishmongers. They were fused into one guild or company in 1536 after numerous attempts, and at least one temporary alliance.

The Fishmongers appear to have occupied two quarters of the town, one around Billingsgate and the north end of London Bridge, and the other higher up the stream at Queenhithe, where they spread up towards Cheapside, and we now find a relic in the name of Friday Street where the Friday or fish market flourished. This division was caused by Henry III. forbidding any fishing vessels to land goods except at Queenhithe, in order that his Queen's revenue might increase. Edward I., however, greatly widened this regulation, permitting fish to be landed and sold within the bounds of St. Thomas's Chapel on London Bridge, Baynard's Castle, and Jordan's Quay. This monarch caused the trade to be severely regulated, fixing the price at which fish was to be retailed, limiting the profit of the fishmongers to a penny in the shilling, and forbidding what is termed forestalling, i.e., the intercepting by middlemen of the fishing vessels in their passage up the river and so stealing a march on the market and making what was thus considered an improper profit. No fish was to be stored in London beyond the second day after arrival on pain of confiscation and fine, and holding up in expectation of a better market was forbidden. In 1405 Parliament enacted that anyone who should hinder any fisherman, English or foreign, from disposing of his fish as he might see convenient, should be liable to a fine of 10*l*. Elizabeth, however, 150 years later forbade the import of cured fish, as it was considered far "inferieure to the fysshe taken by Englishmen in the island voyages."

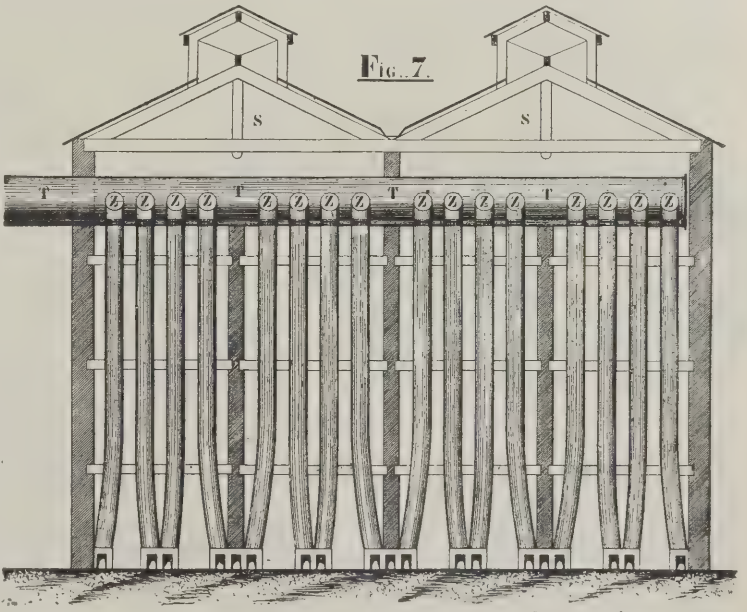

Fig. 7.

---

[*] A paper read at a meeting of the Upper Norwood Athenæum by Mr. Frederick Higgs.

The Fishmongers' Company has numbered in its ranks many distinguished persons, Lord Mayors and others, perhaps the most notable having been Sir William Walworth, who in 1381, when at the head of the City's forces, killed the rebel Wat Tyler, when heading a disorganised mob of thirty or forty thousand malcontents from Kent and Surrey. He must have been a strong man and a wealthy, notwithstanding the aforesaid limitation of profits, and comes down to posterity as the chief warrior patriot of the City of London. There was also Sir John Leman, one of the fishmonger Lord Mayors (in 1616). Then we find Doggett, of a numerous family of the name early in the eighteenth century, who hated the Stuarts, and established the coat and badge which is rowed for annually by the Thames watermen between London Bridge and Battersea, the most ancient boat race extant.

Among the treasures of the company are several oil paintings by Beechey, Romney, Murray, Shakleton, Ouless, and others, representing royalty and notables, chiefly within the last 150 years. Also eight sets of paintings of fish by Arnold van Hacken, illustrating all the principal fresh and salt water species. There is also a curious chair and snuff box, made from the woodwork of the foundations of old London Bridge, demolished in 1832, after having done duty for 656 years; it was made and carved by John Ovenston from the design of Sir John Rennie, who constructed the new bridge.

There is also the celebrated Walworth pall, the date of which is doubtful; judging from its design and composition it should be pre-Reformation, but on the other hand the company's arms as worked upon it were not granted until Elizabeth's reign, viz., 1575. It is considered one of the most rare and valuable works of its kind existing. The statue of Walworth is worked in wood and stood in the former hall; it was carved by Edward Pierce in 1698. The dagger in the hand is a modern imitation, but the one preserved in a glass case with the City Arms and those of the company engraved thereon is said to be the original weapon from which Wat Tyler met his fate; it is certainly of that period.

There are busts of the late Queen Victoria and her Consort, of Gladstone, and other statesmen of the last century.

The silver plate possessed by the company is both ancient, numerous and valuable, there being nearly fifty pieces in all, the greater number of which date from the sixteenth and seventeenth centuries. Most of them are beautiful in design and of excellent workmanship. There is also a snuff box made from the wood of a tree under which Wellington stood for some hours at Waterloo, June 18, 1815.

The buildings of the company have, like many other guildhalls, been numerous and varied. Hollar's "View of London," dated 1647, shows the buildings destroyed, like so many others, by the Great Fire in 1666. Little information can be gleaned from this source except that it was a large building of three storeys abutting on the river, partly gabled and partly with embattled parapets, and having a terrace in front with a landing-stage to the river. This structure was replaced by one designed by Mr. Jerman, whom the Drapers also employed, and who designed the Royal Exchange of that day. Like the Drapers' Hall, it was built in quadrangular form, its main front to the river being in the orthodox Classic style of the period after the Great Fire. The interior arrangements are said to have been convenient, spacious, and richly decorated and ornamented.

HOLLAR'S VIEW, 1647.

After 160 years Jerman's building had to come down owing to the alterations consequent on the rebuilding in 1830 of London Bridge 100 feet westward of the old structure. The company employed Mr. Roberts, who certainly produced a dignified and noble building. Like its predecessors it has its river front, but its principal entrance is from the bridge approach. We are greatly indebted to the clerk, Mr. Towse, for his assistance, and to the company for their consent to allow us to see their treasures (a consent most exceptional) and for their kind hospitality.

St. Magnus the Martyr parish church now also serves tw other little city parishes, one St. Margaret's, which formerl stood on the spot now occupied by King William's statue an its surroundings, and another, St. Michael's, Crooked Lane formerly upon the site of the Underground Monument station There are still wardens for each parish, and their ancien wands or staves with their individual patterned tips are stil in use on ceremonial occasions.

St. Magnus's Church was known to exist in 1300. In 130 Hugh Pourt, a London sheriff, together with his wif Margaret, founded a charity in connection with the church The first rector mentioned is Robert de St. Albano, who resigned in 1323. One Yevile was buried here; he was mason t Richard II. and conducted the restoration of Westminste Abbey in 1396. He also founded a charity here. The gift o the living alternated between the abbots of Bermondsey an Westminster. The Crown took it in 1535, but Mary in 155 gave it to the Bishop of London. Arnold's Chronicles, abou 1500, says that "the church was much neglected, the service insufficiently performed, many of the priests and clerks spending the time of divine service in taverns and ale houses, i fishing, and other trifles."

SECOND FISHMONGERS' HALL.

Hollar's picture, 1647, shows a building of nave and aisle with Perpendicular windows to the latter and Decorated clerestory, a square tower at the north-west corner with castellate or embattled parapet. Its history all along is interwoven with that of old London Bridge, the approach to which passe alongside its west end. This building perished at the Grea Fire and was replaced under Sir Christopher Wren in 167 by the structure you have visited to-day. As Wren left it, the north and south aisles extended to the western face of the tower (completed in 1705), which thus appeared to rise from the roof of the main building; but in 1768 when the old bridge was widened and improved the north-west and south-west corners were removed, leaving the tower detached on three sides, thus adding in my humble opinion to its importance and dignity. From 1768 to the opening of Sir J. Rennie's new bridge in 1833 foot passengers were constantly passing under this tower to cross and recross the bridge on its eastern side. After 1833 it has spent a quiet life undisturbed by the eternal roar and bustle of London life and traffic across the bridge, and stands as a monument, and one of the best, of the genius of our greatest Renaissance architect, Sir Christopher Wren, and of his inimitable co-worker, Grinling Gibbons.

The vestries contain many pictures showing both the church and old London Bridge at various periods since the seventeenth century, also twelve chairs and two arm chairs of Chippendale make, and a Jacobean clock, all very rare and valuable. The pre-Reformation plate is almost unique; paten, drinking cups, old spoons, and some Maundy Thursday feet washing dishes. In the church are two very old fire engines said to be 200 years old, an old chest preserved from the Great Fire and bearing date 1614; a framed schedule of the duties of clerk and sexton, and bearing date 1678, is hanging on the entrance screen.

The pulpit presents some beautiful work, particularly the carved enrichments and the panels, the mitreing and inlaying of which owing to the overlay of successive coats of varnish are almost undistinguishable. The sounding board formerly over the top deck has been taken down and is standing in the entrance lobby; it too is elaborately constructed with mitred soffit, also almost undistinguishable for gum. I believe this church is now almost alone in the antiquarian honour of possessing a real original three-decker pulpit.

When Wren erected the buildings the windows on the north side flanking Lower Thames Street were long ones like those on the opposite aisle, but the wardens of the eighteenth century found the task of repairs owing to the damage done by the fish porters of Billingsgate so excessive that they filled up the lower parts, constructing the bullseye windows which now exist.

The reredos and organ front are both splendid specimens of Grinling Gibbons's work, or of the school of wood carvers controlled and inspired by that genius. The reredos picture is either by Sir Joshua Reynolds or by a Dutch artist. The organ was built in 1712 by Jordan, and is said to be the third finest instrument in England. The marble font is a good one and dates from 1683. There is more than one quaint tombstone in and around the church. One to the memory of a sober and temperate potman or bar-tender at the historic Boar's Head Tavern, Eastcheap, Robert Preston by name. There is another commemorating a kinswoman of my own, Amelia Corderoy, who died "a victim to conjugal affection"; but the greatest of these memorials is undoubtedly that of Miles Coverdale, the translator and publisher of the first English edition of Holy Writ authorised by the King. Brought up an Augustinian monk, he was converted to Protestantism and became under Henry VIII. Bishop of Exeter. Deposed by Mary he fled to Denmark, returning on Elizabeth's accession, and in 1563 he was appointed rector of St. Magnus the Martyr.

Among the property held by the parish of St. Michael, Crooked Lane, was the ancient hostelry famous to Shakespearean students as the Boar's Head, Eastcheap. This property was bequeathed somewhere about 1390 A.D. by the then owner, William Warder, to a college of priests founded by Sir Wm. Walworth for the church named The wardens and parishioners used to hold their vestry meetings there, and the bar parlour was doubtless one of the places of resort referred to by Arnold in his Chronicles, which I have already quoted. The immortal bard must frequently have journeyed across from the Globe Theatre over the bridge in Southwark, and enjoyed the revelry often to be witnessed there. Shakespeare must have often seen the iron tobacco box and the gilt goblet which were in use there, and which he mentions, and which are now amongst the most treasured possessions of the church of St. Magnus the Martyr.

One cannot deal with these subjects of Fishmongers' Hall and St. Magnus Church without a short reference in closing to the ancient highway over the river close by with whose fortunes both have been so inextricably connected.

King Ethelred caused a timber bridge to be constructed in 1002, which lasted a century and three-quarters, when in 1176 the monk Peter of Colechurch commenced the structure which in the main existed till 1830, a monument to sound work in bridge building so far as its principles were known in the twelfth century. Peter died in 1201 before completing his work, and one Isembert was commissioned to finish it, which in due course came about in 1214. The whole work thus consumed thirty-eight years. It was built upon platforms of timber constructed on clusters of timber piles. There were nineteen pointed stone arches of various spans, with a drawbridge in the centre, and the whole measured over 900 feet long and 40 feet wide. In one of the spandrils or pocket haunches between the spans a chapel crypt was constructed by Peter with Gothic vaulted roof, carrying the roadway above. It was approached either from the water level upwards, or from the road downwards by winding stairs. It was dedicated to St. Thomas à Becket. At the ends of the bridge there were massive stone gateway structures. Wooden houses were built at frequent intervals along its length, stretching more than the width of the bridge by being bracketted or corbelled over the sides, the traffic passing under the first floors as in a series of tunnels, the lower floors of these houses being utilised as shops with their fronts to the roadway. Fires from time to time destroyed these houses, and they were finally done away with in 1760. The narrow waterways between the pile piers so impeded the tide flow that it was quite an exciting and dangerous experience to shoot the rapids caused thereby, and it is recorded that fifty persons perished yearly from this cause. It was said that "London Bridge was made for wise men to go over and fools to go under."

OLD LONDON BRIDGE, 1756.

By the middle of the eighteenth century the state of the structure became so bad that it cost 2,500l. per annum to keep it up anyhow, and in 1760 to 1768 its repair was taken in hand. Smeaton, of Eddystone fame, being called in to advise, the old houses were swept away, some of the arches reconstructed, the roadway widened as far as might be, and the approaches also, entailing the alterations to St. Magnus's Church west end already noted. This work, however, was only tinkering with the question, and before fifty more years had passed the Corporation determined on a new structure, 100 feet west of the old one, with the result we now know and appreciate as Sir John Rennie's masterpiece.

OLD LONDON BRIDGE AND ST. MAGNUS CHURCH.

London Bridge! Of what scenes of comedy, tragedy, revelry and woe have you been the witness. Now, joyful processions of happy subjects celebrating a monarch's nuptials; now, running red with the slaughter of men, and perhaps women too, rising in protest against injustice and oppression; now blazing with banners and decorations over some Church or State festival; now desecrated or consecrated by the public exposure of the heads of decapitated traitors, patriots, or religious reformers, the victims perchance of prejudice, misunderstandings and bigotry. We live in milder and happier, if more strenuous times, and the countless throngs who pass to and fro all day and every day are mainly concerned as to how to earn their daily food and do their daily duty, holding whatever beliefs and opinions they may upon religion and politics without let or hindrance, no man making them afraid. "Think and let think," "Live and let live." May the Victorian traditions long continue the ruling spirit in British life and politics.

## GROUND PLAN OF LONDON.

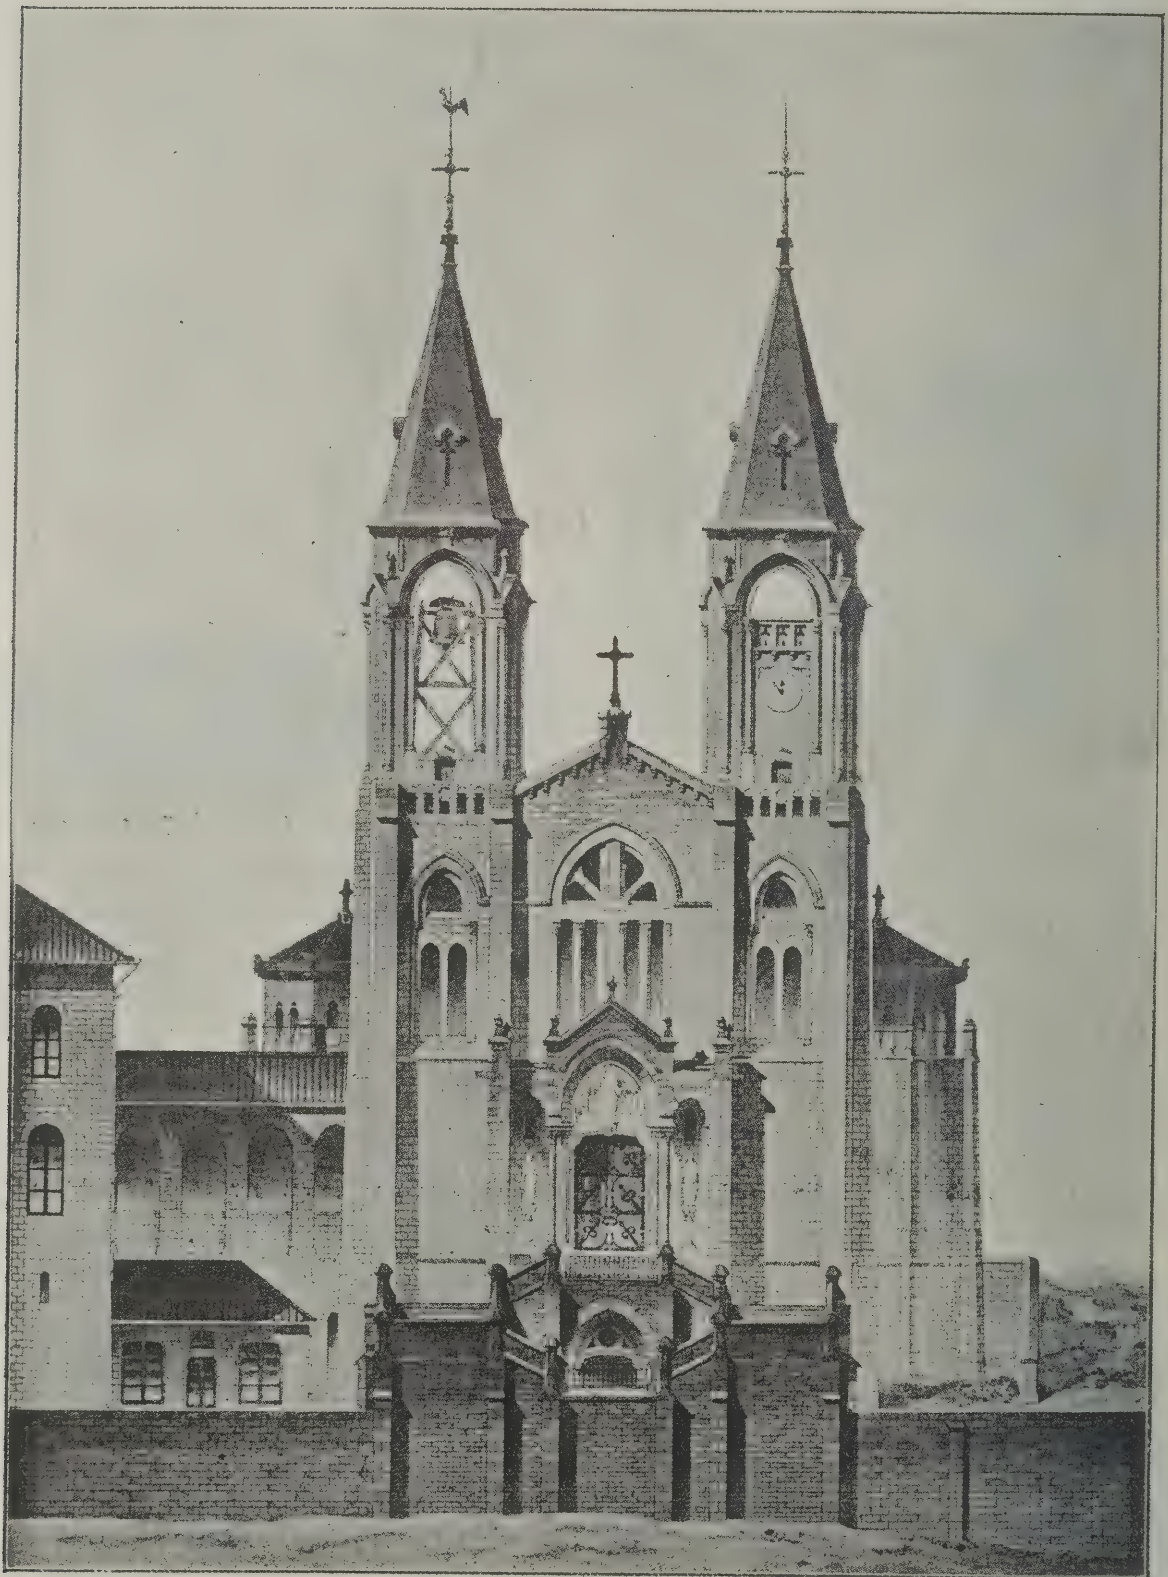
THE Local Government, Records, and Museums Committee of the London County Council has reported as follows:—

The Council on March 13, 1894, decided to prepare, for its own use, a ground plan showing the various freehold ownerships in the County of London. This course was taken in view of the fact that great difficulty had been experienced in ascertaining the ownership of property affected by street improvements and other schemes. The plan consists of ownership and detail sections, and is being prepared by the valuer. The ownership section consists of defining estate boundaries and registering the names and addresses of the owners or their agents, and the detail section of the work consists in the keeping up-to-date of the existing five-feet ordnance survey.

As regards the ownership section of the plan, the Council has sanctioned a total expenditure of 16,650l. in respect of

## MODERN EUROPEAN ARCHITECTURE.

### FRENCH WORK IN PALESTINE.



[From *La Construction Moderne*.

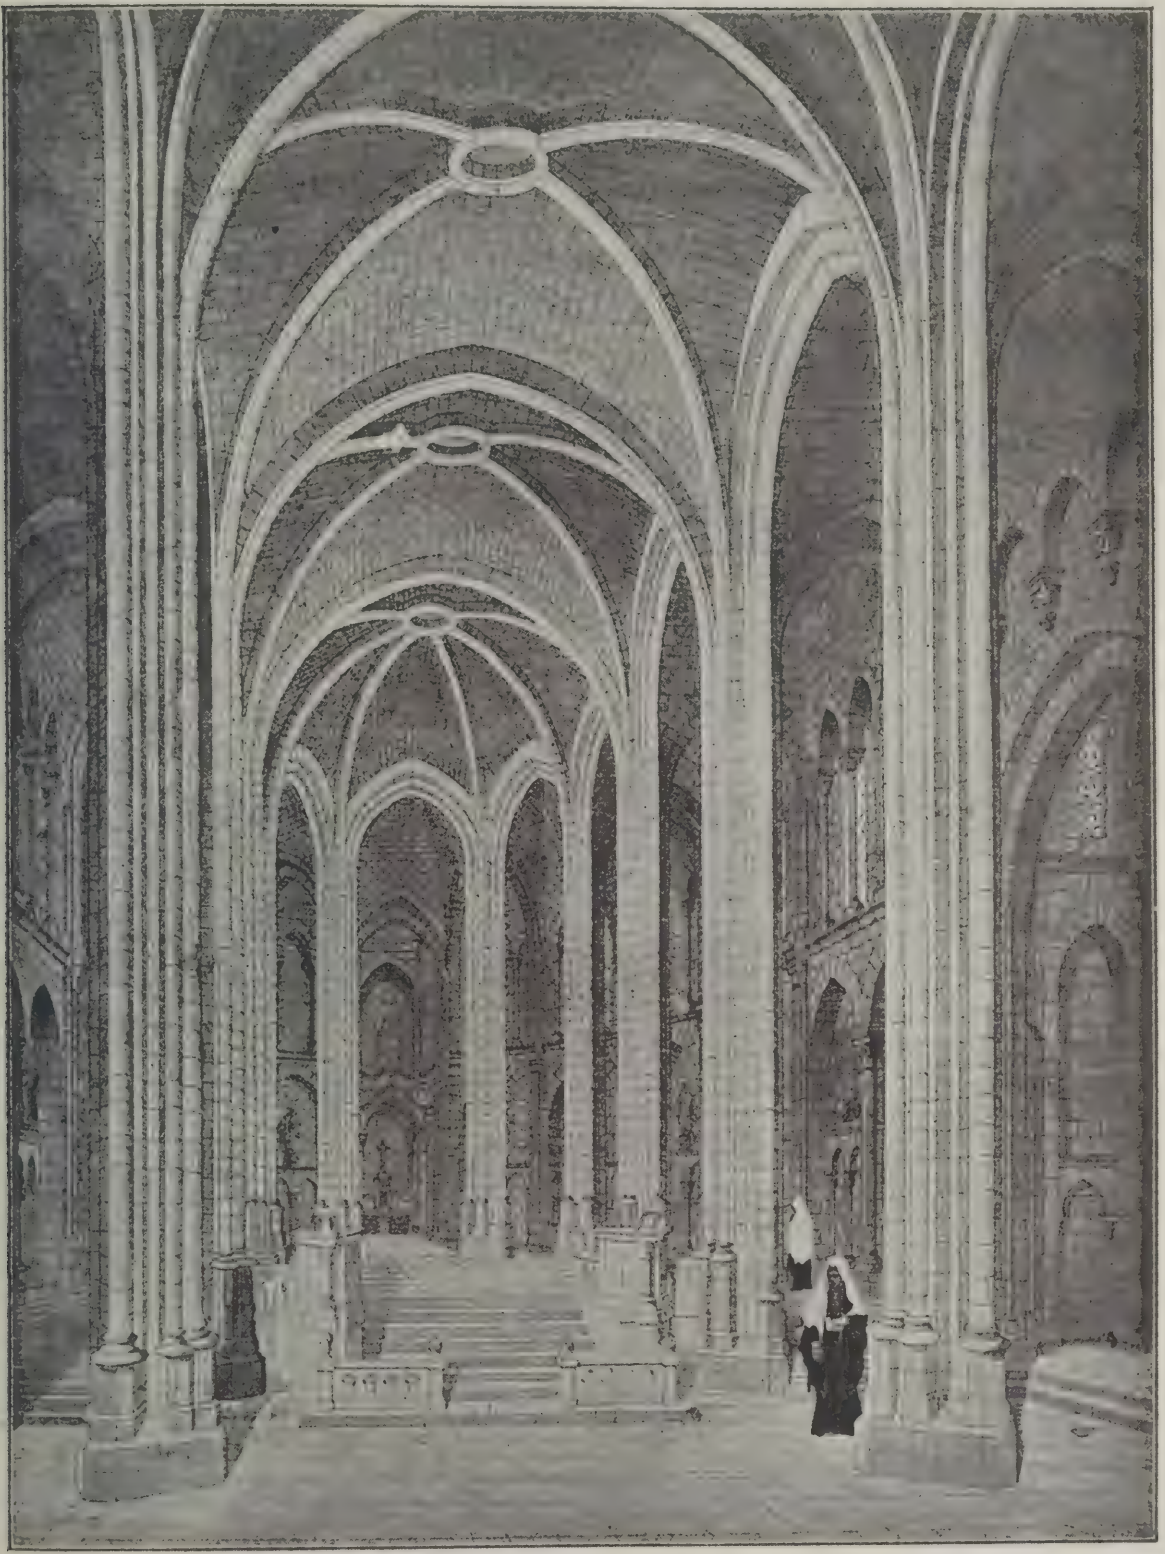
BASILICAN CHURCH OF JESUS ADOLESCENT AT NAZARETH.—M. L. GAUTHIER, Architect.

the work, and the valuer has assured us that the advantage derived from the possession of the information which has been collected has resulted in a saving of more than the sum spent. The work has now been completed, with the exception of an area of about 1½ square miles, in respect of which considerable difficulty has been experienced in ascertaining definite particulars as to ownership. Information as to these estates will probably be obtained from time to time. Up to March 31, 1910, the total cost of the work amounted to 16,634*l*. 8*s*. 5*d*., or 3,366*l*. less than the valuer's original estimate of 20,000*l*.; and the area of the estates drawn on the plan was 114 square miles 70 acres, representing 35,700 estates.

In the preparation of this section of the ground plan the 25-inch ordnance sheet has been used, and this size has been found suitable when defining the larger estates, but when dealing with the smaller estates, of which there are a large number and over 8,000 consisting of only one house, the 25-inch scale has been found too small. The wear and tear of fifteen years' work on the plan has, moreover, rendered it

## MODERN EUROPEAN ARCHITECTURE.

### FRENCH WORK IN PALESTINE.



[From *La Construction Moderne.*

BASILICAN CHURCH OF JESUS ADOLESCENT AT NAZARETH.—M. L. GAUTHIER, Architect.

necessary, on account of the dilapidated condition of the majority of the sheets, that a new copy should be made. We are satisfied that the re-drawing should be done on ordnance sheets of the 5-feet scale, which will allow of a larger reference number, thereby facilitating reference and expediting the work of re-drawing and prolonging the life of the plan. We also consider that a new index should be prepared. In addition, while the fair copy is being made, a complete revision of the changes in ownerships will be undertaken, thereby rendering the work more valuable as a means of reference.

To carry out the work above-mentioned, it will be necessary to retain the services of most of the staff who have been engaged on the ground plan during the past year, and a sum of 1,865*l*. has been included in the estimates for the current financial year for the purpose. Twenty assistants were employed in the year 1909-10, but it will be sufficient for the services of fifteen to be retained for 1910-11. When the plan has thus been revised, it will still be necessary to keep it up-to-date. We will report at a later date as to the cost of this, but it will probably be found that about half the number of assistants now proposed to be retained will suffice for the work. We have communicated with the Establishment Committee in regard to the employment of the assistants required during the year 1910-11.

## LETCHWORTH'S EXPERIENCE OF TOWN PLANNING.*

I HAVE been asked by the National Housing and Town Planning Council to contribute a few words written from the point of view of Letchworth Garden City, and of the experience gained there. I very gladly consent to write on the subject, though I fear that my words will chiefly be engaged in raising questions rather than in solving them. It may, however, be pointed out that the absence of theoretical solutions has not prevented a very considerable measure of practical success.

At Letchworth we have had in the main two problems to solve:—

(1) The laying out of a town in open order; and

(2) The means whereby the town could be created, in other words—how to attract industries by which people could earn their living.

As to the first, the town we have laid out stands on land which was previously agricultural, almost entirely free from population, and almost free from any existing roads. At Letchworth, in fact, we began as near a clean sheet as anybody is likely to begin with in this country. Nevertheless, the details of this problem were in many respects the same with us as in other instances of town planning. Having agricultural land at nearly an agricultural price, we were able to make a greater point than other towns of building in open order, with gardens and abundant open spaces. Our experience has very clearly shown the possibility and great advantage of forming beforehand a very clear plan of the method of development, and the great advantage of such a plan, and of the methodical laying out of roads and open spaces, of assigning special positions for the factories, of establishing gas and water works, and of carrying out drainage before the population had come to make such works imperative and costly.

We have had to consider the problem of the separation of classes into different parts of the town, and here it has been necessary to take a middle course. Theoretically one would have liked to see no separation of classes in the town; practically, the factory workers and the villa residents have inevitably gravitated to different quarters—the one seeking cheapness and nearness to their work, the other seeking quietness and pleasant views and other advantages for which they could afford to pay. Nevertheless, the separation is by no means complete. There is very much less of it than in an ordinary town.

One great difficulty which confronts us all the time, and with which we are grappling more or less successfully, is the heavy expense of the open order system of development. If you have 10 houses to the acre instead of 40, your roads and sewers, gas and water mains, street lighting, road repairs, and other items, cost you about four times as much per house as they otherwise would. This, of course, is a very serious matter, and in the development of our town we are constantly striving to economise road frontage, so far as that is possible, without reverting to the old system of crowding many houses on to the acre.

But it is in the second problem of attracting industries that the most valuable experiences of Letchworth are being gained. To create a new town, you need, of course, industries, and that means factories. Factories are all the time moving out of great cities, and especially out of London, on account of the high rates and rents, and of the darkness and dirt. Our object has been to methodise this exodus, and to get these factories that move out to come to a new centre, where they will have all possible advantages for carrying on their work cheaply In this we have been successful to an extent that many prophesied to be impossible. We have been successful by giving ample sites at low rents, cheap gas and electrical power, direct connection with the railways, and, of course, freedom from interference; formally the power to prevent any nuisances caused by the factories of the town is being reserved, but in practice it has never once been found necessary to use such powers, because no nuisance has ever arisen. Nevertheless, there are difficulties that make it ten chances to one whether a new centre such as ours can catch any particular industry that is moving out. Some manufacturers must have water carriage, some two or more railways competing for their custom, some will only build on freehold land absolutely free from conditions, and, of course, our land has hitherto only been offered leasehold. Others, again, though they might be willing to take leasehold land from an ordinary landlord, are afraid of collective ownership of land, and indeed have a general idea that a new town is an unsaf place for people of staid and well-tried opinions and principles.

Then, again, it is the light industries that can mos easily be moved out of the great cities; these employ women' labour chiefly, while the heavy industries employing men are much more likely to be obliged to go to tidal water or the coal fields. In spite of all these difficulties, we have got and we are getting, industries. We have already some 20 factories and workshops, employing about 1,000 people on the estate. As time goes on, and town planning, and perhap other forms of regulating the use of land in the common interest, spread more and more, it will be less easy for manufacturers to move their factories to some spot where they will have, or hope to have, complete liberty to do as they please. This liberty, as I have shown, is really for practica purposes no greater than they get in a Garden City such as Letchworth, and it is often accompanied with uncomfortable demands upon the manufacturers for high prices when they need additional land for extensions or for housing.

I said I should raise more questions than I should attempt to solve; we are, however, solving them as we go along at Letchworth. Every extension of town planning in other centres will help us by putting them more nearly on the same footing as we are. Moreover, now that we have a nucleus of 6,000 people, and so many manufacturers, the fear which some have had about supply of labour, about associating themselves with a novel idea, cannot but grow less and less.

---

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* (New York) has rather a mixed number of illustrations and so gives a fair impression of the many-sidedness of modern American architecture. The Hudson City Savings Institution, by Messrs. Warren & Wetmore, is a mixture of Greek Ionic and Italian Renaissance detail. A mausoleum at Salem Fields Cemetery, Brooklyn, is a study in Egyptian detail and a successful one. Three small suburban houses are fairly respectable, but to balance them there are three small town houses not calculated to give joy. The first of a series of articles on "The Origin and Development of Furniture," starting with Assyria and Egypt, gives promise of interest and thoroughness.

*La Construction Moderne* (Paris) illustrates a quite satisfactory block of flats at the corner of the Avenue Elisée Reclus and Rue Marinoni by M. O. Lambert, and a clever but rather weird clock-tower at Jerusalem over the Bab-el-Khalil Gate by M. P. Séraphin.

*Moderne Bauformen* (Stuttgart) is chiefly occupied this month with the work of Dresden architects and other artists, the most important series of views being of the Munich University building, by Herr German Bestelmeyer. This though mainly on "new art" principles includes an eclectic commingling of historic detail of various periods for its basis of design. A remarkable series of wooden galleries in the cathedral church of St. Peter, Bautzen, is the work of architect Fritz Schumacher and sculptor Karl Gross. Several examples of cemetery architecture are included and some effective houses at Mannheim and Zittau, these with other smaller items making quite a good number.

*Construction* (Toronto) preaches a sermon on "Terra-cotta in Residential Work," advocating the use of hollow terra-cotta blocks in lieu of clapboarding and wooden shingles. The use of the material is illustrated by numerous examples in which the finish is usually rough-cast. As a contrast and showing the possibilities of terra-cotta the Ospedale Maggiore at Milan is illustrated by some excellent photographs. The Toronto General Hospital, which will cost two and a half million dollars, is described and illustrated. Messrs. Darling & Pearson are the architects.

The Institution of Civil Engineers.—In consequence of the death of His Majesty King Edward VII. the Council have decided not to hold their annual conversazione this year. The eighteenth "James Forrest" lecture will be delivered at the Institution on June 22, at 8 p.m., as already announced.

Workmen are putting in the foundations for the proposed new south transept of Selby Abbey. The original structure was demolished by the fall of the tower in 1690. Mr. William Liversedge, a local magistrate, last week announced that he would give the sum of 1,000*l*. towards the cost of rebuilding the transept, in the hope that the matter will be taken up by the public as a memorial to King Edward VII.

## FORTHCOMING EVENTS.

*Friday, June 3.*

Carpenters' Hall : Exhibition of Works in Wood and Wood Carving, opened on June 1, closes June 11.

*Saturday, June 4.*

Royal Institution : Paper on "Electric Heating and Pyrometry" (Lecture 1), by Professor J. A. Fleming, M.A., D.Sc., F.R.S.

*Monday, June 6.*

Royal Institute of British Architects : Business Meeting; Annual Elections.

Society of Engineers : Paper on "The Inspection and Testing of Engineering Materials and Machinery," by Mr. C. V. Biggs.

*Tuesday, June 7.*

Founders' Company : An exhibition of foundry work opened in Ironmongers' Hall, Fenchurch Street, E.C.

*Saturday, June 11.*

Royal Institution : Paper on "Electric Heating and Pyrometry" (Lecture 2), by Professor J. A. Fleming, M.A., D.Sc., F.R.S.

## ARCHITECTURE AT THE ROYAL ACADEMY.

### III.

THE display of church architecture in this year's Academy is not of a very remarkable character, and seems even more than other departments to have suffered from a desire on the part of the hangers to get in as many small frames as possible, so as to total up a good number in a restricted space.

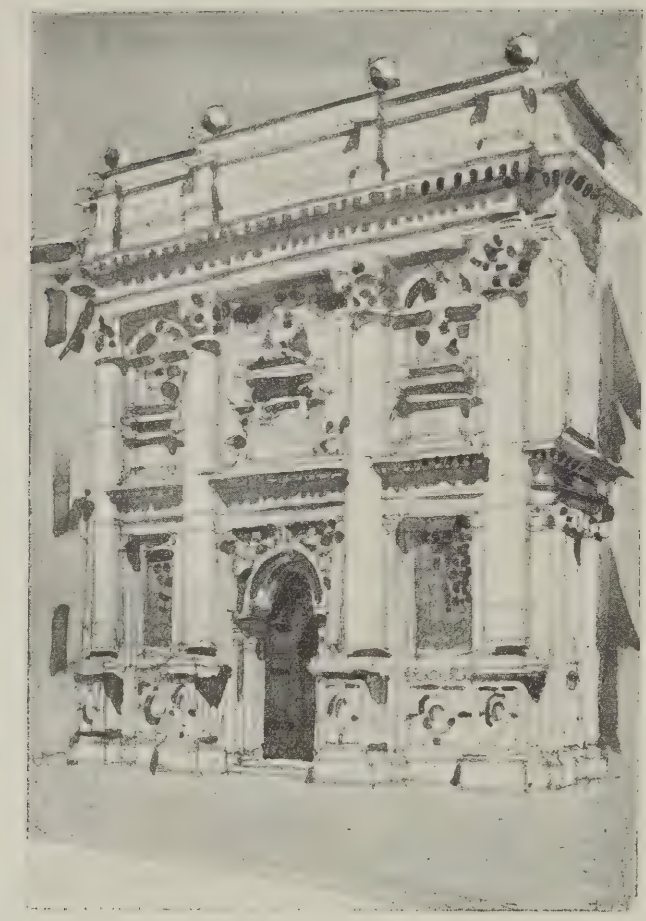
Mr. FRANK L. PEARSON'S "Brisbane Cathedral: Interior looking East," shows a design with Early English detail combined with German characteristics of massing. Apparently the cathedral is a "hall-church" with an apsidal east end, which, though, is closer to the French type than German. The nave arcade has a big triforium and no clerestory. The altar is surmounted by a curious baldachino or iconostasis. "St. Magnus Cathedral, Kirkwall: Restoration," by Mr. HIPPOLYTE J. BLANC, is a fine drawing of the interior showing Norman work in the chancel and Transitional in the crossing, with Jacobean screens. How much is original and how much "restoration" is not clear from the drawing. Another interesting drawing of similar character is "The Church of St. Helen, Ranworth, Norfolk: Proposed Restoration," by Messrs. W. DAVIDSON & E. J. MACRAE, in which the little church is made to look quite big. We hope the "restoration" does not include any re-painting of the famous screen, for the colour of the East Anglian screens to-day is very different to what it was at their first appearance, and any attempt at "restoration" must be shipwrecked on the Scylla or Charybdis of the original or the present. The church has needed repair for many a year, and the hammer-beam roof, of true Norfolk type, and the organ are quite enough of conjectural restoration, to say nothing of the rood-beam, which is scarcely even conjectural.

Mr. J. E. DIXON SPAIN'S "Swedenborgian Church, Willesden Green," is as peculiar in its design as the tenets of the sect for whom it is intended, being a study in red-brick herring-bone work with stone for the entrance. Suburban churches in which the designer has been limited for funds are quite a feature of the ecclesiastical architecture shown in the present Academy, and Mr. ARNOLD H. HOOLE'S "Church of St. Alban, Romford: Exterior," is apparently one of these, and shows how the most has been made of a limited opportunity. The "Church of St. John, Herne Hill," by Messrs. TREADWELL & MARTIN, is another example of a cheap suburban church in red brick with stone dressings, and here the architects seem to have been called upon to provide also Sunday-school or Mission-room accommodation on a lower floor for a sum barely sufficient to build an unpretentious church. "All Saints Church, Farnworth, near Bolton," by Mr. FRANK R. FREEMAN, is another cheap suburban church in which the designer has allowed himself the luxury of a good Perpendicular west window, but nothing else, as far as the drawing shows.

Mr. EDGAR WOOD'S "Design for Church," illustrated in *The Architect* of May 6, is another case in which the architect has been required to put his church proper over a Sunday school, and has solved the problem with characteristic originality and power. Messrs. HALL & DODS, in their design for "Proposed Anglican Country Church, Laidley, Queensland," have shown how a church for a tropical climate should be treated with windows reduced to a minimum, a verandah on the ground floor, and very widely-projecting eaves over a recessed clerestory, the whole an original and able design. Mr. GLENDINNING MOXHAM'S "Proposed Church, Gowerton, near Swansea," is a study in purple-grey walls with a few small windows and a tower. Mr. J. FRANCIS DOYLE in "The Harrison Memorial Church, Wallasey, and the Sir John Willox Memorial Church, Orrell," shown in one frame, maintains a fussy and restless feeling, too much approaching the type of chapel architecture in the eighties of the last century.

Mr. LOUIS AMBLER'S "Proposed Church at Holbeck Woodhouse, near Welbeck, Notts," though skied, looks a promising solution of an aisled church without clerestory in which the lighting is obtained from large east and west windows and the transepts. These, however, are carried up too close to the gable copings to be comfortable. A good square tower helps the composition. The "Church of St. Thomas, Charlton, Andover, Hants," by Mr. HUGH C. BENSON, is a small and cheap village church with a square shingled bell-turret to give character.

Mr. CHARLES J. BLOMFIELD'S design for "Proposed Rebuilding: St. Nicholas Church, Taplow," is one of the few that rise above starvation point, and is a good piece of Perpendicular work with a tower and spire, albeit the latter is somewhat, perhaps, Decorated in outline. "Church of St. Andrew, Coulsdon: Exterior," by Messrs. F. H. GREENAWAY & J. E. NEWBERRY, is another aisled church without clerestory, built of brown stone and red tile, in which the authors striving for the picturesque have evolved a new type of window, a traceried head with the sill at the springing, and even so with segmental-pointed arches. Mr. W. HENRY JEWITT'S "Reredos in Carved Oak: Painted Panels," is a very elaborate affair in late Gothic of Spanish type, with some Renaissance detail far too crowded and fussy, whilst the idea of a painted panel on high over others at



SAN GIUSTINA, VENICE.
Drawn by Leslie Wilkinson, A.R.I.B.A.

retable level furnishes quite a discordant clash. Mr. Roland W. Paul's "New Screens, &c., Weobley Church, Herefordshire," suffer from the affectation of cut-away mullions, which suggest that though the screen was not wanted as a screen, something must be put up if only the cornice and tracery heads.

In Mr. Temple Moore's "St. Wilfrid's Church, Harrogate," we have some refreshment after the wearisome monotony of unfortunate architects trying to design churches without money—a fine piece of composition, studiously irregular, suggestive of height, of triforium or galleries, with two obviously staircase towers at the west end. Messrs. J. Oldrid Scott & Son's "Proposed Design: All Saints Church, Pokesdown, Bournemouth," is clever, with a double south aisle at the west end of which is a small tower made to look big. There is a good Decorated window shown at the east end. Messrs. E. B. Hoare & M. Wheeler have produced a good effect in "St. Saviour's Church, Westcliff," with a wide nave and processional aisles, transepts, and morning chapel treated with Perpendicular detail. "All Saints Church, Porthcawl," by Mr. George E. Halliday, is another aisled church with no clerestory, but with a big square tower, which seems necessary in the design of this type of church to save it from insignificance, but which we fancy, in many instances, is a hope for the future.

Mr. Temple Moore's "St. Anne's Church, Royton, Oldham," has the big square tower to an aisled church with great roof and no clerestory. We do not understand the western projection; it seems to be large to be a narthex, and may be part of the church. A plan or section is wanted for explanation. Mr. C. E. Bateman shows the interior of "Hill Church, Sutton Coldfield," a barrel roof with ribs and apparently plaster decoration, and low squat arches to the nave arcade, with a modestly-treated chancel, the whole effective and unpretentious. "St. Gabriel's New Parish Church, Bishopwearmouth, Sunderland," by Mr. Clare A. C. Greene, is an example of modern treatment of Perpendicular with considerable originality, of which an octagonal lantern-tower over the crossing is one of the features and the oddity of marking in the parapet every buttress with a merlon is another. Spite of a tendency to eccentricity the design is an able one.

Mr. T. Rogers Kitsell proposes "Alterations to Chancel, St. James-the-Less Church, Plymouth," by substituting a barrel roof for open timber and elaborate Renaissance wood and metal work for poverty-stricken fittings of last century Gothic. But why is symmetry so essential as to demand two pulpits, and why are the sedilia on the north side, unless again to be symmetrical with those on the south which the view does not include? In the exterior of the east end of the "Church of St. Mary the Virgin, Laira, Plymouth," Mr. Kitsell has rather strained for richness in his Flamboyant Decorated window with angels on the mullions. Mr. R. Weir Schultz gives us this year "Khartoum Cathedral: West Front and Tower," of course maintaining the peculiar version of Romanesque that we saw last year from the east. The tower now appears complete at the west.

Mr. Charles J. Blomfield has a pleasant tower with stair turret of the type prevalent in Perpendicular times around London north of the Thames, in his "Proposed Additions: St. Mary's Church, Welwyn, Herts," which we presume includes also the west end shown in the drawing. A good design for "Lectern, Likoma Cathedral," is that by Messrs. Rogers, Bone & Coles, in which, in the drawing, an idea of great size is conveyed by the inclusion of small scale detail. A weird design is that for a "Baptist Church: St. John's Wood," by Mr. H. Rogers Houchin, who seems to have tried to outvie Peterborough Cathedral's west front. Mr. A. H. Ryan-Tenison shows the interior of his "Church of St. Michael, Beckton," the chief feature of which is a great hanging rood suspended from a barrel roof over a simple chancel screen. Mr. William A. Pite's sketch design for "Church of the Good Shepherd, Ealing," shown in small-scale elevations and plans, is a study of the style of church prevalent in the dead and lethargic times before Wesley, surely scarcely a good period to resuscitate. Of course a three-decker should be included, but Mr. Pite does not seem prepared to go quite so far as that. "St. David's Church, Bathgate," by Mr. J. Graham Fairley, is remarkable for the originality of design in the tower, but the author has scarcely escaped too close a resemblance to the town-hall type.

## NOTES AND COMMENTS.

Every architect and every other admirer of good craftsmanship should visit the exhibition of Works in Wood and Wood Carving which is now being held under the auspices of the Worshipful Company of Carpenters and the Worshipful Company of Joiners at Carpenters' Hall, and will remain open till the 11th instant. A very high level of excellence will be found to be maintained amongst present-day British craftsmen in wood and particularly in wood-carving.

The exhibition of drawings at the President's "At Home" on Monday last came as a surprise to many of the members of the Royal Institute of British Architects, who were unaware that the corporate body possesses so many remarkable and interesting examples of the work of famous men of the past. The late Mr. W. H. White, when secretary of the Institute, used to speak of these treasures, and lament that they should be hidden away and never properly appreciated, and since his time they have remained not only hidden, but practically forgotten, so that their exhibition on Monday came as a revelation. Having now been brought to light, we hope they may never again be relegated to the limbo of oblivion, but that means may be found when the Institute is in possession of its extended premises to maintain a permanent exhibition changed at regular intervals.

BY the will of the late Mr. HENRY JARVIS the Royal Institute of British Architects comes into a handsome windfall. The residue of Mr. JARVIS's estate is left in trust "For the Royal Institute of British Architects, the capital to be used either for the foundation of travelling studentships, to be known as the 'Jarvis' Travelling Studentships, or for the purchase and maintenance of a building to be used as the headquarters of the Royal Institute of British Architects." The trustees under the will are Mr. NICHOLAS SAVERY PASMORE, Mr. HERBERT DUNCAN SEARLES-WOOD, and Sir ASTON WEBB, R.A., who are to receive 20 guineas per annum each for administering the trust, which will probably amount to between 15,000*l*. and 20,000*l*.

SOME correspondence has taken place in the *Times* relative to the present condition of the wrought-iron screens made by JEAN TIJOU for WILLIAM and MARY and erected in the gardens of Hampton Court Palace. First there was the statement that after being moved to various parts of the grounds in order to preserve them from perishing by exposure to the weather, they were removed in 1865 inside the Palace and to various museums. In 1904 they were replaced on a curb of elegant ogee plan in the Privy Garden facing the river, where they form a palisade worthy of this Royal Palace. But it was felt at the time of their replacement that, in spite of very careful painting, the rich but thin ornament of acanthus leaves and eagles' heads with the festoons from their beaks would suffer injury from wet and wind. Unfortunately the destruction has been rapid, and the grilles are now in a far worse condition than was the case six years ago. Portions of the ironwork are red with rust, and should be painted without a day's delay. Worse than this, some of the eagles' heads are perforated by corrosion, the water does not drain off other parts, and the injury is going on. Indeed, nothing but immediate removal to a dry place can prevent the lighter parts of these screens from dropping to pieces with rust, and their becoming mere wrecks; whereas the gates of the east front of the Palace, made by the same smith, being protected by the overhanging cornice of the portico, are in as perfect condition as when erected more than 200 years ago.

THIS was followed next day by a letter from Mr. ERNEST LAW, who asserted that the injury received by the screens occurred during the 100 years that followed GEORGE III.'s accession and his abandonment of Hampton Court as a Royal residence. It was pointed out that TIJOU's two great gates, which have stood in the open for 218 years, are still practically unimpaired, and that the Office of Works is to be congratulated on the re-erection of the screens in the original position instead of being entombed in the Victoria and Albert Museum. The Office of Works has proved itself so excellent a custodian of all antiquities of historical and artistic interest that have been placed under its care that we feel confident that such valuable work as TIJOU's screens is being properly cared for, whilst there can be no question that with this proviso their retention in the position selected for them by WREN is æsthetically infinitely better than their seclusion in a museum.

PRURIENT curiosity could hardly go further than the suggestion that as the paving of Chelsea Old Church requires, in consequence of subsidence, to be taken up and relaid, the opportunity should be taken to test the truth of the tradition that the body of Sir THOMAS MORE is there buried. The evidence seems to be strongly in favour of the view that the body of Sir THOMAS MORE remains where it was originally buried, in the chapel of St. Peter ad Vincula in the Tower of London. It is true that MORE's monument stands in the south side of the chancel, but this was erected by MORE himself in 1532; and his son-in-law, WILLIAM ROPER, refers in his will to the vault at Chelsea "where my father-in-law, Sir THOMAS MORE, whose soul JESUS bless, did mind to be buried." CRESACRE MORE, the great-grandson of Sir THOMAS, states that "the body was buried in the chapel of St. Peter," but makes no mention of any subsequent transference.

THE law of ecclesiastical dilapidations is admittedly in an unsatisfactory condition, and entails undue hardship and even injustice in many cases, largely by the facility it gives for dilapidations to accumulate instead of requiring proper maintenance of the property of the Church by the incumbents for the time being. Hence we welcome the support given by the Upper House of Convocation of the Northern Province to the principles laid down by the Upper House of Canterbury:—(1) There must be periodical and compulsory inspection; (2) there must be annual payments by all incumbents—that is, a system of insurance; (3) surveyors should receive fixed salaries, and not be paid by fees.

AT the first annual meeting of the Edinburgh and East of Scotland Branch of the Garden Cities and Town Planning Association the future of the dockyard town of Rosyth came under consideration. Professor LODGE, in moving the adoption of the annual report of the Association, said that at Rosyth they had, on land owned, or largely owned, by the State, the prospect, he might say the certainty, of building up a very considerable town connected with the development of the Navy—a considerable dockyard town. They had all felt, he supposed, it would be a positive scandal if a town rising under these conditions were not built on model lines. Here was the growth of the town calculated, the ownership of the land favourable; here was this opportunity, and here was the Town Planning Act to give the necessary driving force. It all made one feel that unless the opportunity was taken, the garden city movement would be condemned, and the Act would prove itself rather a fiasco. There were with regard to this scheme certain proposals which had not yet taken shape, certain negotiations which could not be divulged, but he thought it was an open secret that the Admiralty was extremely well disposed to consider favourably any scheme for the proper and harmonious development of Rosyth on what might now be known as garden city lines. Secondly, it was no secret that the Scottish Local Government Board was eager and willing to use all the powers which the Town Planning Act gave it to encourage the development of Rosyth on such lines as he had mentioned. It was the duty of the Branch, if it could not take a share in the development of Rosyth, to watch over its development, and to keep public interest roused about it, and to render any service open to them.

MR. WILLIAM ROBERTSON, member of the Carnegie Trust, Dunfermline, pointed out the great practical difficulties that faced them in dealing even with such virgin soil as Rosyth. He said that he knew the owners of the ground, and their action was paralysed by the fact that the Government was prepared to feu 600 acres of land. The Government ground lay nearest to the busy part of the dockyard, and the adjoining proprietors' ground would come in after the Government ground had been dealt with. He thought the hopes of the Association must largely centre in what was done with this 600 acres of Government ground. If a beginning was made on that ground in the way of forming a garden city, that would probably give a lead to the character of future villages. But knowing the district as he knew it, he could not see how it was possible to be generous in the way of wide roads, open spaces, low houses, and low feus. The local authority, he took it, in this case must be the County Council. The local authority had laid a water supply. It was estimated to cost 100,000*l*. It had actually cost 200,000*l*. It was undertaken with a view to meeting the needs of a probably large population, and it would be some years before they could have anything of an income from rateable subjects on that land. A drainage scheme was estimated to cost over 100,000*l.* The County Council naturally hesitated to adopt a scheme of that extent, because who meantime was to bear the assessments? They could not expect the income from land as it was to-day to meet the cost of a huge drainage scheme intended to meet the needs of a large and closely concentrated population. As this 600 acres of land were a sort of by-product of the Naval Base, the chances were that the Government would be willing to feu that land at a very low price. If there was any fear of their doing that, they could quite well see the local authorities would hesitate as to committing themselves to a drainage scheme until they knew where they were. He thought that the best solution would be if the Government handed over the acres to the Garden City Association to develop.

We regret to note that the Manchester City Council has refused to make to the Art Gallery Committee the usual provision of the sum of 2,000*l.* for the purchase of works of art, and also to further reduce the grant to the committee by 400*l.* This, although the estimates for the year, without this crippling of the Art Gallery, showed a decrease in the city rate of 0.63*d.*

The decision of the Divisional Court of the King's Bench in the case of Collins *v.* Greenwood is of interest and importance. The case was an appeal from a decision by the justices of Durham that a stable erected by the respondent was not a "domestic building" within the meaning of the by-laws. The justices found as a fact that the respondent had built the stable without having a plan approved by the District Council, but, being of opinion that it was not a domestic building within the meaning of By-law 1, and that there was no contravention of the by-laws, dismissed the information, but agreed to state a case for the opinion of the High Court. Their Lordships were divided in opinion, Mr. Justice Coleridge, who dissented from the conclusion of the other judges, holding that the justices were wrong, and that there ought to be a conviction. The Lord Chief Justice and Mr. Justice Channell were of opinion that it was not a reasonable interpretation of the by-law to hold that a stable was a domestic building requiring windows and an extended air space for ventilation. They therefore agreed that the justices were right in dismissing the information. The appeal was therefore dismissed, with costs.

The absurdity of the conditions under which local authorities too often expect responsible positions to be accepted has been well satirised by an applicant to the Ruthin Rural District Council for the post of surveyor and sanitary inspector, which had been advertised at a salary of 80*l.* a year, including expenses, the successful candidate to devote the whole of his time to the duties of the office. The applicant said he was tall and good-looking, able to speak eight languages, and was at present learning others. In addition to carrying out the ordinary duties mentioned in the advertisement, he was willing without extra remuneration to act as police constable, as caretaker of the municipal buildings, as fireman, assist at the cleaning of streets and the collection of house refuse. The writer said it appeared that there was need to provide a future home for the beneficial treatment of maniacs in the district, and should the soil be clayey he would make bricks in his spare time for the building of the "home," and he would even clean the councillors' boots with "Nugget" bought with a portion of the lavish salary offered. He had spent 600*l.* to qualify as a sanitary engineer, but he thought the post such a unique one that it would give him ample scope to complete his education in municipal work. The applicant concluded by asking permission to keep fowls and a cow, in order to provide the poor of the district with eggs and milk free.

## MODERN COLD STORAGE AND REFRIGERATION.

By W. S. Douglas, B.Sc.

### X.—METHODS OF COOLING.

So far we have dealt in a general way with the construction of cold stores and with refrigerating machines. These form the component parts of a cold storage installation, but unless the proper connection is made between the two a self-contained whole cannot be produced. To explain how such unity can be established is the object of the present article.

We have spoken very freely of the refrigerating "machine." It should be explained, before going further, that this is a term in the interpretation of which much undue latitude has been allowed and taken. A refrigerating plant, as we know, consists of three essential units: the compressor, the condenser, and the evaporator. Of these three the compressor is actually a "machine," but the others are merely accessories. Hence the undesirably loose practice has grown up of applying the expression with indifference either to the compressor only or to the complete plant, according as the purpose of the speaker or writer might best be served. In these articles let it be stated, to avoid any misunderstanding, that the latter is the sense in which the term will invariably be employed, and that each of the separate units will be referred to by name.

The unit which we have to do with now is the evaporator. The compressor and the condenser, with which we are acquainted, are quite separate from the cold rooms, but the evaporator is intimately connected with them. It consists (to recapitulate) of the coils of piping, in which the suction of the compressor causes the refrigerant to vaporise, and consequently to draw its latent heat from its surroundings, rendering these intensely cold.

In the ordinary evaporator, as already explained, the coils are immersed in a tank, filled with unfreezable brine, and the chilled brine is circulated by a pump to and from the spot where the actual cooling is required. The brine acts, in fact, as a carrier. This apparatus is the evaporator proper, but we may also place the evaporating coils inside the cold rooms themselves. We have then what is known as direct expansion. A further modification is to place the pipes in the cold room, but at the same time to surround them with brine either in tanks or drums. In this way the two first arrangements are combined and the advantages of each obtained. Yet another system, introduced originally by St. Clair, is to build the pipes into stacks in a separate chamber and to circulate the air from the cold room over them by a fan. This is known as the cold air blast method.

There are, therefore, four principal methods of cooling cold stores:—

1. Brine circulation.
2. Direct expansion.
3. Direct expansion and still brine.
4. Cold air blast.

*Brine Circulation.*

For the sake of simplicity in explaining this method of cooling, we take as example a small cold room, 360 cubic feet inside capacity, connected to a small vertical compressor, with its attendant condenser and evaporator. These are shown both in plan and elevation in fig. 31. The compressor, marked "A," is bolted to the side of a strong cast-iron tank "B," which contains the condensing coils. It is arranged for belt drive, and the pulleys are seen on the opposite side of the condenser tank, through which the driving shaft is carried. The refrigerant used is sulphur dioxide, and the machine is therefore enabled to operate at the low condensing pressure of 45 lbs. per square inch (with cooling water at 70° Fahr.). At this pressure, by means of the delivery pipe "C," the compressor discharges the gas into the condensing coils. There it is liquefied, and spurts through the expansion valve "D" into the pipe "E," which leads it to the coils of the evaporator. These are immersed in calcium chloride brine, contained in the well insulated tank "F," and are connected once more to the compressor by the suction pipe "G." Through this pipe the vaporised gas is drawn back to be recompressed after having absorbed its latent heat from the unfreezable brine.

This is the first circuit, which is followed by the gas. The second, interlinked with the first, but quite separate from it, is that followed by the brine, and the agitating force in this case is, instead of a compressor, a small rotary circulating pump "H," which is driven off the driving shaft near the pulleys. It is connected to the bottom of the evaporator tank, and sucks therefrom the coldest brine, which it discharges by pipe "J" to the drums in the cold room. These consist of 7-inch or 8-inch galvanised cylinders, having end plates arranged to take the necessary connections. They are supported on bars, which are carried from the ceiling by forged hangers, and are kept equidistant by the stiffness of their end connections. The arrangement of the latter will be seen by inspection. Delivery of the cold brine to the first drum must take place at the bottom, and its exit is arranged at the top. It then flows to the bottom of the second drum, leaves at the top for the bottom of the third, and so on, finally quitting the system at the top of the last drum, whence it returns through the return pipe "K" to the evaporator. In this way the circulation is greatly aided by convection currents within the drums. The pipe "K" should be stopped some distance above the tank in order that the return flow of the brine may be visible, and any checking of same at once made obvious. A probable cause of such a checking would be the locking of air in the higher points of the circuit, and, to avoid this, petcocks should be placed at all points where the said locking might occur.

FIG. 31.—SMALL COLD ROOM COOLED BY BRINE CIRCULATION.

When the brine returns to the evaporator its temperature under ordinary working conditions will have risen by some 6—8° Fahr. It is then gradually cooled by the vaporisation of the sulphur dioxide inside the coils, and finds its way to the bottom of the tank, whence it is sucked once more to the circulating pump and discharged to the drums. All pipes in the circuit which are exposed to the air, as well as the brine tank itself, should be well protected by suitable lagging.

The circulation of air in the cold chamber under this system is effected simply by convection currents, and is in consequence rather more sluggish than it ought to be. As the heated air from the goods in storage during its upward progress reaches the brine drums, it is suddenly chilled, and at once deposits its moisture in the form of snow on the cold metallic surface offered to it. At intervals this snow should be allowed to melt off, dropping, as it does so, in the form of water on to the drip shutes "L" provided. From these it runs to the collecting shute "M" at the lower end of the other shutes, and thence by a trapped pipe to the nearest drain.

Instead of placing the drums on the roof, they might be built into a stack at one end of the room and separated from the rest of the chamber by a thin partition. Hot air could then be sucked in from the top of the apartment by a fan, cooled by contact with the drums and discharged into the room again through holes in the bottom of the partition. Great dryness of the air is obtained in this way, and also a continuous circulation, which is found with some classes of goods to be most essential. The snow water is with this arrangement collected in a lead tray, which is connected by a trapped pipe to the drain in the usual way.

Yet another method frequently adopted is to circulate brine in 2-inch galvanised pipes. These are arranged in grids round the walls and on the ceilings of the rooms, being subdivided into sections for the purpose of easy regulation and for thawing off the frost from each in turn. No partition is erected between the pipes and the cold store, and circulation is entirely by convection. This system is greatly favoured for large stores in America, and for certain classes of goods has its advantages. Where there are many rooms and several floors, as in public stores, it is as well when brine pipes are used to have separate delivery and return pipes for each floor, these being connected to distributing mains, from which branches are led to the various rooms. The usual precautions should be taken to prevent locking of air.

Brine circulation, as a method of cooling, has the great advantage that it permits of easy regulation of the temperatures, and tends to eliminate small variations. In this respect it might be likened to the flywheel of a gas engine, which converts the irregular bursts of the explosions into a uniform and even turning movement. It possesses in fact, that useful quality "inertia" whereby all the irregularities which are always present in direct expansion are toned down to a mean value. This, in certain cases, as will presently be seen, is of the highest importance.

Another advantage of brine pipes in the chambers, which is more telling in America than in England, is that, in the event of a breakdown of the refrigerating machinery, it is possible still to refrigerate the rooms on the system introduced by Mr. Madison Cooper. This is exactly analogous to the hot water arrangements in an ordinary house. At a higher level than the pipes on the cold chambers a set of coils is placed, immersed in a freezing mixture of ice and salt, contained in a large tank. The pipes in the chamber are then connected to the coils in the tank, and the whole system of tubes is filled as usual with brine. The effect is that the brine, while doing its cooling work in the stores becomes heated, and rises by displacement to the coils in the ice and salt above. There it becomes cooled and finds its way by the return pipe back to the cold rooms, and the circulation is thus kept up continuously. In installations where uninterrupted running is essential and where there is no stand-by compressor, this adaptability is a great point in the favour of brine piping.

With brine it is also possible to lay up a store of "cold" (to use once more a most convenient inaccuracy) for use when the machinery is stopped. To effect this the plant is run for some hours on the brine tank until a very low temperature is obtained. The brine can then, if the pump is kept going, be circulated through the rooms and the cooling carried on as usual, after the main plant has been shut down. In many cases this is extremely convenient.

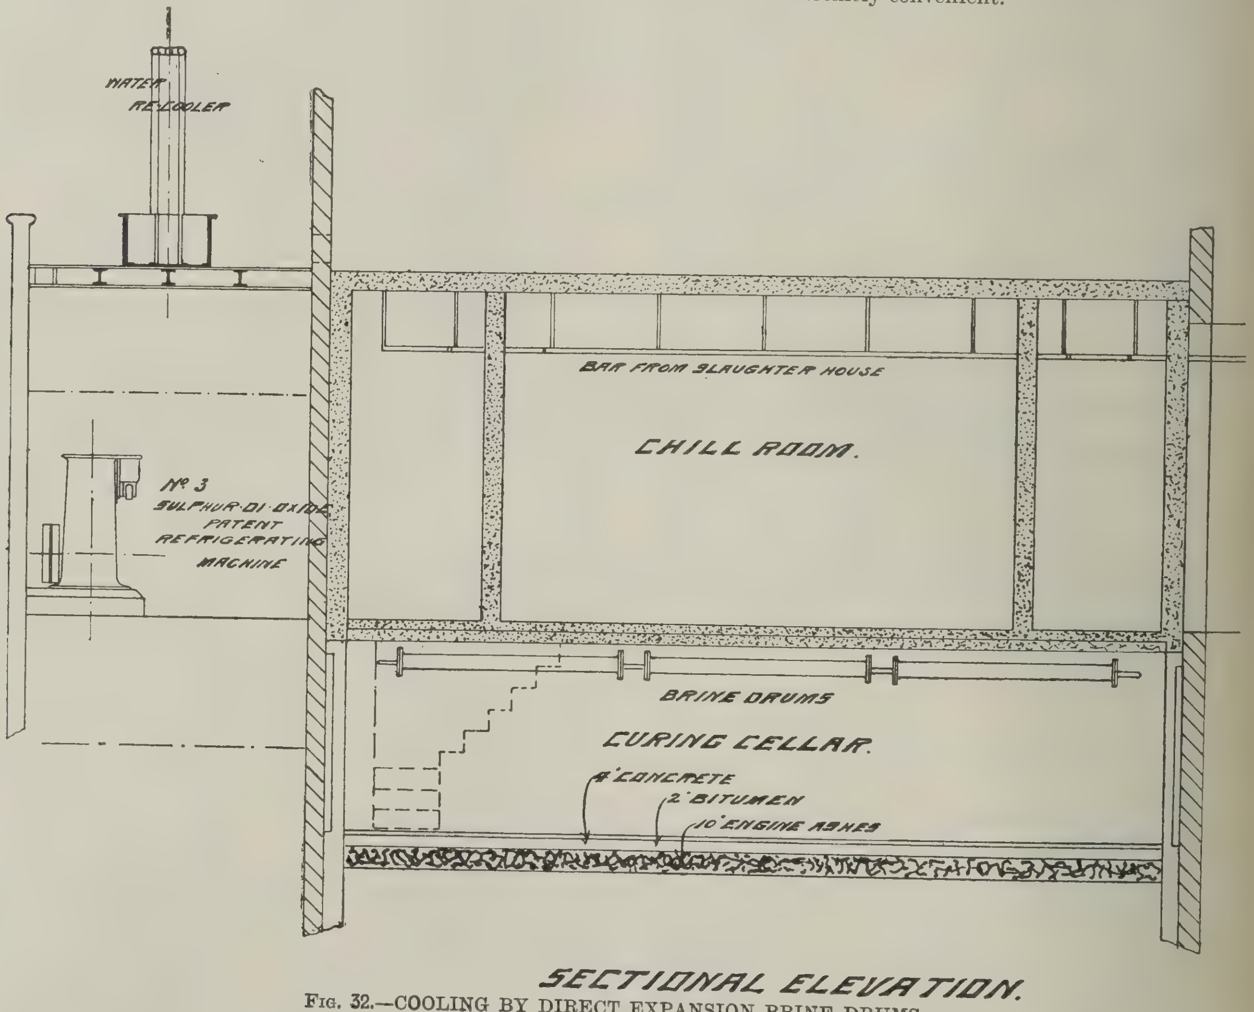

FIG. 32.—COOLING BY DIRECT EXPANSION BRINE DRUMS.

### *Direct Expansion.*

As far as construction goes this is the simplest system of any. No brine tank is needed and no fan or separate air-cooling chamber. The evaporating coils, which are connected direct to the compressor and condenser, are fixed to the sides and ceiling of the cold rooms, and the hot air rising through the goods in storage comes into contact with these by flowing in convection currents. When it is cooled it descends again by gravitation to the bottom of the room, and is able to restart its upward path. Its moisture is to a large extent condensed on the piping owing to the sudden chill, and forms snow, which must be scraped off, if the plant is running continuously, or which falls as snow water if there are intervals. A very good plan, if the piping is arranged, as it should be, in several sections, is to shut down each section in rotation as the snow accumulates. That particular section is then thawed out or defrosted, and when all the snow on it is melted, can once more be switched into circuit. In the meantime since only a small portion of the total range of pipes has been interfered with he cooling effect is not materially lessened. In any case drip hutes, arranged to fall towards a suitable outlet, must be ixed underneath each range of pipes.

Direct expansion for quite a long time in the early history f refrigeration was regarded with great disfavour. There vas a strong prejudice existing against it, which was probably due to the innate conservatism in man, but was ostenibly put down to the fear of leakages. Long trial and experince have proved however that no such danger really exists, nd the system is now, on this side of the Atlantic, and for emperatures below freezing point, more widely in use than ny other.

Its first chief advantage is great simplicity of construction, ombined with low first cost. To begin with, the gas inside he pipes is at a lower temperature than the corresponding rine would be, and more heat is therefore abstracted per quare foot of pipe surface. This means that the length of ipe necessary to cool a given space to a given temperature is ess, and that, for this reason alone, quite a large economy nust be effected. As a matter of fact, the length of pipe of he same diameter required with direct expansion would be nly two-thirds, or even one-half, of what must be put in with rine. A simple calculation will show what a saving this neans, when it is a question not of feet, but of many miles of ubing.

More important even than this reduction is the total limination of the evaporator (in its brine tank form). In the rine system it is obvious that at least the same amount of ieat must pass from the brine through the evaporator coils to he refrigerating gas as is taken by the brine tubing from he cold rooms. That is to say, as the temperature difference is bout the same in each case an amount of pipe surface must e provided in the evaporator coils at least equal to that xposed by the brine tubing to the cold rooms. Hence with rine not only is the amount of tubing in the room itself inreased, but the new total, including the increase, is doubled n the evaporator. If we also add to this the cost of the nsulated brine tank, which forms an integral part of the vaporator, and that of a brine circulating pump with belt nd pulleys, it is obvious that quite a formidable total is btained. No difference is made in the method of fixing the ipe to the walls as that is the same in both cases.

The second important point in favour of expanding lirectly in the cold rooms is that the temperature of the gas, lthough lower than that of the brine would be, is not so low s the temperature of the gas in a brine tank evaporator. Hence the compressor can work with a higher suction or 'back'' pressure (since this depends on the evaporating emperature) and consequently absorbs less horse power. It ollows that the running costs, as far as the coal or electricity ill is concerned, are considerably reduced.

It has been urged by its detractors that, where there are several rooms to be maintained at different temperatures, involving of course different back pressures, direct expansion fails. There is a certain amount of truth in this, as the varying pressures in each of the parallel circuits formed by the different rooms are bound to produce a slight unevenness of working. In the writer's experience, however, the difficulty is slight, and by paying proper attention to the different expansion valves can be quite easily overcome. In extreme cases it can be practically eliminated by subdividing the coils in each room into sections, and regulating the temperature by shutting off one or more sections in a given room as required, making the finer adjustment by means of the remainder. The back pressures would then all be approximately the same, but the system, except in rare cases, is not a good one, and is rendered exceedingly complex by the multiplication of valves. In fact, where the difficulty of widely varying back pressures arises (which will be only seldom) it will be found much simpler and quite as efficient to adhere to the ordinary arrangement. The only real trouble with direct expansion is that the cooling effect comes sometimes in gusts, as it were. To overcome this, where it is absolutely essential, the brine "flywheel" must be brought into being.

### *Direct Expansion and Still Brine.*

This system is used in installations of moderate size, when the circuits are on the direct expansion principle, and it is essential that one should be steadied by the action of brine. In such a case it would not be economical to instal a special evaporator for the benefit of that one circuit, and the compromise known as direct expansion and still brine is therefore adopted. The arrangement is illustrated in fig. 32, which shows a vertical section of a small refrigerating installation, consisting of a chill room for beef and mutton, with an air lock at either end, and a bacon-curing cellar underneath. Meat is brought into the chill room at one end when it has hung for some hours after slaughtering, and, when required for use, is taken out at the other end for distribution. For this purpose air circulation is necessary, and the chill room is cooled on our fourth system—the cold air blast. In the curing cellar below, however, an even, never varying temperature had to be maintained, and to avoid installing a special evaporator, direct expansion brine drums were put in to give the necessary steadiness. These consist of 8-inch galvanised drums filled with still brine. Through them, by stuffing boxes in the end plates, pass 1¼-inch pipes, which communicate their cooling effect to the brine, and are connected direct to the refrigerating compressor and condenser, seen in the engine room to the left hand, where the gas engine driving the compressor and dynamo is also located. It should be noted that, owing to the scarcity of water, a recooling apparatus for the condenser water was installed on the roof.

The action of the direct expansion brine was also assisted by blasts of fresh air from the chill room cooler.

## ALL SOULS COLLEGE, OXFORD.

By C. GRANT ROBERTSON, M.A.

THE buildings of All Souls College offer a triple interest to the student and sightseer—the interest of the historical evolution of the College from its foundation in the year 1438 to its present form, the interest of architecture æsthetically considered, and the interest of the builder's technique, which appeals especially to the professional expert. In the following brief paper the first two elements alone are considered, since the writer is not properly qualified to discuss problems with which no one but a trained architect could satisfactorily deal. Broadly speaking the buildings of the College as a whole fall into three well-marked groups, corresponding respectively to three historic periods of expansion. To the first—the epoch of foundation—belongs the present front quadrangle, which contains the original chapel, the old library and the site, though not the construction, of the modern hall. To the second in the sixteenth century we owe what is now called the warden's quadrangle, bounded on the east by the warden's garden and on the south the extension of the face of the front quadrangle along the High Street. From the third in the eighteenth century comes the new hall, the great quadrangle lying to the north with its piazza cloister, the Codrington Library, and the block of buildings which links the library with the hall. Since the middle of the eighteenth century there has been very little additional building, and the boundaries of the College to-day remain practically as they were demarcated about 1750.

The buildings therefore contain in epitome the history of the College in its successive expansions, and present to the historical student of domestic and public architecture interesting examples of various clearly defined styles. It is worth noting that in comparison with several of the other Oxford colleges All Souls has been less tampered with by the restorer of previous generations, while the College archives contain material which enables the student to examine several of the stages in full detail. In particular, a drawing of the College as it existed in 1598 (reproduced in a reduced form as frontispiece to the present writer's "History of All Souls") is exceedingly valuable, as it is obviously a work of care and accuracy, and provides an instructive comparison with the freely drawn and somewhat imaginative crude cuts to AGAS's well-known map of some thirty years earlier, and to LOGGAN's print of some eighty years later. Not, of course, that the restorer has not in All Souls at various epochs been as anxious to "improve" as elsewhere in Oxford, but fortunately the most elaborate efforts of the middle eighteenth century in this direction were frustrated. Conversely, the "restorative" work of the last quarter of the nineteenth century has been devoted mainly to removing the results of previous partial restorations, with the object, where it has proved possible, of bringing back the buildings to their original form. This has been, as will be seen further on, especially the case with the chapel.

The front quadrangle, begun in 1438, remains virtually the same as originally planned. It is perhaps the best example of unrestored fifteenth-century work in Oxford. The cusps of the windows have been apparently cut square (probably in the seventeenth century), grass has been laid down in the centre, and much of the stonework has of necessity been refaced. But the original lines remain intact. The original carving on the main gateway —the souls rising from Purgatory, thanks to the prayers of the faithful—still remains, and though the internal division of rooms has been in places reconstructed, doorways and archways have been untouched. The tower is a genuine fifteenth-century tower, and the whole presents an instructive plan of the collegiate economy of the late Middle Ages. Into this quadrangle were packed on the founder's scheme the warden and forty Fellows; the warden alone had two rooms (on the right-hand side, first floor, as you enter), partly forming the arch above which the tower rises. Here lived the warden, thus able to see all that went in or out of the College. The chapel forms the north wall, and is large in proportion to the rest of the then existing College. But, seeing that All Souls was founded by HENRY CHICHELE, sometime Archbishop of Canterbury, to be both a religious and a studious foundation, the chapel naturally was the centre of the Society. The plan seems to be based on that of New College, of which CHICHELE was both a scholar and Fellow, and both on Magdalen and All Souls the genius of WILLIAM OF WYKEHAM, the most original and munificent of the founders of Oxford colleges, has left its stamp. The first hall ran at right angles to the chapel (not as at present a continuation of its lines), and the drawing of 1598 shows that it was surmounted by a large lantern. As at New College and Magdalen, so at All Souls, the fact that the hall was built on to the east wall of the chapel prevented an east window from forming a feature of the building. Hence above the main altar in all three colleges comes the stone reredos, which is so memorable for all who have compared the architecture of these three chapels. The chapel at All Souls has a unique and dramatic history. You enter through a stone-vaulted passage with fan-tracery on the ceiling into the antechapel, separated from the chapel proper by a screen. At All Souls the antechapel does not form a strictly rectangular oblong, for it is narrower at the north than at the south end. This is apparently due to two causes: the west and outer wall follows the slanting line of the mediæval street ("Cat Street," not "St. Catherine Street," as a modern municipality in defiance of well-attested historical facts has chosen to name it), but in order to make the orientation of the high altar correct and keep the form of the chapel rectangular the inner line of the antechapel marked by the screen has been taken out of the true parallel. The difference is scarcely perceptible to most sightseers, but when once it has been pointed out it is strikingly apparent. The present screen of painted wood and Classical design dates from the seventeenth century. The first screen was probably Gothic in form (though no drawing of it exists) and disappeared in the sixteenth century. Though its style is wholly different from that of the rest of the architecture, the contrast is really not so jarring as description on paper might suggest. The oak stalls with their beautifully carved miserere seats (no two alike in the whole chapel) date from the foundation, and the woodwork, though not the carving, has only been slightly restored. The original reredos, "the things they call organs" (the position of which is uncertain), and the six altars were all either mutilated or destroyed by the Protestant reformers in 1549. The organ has never been replaced, and to-day All Souls alone of all the Oxford colleges has no music at its services. For a century the reredos remained a defaced ruin. In the seventeenth century the wall was plastered up and covered first with one fresco (of which EVELYN said that "it had too many nakeds for a chapel"), and then with another, representing the Apotheosis of CHICHELE. The windows were altered, the oak stalls painted over, and the superb hammer-beam ceiling filled in and transformed out of existence. An altar with an entablature was then placed against the east wall, and so the chapel remained until 1870, when some necessary repairs to the fresco revealed to a college and a world that had forgotten that All Souls once had a reredos the remains of the beautiful fifteenth-century stonework beneath. Thanks to the munificent benefactions of past and present members of the foundation, notably Earl BATHURST, who alone gave 4,000*l.*, a thorough restoration of the chapel was undertaken, and under the guidance of Sir GILBERT SCOTT the reredos was reconstructed, the hammer-beam ceiling once more brought to light and renovated, the paint taken off the stalls and desks, and the windows recut to their original form. So far as the historic data could provide, the chapel to-day represents the chapel that CHICHELE and his immediate successors planned. Its chief glory is the reredos, which both in form and workmanship is superior to that both at New College and Magdalen. One feature the modern restorers shrank from attempting to replace. A careful inspection of the reredos shows that in its fifteenth-century form the stonework, both of niches and the canopies over the statues, was completely coloured in red, blue and gold. The problem of restoring this colour without adequate authority as to its scheme, nature and extent, was regarded, and probably wisely, as too difficult to be satisfactorily solved. But it is interesting to note that quite recently, under the expert advice of the late Mr. KEMP, the College, when restoring the tomb of Archbishop CHICHELE in the chancel of Canterbury Cathedral, decided not merely to remove the baroque and grotesque additions made in the seventeenth century, but to replace the original colouring on the stonework. Those who know the cathedral will probably agree that the restoration has been eminently successful, and the tomb of the founder of All Souls is now one of the finest of fifteenth-century memorials existing in this country.

*(To be concluded.)*

## COMPETITION FOR ENLARGEMENT OF QUEEN'S UNIVERSITY, BELFAST.

IN the particulars of this competition Sir ASTON WEBB, C.B., R.A., has found it possible to follow the suggestion made in the professional Press as to the reduction of the labours of competitors. The only drawings required are plans, two elevations, and two sections to a scale of 20 feet to an inch, and a small bird's-eye view is optional. Nobody, we think, can object that in this case too much is asked of competitors.

## ILLUSTRATIONS.

### OXFORD COLLEGE SERIES, ALL SOULS.—QUAD—FRONT QUAD.

WE commence this week the illustrations of All Souls College, of which an historical and descriptive account appears on p. 351.

### COMPETITION DESIGN FOR NATIONAL MUSEUM OF WALES

MR. A. GILBERT SCOTT, the author of the competition design we illustrate this week, says:—

In this design my object has been to produce a building with some of that elusive "abstract" quality peculiar to great buildings, and which seems so lacking in most of our modern buildings.

I have endeavoured to design it "as a whole," the internal halls rising above the rest of the building helping the exterior to express the interior.

I have made no attempt to reproduce the design of the adjacent buildings, the purposes of the buildings being so very different that I felt this would be an architectural mistake. The lower cornice of the design carries through the level of the City Hall and Law Courts, which is all that is artistically necessary.

As regards the planning, all the public exhibition galleries are on the ground floor, a great convenience both for the public and for supervision purposes.

The reserve was specially arranged to be "well away from the noise and traffic of visitors to the galleries," as requested; and none of the public galleries are dependent upon side lighting.

## ZINC OXIDE.*

*(Continued from last week.)*

THE chemical equations showing the reaction are as follows. Combustion of the anthracite with production of $CO_2$ and $CO$:—

$$C+O_2=CO_2$$
$$CO_2+C={}_2CO$$

Reduction of the ore: $-ZnO$ (of the ore) $+ Co = Zn$ (in vapours) $+ CO_2$ $ZnO$ (of the ore) $+ C=Zn$ (in vapours) $CO$ (in the presence of coal).

The re-oxidation of the metal in vapours:—

$$Zn+O=ZnO \text{ (white zinc).}$$
$$Zn+CO_2=ZnO+CO \text{ (white zinc).}$$

This second reaction takes place because it is not in the presence of coal, the reagents Zn and $CO_2$, being in a gaseous state, are in the upper part of the chamber (K), and even in the tubes (M), plan 3 and 4. Of course, in the presence of coal the inverse reaction takes place, as we have seen in the reduction of the ore. It will, no doubt, be interesting to give some information concerning the ores usually treated by this method.

In the United States, most of the ores consist of a mixture of franklinite—chemical formula, $3\ FeO + 3\ ZnO + (Fe\ Mn_2)O_3$. Willemite, chemical formula: $2\ ZnO.SiO_2$ and a little zincite, $ZnO$. Here is the approximate composition of such ore:—

| | | |
|---|---|---|
| $SiO_2$ ... ... ... ... | 9 to 12 | per cent. |
| $Fe\ 2.0_3$ ... ... ... ... | 28 to 33 | ,, |
| $MnO$ ... ... ... ... | 15 to 12 | ,, |
| $ZnO$ ... ... ... ... | 35 to 30 | ,, |
| $CaCO_3$ ... ... ... ... | 9 to 4 | ,, |
| $MgO+Al_2O_3$ ... ... ... | 3 | ,, |

Thanks to the magnetic separation which is now in practice, it is possible to separate almost completely the willemite used for the manufacture of the metallic zinc from the franklinite and zincite employed more especially for the manufacture of white zinc. With such ores the residues obtained from the zinc oxide furnaces come in the form of clinkers, which are smelted in blast furnaces for spiegeleisen. These residues are composed approximately of the following:—

| | |
|---|---|
| $SiO_2$ ... ... ... ... ... ... | 16.00 |
| Fe ... ... ... ... ... ... | 37.00 |
| Mn ... ... ... ... ... ... | 16.00 |
| Zn ... ... ... ... ... ... | 6.00 |

As it will be seen from the following composition, these residues are in reality iron manganese ore with a fair percentage of zinc. The blast furnaces employed for their treatment are of special construction, being approximately 36 feet high and 6 feet in diameter. The gases are not in this case taken off by tubes of large calibre, as is customary, but by bunches of small sheet iron tubes forming an extensive wall space, thus facilitating the precipitation of the zinc dust. This zinciferous ore is of a yellowish brown colour, and represents from 2 to 3 per cent. of the ore treated in the blast furnaces, and yielding 75 per cent. of ZnO, this product entering in the charges of the metallic zinc furnaces. It is most important here to notice that the manufacture of zinc white is not in this case the principal object, but rather the manufacture of spiegel. The zinc oxide being in this instance practically a bye-product, and the quantity entirely in proportion to the demand for spiegel. Before passing into the zinc oxide furnaces the ores containing too much zinc have first to be passed through the smelting furnaces, as it is necessary to rid them of the greater part of their zinc before heating them for cast iron.

What I have said above refers to some ores treated in the United States. No doubt, other ores are treated by the "direct" method, such as calamines and roasted blends. The term "calamine" has two distinct significations: for the mineralogist it is well defined as $2ZnO,\ SiO_2+H_2O$. For the metallurgist the term "calamine" means the various oxidised zinc ores which are often found, viz. the calamine of the mineralogist, willemite, zincite, hydro-zincite ($ZnCO_3.\ 2ZnO+HO_2$), and finally smithsonite ($ZnCO_3$). Franklinite, in that it constitutes an ore peculiar to the United States, is of no industrial importance to other countries. The roasted blend treated in Europe is obtained by roasting sulphide of zinc ore called "blend," having the formula of $ZnS$. The reaction of the roasting operation is as follows:—

$$ZnS+3O=ZnO+SO_2.$$

As you see, the roasted blend enters into the category of the oxidised ores, and can then be used for the "direct" method.

From what I have said one can well imagine that the "direct" method is a most delicate industrial operation, needing a constant supervision of the furnaces and charges. This complication is specially noticeable when one considers the simple nature of the "indirect" method.

### *Other Processes—Precipitation Process.*

This is a wet process, consisting essentially in the precipitation of the hydrate of zinc ($ZnH_2O_2$), from a zinc solution by means of an alkali. This hydrate is collected, washed and dried, and finally calcined to transform it into oxide.

$$ZnH_2O_2=ZnO+H_2O.$$

I will give you an example of this method, starting from the blend which is roasted in special furnaces at a low temperature, in order to form a sulphate and not an oxide.

$$ZnS.O_4-ZnSo_4.$$

This product is treated with water to obtain a weak solution of sulphate of zinc. This solution is concentrated and treated with ammonia in excess to precipitate the iron. The filtrate is then freed from the excess of ammonia by passing a current of steam, which then finally precipitates the hydrate of zinc, which is then treated as I have said above. It is necessary to proceed with a view to recover the maximum amount of ammonia during the operation. This process has never been worked on a large scale, on account of the bad quality of the white zinc obtained. It has no doubt been possible to obtain a zinc oxide very white, absolutely pure, answering to the formula of ZnO, but having none of the qualities necessary to the making of a good pigment. Commercially, this process does not exist, and I only mention it to show that it is not by arriving at the production of a zinc oxide answering to the formula of ZnO that one is certain of obtaining a pigment of any value as paint material.

### *Electrolytic Process.*

Many electrolytic methods have been tried, but up to to-day none have given good results. I will only mention two for your information. The electrolysis of water, with a positive electrode constituted by metallic zinc and the negative electrode by carbon. The oxygen from the decomposition of water attacks the zinc, oxidising it with formation of $Zn\ H_2O_2$. It has been proposed to replace water by a solution of $Na_2\ SO_4$ at 1 per cent. Attempts have recently been made of an electrolytic process with water charged with $CaCO_3$, taking always as positive electrode metallic zinc, and carbon as negative electrode. The first reaction taking place is the decomposition of water and formation of hydrated zinc oxide $ZnH_2O_2$. This hydroxide is then carbonated by the $CO_2$ from the $CaCO_2$ in suspension in the bath. There is a final formation of hydrocarbonate of zinc, which is said to give a product comparing favourably with ZnO. This process is still in the experimental stage.

### *Pyro-Electric Process.*

This process consists in treating in an electric furnace melted zinc ores, mixed with reagents. The exact methods are no doubt purposely not given, but in the opinion of experts it could hardly be a financial success, taking into consideration the exorbitant price of electricity as fuel. As a matter of fact, the price of 10,000 calories with coal is approximately one farthing, whereas, with the electric current, taking the kilowatt-hour at one halfpenny, which is fairly low, you arrive at a price of about 4½*d.*, about 10 times as much. In Sweden numerous trials have been made, but have only resulted in financial failures.

### *Advantages and Disadvantages of the "Direct" and "Indirect" Process.*

Before thoroughly discussing this question, I would like to focus your attention on a point of great importance, viz. that though both have their characteristics, the personal influence of the manufacturers practising them is enormous; I may almost say it is a preponderating one. With the same raw materials and the same methods, two manufacturers can obtain different products; no doubt they will both be zinc oxides having as formula ZnO, but one may constitute an excellent pigment, whereas the other may be worthless. The reason of this phenomenon is known to well-organised factories (some of which I have the pleasure of knowing) who have undertaken the systematic study of the conditions to be realised for a body to constitute a good pigment. These conditions are almost exclusively of a physical order; the micro-structure of a substance plays here a part of greater importance than its chemical nature. It is for having ignored these true principles that many firms are now wedded to inferior products.

---

* A paper read on May 12 before the Paint and Varnish Society by Mr. Gaston Depièrres.

*"Indirect" Process.—Real Advantages.*

(*a*) It is possible to obtain by this process a purer white than by any other method. But, in connection with this, it is only logical to remark that the perfectly pure snow white is not very often required; most people describe it as "too raw," "too hard," "too cold," consequently this quality of perfect whiteness should not be overrated. Here is a specimen of two enamels, one made with pure white zinc oxide obtained by the "indirect" method and one made from zinc oxide obtained by the "direct" method; as you will see, the difference is hardly noticeable. (*b*) The "indirect" zinc oxide is of a slightly lighter S.G. than the "direct" ZnO, and is said on that account to be very suitable for making enamel paints. In my opinion, this advantage is of little importance. I have now some enamel paint over 3½ years old, made with "direct" ZnO which has not settled in the least. (*c*) By the "indirect" process in selecting carefully the raw material, it is possible to obtain a chemically pure zinc oxide as specified by the British Pharmacopœia for use in pharmacy.

This, of course, is quite impossible by the "direct" process, where the elimination of impurities cannot be carried out to such extreme limits, but here I can affirm before you, without fear of contradiction by a single competent man, that the slight advantage as regards its purity is of little value in connection with paint making. The "direct" process enables us to obtain white zinc which will give, as regards purity, all the guarantees that one can reasonably expect from an industrial product. In connection with this, I cannot help referring to the specifications of many public bodies who seem unable to rid themselves of their antiquated formulæ on account of their inertia and redtape.

Let me take a concrete example. Supposing that, say, in 1860, one of these administrations had drawn a specification with a clause fixing the maximum amount of lead salts in zinc oxide not to exceed 1 per cent.; this clause, then, might have been a logical one, taking into consideration the chemical and medical knowledge of those days, but when, 20 years later, it is irrefutably demonstrated that even 4 per cent. of lead salts do not constitute any danger whatsoever, from a sanitary point of view—that the pigment is greatly improved and that the price is 15 per cent. less—what will the administration do? There are 90 chances out of 100 that the said administration will continue for another 50 years to send out the same ridiculous specification with the consequence that a large amount of money will be wasted without any compensation whatsoever.

Fortunately, there are to-day many signs that in the struggle for victory men are accepting the logical conclusion from classified facts, viz. that to be advocates and exploiters of pure "this," "that" and "the other," is a relic of past ignorance and doomed to lose its force.

*Disadvantages of "Indirect" Zinc.*

(*a*) The "indirect" zinc oxide is about 15 per cent. dearer than the "direct" oxide, and this difference in price will increase as the raw products—such as the by-product of galvanisation, &c.—become scarcer; this, in my opinion, constitutes one of the future disadvantages of the "indirect" method—so simple technically.

(*b*) The covering power of the "indirect" zinc manufactured in different factories varies greatly, and this variation, I may say, has nothing whatever to do with purity of the product. It is a well-known fact to practical men that certain brands of "indirect" zinc have an inferior covering-power, notwithstanding the fact that makers have made many attempts to remedy this defect. In all cases the covering-power of "indirect" zinc is inferior to that of "direct" zinc. I have prepared here a specimen showing a comparison between the covering-power of white lead (best English made), "indirect" zinc oxide (made in Silesia by a firm of very good repute), "direct" zinc oxide (made in Holland by manufacturers of undoubted capabilities, and well versed in modern methods), and a "direct" oxide (made in America). As you will see the "direct" zinc oxide—made in Holland—and containing 2 per cent. lead salts, easily proves its superiority over all the others. Then comes the Silesian zinc, followed by the American zinc, all of them being better than white lead.

(*c*) I think it is pretty well admitted now that "indirect" zinc, though irreproachable as far as colour and chemical composition are concerned, is inferior in resistance to "direct" zinc, especially when used for outside painting. Exhaustive experiments recently carried out in France, America, Holland, Belgium, all tend to demonstrate this fact. Personally, I have noticed that chalking takes place more or less with "indirect" zinc, according to the brand, whereas with "direct" zinc it is noticeable much later—about 10 per cent. to 15 per cent. being the approximate difference in favour of the "direct" zinc.

(*d*) It will be no surprise to practical men to hear me say that "indirect" zinc in the powder state lacks unctuosity, those who have manipulated both "indirect" and "direct" zinc will understand me, and bear out what I say. I know of some "direct" which, to the touch, gives the impression of a greasy substance, and I am convinced that the unctuosity is a physical state eminently favourable to the combination of the zinc oxide powder with the oil. White zincs well manufactured by the "direct" method are much whiter than the best white lead, and if paint-users in comparing the pigmentary value of white lead with white zinc had had an opportunity of using a well-ground zinc oxide made by the "direct" method, many prejudices against this valuable pigment would rapidly disappear. The value of a pigment, and more so with zinc oxide than with any other, is not defined by its chemical composition, it is, as I have said before, the greatest mistake made by some public bodies and a quantity of buyers. A ZnO may be chemically pure, and yet be a very poor pigment, that is to say, it may not have sufficient affinity for linseed oil to be able to produce a paint which will spread well under the brush, cover the surface satisfactorily, and give a good finish.

*(To be continued.)*

## THE ROBERT GEFFERYS ALMSHOUSES, SHOREDITCH.

THE Parks and Open Spaces and the Local Government, Records and Museums Committees of the London County Council have presented the following joint report:—

We have had under consideration the question whether steps can be taken by the Council to preserve from destruction the old almshouses and the adjacent garden belonging to the Sir Robert Gefferys charity in Kingsland Road, Shoreditch.

The almshouses were erected in 1715 and consist of 14 houses and a chapel. The buildings form three sides to a picturesque garden in which there are some very fine lime trees 200 years old. The almshouses are constructed of yellow brick, with red brick dressings and tiled roofs, which latter were renewed in 1898. The houses possess many of the best characteristics of eighteenth century architectural work of which there are only a few specimens now remaining in London. Their simplicity is one of their chief merits, and, together with the garden, they constitute quite a beautiful treatment of street architecture and garden planning, and they are undoubtedly an important relic of that phase in the history of London which deals with the treatment of the poor under the charitable donations which allowed the provision of almshouses.

The total area of the site is about 1.62 acres. This includes a garden in front of the buildings occupying 1.06 acres, and a disused burial ground at the back of the northern wing of the buildings of about one-eighth of an acre.

An inquiry was held by the Charity Commissioners in 1908 in regard to an application by the Ironmongers' Company, as trustees of the charity, to sell the almshouses and garden to the trustees of the Peabody Donation Fund, who proposed to clear the site and erect model dwellings thereon. The application was opposed by the National Trust for the Preservation of Places of Historic Interest, the Society for the Protection of Ancient Buildings, the Shoreditch Metropolitan Borough Council, and the Metropolitan Public Gardens Association. The Council, although not represented at the inquiry, wrote to the Charity Commissioners stating that it had received a letter from the Shoreditch Metropolitan Borough Council advocating the retention as an open space of as large an area as possible of the garden, and expressing the hope that this aspect of the case would receive careful and sympathetic consideration by the Commissioners. The Charity Commissioners refused to sanction the sale, and, in announcing their decision, stated that they were not precluded from taking into consideration the question of public policy which had been indicated by Parliament with regard to the desirability of retaining open spaces in London and of preserving ancient buildings.

The Court of Chancery, on the petition of the Ironmongers' Company, subsequently ordered an inquiry to be held as to whether it would be for the benefit of the charity that the almshouses and lands should be sold, and, as a result, the Court made an order allowing the property to be sold, on the ground that the only question before it was whether the sale would benefit the charity; and the Court referred it to Chambers to ascertain whether the offer of the Peabody Trustees (amounting to 23,500l.) should be accepted. This offer is about to be formally submitted to the Court, which will doubtless direct the trustees of the charity to accept it unless another offer is made by some responsible body forthwith. If, therefore, the Council desires to preserve these ancient and interesting buildings and to utilise the open space, the only course is to purchase the site.

A deputation from the Shoreditch Metropolitan Borough Council has attended before the Parks and Open Spaces Committee and urged with considerable force that, having regard to the densely populated character of the surrounding district and the lack of open spaces in the neighbourhood, steps should be taken to secure the preservation of the garden. The borough council points out that, while the Metropolitan Borough of Shoreditch contributes its share towards the provision and maintenance of parks and open spaces in London, it receives comparatively little benefit in this respect in the neighbourhood, although it is one of the most densely populated parts of London, particularly that part lying between Kingsland Road and Hoxton Street.

In the Metropolitan Borough of Shoreditch there are less than eight acres of open space dedicated to public use, of which only about three acres is land other than churchyards or burial grounds, the area of the largest being 1½ acres only. The total area of the borough (exclusive of waterways) is about 643 acres, and the population at the time of the 1901 census was 118,637, and is now estimated at 115,000, or about 178 persons an acre. The density of the population in the neighbourhood of the almshouses is about 250 persons an acre, while in the immediate vicinity there is an area, the density of which, according to the census of 1901, is 540 an acre. The infantile mortality is the highest in London.

We understand that both the Ironmongers' Company and the Peabody Trustees, who are interested in the property at the present time, view with sympathy the proposal to acquire the property for public purposes.

The Local Government, &c., Committee have expressed the opinion that the historical interest attaching to the almshouses, taken together with the amenity of the open space formed by the garden attached thereto, is sufficient to render the almshouses worthy of preservation. That Committee and the Public Health Committee reported to the Council on July 6, 1909, in favour of the retention of the almshouses and garden on historical and public health grounds, and the debate which took place on the reception of those reports clearly indicated that the Council was fully in sympathy with the movement to retain the property in its existing state.

The Parks and Open Spaces Committee are greatly impressed with the desirableness of the existing open space being preserved in its entirety, more especially having regard to the extremely congested condition of the district, and to the fact that there is in the neighbourhood no land, other than that now threatened, available for the purpose of a public open space or a pleasure ground. In order that this may be secured, it is essential that the whole of the property should be acquired. The Council has the statutory authority for the purpose in the London County Council (General Powers) Act, 1898, section 60 of which enables the Council to purchase by agreement buildings and places of historical or architectural interest, or to contribute towards the cost of maintaining and managing any such buildings and places; and also possesses further powers under the Open Spaces Act, 1906. By proceeding under these Acts the Council will not only preserve for London buildings of considerable interest, but will, in addition, have at its disposal the great asset of a valuable open space.

The Parks Committee state that by retaining the whole of the existing open space practically no capital expenditure will be necessary in respect of laying out works, and that the annual cost of maintenance is not likely to exceed 200l. There can be no question that the garden will be devoted to the use of the public, and will, if the Council acquires the property, be placed under the management of the Parks and Open Spaces Committee. The question of the use to which the Council can put the buildings must be considered. There are several purposes for which the buildings might be adapted, and the Local Government, Records and Museums Committee will in due course present to the Council a report on this matter.

The estimated cost of the acquisition of the property is, it is true, somewhat higher than that usually paid for such purposes, but in view of the very exceptional circumstances of the case, we feel strongly that the opportunity which now presents itself (and which if not seized cannot possibly recur) should not be lost.

The cost of the acquisition will not exceed 24,000l., but we consider that the Council's contribution should be limited to a sum not exceeding 16,000l., and that the payment by the Council of this 16,000l. should be subject to the contribution of the remaining 8,000l. being made by the Shoreditch Metropolitan Borough Council, or being obtained by that authority from other sources.

## ST. NICHOLAS CHURCH, DEPTFORD.

THIS church, which may fairly be regarded as a national monument, has been found to be in need of extensive repair.

The roof of the nave is sagging badly and the east wall bulging. There are also signs of extensive rotting of the beams supporting the roof. A preliminary estimate by a local builder puts the probable cost at 5,000l., but a more detailed report is being prepared. The church was built in 1697 on the site of a much older structure and is of red brick. The tower is of flint and stone, and dates from the twelfth century. It contains a staircase of Purbeck marble, and a fine peal of eight bells.

Among the ornaments of the church are some fine carvings by Grinling Gibbons. One, a representation of Ezekiel's vision of the valley of dry bones, was found concealed by boarding over the door of the charnel house—formerly the parish mortuary—whence it was removed and built into the wall of the church.

The contrast between the mean exterior of the church and its beautiful interior led a writer in the *Gentleman's Magazine* in February 1795 to remark, "Nothing, surely, can exceed the monstrous incongruity of the church and its tower, stone and brick, Gothic and a defiance of every order jumbled together. Yet its interior is elegant."

Among the men who have left their mark upon the history of their country and who sleep within its precincts are Christopher Marlowe; Peter Pett, the inventor of the frigate, the vessel which laid the foundation of England's sea power; and Edward Fenton, the commander of the admiral's flagship in the fight against the Armada.

## THE ART OF WORKING METALS IN JAPAN.*

PROFESSOR W. GOWLAND said the subject which he was to bring before them was the working of metals in Japan, or rather he should say in old Japan, and it was one of interest. It presented to the metallurgist and the craftsman unique modes of extracting metals and purifying and adapting them by simple processes to both practical and ornamental uses. The metals he proposed to deal with were gold, silver, copper, iron, and tin. They were the only substances recognised as metals proper by early Chinese and Japanese writers, and were technically known as jo-kui, which meant the five metals, and they were supposed to have some mysterious relationship with the five colours and were believed to have originated with the sun and not to be simple bodies or elements, but to be capable under certain influences of being transmuted one into the other. Gold was called the king of the five metals because, as they said, it never rusts and it could be melted many times without appreciable loss of weight, and it was believed that under certain conditions other metals could be converted into gold, but a space of two hundred years at least was required for the completion of change. But much as the acquisition of this alchemic knowledge was sought after no record of transmuting a baser metal into gold had been handed down by tradition. The first discoveries of gold were made in river sand, then mineral veins were worked and the process of extracting gold from quartz commenced. River sand that had been powdered was mixed with water, the water and powdered ore were then passed over a series of cotton troughs, the earthy matter being thus removed from it. The gold washing in Japan was so very skilfully carried on that the washers who worked a river would make it yield a profit in the precious metal when others (foreigners) with modern appliances had decided that it would not pay. Those old gold-washers received no wages, but recouped themselves by the gold dust which adhered to their clothes, and even nuggets would sometimes find their way into the washer's garments.

---

* A lecture delivered before the Institute of Metals at the Institution of Mechanical Engineers, Westminster, on Tuesday, May 24.

They found glowing accounts of the gold deposits in the narratives of old voyagers and the richness of Japan in gold generally, but those accounts were all erroneous. The copper used on the temples was covered with a slight coating of gold, and those early voyagers imagined the ornaments were of pure gold, and believed therefore that there must be a large quantity of ore in the country. The effects of laws forbidding the use of gold and silver on the dress had an æsthetic value, which became a mode or fashion, so that the gold jewellery worn about the person consisted of a single gold hair-pin for the women, and in men's use the ornamentation of the pipe or tobacco pouch. The earliest example of its use was seen in the horse-bits belonging to the fourth century and taken from some burial mounds. There were also instances of horses' shoes in copper plated with gold. Then during later times, more particularly after the introduction of Buddhism, copper plated with gold was in demand for ornamenting the exteriors of the temples, and the Shinto temples followed the same custom. It was that lavish display which misled the old voyagers. But the extensive gold mounting did actually require a large supply of gold. The method by which gold was applied to the surface of copper was thus. The object was immersed in plum vinegar, it was then washed and dried over a brazier and gold in the form of leaf worked in. With regard to gold-plating the lecturer said it was quite unknown in Japan in early times, so that in the houses they found nothing of gold except tiny wine cups or the mount of a pipe. The only large vessels of gold were two caskets in the Shinto temple of the goddess Inishi. In 1883 it was decided that one of them should be melted down and replaced by a new one. The casket came to the mint and the melting down was carried through with a priest in attendance. On assay they found that it consisted of about 66 parts of gold and the rest of silver. The golden colour which it had originally, and which led many to believe it was all pure metal, was due to a special process. With regard to gold jewellery there was little of it in old Japan and in no case was copper used as an alloy with gold, the alloy was always silver. Whenever jewellery was made a very high standard of gold was used, but as years went on, and as the gold currency gradually became debased, the standard was lowered until in the last century only 35 per cent., and in some instances only 12 per cent. of gold was employed, but objects made in the lower standard were indistinguishable in external appearances from those wrought in pure gold. It was strange to note that there was no mint in Japan until the sixteenth century; before that time gold circulated as currency in the form of dust carried about in quills or in small paper packets. The first coin struck was valued at about 16 guineas and contained several ounces of gold. In addition to the production of coins it was also the function of the mint to prepare gold bars called homar, which were kept in the treasury as a reserve against pestilence or war. The bars were about 13 inches long and 5 inches broad, and 5 inches thick. The assay of the gold bars was all done by the process of the touchstone, no acid being used. The method was a most successful one to employ when the alloy was silver and in Japan they had been able to get within ten parts of gold in a thousand. There were other methods practised in order to determine whether there was too much copper in the gold or silver alloy. Gold was only alloyed with silver and not with copper, so that the coins were nearly all white or faded colour. It became necessary therefore to give them a surface of gold, and that was effected by dissolving out the silver in the upper surface of the alloy. Another process, and one followed by all the modern jewellers, was to plaster over the object and mixture of the alloy, heating it to redness and then afterwards washing it in a solution of sulphur chloride. Silver was called by the Japanese the white metal, and it had been in use among them from very early times and two or three centuries before our era. The earliest specimen of silver seen by the lecturer was a bowl belonging to the eighth century, about A.D. 766. Silver was used but seldom for their religious vessels and utensils, and when used it was generally gilt, so that they had only specimens of coinages and a few sword mounts surviving the early periods. After the civil war silver came largely into use for making sword ornaments, pipe bands, and ladies' hairpins, but these articles were not made so much in pure silver as in an alloy of silver and copper. The methods for assaying the standard of metal were very closely analogous to those employed for gold—99.7 per cent. was the general average of the assay. Silver in the old days of Japan was used in that pure state, but later on copper was added, firstly because it was difficult to cast pure silver, and secondly because pure silver was not sufficiently hard. Yet the ornaments generally showed 94 per cent. and some 97 per cent. of pure silver. Later, and especially during the last century, a large quantity of debased coins became current, and the jewellers made articles of the same metal. Silver was cast by being melted in earth furnaces with charcoal fires and cast in troughs in linen moulds under the surface of water. Linen moulds were used so because when cast in water the surface of the mould was always clean and the silver was not coated with oxide of copper. When debased silver was to be used the colour was not good, and to remedy that defect it was heated to redness in a brazier over a fire and plunged into vinegar. The process was still very largely employed, and deceived people, since it made the object appear to be wrought of true metal when it was debased. The largest works of the art metal workers were not as a rule carried out in pure gold or silver, but were fashioned in alloys. Their art was best displayed in the peculiarly Japanese alloy known as spakisdo, containing gold, silver, copper, lead, iron, and arsenic. In order to obtain the best results in colouring a percentage of no less than 3 per cent. of gold was introduced. Shakudo was especially Japanese. It had deep rich tones of black, was capable of receiving a splendid polish rendering it alike a good substance for casting and a perfect ground for inlay in designs of gold, silver, and copper and for being similarly inlaid in tin. The appearance of this alloy was quite superior to any of the old Chinese alloys. When first cast it had the appearance of gunmetal, but it was treated by a special process to obtain the fine violet sheen which distinguished it. The lecturer said it might interest them to know that the Japanese were still adding to their number of alloys. Latterly a variety of shakudo had been introduced by the chief assayer at the mint and formerly the lecturer's first assistant there, which contained no gold. This new alloy was used for the preparation of medals for the soldiers who took part in the war with China. It was made from the old bronze guns taken from the Chinese, but so that the medals should not have the appearance of copper coins the bronze was melted and mixed with a small quantity of iron-arsenic spice. The medals after being struck were carefully burnished and boiled in a solution of copper sulphate, verdigris, and water. That alloy almost rivalled shakudo, and it was one which might well be copied by Western nations. There was a silver alloy called shibuchi. Most of the best works were made of it, the composition being one part of silver to two of copper. The value of the alloy in decorative work was entirely dependent on its patina. It possessed no special beauty when cast, but after the surface had been subjected to treatment the patina took on a delicate grey and was a beautiful ground for inlay. It was produced by precisely the same process as shakudo. Copper or as it was called red metal was really the metal par excellence of Japan because its applications were more numerous than in any other country, and in many respects quite unique. It was first employed for ornamenting the cheek plates of their horses' bits. With regard to the treatment of the ore to produce the copper, various curious methods in the smelting were followed by the Japanese. The furnaces employed were those which had been in use from early times, though during the last century the furnaces were of greater magnitude. One of the necessaries of the smelting was the bellows, and the Japanese used a box bellows worked by men. The furnace was put in the ground, and it was so simple that he recommended it to prospectors who might be engaged in opening up a mineral vein. With regard to the use of copper in Japan a very large quantity of it was employed for round water spouts, roofing, and ornamental architectural plaques, and as a constituent for bronze. The casting of bronze presented one or two interesting features. In the first place every bronze piece or large vessel was cast without a bottom, because there was a core to the vessel to be modelled. Big bells and images were cast *in situ*. The alloys used varied considerably from 70 to 81 per cent. of copper, and nearly all the bronze contained certain portions of arsenic and antimony in order to give hardness and in some cases to give a special patina. With regard to the patinas, and especially the best ones, the rich effect was due to the lead present in the alloy. In conclusion Professor Gowland paid tribute to the intense love of art with which the Japanese had been imbued for centuries past, and the enthusiastic appreciation of faithfulness in all work. Those qualities had made every workman and craftsman an artist, and hence the patience and marvellous skill bestowed even upon articles for domestic purposes. The modern Japanese worker in metals, owing to the pressure of Western competition, was working in an adverse environment to those who in the early centuries were stimulated by religious fervour. But the old art was only dormant and not dead. The number of craftsmen was increasing, and during recent years the Emperor had done much to encourage its revival, and some of the modern work carried out at the Imperial Palace was equal to the best of the earlier periods.

## ANCIENT LIGHT CASE.

THE action brought by Mr. Alexander Murray Smith, proprietor of Nos. 40 and 42 Queen Anne's Gate, against the Anglo-American Oil Company, for an injunction in respect of an alleged obstruction of ancient lights, was again before Mr. Justice Joyce in the Chancery Division on May 25 and 26.

Mr. Hughes, K.C., for the plaintiff, reminded his lordship that the action came on for hearing on February 1 last, when an order was made directing Mr. John Slater to inspect and report upon the matter for the assistance of the court. Mr. Slater had made his report, and it came before the court now for the parties to discuss and see how far they accepted or questioned it. The old houses opposite, upon the site of which the defendants were erecting new premises, had been of considerable height, and the plaintiff's houses, which were low, had never been well lighted towards the north. The street was a narrow one—30 feet wide at the eastern end and 25 feet at the western end. The complaint made was that the proposed new building of the defendants went higher than the old houses, and that the non-sloping part of the roof was much greater in extent than formerly, and further that the building was taken towards the westward 5 to 6 feet beyond the old premises. In other words instead of having a rounded end it was brought out to an acute angle about 5 feet 6 inches further to the westward. The new roof was almost entirely composed of dormer windows so that plaintiff did not get the advantage of the slope. Counsel proceeded to read Mr. Slater's report, which stated that with respect to No. 40 the first floor windows were affected to the extent of four and the second floor windows five degrees by defendants' new building, and that three windows in No. 42 were affected in precisely the same way. The kitchen of No. 40 was affected to the extent of 10 per cent. On the other hand Mr. Slater thought that plaintiff's houses would get more reflected light from the white building of the defendants than from the old red brick premises which had been pulled down, and came to the general conclusion that the access of light enjoyed by plaintiff's houses would only be interfered with to a slight extent, and that the houses would not be rendered in a sensible degree less comfortable and convenient than they were before.

Counsel said he recognised that upon this report he could not usefully renew his application for an injunction, but he submitted that the result of the report was that there was a material reduction in the light coming to plaintiff's houses considering how inadequately they were lighted under the old conditions and that Mr. Smith was entitled to some damages or compensation for the obstruction of his light. With respect to the reflected light Mr. Hughes said this was a very poor substitute for the real thing, and that white stone in London buildings turned black very much sooner than red brick. In the course of a very short time Mr. Smith would have a black building instead of a white one opposite him.

Without calling upon Mr. Younger, K.C., for the defendants his lordship dismissed the action with costs.

## INCORPORATED CHURCH BUILDING SOCIETY.

THE above Society held their annual Court on Thursday, May 26, at Church House, Westminster, under the chairmanship of the Archbishop of Canterbury.

The ninety-second annual report showed that on nearly all the items of receipts there had been an increase in income during the year 1909 over that received in 1908, the total being 7,862*l*. against 6,998*l*.

The past history of the Society shows that it has been instrumental in aiding in the erection of no less than 2,603 additional new churches, and in assisting in rebuilding, enlarging or otherwise improving the accommodation in 6,654 other churches or consecrated chapels-of-ease. By these means more than two million additional seats have been secured, far the greater part of which are for the free use of the parishioners according to law. The actual amount of money entrusted to the Society and used in making grants toward the objects named has reached 931,321*l*.

In the last annual report the Committee called attention to the fact that the "Occasional Notes on Church Furniture and Arrangement" had been reprinted and published in pamphlet form. These articles were originally contributed to the Society's quarterly magazine, *The Church Builder*, by the eminent architect and antiquary, the late Mr. J. T. Micklethwaite, F.S.A., who was for many years a member of the Committee of Honorary Consulting Architects of the Society and Surveyor to Westminster Abbey. The Committee strongly urge that all lovers of Church architecture should carefully study these valuable articles, and do all in their power to ensure their wide circulation. If this be done, the Committee feel that the high standard in Church building which the Society fosters, and which Mr. Micklethwaite did so much to promote, will be maintained. A copy will be sent post free for 7½*d*. on application to the Secretary of the Society.

In accordance with a resolution of the Committee a copy of the pamphlet was sent to the Archdeacons and the Chancellors of England and Wales, and many letters of thanks were received bearing testimony to the great value placed upon the articles by those to whom they are of peculiar service.

The series is being continued in *The Church Builder* by Mr. W. D. Caröe, M.A., F.S.A.; and among the articles which have recently been included are two bearing the title, "A Manual of 'First Aid' for Archidiaconal and other Inspections." These were suggested by a clerical member of the Society who felt the need of such expert guidance. The "Manual" has lately been reprinted and published under one cover.

During the past year the Committee of architects reported to the Committee that it had for some time been evident to them that certain alterations were desirable in the paper of "Architectural Requirements and Suggestions." Owing to the greatly extended use of concrete and asphalte at the present day it was felt that the requirements of the Society should be brought up to date, and further, that some minor alterations as to thickness of walls, width of steps, &c., under certain conditions could be made without detriment, so as to give some relief to the many applicants for grants who now consider the Regulations somewhat too stringent.

After careful consideration the proposed modifications were adopted and the revised paper is shortly to be circulated.

It was further felt essential that in order to encourage the better planning and design of the churches brought before the Society the following words should be embodied in Rule xxi., "Good planning and design will have considerable weight in determining the amount of the grant to be made by the Society."

In consequence of it being found that detrimental alterations are frequently made in the arrangement of churches aided by the Society's grants after the plans have been finally approved, the following words have been added to Rule xxxi. of the Society at the suggestion of the Committee of architects:—"Grants are made on the distinct understanding that there shall be no deviation from the plans sanctioned in the arrangements of a church aided by the Society without further consultation with its Committee."

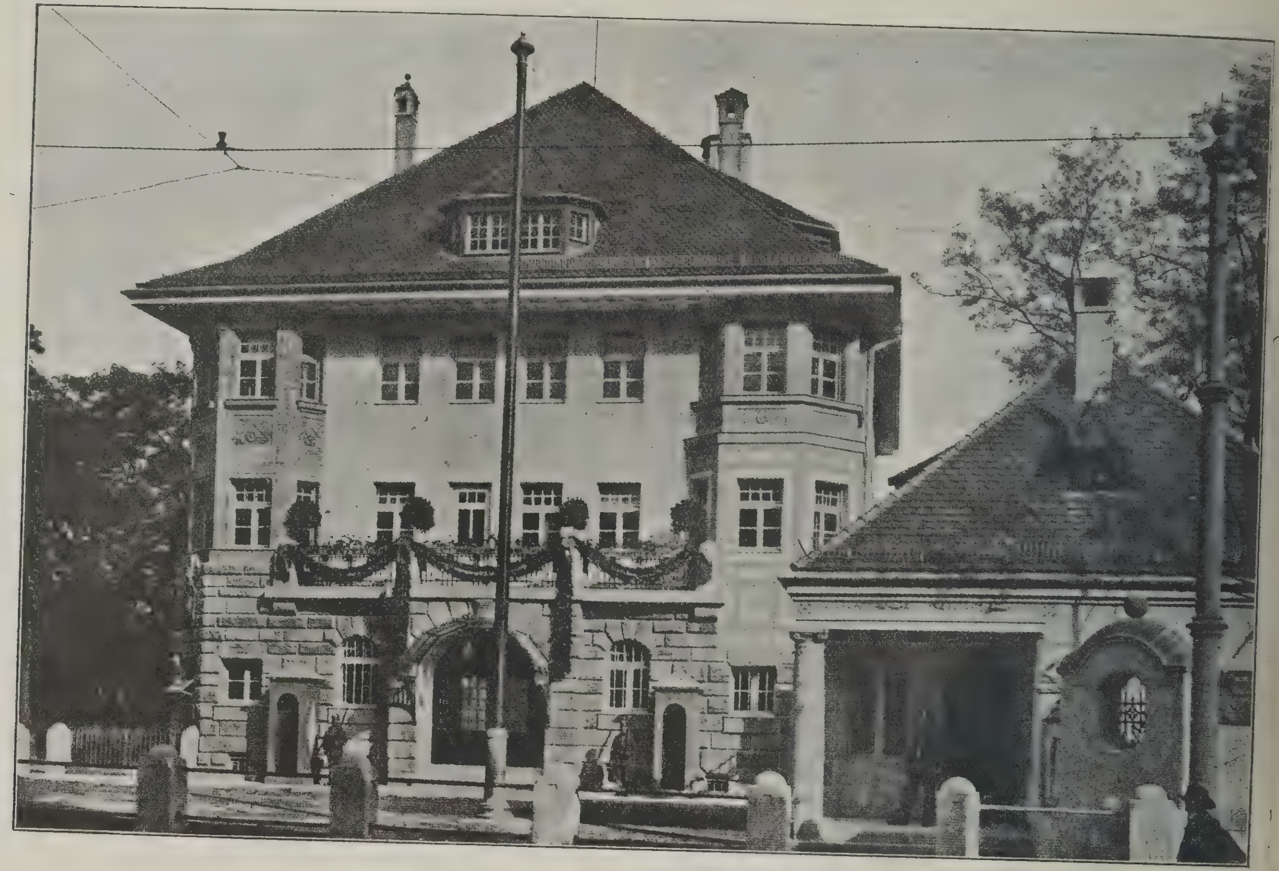
The Honorary Consulting Architects are as follows:—W. H. Bidlake, Esq., M.A., W. D. Caröe, Esq., M.A., C. Hodgson Fowler, Esq., C. H. M. Mileham, Esq., Temple Moore, Esq., Sir C. A. Nicholson, Bart., E. S. Prior, Esq., G. H. Fellowes Prynne, Esq., J. Oldrid Scott, Esq., R. Norman Shaw, Esq., C. S. Spooner, Esq., E. P. Warren, Esq., and Sir Aston Webb, C.B., R.A.

Sir Charles A. Nicholson, Bart., moved the adoption of the report, and in the course of his remarks said:—We members of the Architects Committee are sensible that it is a privilege to take our part in the work of this Society. The Society's influence is far greater than might be expected considering the relatively small sums it is in a position to grant in most cases. In a way its work may be compared with that done by the old "Ecclesiological Society" of the second half of the last century. It is largely to the influence of the Ecclesiological Society that we owe that fine series of churches by Butterfield, Street, and other masters commencing with the wonderful church in Margaret Street, built at a period when the popular ideal of ecclesiastical art was a pile of common brickwork faced with rude ragstone with skimpy varnished deal roofs, long rows of pews, and texts round the arches. Thanks to the exertions of men like Beresford Hope, and to the example of artists like Butterfield, Sedding, and Bodley, I think we may say that the general level of modern church work is higher than it was 25 years ago. But for all this I doubt if we build very many churches nowadays that are worthy of comparison with the best productions of the last half of the nineteenth century. I refer to such buildings as St. Alban's, Holborn, All Saints, Clifton, the church at Hoar Cross, or St. Agnes, Kennington. And although much good work comes before the Architects Committee, there are a great many designs we are asked to criticise which it is not too much to say it is difficult for us to pass without regret.

In the case of a new church it is not our province to

## MODERN EUROPEAN ARCHITECTURE.

### GERMANY.



[From *Der Profanbau.*

HEADQUARTERS OF THE COMMANDANT OF GARRISON, NUREMBERG.—Baurat G. Kurz, Architect.

reject a merely commonplace and unintelligent design unless it is structurally defective; but in cases where grants are sought in aid of "restoration" work it is, it seems to me, our clear duty to prevent, as far as lies in our power, the waste of funds to which the Society is asked to contribute upon doing work which is either unnecessary or even Grimthorpean.

Take the case of some old village church, possibly covered externally with roughcast a couple of centuries old, with a weatherbeaten tile roof and a rough floor of old bricks and gravestones. A new vicar is appointed, and some architect called in who proposes to set up a new deal roof covered with brittle Broseley tiles of mathematical hideousness, to reglaze all the windows with that monstrous invention called cathedral glass, to strip off the old plaster and reface the walls with flint or what not, at a vast expense by the way, and to convert the interior by means of some pitchpine furniture and a smart tile floor into the semblance of a ritualistic chapel-of-ease in a seaside resort. The aid of the Society is sought for this laudable purpose; but is it fair that the Committee of architects should wink at your hardly-collected golden sovereigns being so expended?

I think there is a general idea among architects who do not get many opportunities of church building that your Committee of architects are rather hard taskmasters. Well, as I have said, we get all sorts of schemes to criticise, and, subject to their being workable schemes, we have no choice but to pass them. Sometimes, but very rarely, a scheme is hopelessly deficient, and in such cases we can only decline to make any report. But wherever there is the least chance of bringing a scheme up to the Society's standard, I think I may safely say that the Committee spare no pains to attain this end.

Again, on one or two occasions we have had really fine schemes before us, admirably designed both in mass and in detail, but obviously the work of men without much previous experience of church work, and not entirely conforming to the rules of the Society. In such cases a long list of criticisms may have been made; but such criticisms should never be misunderstood as in any way reflecting on the architect who has prepared the design. Rather are they a compliment to his genius—the work may be so good that it is worth criticising, worth taking trouble over, not a crass, dull thing that no criticism can ever raise above the uninspiring and commonplace. In such cases as these it seems to me that it would be well for the Committee of architects to express its appreciation of the aims of the designer even though it may be advisable to recommend alterations either for structural reasons or for purposes of convenience.

I now wish to say a word on the subject of cheap churches. The Society has rightly laid down a schedule of requirements as a condition of its helping any scheme. But I regret to say that there are certain church builders who habitually exercise an almost uncanny ingenuity in fulfilling the letter of the Society's requirements in order to secure the Society's grants, and, what is even more valuable to them, the prestige of the Society's approval of their undertakings. It would, I venture to suggest, be well if the Committee of architects were empowered to condemn schemes in which obedience to the letter of the law obviously covers a disregard of its spirit, and, conversely, if they were free to pass plans in which the literal fulfilment of all the Society's requirements is not in their opinion necessary, as no doubt is the case in many instances which may be quoted.

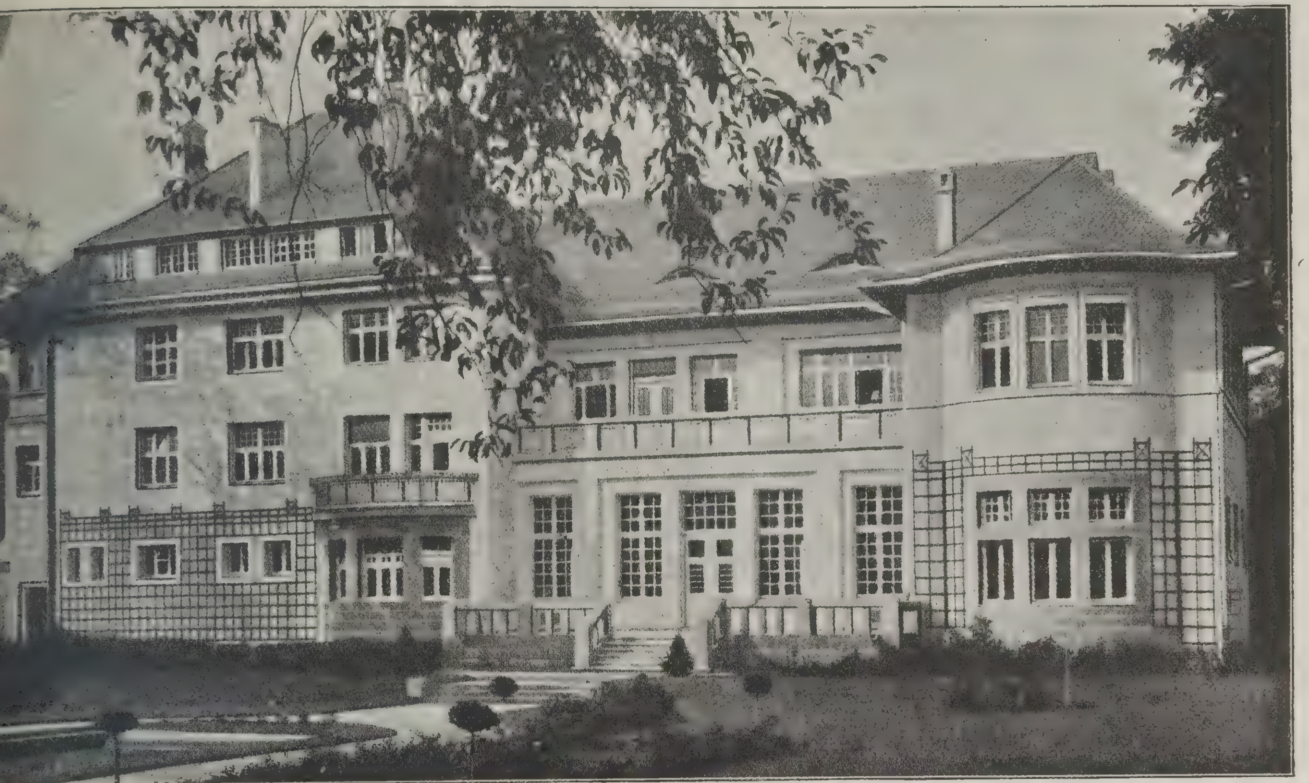
I take it there is no harm whatever in building a cheap church, provided it be solid and sufficiently spacious. The harm comes in when people try to build showily as well as cheaply, when they starve the roof tree so that they may gild the altar, when they cram seats into every odd corner in order to swell their "tables of accommodation," and where they juggle with the number of pounds they must pay "per sitting," a form of trickery wasteful in the long run, as many have found to their cost.

In this matter I fear the regulations of the Society have something to answer for. Its grants are based upon the number of sittings provided, which affords a distinct temptation to all of us architects to spoil our churches by overcrowding them for the sake of getting a big grant from the Society and of acquiring merit in the eyes of building committees. They certainly manage these things better abroad, where the modern churches are roomy and spacious, where one can breathe in comfort, and if one likes sit behind some pillar sheltered to a certain extent from the full blast of musical and other aids to worship.

Would that we had more such churches here; perhaps the Society could do something by basing its grants not upon

## MODERN EUROPEAN ARCHITECTURE.

### GERMANY.



[From *Der Profanbau.*

GARDEN FRONT, COMMANDANT'S HEADQUARTERS, NUREMBERG.—Baurat G. KURZ, Architect.

the actual number of seats provided, but on the cubic space enclosed within a church—for I think the average building committee will be found quite anxious enough to overcrowd a small church without being aided and abetted by any society such as this.

As regards the largeness of our ideas in the present day I fear we do not compare over favourably even with our grandfathers and great grandfathers. For instance, I read that St. Pancras Church cost over 70,000*l.*, and that the velvet hangings of its pulpit and reading-desk cost no less than 567*l.* Of course, this was in the days of church rates, and at a time when a dozen churches were building where now we should be building a hundred. Still these things give us food for reflection. And if we cannot afford to build handsomely, then at any rate let us build simply and modestly. And when we have got our churches, which in nine cases out of ten have to be cheap ones, do not let us bedizen them with the brazen birds and the sentimental windows which the clerical tailors are ever at our elbows to supply.

## THE LATE SIR THOMAS DREW, R.H.A., F.R.I.B.A.

AT a meeting of the Royal Institute of Irish Architects lately held at their chambers, South Frederick Street, Dublin, it was determined that a suitable tablet should be erected at St. Patrick's Cathedral to the memory of the late Sir Thomas Drew, for many years President of the Irish Institute and Royal Hibernian Academy. The expense will be borne by the members of the Institute in general.

Mr. R. Caulfeild Orpen, F.R.I.A.I., has been appointed architect to the Dean and Chapter of Christ Church Cathedral, Dublin, in succession to the late Sir Thomas Drew, with whom he worked in conjunction for many years past.

## COMPETITION RESULT.

IN the competition for new grammar school at Otley, Yorkshire, there were 30 competitors, and the assessors, J. H. HALLAM, Esq., of the West Riding County Council, and Messrs. WILLINK & THICKNESSE, of Liverpool, have awarded the premiums as follows:—First, Mr. WALTER H. BRIERLEY, of York; second, Messrs. OLIVER & DODGSHUN, of Leeds; third, Mr. J. T. HALLIDAY, of Manchester.

## NEW ENGLISH ART CLUB EXHIBITION.

LAST year the New English Art Club migrated for their winter exhibition from wofully deficient premises off Bond Street to the galleries of the Royal Society of British Artists in Suffolk Street, Pall Mall. This year they again occupy these quarters for their summer exhibition, and show nearly three hundred pictures, not merely without overcrowding, but with an actual appearance of spaciousness. The walls are so well arranged that everything is within range of easy vision, and the quality is so high as almost to make the visitor wish the works had been packed a little closer so as to make room for more. The New English Art Club have held forty-two exhibitions, and have established for themselves a notable position. Their forty-third will not disappoint those who have come to look on the society as a half-way ground between the ideas of the old and the new. This latest exhibition is exhilarating to a degree, and shows that Burlington House does not reflect every vital force in contemporary national art. Picture after picture delights with its revelation of freshness, spontaneity and power. There is little that is jaded, for each and every picture seems to bubble over with vitality, and the spirit of adventure. These qualities were perhaps to be expected in the work of artists like Mr. John S. Sargent, Mr. William Orpen, Mr. P. Wilson Steer, Mr. William Shackleton, and Mr. H. Tonks, who have in the past achieved a high reputation. All the other painters, however, appear to have been similarly compelled to reach forward and catch new modes.

If there is one outstanding figure among the exhibitors it must be that of Mr. John S. Sargent, R.A. This wonderful artist shows no less than six works, and none of them are portraits. The place of honour in the central gallery has been accorded to his "The Church of Santa Maria della Salute," which is an architectural painting if there ever was one. The church must have been represented thousands of times for, as the late Mr. W. J. Anderson wrote, "its exterior effect is the delight of painters, and a familiar object in most representations of the scenery of the glorious sea-gate to the presence chamber of the Queen of the Adriatic." Mr. Sargent, however, was not wishful of merely adding another to the charming pictures of the church in its beautiful setting. He concentrated his skill on the angle of the pillared entrance with its flight of steps, and the first of the chapels. As a tour-de-force the picture must win unqualified admiration, and the Johannesburg gallery will be richer for this acquisition. His large "Florentine Nocturne" reveals skill and poetic feeling of another sort. The subject is Cellini's famous statue of Victorious Perseus in the Loggia dei Lanzi, silhouetted against the star powdered cerulean vault, and it is one of those mental impressions which bring a man a lifetime's pleasure. In the mystery of its setting the nude figure seems imbued with life as it holds aloft the severed head of Medusa. Mr. William Orpen is another notable contributor with five works, each of which is unlike the others. His portrait of Mr. Alfred W. Rich portrays his fellow artist in unconventional garb sketching; "A Woman" shows a prostrate nude figure daringly posed, and looking with entreaty to be freed from her uncomfortable position; "On the Irish Shore" and "The Rest" are just a little puzzling, for as they stand they are scarcely ordinary Hibernian types. Mr. P. Wilson Steer's only large work is this year a clever portrait subject "The Muslin Dress," a girl half lying on a chintz-covered sofa; the pose may not be the most graceful possible, but the work is extremely pleasing in its lack of affectation. Another portrait subject which is eminently successful is "A Window by the Thames," by Mr. W. W. Russell. The art of Mr. William Shackleton has its own enthusiastic admirers, and here they will find seven of his characteristic works. The two first rooms are devoted to a somewhat miscellaneous mixture of watercolours, drawings, and etchings. The series of caricatures by Mr. Max Beerbohm, for instance, makes a curious contrast to the clever drawings by Mr. Muirhead Bone. These rooms may be said to serve as a hors-d'œuvre to the rich, though wholesome fare which awaits the visitor in the remaining galleries.

## CROSBY HALL, CHELSEA.

IT is just three years ago since a committee of the London County Council reported that in consequence of the imminent danger of the demolition of Crosby Hall, Bishopsgate, they were considering whether the Council ought not to exercise its powers to purchase such a building or to contribute towards its preservation or maintenance. Crosby Hall, it may be remembered, was erected in 1466 by Sir John Crosby, an eminent grocer and woolstapler. According to Stow the new house was "of stone and timber, very large and beautiful, and the highest at that time in London." Crosby's Place had during the next two centuries a succession of distinguished tenants, including Richard, Duke of Gloucester, afterwards Richard III.; Lord Mayor Sir Bartholomew Reed; Sir Thomas More; and the Dowager Countess of Pembroke. At the end of that time its greatness began to diminish, and in 1676 when all the buildings with the exception of the great hall were burnt to the ground the occupants used it as a Nonconformist meeting house. In 1836 a public subscription was raised to save the dilapidated structure from destruction, and thirty years later it was again restored preparatory to its being used as a restaurant.

But a still more momentous change in its fortunes came some three years ago, when the Chartered Bank of India, Australia and China acquired the site for the purpose of erecting new premises. A movement which had the expressed approval of King Edward VII. was quickly inaugurated to raise 150,000*l*. for the purpose of its preservation; of this amount 50,000*l*. was to be spent on the purchase of a contiguous freehold site on which the Bank could erect their premises, and 60,000*l*. on the purchase of leasehold interests. The directors gave instructions that until the success or failure in raising the funds was assured only those parts of the premises which were unimportant should be demolished, and that even that work should be carried out with the utmost care. Accordingly the contract was let to Messrs. Trollope & Colls, in preference to an ordinary housebreaking contractor, on the recommendation of Messrs. Gordon & Gunton, the architects. Subscriptions were promised up to 60,000*l*., and there they stopped. As a last effort a sub-committee of the London County Council were instructed to ascertain if arrangements could be made either to preserve the hall as it stood, or to re-erect it or any part of it on another site, to which the public could have access. But as neither that body nor the City Corporation, nor any of the societies interested were prepared to contribute the balance of 50,000*l*. their moral support was of no avail, and the work of demolition was continued. Fortunately the bank directors arranged for the preservation and temporary storage of the most interesting portions until they were handed over to the County Council in 1908. The Council finally acquired them in connection with a scheme put forward by the University and City Association of London, by which it was proposed to re-erect Crosby Hall in Chelsea at More's Gardens, at their own expense. Here it will serve as the college hall in connection with the University settlement proposed to be erected at a cost of 60,000*l*. on the site, and also as a public hall. This proposal was quickly adopted.

The new old Crosby Hall was thrown open by Messrs. Trollope & Colls, the contractors, for the inspection of architects and others last week. As it stands at present it seems a somewhat isolated structure; but when the whole settlement is complete it will form a striking feature of this group of collegiate buildings. Though the important parts of Crosby Hall are the same as in Bishopsgate there is nevertheless a fairly considerable portion of it that is new. The walls, for example, were of rubble and in consequence they had to be formed mostly of new brick plastered over up to the height of the windows. The windows themselves are of the original stone, as is also the remarkably beautiful bay window. The latter is formed of 131 separate pieces of stone each of which was elaborately marked before being taken down from its original position. The famous carved roof is practically intact. Before re-erection, however, the timbers were pickled, and the numerous coats of paint and varnish removed. The great stone fireplace faces the bay window. At one end a new concrete gallery has been put up. The floor is of wood, and is new, the old stone floor being too much damaged. The exterior is conspicuous for its bright tiled roof, its finely shaped chimney stack, and the hexagonal wooden turret and vane rising in the centre. The whole structure is over a roomy basement 15 feet high.

The University students have an historic building in which to foregather, and London has the right to share it. But there is nothing distinctively fifteenth century about it, for the building as it now stands might have been designed by an architect with one eye for his late Gothic forms and the other for his practical requirements. The work reflects great credit on Messrs. Trollope & Colls, who carried out the re-erection as well as the removal. The architects for the scheme were Messrs. Wratten & Godfrey.

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* (New York) illustrates the First National Bank of Hoboken, N.J., by Mr. Kenneth M. Murchison, a refined piece of Classic work; two good houses of moderate size, one for Mr. Samuel H. Austin, at Chestnut Street, Philadelphia, by Mr. Charles Barton Keen, the other at Mt. Kisco, N.Y., by Mr. W. S. Phillips. Mr. Keen seems to be an expert in pergolas, as an extensive one at Walnut Grove, near Bristol, Pa., by him, is fully shown, and he adopts a similar motif for verandahs to a house at Langhorne, Pa. Several designs by students of the Society of Beaux-Arts Architects are also illustrated.

*La Construction Moderne* (Paris) devotes its illustrations to a house in the Rue Cassini, Paris, by M. F. Saulnier, which is an excellent example of "art nouveau" void of eccentricity.

*Stone* (New York) shows us the new chapel at United States Military Academy, at West Point, a remarkable piece of quasi-military architecture, with windows of Perpendicular tracery, of which Messrs. Cran, Goodhue & Ferguson are the architects. The new chapel of the United States Naval Academy at Annapolis is also illustrated. This is a finely designed domed structure on a Greek cross plan by Mr. Ernest Flagg.

*Engineering Record* (New York) gives an interesting account of the underpinning of a 300-ton column on quicksand in the Sargent Building, a seven-storey brick warehouse at Centre and Leonard Streets, New York.

*Het Huis* (Amsterdam) contains the fifth of its series of articles on Oud-Deventer, that wonderful storehouse of sixteenth, seventeenth, and eighteenth century Dutch architecture. There is also an appreciative article on an exhibition of Old English crewel work now being held in the offices of our contemporary.

Professor Schuster has purchased and presented the painting "Olive Gathering," by J. S. Sargent, R.A., to the Manchester Art Gallery.

Messrs. Wood & Kendrick have been appointed architects for the new school to be erected by the local education committee in Oxhill Road, Handsworth.

An immediate appeal is to be made for 40,000*l*. for the purposes of the restoration, maintenance and endowment of Southwark Cathedral.

## FORTHCOMING EVENTS.

*Saturday, June 11.*

Royal Institution : Paper on "Electric Heating and Pyrometry" (Lecture 2), by Professor J. A. Fleming, M.A., D.Sc., F.R.S.

Edinburgh Architectural Association : A Joint Visit with the Glasgow Institute of Architects to Colinton, to be followed by a Dinner.

*Tuesday, June 14.*

The Institution of Gas Engineers : Annual Meeting (three days).

*Wednesday, June 15.*

Surveyors' Institution : Meeting of the Metropolitan Members to discuss the Finance Act 1909-10. Discussion to be opened by Mr. Howard Martin, Past-President.

Association of Municipal and County Engineers : Annual General Meeting at Plymouth (three days).

*Monday, June 20.*

Royal Institute of British Architects : Presentation of Royal Gold Medal.

## EXHIBITION OF WOODWORK AT CARPENTERS' HALL.

As a part of the good work which is being done in the cause of technical education by the ancient livery companies of London the occasional exhibitions of competitive work held at intervals by the Worshipful Companies of Carpenters and Joiners takes a high place.

The first exhibition of works in wood and wood carving inaugurated by these companies was held in the hall of the Carpenters' Company in 1884. There were then eighty-eight exhibits, and at each exhibition the number has increased until this year it is 327.

Cash prizes to the value of 288*l.* have been given by the Carpenters' Company, in addition to a number of gold and silver medals. The Joiners' Company, the Incorporated British Institute of Certificated Carpenters, and the Institute of Builders have also given numerous gold and silver medals. The generous and friendly support accorded to the work by other bodies is highly appreciated by the joint Companies. Particularly the Companies welcome the interest shown by the Incorporated British Institute of Certificated Carpenters, a body of considerable size and importance, which had its origin in the examinations in carpentry and joinery that have been held by the Carpenters' Company for many years past. This is the seventh exhibition of the series, and whilst it contains a greater number of exhibits than any previous one, the works are certainly of a higher standard and more interesting. The Carpenters' and Joiners' Companies, greatly concerned for the welfare of the craft which gave them birth in the fifteenth century, are anxious to preserve the craftsman as distinct from the machinist. In the present strenuous time of keen competition, when cheapness too often displaces worth, and when specialisation and machinery rob the workman of the opportunity of displaying originality, it is difficult to preserve the craft for the craftsman. An effort is being made in this direction by the joint Companies in the school at Great Titchfield Street, which is open to the trade only. An entire absence of machinery and a staff of skilled instructors give the workman an opportunity that he does not easily obtain elsewhere. Several of the prize-winners in this exhibition are passing, or have passed, through the classes of this school. All the exhibits are by British subjects, by whose hands the work has been framed and worked, except the one example in Division IV., to which this condition does not apply.

The programme of the competition, and consequently of the exhibition, embraced the following divisions:—I., Models in constructive carpentry; II., Models having the object of obtaining architectural and picturesque effect; III., Joinery; IV., "Trade" exhibits of specified character; V., Carving; VII., Carving by amateurs; VIII., a cabinet in hardwood. (Division VI. did not appear in the programme.)

Each division contained several classes, in which certain subjects were specified. Thus in Division I. the classes were:—(1) Ordinary roofs; (2) ornamental open timbered roof; (3) bridge centering, &c.; (4) framed centering for a concrete dome; (5) shoring, &c.; (6) a gantry and staging; (7) an elliptical dome. In Division II. the classes were:—(1) Uncovered stand of framed timber for 3,000 spectators; (2) a lych gate in oak. With regard to Divisions I. and II. the judges reported that the exhibits were of exceptional merit, and caused them some difficulty in awarding the prizes; the roofs in both classes showed a good knowledge of construction and careful workmanship; a very good model of a temporary bridge secured the first prize. There was one very good model for gantry and staging. The other exhibits in this class did not comply with the conditions. In Class 7 (elliptical domes) there were only two entries, one of which was excellent and showed knowledge and accuracy in setting out. Only one prize was awarded. There were numerous entries in the lych-gate class, which were distinctly good, and extra prizes were awarded. In the opinion of the judges the exhibitors generally showed a great desire to produce good work, and revealed an unsuspected wealth of sterling workmanship.

The exhibits in Division I. being almost entirely models to a scale of 1½-inch to a foot or less, there was, in our opinion, too great a tendency to employ planed hardwood, and we were pleased to note that the first prize in Class I. was awarded by the judges to Mr. H. F. Broadribb for a model of a king post trussed roof in which the model was true to nature by being in unplaned deal. In Class 2 another defect of the model was prevalent; curved members in hammer-beam and other open timbered roof trusses were cut out of one piece for roofs 50-feet span; consequently they were largely cross-grain and represented utterly impossible pieces of timber. The first prize model of a temporary road bridge over a river in Class 3, by Mr. John Colburn, was excellent both in design and execution. Practical merit was recognised in Class 4, in which Mr. Herbert E. Gibbs's model of framed centering for a concrete dome was rightly, in our opinion, awarded the first prize for clever economy of design, although other models were more elaborate. In Class 5, for shoring, the biggest model won, but it was also superior in idea. The first prize in Class 6 was awarded to a model by Mr. John Colburn for a gantry and staging for conveying a travelling steam crane in the

IN BRUGES.—From a Sketch by Mr. J. Grey West.

erection of a large railway station roof, which was a very excellent piece of work.

In Division II. there were only two competitors in Class I. for the grand stand, and the more practical and less elaborate model won. The lych-gate subject, Class 2, proved very attractive, and the best design won, being the work of Mr. George Jones.

In the joinery, Division III., the judges reported that they were gratified to find not only an increase in the number of exhibits, but also in the quality of the work.

In Class I. they unhesitatingly awarded the first prize to an apprentice, Mr. Albert E. Atkins, whose work, in spite of the merit of the others, was unquestionably the best.

A twin circular staircase by Mr. Herbert H. Durran was of such high quality that it was unanimously awarded a special gold medal given by the Joiners' Company for the best exhibit in Division III. A panelled and moulded niche in mahogany by Mr. Albert Daley ran it so close that through the generosity of the Builders' Institute that also secured a similar recognition.

We understand that Mr. Durran was a student at the Great Titchfield Street School, an evidence of the value of that institution for the training and improvement of craftsmen.

Many good models of doors were exhibited, but we were pleased to see that the prize in Class 5 for a front door in oak was won by a full-sized model, which was of good design as well as workmanship. In the high-class joinery class there was much very good work, and Mr. Albert Daley, who, as already noted, took a gold medal, won both the first and second prizes in the class.

Admirable as was the work exhibited in the divisions devoted to carpenters' and joiners' work, it was surpassed in both quantity and attractiveness—we will not say in excellence—by the wood carving, of which the judges said that the average of merit was remarkably high and, on the whole, above the last exhibition. They were very pleased to see so many apprentices enter in the various competitions, and also to see a great quantity of carving done with a view to the requirements of its special purpose rather than as an exercise in carving alone.

The judges congratulated the Carpenters' Company upon the great interest it has shown in encouraging the art of carving, adding that the Company are doing, in their admirable way, what should be done by the nation, and that it is a matter of great satisfaction that such a response has been made by the craftsmen to the efforts of the Company to promote a higher standard in design and craftsmanship.

Division VIII., in which a valuable prize of 20*l.* was offered for a cabinet in hardwood, attracted some very remarkable work, the winning exhibit, a cabinet in ebony and satinwood by Mr. J. H. W. Brandt, being an entirely satisfactory specimen of high-class British craftsmanship. The opinion of the judges was shown by the award of seven prizes in this division, which contained no more than eleven exhibits.

We consider that the Worshipful Companies of Carpenters and Joiners are to be congratulated on the excellence of their exhibition, which was indeed aided by some good loan exhibits, though these were scarcely necessary, as the high-class craftsmanship that the Companies have fostered is quite capable of maintaining a sufficiency of interest by itself alone.

## "THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

PARTLY, at least, owing to the near approach of the R.I.B.A. intermediate examination, very few students have contributed to the work of the Sketching and Measuring Club for May. The quality of the work submitted is, however, very high, and we have had some difficulty in awarding the prize to distinguish between drawings of almost equal merit.

"Sans Peur" has measured and drawn a stone screen in the north transept of Wells Cathedral, and has done so clearly and well; but the plan of the third order or smallest mullions should have been included with the others to show their joint relation. The design of the screen is not quite satisfactory in the way in which the tracery is cut off by the cornice, the second order of mullions butting up against the flat soffite in a very abrupt manner.

"Balgownie" has selected for his subject the upper part of the Tower of King's College Chapel, Old Aberdeen, with the crown surmounting it, carried on flying buttresses. This is a very difficult subject, and to show it completely would require much careful study and a large number of drawings. The author's work is, therefore, not sufficiently complete to reach the ideal of a perfect set of measured drawings, which should be such that if the building were suddenly to vanish into thin air it would be possible to reconstruct it from the drawings; but, as far as they go, "Balgownie's" drawings are satisfactory.

"Esek's" contribution this month is two sheets of measured drawings of the Tower to Guiseley Parish Church, Yorkshire. The subject appears to have been carefully measured, and many figured dimensions are included, but those shown are not quite sufficient for absolute certainty, while the character of the masonry is not clearly indicated by horizontal lines alone. "Esek" draws in rather too fine a line for Gothic work, and he has yet to learn the real shape of a bell.

Mr. Reginald Pywell has attempted an elaborate subject in the cloisters of Christ Church Cathedral, Oxford, of which he gives the complete plan, an elevation of one side, with sections and details of mouldings. The work is effectively and carefully done, and we have awarded the prize for May to Mr. Pywell for these drawings.

## NOTES AND COMMENTS.

Suggested memorials to King Edward VII. are naturally becoming numerous, and among those that commend themselves to us are the addition of a new chapel to Westminster Abbey, not by any means a novel idea, and a historical painting in the ambulatory of the Royal Exchange of some event in the late King's reign.

The India Society has been founded to promote the study and appreciation of Indian culture in its æsthetic aspects and to enlighten the present ignorance of European artists and students concerning the vast unexplored field of Indian sculpture, architecture, and painting, as well as of Indian literature and music. The Society proposes to publish works showing the best examples of Indian architecture, sculpture, and painting, both ancient and modern, which will be issued free, or at low prices, to members of the Society. The British rule in India has been for the most part concerned with the political and social conditions of the country, and its art has very largely been neglected, at any rate comparatively, despite the inclusion in our museums of some specimens. Therefore such a Society as is now founded may be welcomed as only a part of the duty which our presence as rulers in India involves upon us. The subscription to the Society is one guinea per annum, and the Hon. Secretary is Mr. T. W. Rolleston, of Ardeevin, Christ Church Road, Hampstead.

We regret to have to announce the death of Mr. Matthew Henry Holding, A.R.I.B.A., who for the last thirty years has been prominent as the leading ecclesiastical architect in the county of Northampton. Among some of Mr. Holding's works were the churches in Northampton of St. Crispin, St. Mary, Far Cotton; St. Paul, St. Matthew, Christ Church, and Holy Trinity, and the restorations of St. James and St. Giles. Much restoration work also was carried out under Mr. Holding, both in the county of Northampton and further afield.

In the King's Bench Division of the High Court Mr. Justice Coleridge gave a very important decision in the case of Mudd *v.* General Union of Operative Carpenters and Joiners, to the effect that the Union was an illegal society because some of the rules contemplated such a restraint of trade as to make all the other rules unenforceable, and these were the main feature of the rules in general. The plaintiff was suing the Union, and obtained a verdict from a jury for 5*l.* for the loss of his tools in a fire. Thus, by reason of the Union being an illegal society, the plaintiff, on the point of law, could not enforce his claim for any benefits to which the rules of the Union would apparently entitle him. Thus members of trades unions in general have no legal claim for benefits, which we may suppose are among the inducements for men to join, if the rules of the Union illegally act in restraint of trade, as probably the rules of every trades union do.

The Lord Mayor and other members of the City Council of Birmingham have made a tour on the Continent to study town planning in Berlin, Vienna, Munich, Ulm, Mannheim, Frankfort and Düsseldorf, and have apparently learnt much that will be to the advantage of the city of Birmingham when the provisions of the Housing and Town Planning, &c., Act. 1909, come to be applied in their district. It is well that the members of governing bodies should take such steps to educate themselves rather than that they should rely on their expert advisers for everything. For so far the experts are only learning, and, as far as we can see, are apt to seize on one aspect of the subject and ignore others. Hence the value of intelligent criticism by their employers, more especially as members of local governing bodies are apt to indulge in unintelligent criticism and opposition in default of ability or knowledge to offer better.

A very interesting old house in Friar Street, Worcester, is now in the hand of the repairers, and is being made ready for use as a restaurant. It is fortunate that this house has fallen into safer hands than those that have demolished many of the most interesting houses in the city, which constituted part of the architectural history of England. This house in Friar Street is built in the old Worcestershire style, namely, of oak timber and wattle and daub, but this had been covered by lath and plaster, and it was only when the walls were being cleansed that the interesting archæological features were brought to light. The structure has been very much pulled about, and what was once one commodious house has been turned into five tenements. Perhaps the most important feature is an old fireplace, with a seat in the chimney corner, somewhat smaller than that at the Old Trinity House. One side of the fireplace and the stonework are well preserved; but the left side has been partly destroyed, and is restored in modern brickwork. The date of the feature cannot yet be fixed, but it is certainly probably several hundred years old. The deeds of the house go back to James I. In another room has been discovered a very good plaster ceiling, on which are to be seen the Royal Arms. The arms include the lion, unicorn, Tudor rose and pomegranate, the last-named being very largely used in Prince Arthur's chantry in Worcester Cathedral. It came with Prince Arthur's marriage to Katharine of Aragon, but apart from the fact that the ceiling is of a Tudor period no exact date can be given.

The Bishop of Birmingham has, at St. Luke's Church, Cherrywood Road, Saltley, dedicated a rood screen which has been made and erected by members of the congregation. The figures of Christ crucified and of Mary and John appear in the centre of the screen over the chancel. The Bishop, in an address in which he referred to the erection of church screens in mediæval times, said he was glad to be able to dedicate a screen and rood which the congregation had themselves made and offered to God. The English people had, he said, been particularly fond of these rood screens and roods. There was a time in the fourteenth and fifteenth centuries when the English nation was much more full of artistic skill than it was at present, and it came about that in almost every parish throughout England where already a church of beauty and dignity had been erected the people furnished it with a screen of woodwork so beautiful that the remains of their skill excited the admiration of all who went to look at them. This England of ours must then have been a wonderful land so far as its churches were concerned. There was, at any rate, no doubt that in every parish there was a great deal of artistic skill which was exercised in the production of these screens.

## EXHIBITION OF THE WORSHIPFUL COMPANY OF FOUNDERS.

THE Worshipful Company of Founders is one of those in the City of London that recognises that the craft it represents should receive whatever encouragement the Company can give in the direction of improvement in the craft, in other words, the extension of technical education. With the assistance of the Worshipful Company of Ironmongers, whose interests in craftsmanship are naturally closely allied, the Founders' Company has organised a competitive exhibition for specimens of the founder's craft. The sum of 187*l*. 10*s*. has been offered in cash prizes, besides numerous medals and certificates.

The scope of the exhibition may be best gathered from the resolution of the Court of the Company that "The Master, Wardens, and Court of Assistants of the Worshipful Company of Founders do hold an exhibition of castings and models in metals—viz. aluminium, bronze, brass, gold, iron, and silver, all to be cast from the crucible; also designs in wood, plaster, or any suitable material for casting from, and they would offer the prizes set out on the following pages, to be competed for by founders, designers, craftsmen, apprentices, and improvers, British born, engaged in foundry business or allied trades, and residing in England."

We regret that only sixty-nine competitive exhibits make up the response to the invitation of the Company, but it must be remembered that in the present day there are few actual craftsmen founders who are not simply paid servants of a commercial firm or limited company. The founder, in fact, is now scarcely, in the true meaning of the word, a craftsman, but a skilled artisan who cannot determine what he shall cast or how he shall do it, but has to do what he is told to fulfil his master's contract with some customer of whom he knows nothing.

In foundry work there are two distinct divisions—the making of the model or pattern and the casting. It is but seldom now that a craftsman is in a position to unite both, and he cannot therefore be considered a complete and true craftsman under such conditions.

The principal prize was for the best model of a medal for the Founders' Company, obverse, coat of arms of the Company; and a design for the reverse, 12 inches in diameter. This has been won by the reverse of A. Stanley Young, which is a fine piece of composition representing a master founder and his apprentice or journeyman in the act of casting. The modelling is excellent, and the relief just what it should be for a medal. The second prize design by Agnes Keshaw Halliday also obtains its position for the reverse, although this is not equal to that of the first prize-winner in the treatment of the subject, which is lacking in decorative feeling and is in too high relief. In neither of the two prize designs is the heraldry of the obverse quite satisfactory, and it is far inferior to that of Edmund Ware, who has given quite the best rendering of the Company's arms, but whose reverse is tame, commonplace, and unimaginative, although well modelled.

The prize for the best casting has been won by a "Goat modelled from Life" by Arthur Huskinson, which is a fine work both in modelling and in casting. For the best group, or figure, or head, the first prize has been awarded to a bust of Sydney R. Pollard, Esq., Master of the Founders' Company, by Mortimer Brown. We had no difficulty in recognising the Master from the bust, although in the latter we think the geniality of character of the original is not sufficiently expressed.

The second prize, won by a "Bronze Figure of Inniskilling Dragoon (1815)," by J. A. Jackson; and the third prize for "A Reaper," by Samuel W. White, have both been obtained by work admirable in pose, in modelling, and in casting.

For the best panel in ornament or figure the first place has been obtained by an "Ornamental Panel for Grate-back," by H. E. Warren, a magnificent piece of heraldry. We prefer the work of the winner of the third prize in this class, Thomas Benton, to that of F. W. Braddock, whose "Monk Writing at a Desk" is placed second, and is, to our thinking, in too high relief. A very good piece of low relief is "Helias descending into the Sea," by A. Stanley Young, which is awarded a certificate.

The prize for the best bell has been given to a "Model of a Church Bell, loam cast," by A. F. Sysachman, which is good in design and cleanly and sharply cast. There are only three competitors in this class, and each receives a prize, so that it follows that all are meritorious.

Three designs compete for the prize for a cast railing, and the first prize has been awarded to J. W. Wilkinson for a railing for a pier, which cleverly is made up of dolphins and seaweed conventionalised, and is a successful production. The first prize for the best design for any kind of cast metal-work is shared between Miss Dora Bard and G. Edwards Tucker, the former submitting a rain-water head and the latter a gold cup representing "Life and Music." Neither are entirely satisfactory.

The exhibition has been made more attractive by a loan collection contributed by Sydney R. Pollard, Esq., the Master of the Company; John Place, Esq., Messrs. S. B. Goslin & Son, Messrs. James Dixon & Son, Messrs. Elkington & Co., Ltd., and Messrs. H. Young & Co., Ltd., which served to adequately fill the rooms in the hall of the Ironmongers' Company in which the exhibition was held.

## EXCAVATIONS AT TORTINGTON PRIORY, SUSSEX.

A MEETING of the Royal Archæological Institute was held on Wednesday, June 1, at 20 Hanover Square, W., when notes were read by Mr. P. M. Johnston, F.S.A., F.R.I.B.A., on the excavations which he is superintending at Tortington Priory, in Sussex.

Tortington, he said, is one of those small parishes with a small population and a small church to match, so common in Western Sussex, near the sea. Though only three-quarters of a mile from Arundel, with the living of which it is now united, its proximity does not seem ever to have affected the number of its inhabitants. The parish church now stands quite alone, with the exception of a farmhouse near by. It is not mentioned in "Domesday" (1086), and it is uncertain that any then existed. For this reason it is possible that it was the child of Tortington Priory—*i.e.* it may have been built by the monks to supply the wants of their tenants. This would give the tiny structure an interest of its own, as, unlike all the neighbouring village churches, it has not replaced a more ancient building and preserved an older plan or incorporated in its structure earlier features.

The priory was founded for a small establishment—never more than seven or eight—of canons of the Order of St. Augustine, commonly known as Austin Canons or Black Canons, at some date in the twelfth century. A good deal of uncertainty exists as to who were the founders of the priory, and at what date it was established. Upon the answer depends the truth or otherwise of the assertion that the parish church was built by the canons of Tortington for their tenants and dependents, a statement which, though probable enough, at present lacks both documentary and architectural evidence.

According to Dallaway the foundress was Alicia Corbet, who is supposed to be a member of the D'Albini family. Dugdale gives the name more correctly as Hadwissia (the same as the German *Hedwig*) Corbet. Popular report of her is that she was a mistress of Henry I., but there is no documentary evidence of this. All the architectural evidence goes to show that the priory church was a good deal later than it would have been if there was any truth in this legend; 1180 is the earliest date for any architectural features. There was found a good deal of hatched work of Middle Norman date. Very large parts of the excavations have been abandoned.

The dedication of the priory was in honour of St. Mary Magdalen, and the parish church seems to have been placed under the same saint. The late Mr. Charles Gibbon (Richmond Herald), in a paper upon the dedications of churches and chapels in this part of Sussex, wrote "Unknown as yet" against Tortington, and in the "Chichester Diocese Clergy Lists" there is no saint appended to the name. However, in the "Feet of Fines for the County of Sussex" there is an entry relating to an arrangement come to in 1214 between William, Earl of Arundel, and Pharamus de Tracy in which "the advowson of the Church of St. Mary Magdalen of Tortington" is mentioned. If this can be taken as referring to the parish church it would show that the priory and the parish church were placed under the same patron saint.

For the last century and more of its history, until in 1536 the priory was surrendered to Henry VIII., its record is one of decay, neglect, and disorder. There were at the date of its suppression five priests and one novice. The revenues of the priory were mainly derived from lands in West Sussex. Among the advowsons it possessed was that of St. Swithin, in London, where the prior had a house in which he occasionally resided. This was the gift of Robert Aguillon, North Stoke, when he bequeathed his body to the canons to be buried in the priory church. The architecture of the building must have influenced that of the little church of the parish. To what extent this was so it is difficult to judge owing to the scanty remains of the priory church and buildings. At present all that exists above ground are parts of the north transept and north wall of the nave of the priory church, with some graceful vaulting shafts, which indicate a date about the middle of the thirteenth century. Built up in some comparatively modern walls of the farm buildings now occupying the site are numerous fragments of columns and sections of mouldings belonging to more than one date in the twelfth and thirteenth centuries. It is probable that the adjacent barn was built of the old materials.

When the buildings were surrendered to Henry VIII. in 1538 the site of the priory was granted to Henry Lord Maltravers. In Elizabeth's reign the estate came into possession of Roger Gratwick, of The Ham, Angmering. He built the old manor house called Tortington Place largely with the materials of the priory, for, as far as one can conjecture, he seems to have pulled down the greater part of the buildings immediately and to have commenced the erection of a house. These Gratwicks, however, seem to have exercised a generally protective influence over churches. The estate passed through the female line to the family of Weekes, one of whom represented Arundel in Parliament in 1702, and this gentleman sold it to William Leeves in 1706, from whose descendants it was purchased by Charles, Duke of Norfolk.

Mr. Johnston expressed his warm gratitude to the present Duke of Norfolk for the trouble he had taken and the monetary assistance he had given towards carrying out the excavations. Thanks to his help, no difficulties had been encountered.

The work of demolition was carried out very thoroughly at the time of the Dissolution. The most interesting finds were three leaden coffins with richly ornamented lids dating between 1180 and 1200. One of these has been sent to the British Museum. There seems to be no question that the priory church had a central tower. Close by are the remains of a large building which was probably the refectory and near to it more remains which were presumably a kitchen. Among the latter was a well-made shoot filled with oyster and snail shells, tiles, and remains of stained glass.

## RENAISSANCE MONUMENTS IN THE ROMAN CHURCHES, AND THEIR AUTHORS.*

RENAISSANCE sculpture in Rome has, naturally, been overshadowed by the Antique. And yet the monuments which fill her churches, or have been broken up and hidden in crypt and cloister, display a remarkable, and, in a sense, unique development of fifteenth century art and portraiture.

Here you may follow, sometimes in one single church, the whole evolution of monumental art, from the earliest times, when it began to be an object to those who were leaving an uncertain and unquiet world, to secure a last resting place in the immediate neighbourhood of the shrine, where the relics of the saint and the presence of the miraculous elements offered the surest guarantee against disturbance. But it was only for the great and influential that room was found within the sacred edifice. Their effigies were set recumbent, inlaid in the pavement, humbly near to mother earth, the bishop clasping his crozier, the warrior of the church his cross-hilted sword, and soon the feet or knees of thronging worshippers wore away their marble outlines and even the record of their names. Then some of the more illustrious were elevated on a base, secure above the tramping feet, as on a pier set against the wall. As time went on, a niche was hollowed out to receive the tomb; the vault became a canopy, and the effigy lay as it were on a bed, from which angels, rudely carved, drew back a curtain to reveal the face of the sleeper. So the wall-grave arose, and the living fought with tooth and claw to secure the option of the choicest spot wherein to lie through future centuries. The delicate art of the Cosmati redeemed by exquisite colour and design the incompleteness of the sculptor's craft, and gradually, with the spirit of the Classical revival, the Gothic and Romanesque character of the wall-graves gave place to the more accomplished and conscious manner of the Renaissance. Rome, which has always rather tended to assimilate than to produce, summoned the skilled craftsmen of Tuscany and Lombardy to assist in preparing for the princes of the church memorials appropriate to the stateliness and magnificence of their lives. In the latter half of the fifteenth century the revived art of sculpture was touching the plenitude of achievement, and for a brief moment in the finest examples of the Roman ecclesiastical monuments, we are dimly reminded of the restraint and dignity with which the Attic Stelæ treated the presentation of death. The great prelates of the Renaissance are portrayed to us, robed and mitred, lying in tranquil sleep on the flowered sarcophagus. The saints of their choice occupy shell-vaulted niches in the pilasters which support the architrave above them, and from the lunette the Madonna looks benignly down on one who should have been her faithful servant. If the modern spirit had already invaded their lives, if rationalism and materialism were in reality fast undermining the significance of forms and ceremonies from which they turned to Pagan intellectualism, fifteenth-century art at any rate preserved for a little longer the tradition of a less complex psychology. But as the struggle for mastery over material execution ceased to be apparent, the vanities of the world invaded even the monopolies of death. Not willingly did the great and powerful resign the state that had meant so much to them, and even in death they were reluctant to be dissociated from a part in life. The recumbent figure on the sarcophagus draws up one knee, raises the head, and, propped on one elbow, the departed prelate watches the movement of life below, or enviously regards the more sumptuous sepulchre of his rival. So Sansovino interpreted the new spirit of the age. Before long the tenant of the costly monument is sitting bolt upright, and the suggestion of death is conveyed by a skeleton deftly carved in yellow marble relieving against the background of basalt. From the baroc piles in St. Peter's the enthroned pontiffs of the seventeenth and eighteenth centuries continue, as in life, to dispense benediction or menace heresy, and, following the descending curve of degeneration, we reach the nadir of art in the modern horrors of the Campo Santo.

I propose to deal briefly with the second half of the fifteenth century, and attempt to establish a few attributions of authorship, to clear away a few misconceptions, due in many cases to the confused statements of the indispensable but uncritical Vasari, and to introduce to your notice certain craftsmen little known to the general public, whose contribution to the achievements of Renaissance art has emerged from the researches of Müntz and Bertolotti, and the critical investigations of Guoli, Venturi, Tschudi, Schmarzow, Fabriczy, and others.

The great Donatello visited Rome in 1433, and executed a sepulchral slab for the tomb of the Archidiacono Crivelli in the Church of Aracœli, as well as a marble tabernacle, once in Sta. Maria delle Febbre, and now preserved in the Sacristy of St. Peter's, which is historically important, as being the first work of a monumental character in which he finally discarded all trace of the Gothic tradition. While here, he no doubt came across an old associate whom he had known at Pisa, who was now engaged on various works in the Vatican, one Pippo, or Filippo di Gante, a Pisan sculptor, whose father had exercised the same craft before him, and whose son, Isaiah of Pisa, brought up it would seem in the eternal city, may be regarded, in conjunction with his constant associate, Paolo Romano, as the founder of the Roman Renaissance school. Isaiah's son, Gian Cristofero Romano, well known for his work in the Certosa of Pavia, became its most skilful exponent in the early years of the sixteenth century. We have thus four generations of craftsmen in the same family. The principal works of Isaiah are recorded in a contemporary Latin panegyric poem by one Porcellio de' Pandini, preserved at Pisa, and others we are able to identify by his well-marked archaic style, formed it would seem by the study of late Roman classical models, or again by the entries of payments in the pontifical accounts during the reign of Pius II., where he is found constantly working with the favourite artist of that pope, Paolo di Mariani di Tacco, better known as Paolo Romano. Time will not allow me to investigate in detail the work of these two masters, or the parts they took in the most considerable monument of the time, the triumphal arch of Alfonso of Aragon, at Naples, but one or two points I must ask you to hold in mind in view of their bearing on the subsequent evolution of sculpture in Rome.

---

* A paper by the Right Hon. Sir Rennell Rodd, G.C.V.O., K.C.M.G., P.C., His Majesty's Ambassador to the Court of Italy, read before the Royal Institution of Great Britain on June 3.

In the first place it seems to have been Isaiah of Pisa who set and fixed the type in Rome generally adopted for the sepulchral monuments of the Renaissance. At any rate the first complete example we have is from his hand, in the tomb of Pope Eugene IV., who died in 1447. It was executed during the reign of his successor, which extended to 1455. Removed from St. Peter's to San Salvatore in Lauro, probably in the reign of Paul II., it may have suffered in transport, as certain portions, the two figures in the niches on the left side and the kneeling angels in the recess, are the work of another and apparently somewhat later artist employed to reproduce the broken pieces. The monument was evidently similar in design to another tomb of Isaiah's, namely, that of Saint Monica in the church of S. Agostino, which was broken up when the church was modernised. Only the recumbent figure and the plain sarcophagus remain *in situ*. The four saints from the pilaster niches, much mutilated, are now set up in the porch of the transept entrance, and they are identical in design with the figures on the tomb of Eugene IV. Another monument by Isaiah, slightly earlier in date perhaps than either of these, that of the Portuguese Cardinal Chiaves, might be reconstructed from the pieces scattered over the Church of St. John Lateran. The type of Isaiah's monuments is rather Tuscan in character, modified perhaps by a study of the Roman triumphal arch. The latest record we possess of his activity is an entry in the pontifical accounts, in the year 1464, when he received payment for work done in conjunction with Paulo Romano on the tabernacle made to contain the head of Saint Andrew, a priceless relic brought to Italy from Greece by Thomas Palaeologos, despot of Morea. The remains of this tabernacle are now in the crypt of Saint Peter's, and a comparison of the pieces from two lunettes is interesting as showing the difference between the work of Isaiah and Paulo.

I must content myself with but a brief reference to that interesting personality in the history of Roman sculpture, Paolo di Mariani, known as Paulus de Urbe, or Paolo Romano, who is not to be confounded with another earlier Magister Paolo, the author of several monuments erected at the beginning of the fifteenth century. He will, however, serve to introduce to you another name, which presents a very curious problem.

Vasari knew but little of either Isaiah or Paolo Romano. He assigns to the Florentines, Niccola and Varrone, the tabernacle of St. Andrew, and to the latter the statue of St. Andrew, near the Ponte Molle, erected on the spot where the relic was received. But the evidence of the pontifical accounts is conclusive, and they show that Paolo Romano was paid 33 ducats for its execution. In his short biography, however, Vasari tells a curious story of a rivalry which sprang up between Paolo and a certain Mino del Reame, or del Regno, which means, of course, the kingdom of Naples. This Mino, whose name, he says, was perhaps Dino, challenged the Roman sculptor to compete with him for the execution of a colossal statue of St. Paul, and adds that Paolo was so harassed by the persecutions of this Mino that he renounced his intention of carrying out a colossal statue of St. Peter, which had been ordered from him by Pope Pius II. Now the curious thing is that the Vatican accounts contain records of payments for pedestals for the statues of St. Peter and St. Paul, ordered of Paolo Romano, which were to be placed at the foot of the steps leading to the old Basilica, as well as for a statue of St. Paul, while there is no entry of payment for a statue of St. Peter. On the other hand, the two statues which originally decorated the approach to the church actually exist in the sacristy of the present St. Peter's, and both of them would seem to be from the same workshop, and resemble the other work of the Roman sculptor. Again, there is another statue of St. Paul, stated by Vasari to be by Paolo Romano, which now stands on the bridge of St. Angelo. The idea of two sculptors making statues 14 or 15 feet high, merely in a spirit of rivalry, is rather extravagant, but there is probably, as usual, some truth behind Vasari's story, and curiously enough we find over the door of the church of St. Giacomo in Piazza Navona two angels by different hands supporting an obliterated shield. Under one of them is carved in large letters "Opus Paoli," and under the other "Opus Mini." The latter, which is much the better and freer of the two, is, in my opinion, not the work of Mino da Fiesole. There are other references in Vasari, too circumstantial to be ignored, to this second Mino, and I think there is justification for the re-establishment of a personality new to general experience, and for a differentiation of his work from that of the better
known Mino of Fiesole, who has hitherto been credited w
it.

Mino de Fiesole no doubt did important work in Ro
and exercised influence over other sculptors there. To ap
ciate what he really did, the chronology of his visits is
portant. Leaving untouched the question of whether or
he was the author of the Strozzi bust in the Berlin Muse
with an inscription recording that it was made by him
Rome in 1454, when he can only have been twenty-one
twenty-two, we know from the Vatican registers that
was there in 1463, when he was employed, together w
Isaiah and Paolo, on sculptures for a pulpit which Pius
designed to place outside the Basilica of St. Peter's, f
which to give the benediction. This pulpit was ne
finished, but the statues of the Apostles made for it may
seen in the crypt of St. Peter's. To this period no do
belong some panels made for a casket to contain relics
St. Jerome ordered by Cardinal d'Estouteville for Sta. Ma
Maggiore, which church his eminence was restoring at
own cost. They may be seen to-day in the Industr
Museum at Rome, and are of extremely poor workmansh
though unmistakably revealing Mino's characteristic st
In the Vatican registers no mention of him is tracea
during the reign of Paul II., 1467-71, and we can acco
for his presence elsewhere from 1469-73. He was apparen
recalled to Rome in or about 1474, in the reign of Sixtus I
to carry out the monument of his predecessor. In 1480
was back in Florence, and in 1484 he died.

The manner of Mino da Fiesole is well known to all
have studied Italian art; the fine and delicate folds of
draperies, his constant use of sharp angles, with a prevail
suggestion of the diamond shape, which even seems to
vade faces and individual features; the thick eyelid and h
closed eye; the sharp knee, protruding through the d
phanous dress fabric; the regular fall in rather conventio
repeating angles of draperies between the open knees of
seated figures; the flat treatment of hair, consistent with
general shadowless scheme, free from all deep cutting;
weak and rather meaningless pose of the hands; the secu
and aristocratic type of his Madonnas, as opposed to
devotional type; all these, together with a certain precio
ness and an artist's love of his material, which make h
give the marble an ivory-like polish, and in his later w
an elaboration of delicate ornament and tracery.

During his second visit to Rome after 1474 we must rat
regard him as having been the guiding spirit of a great wo
shop from which issued a number of the finest monuments
the period. No single one is entirely from his hand, unl
it be the tomb of Francesco Tuornaboni, in the Mine
Church, which was probably carried out in Florence. Th
extensive commissions were probably divided up among
members of an artistic partnership, each undertaking
portion for which he had a special reputation or aptitu
In some cases the only contribution of Mino seems to h
been the Madonna of the central niche or lunette.

And first, as regards the more important work in Ro
which has been wrongly, I venture to think, attributed
him. In the Church of Sta. Maria Maggiore are the c
ponent parts of a magnificent ciborium, made for Cardi
d'Estouteville, whose portrait appears on one of the panels
donor. The four large panels are now set up in the apse
the church, and a large number of smaller fragments are
the sacristy, including a relief of the Madonna and Chi
inscribed "Opus Mini," one very similar to which, but
signed, is in the collection of Count Strogonoff, of Ro
As the restoration of the church, of which this cibori
was the principal ornament, was completed by 1474, it see
probable that the altar itself was also anterior to the ret
of Mino da Fiesole to Rome, and were it admittedly his,
could not be contemporary with the very inferior work
the panels illustrating the life of St. Jerome. While cert
pieces have features which resemble the style of the Fiesol
especially in the poise of the figures, which rest on one
only, I have, after a careful study of the whole, come
the conclusion that it is not his work, but that of a c
temporary, whose manner presents analogies and affinit
but also marked differences. The Fiesolan was not a s
cessful craftsman in relief: witness his feeble contributi
to the pulpit at Prato. The panels of this ciborium
finely and boldly conceived. The scene of the Nativity i
charming and felicitous composition. But the type of
Madonna in the Adoration of the Magi, as well as in
Assumption, is quite unlike the type of the Tuscan. S
more may this be said of the Virgin on the panel in
sacristy and its fellow in Count Strogonoff's collection, wh
are essentially devotional in character, and I, at any ra
know of no example by Mino da Fiesole the least resembl

them. The flying angels in the *mandorla* round the Virgin of the Assumption appear to be by the same artist who competed with Paolo Romano for the angel over the door of the Church of St. Giacomo. A tabernacle for holy oil in the Church of Sta. Maria in Trastevere, also inscribed "Opus Mini," appears to be by the same sculptor, as well as a Crucifixion in Sta. Balbina, which is strongly reminiscent in execution of the fragments in Sta. Maria Maggiore. On the other hand, the master of Fiesole does not seem to have blazoned his name on the marbles in Rome which are undoubtedly his. On one of these only have I found a signature, and there it is quite difficult to find, modestly hidden in a top corner. Under these circumstances I was not surprised to find that Professor Venturi, in the new volume of his monumental work on the history of Italian art, boldly assigns the sculptures of Sta. Maria Maggiore to Mino del Reame, an artist who had studied the Tuscan Mino, and was a rival of sufficient importance to be styled the Mino of Naples, and to sign that name on his own work without any compunction as to infringement of copyright.

In considering Mino da Fiesole's own work in Rome, I will first ask you to accompany me to the crypt of St. Peter's to inspect the fragments of the tomb of Paul II., of Pietro Barbo, the Venetian Mæcenas of art, the builder of the Palazzo Venezia, and the greatest collector of his time. It was erected by his nephew, Marco Barbo, immediately after his death, removed when the old Basilica was pulled down, re-erected in the new St. Peter's in the middle of the sixteenth century, and subsequently once more broken up and relegated in fragments to the crypt to make room for other sepulchres more appropriate to the baroc splendour of the new edifice. Its original design was somewhat different, as we learn from a rough sketch in a manuscript now in Berlin. The panels at the side are an addition, as well as the corner pieces squaring the lunette. Over the centre of the lunette there was originally a relief representing the Father in a glory of cherubim, and on either side winged angels, set like crockets, on the arch. Even a superficial examination of the component parts shows that the sculptures are by two different hands. The lower base, in two pieces, is now in the Louvre. Vasari says Mino del Reame worked on some small figures in the base, and these putti between the floral festoons have analogies with some of the ornamentation of the ciborium in Sta. Maria Maggiore. By Mino da Fiesole are the allegorical figures of Faith and Charity in the base, the latter among the finest examples of his art, and signed at the top right-hand corner unostentatiously; the Temptation, now stripped of its two principal ornaments, which were originally mortised on, and were probably objected to by the same spirit which imposed the addition of breeches to the nude figures in Michel Angelo's "Last Judgment"; the evangelists Luke and John, of the pilaster niches, and the relief of the "Last Judgment" in the lunette, as well as half the angels on the rim, now scattered about the crypt with their fellows, designed by his associate in the execution of the monument. The rest of the sculptured pieces are evidently all designed by the same artist, and though his personality and style are very individual and quite unmistakable, his name might have remained a mystery had he not recorded it in large letters under the feet of the figure of Hope: Giovanni Dalmata—John the Dalmatian. So far as I am aware, this inscription is the only record of his name in Rome, and no written document has yet been found which testifies to his presence there. But with the evidence of style afforded by the monument of Paul II. we are able to identify a considerable amount of work by this artist in Rome. The panel in the base displaying the creation of Eve is also his—a remarkable composition, minutely and scrupulously finished—as well as the evangelists Matthew and Mark, the large panel above the recumbent figure, representing the Resurrection, and the relief of the Almighty in benediction, which once surmounted the lunette. Dalmata also executed the recumbent figure of the Pope—a remarkable piece of portraiture—and a very graceful design for the panel roofing the square niche in which it lies.

This interesting sculptor, who, like Laurana, Georgio da Sebenico and others, hailed from the further side of the Adriatic, is little known in this country. For contrast's sake compare Mino's figure of Charity, typical of his well-known manner, with this Dalmata's figure of Hope. The most obvious differentiation lies in the mode of treating draperies. The stuff falls in heavy round folds and rock-like masses. There is a realism of execution suggesting direct study from the model which contrasts with the artificial precision of Mino's method. His angels and female faces have a cast of countenance foreign to Italian art, and perhaps recall the types of his country of origin. For the masculine faces, look at the creation of Eve and the Resurrection. In all these faces you will notice a characteristic not very pleasing, a certain obtuse and inert expression. Once appreciated it is unmistakable, and gives a clue to nearly all Dalmata's work in Rome. Another monument, executed about 1479, that of Cardinal Eruli, the fragments of which are also in the crypt, seems to have been entirely Dalmata's.

We have another example of co-operation between Mino and Dalmata in the fragments of a ciborium altar, also executed for Marco Barbo, and set up in the church of St. Marco in 1476, which have now been put together, with barbarous disregard for its original design, in the sacristy of that church. The reliefs, however, belonged, there is little doubt, to the tabernacle which is inserted between them, as their subjects are typical of the holy elements to be reserved there. That on the left, representing Jacob bringing savoury meat to the blind Isaac, is Dalmata's; that on the right, by Mino, represents Melchisedec giving bread and wine to Abraham.

(*To be continued.*)

## ALL SOULS COLLEGE, OXFORD.

By C. Grant Robertson, M.A.

(*Concluded from last week.*)

Of the other features in the first quadrangle the old library now used as a large lecture-room is the chief. This fine long room of the fifteenth century, lit on two sides by Perpendicular windows, has a superb barrel ceiling moulded in stucco, dating from the reign of Elizabeth. Into the ceiling are worked small pendant lanterns on a diaper ground studded with Tudor roses, and the shields with colours of the fifteen colleges founded when the ceiling was completed add a warm touch of heraldic colour. At the south end are emblazoned the Royal arms of Elizabeth, and at the other those of Archbishop Chichele. Between the windows the walls are panelled, and here until the Codrington Library was built were kept the College books and MSS. The modern hall, which forms the connecting link between the mediæval College and the great quadrangle is essentially an eighteenth-century structure, semi-Classical in design, with a minstrels' gallery at the east end and a raised daïs at the other. The six windows are now filled with stained glass, designed by Mr. Kemp and executed by Messrs. Powell, to commemorate notable members of the foundation—Christopher Codrington, Christopher Wren, Lord Chancellor Talbot, Bishop Heber, Blackstone and the late Lord Salisbury, whose portrait as Chancellor of the University hangs on the west wall. Other notable portraits are those of Archbishop Sheldon, Jeremy Taylor, Linacre and Max Müller, while the only extant portrait of the poet Edward Young, famous as the author of "The Night Thoughts," with many others, may be seen here. The great quadrangle to the north of chapel and hall worthily completes the College buildings, and points to the last great expansion that took place from 1700-50. Before that date the ground was occupied by small cloisters, similar in design and scope to those at New College, and a large garden known as "The Orchard." It was the munificent benefaction by Christopher Codrington of the library which bears his name, a notable scholar and soldier of the Revolution period, which decided the College to embark on an extensive scheme which, after much criticism and discussion, resulted in the present noble square. The mediæval cloisters were swept away (though their memory is preserved by the long piazza which makes the west side); the library was placed to form the north line, while to the east a block of buildings for public purposes and Fellows' quarters completed the design. Hawkesmoor, the favourite pupil of Wren, was the architect, and his twin towers surmounting the east side are amongst the most conspicuous features in Oxford. They have been much criticised as a barbaric departure from the Gothic style they profess to illustrate, and certainly their detail is as original as it is quaint. They bear a strong resemblance to Hawkesmoor's work at St. Anne's, Limehouse, and if at first they impress the spectator rather by their oddity than

their beauty, most would admit that they are extraordinarily effective. Familiarity, too, with their peculiar characteristics inspires affection, and no one who has lived long under their crocketed pinnacles would wish to alter them for the most orthodox Gothic type. About Hawkesmoor's work on the library, however, there can be no two opinions. Both within and without the design is impressive and singularly beautiful, and as an example of Italian Gothic it is not surpassed by any building in Oxford or, indeed, England. Those who know the Medici Library at Florence and Wren's Library at Trinity College, Cambridge, can see at a glance whence Hawkesmoor drew his inspiration, but he has so handled the creative idea as to make his treatment an original and inspiring contribution to the wonderful wealth of architectural form in Oxford. The proportions throughout are faultless, and the austere scheme of colour blends to perfection with the design as a whole and with the restrained decorative treatment of the details. If I may quote words I have used elsewhere—to see this library is to love it, to love it is a liberal education. And to-day the splendid room, lined with some 90,000 volumes, mainly in Law and History—the two subjects to the study of which the College is devoted—is a fit memorial to the benefactor who not only provided for its creation, but also endowed its maintenance. Two further features of the great quadrangle call for notice. Above the central entrance of the library stands the famous sundial of Christopher Wren, which registers the hours (when our climate permits) so accurately that until quite recently Oxford watchmakers would correct their clocks by it. Wren rightly is reckoned amongst the greatest of the past members of the College. Although he was a Fellow for some eight years, the sundial is the sole external relic of his genius that the College possesses. The eighteenth-century expansion came too late for him to take part in it, but his appreciation of his membership is best proved by the legacy at his death of four volumes of his original drawings—a priceless treasure. These contain, amongst many plans and designs, notes and sketches never executed, most of his drawings for St. Paul's and other great buildings. The collection is unique, for in many cases—St. Paul's in particular—it is possible to trace the workings of the architect's mind from the first rough note or sketch through successive stages to the completed design, and no few of the papers also are filled with elaborate calculations in his own hand as to "quantities," material, prices and mathematical problems involved in the particular scheme. Needless to say, this record has been frequently studied by many leading architects and historians of architecture. Even to the most uninitiated layman they bear overwhelming testimony to the consummate draughtsmanship and imaginative fertility of their author. The second feature is the iron gateway in the piazza which leads into Radcliffe Square. The design of the ironwork is singularly beautiful, at once strong and light, and is a fine example of eighteenth-century work at its best. Tradition assigns it also to Hawkesmoor, but documentary evidence points to a slightly later date. Hawkesmoor, however, deserves to be remembered almost as much for what he did not do as for what he did. Fired by the success of the great quadrangle, the College seems to have entertained seriously the idea of transforming the fifteenth-century quadrangle on lines not unlike those of Queen's College just down the street, and in the archives are a set of plans for carrying the idea out; but compared to-day with the strength and simplicity of what has fortunately been preserved these drawings do not carry conviction. This brief sketch therefore could not be ended more fitly than by quoting the architect's own words when consulted on the scheme; and the present generation of Fellows who have endeavoured to act on them may thank Hawkesmoor for his courage and wisdom. "I must ask leave," he wrote, "to say something in favour of ye old quadrangle. . . . Utterly destroying or barbarously mangling it would be useing ye founder cruelly and a loss to ye present possessours. . . . What I am offering at in this article is for the preservation of antient durable public buildings, that are strong and usefull, instead of erecting new fantasticall perishable trash, or altering and wounding ye old by unskillf
knavish workmen." These sentences may certainly
recommended to all in whom the passion for "resto
tion" is strong.

## ILLUSTRATIONS.

### DESIGN FOR NATIONAL MUSEUM OF WALES.

THIS design, by Mr. Martin S. Briggs, A.R.I.B.,
was mentioned by our critic some weeks ago as
of those singled out from the very large number submit
in this much discussed competition by originality of tre
ment. A comparison of the block plan and the persp
tive, which we reproduce, shows the principle controll
the whole design. Its author, after studying the s
came to the conclusion that a building forming part
so symmetrical a scheme—a scheme so magnificent t
recent critics have said that nothing vies with it in t
or, perhaps, any country—must in some way be relat
not only to the adjoining City Hall, but also to the U
versity College frontage and to the Law Courts.
solution was arrived at by asking a mental questi
Whence is the finest view of this museum to be obtain
and how is its silhouette to affect its surroundings?
has therefore boldly set back his main frontage on
west so as almost to obtain a width of roadway and gr
in front equal to that between the City Hall and L
Courts, and so as to allow a view of the façade of Univ
sity College from the gardens between this great block
buildings and the shopping streets of Cardiff.

It is a question how far this sacrifice of space to p
duce a monumental effect has caused the internal econo
of the museum to suffer, whether the facilities for
passage of heavy specimens up and down the galle
are sufficiently considered.

The award in this competition has decided once
for all a point which apparently worried competit
great and small, experienced and inexperienced; for
the opinion of three famous and unbiassed masters
planning, the reserve collections and exhibition galle
should be on the same floor, and the public should h
access to all floors of the building. Mr. Briggs is by
means original in his interpretation of this requireme
and even among those mentioned favourably by our cr
a majority of competitors have carefully separated
reserve collections' and students' rooms from the fl
on which all the exhibition galleries open to the pu
are placed.

It is the controlling idea, the disposition of mass
and the breadth and dignity of the conception, which h
played the principal part in the settling of this gr
trial of architectural wits rather than minor details
planning or elevation; and for any further description
such matters we refer the reader to the drawings the
selves.

### OXFORD COLLEGE SERIES, ALL SOULS.—HALL—LIBRARY.

WE continue this week our illustrations of All So
College, and the completion of the histor
description is given on p. 367. We shall give furt
views of this college in the next and subsequent issues

Mr. Weir, architect, acting on behalf of the Society
the Preservation of Ancient Buildings, has exami
St. Peter and St. Paul's Church, Watford. He reports t
many repairs are needed. Several parts of the structure
in a serious condition, and he mentions that "the bell fr
is of oak beyond repair, and the beams supporting it
unsafe." He estimates the cost of the work at 700*l.*,
states that in case of urgency the work might be divided
four sections.

A sub-committee of the Leeds Education Committee
a conference with the architects of the new training col
with a view to progress with the building works. The
at Kirkstall Grange was viewed from all points, and
transpired that the plans are so far advanced that the lett
of tenders for excavations can shortly be advertised.
levels are made, and trial borings show that excellent foun
tions can be obtained on the ganister.

## ZINC OXIDE.*

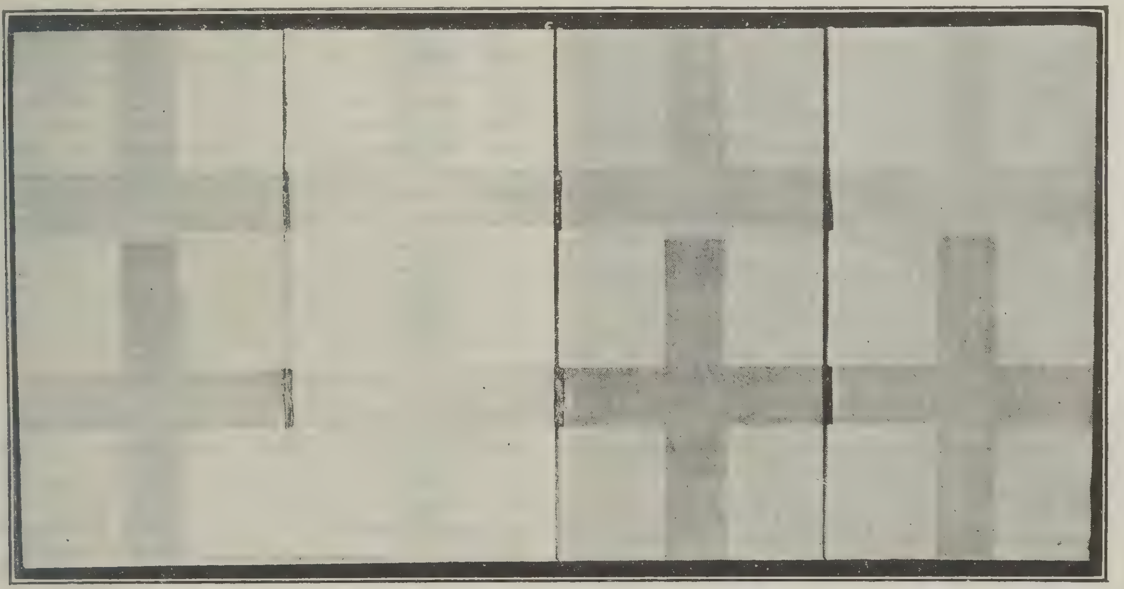
*(Continued from last week.)*

IT is useless here to attempt to find in chemistry an explanation of these facts. Physical explanations alone can solve this problem. Unfortunately the majority of our chemists in the laboratories of public administrations and industrial concerns neglect these considerations. These are allotropic states different from the matter, that is to say, modifications in the nature of the crystallisation. An oxide of zinc, as I have said, may be chemically pure and yet be of no use whatever as a pigment, consequently it is undeniable that the physical state has a preponderating influence. Also from the chemical or chemico-physical point of view the presence of a certain matter in small quantities has a great influence on the physical state. For example, zinc oxide manufacturers by the "indirect" process, in using the metal, know quite well that better white is obtained when starting from the residues of galvanic liquors than when starting from ordinary pure zinc. So most probably do the lead salts (in traces) modify the product which is obtained direct from the ore: the pigment is softer, more opaque, and has a better oil assimilation. These are not only remarks, but absolute facts. To give you an example. As an illustration to what I have advanced let me for one instance take you away from zinc oxide to iron. Is pure iron used in our constructions to-day? No. What is employed is an impure iron containing silesium, carbon, &c., which is called steel, and which is very superior indeed to pure iron as regards resistance, hardness, &c.

Are we not going in that direction more and more every day with the metal steel containing vanadium, &c., employed on our *Dreadnoughts*? Paint grinders on the Continent have for many years past realised the qualities of well-made "direct" zinc, and do not seem to attach any importance to the small percentage of lead salts. The administrations abroad are also going in this direction: in Belgium, Holland, Sweden, Switzerland, the Government specifications admit of 4 per cent. of lead salts. The case of the Belgian State Administration is practically interesting: the Belgian Government, following the example of many others, was anxious to prohibit the use of white lead for its work; specifications were drawn up, fixing the maximum amount of impurities in zinc oxide to 1 per cent. This was supplied according to specification, but the reports were not satisfactory, and the officials entrusted with the trial almost indicated their intention of continuing to use white lead. It was then that the manufacturers of the "direct" process zincs drew the attention of the Belgian Government to their products. After much difficulty these specifications were altered allowing 4 per cent. of lead salts, and after a careful trial, the "direct" zincs finally demonstrated their superiority over white lead. It was then decided by the State to employ it exclusively, and the question of coming back to white lead is "ancient history."

It must be clearly understood that the same results cannot be obtained by mixing mechanically 2 to 4 per cent. of white lead with pure ZnO. To obtain this molecular disposition, it is essential that zinc oxide should be formed in an atmosphere where lead is present and where every particle of ZnO is intimately married to an infinitesimal proportion of lead salts. From this results a very noticeable modification of the physical state: a kind of micro-crystalline formation, easier to obtain in the presence of lead salts than in their absence. A fact also which fully demonstrates the importance of the physical state and is well known to grinders is that "direct" zinc, though exhibiting a creamy appearance in the dry powder, does not turn so yellow in proportion when mixed with oil as the "indirect" zincs, proving again the superior pigmentary value of the former over the latter, and also the complete and irrefutable demonstration of the importance of the micro-crystalline state, of which no specification and few chemists take any notice. A commission of experts appointed in Holland to investigate questions relating to the suppression of white lead has given a number of interesting reports in connection with this point. The experiments extended over a period of five years, and careful comparisons were made as to the relative merits of white lead lithopone, "indirect" ZnO, and "direct" ZnO. The results of these tests clearly demonstrated the superior durability, covering power, and economy of the "direct" ZnO. It is curious to notice, however, that in the early stage of the experiments the chemical analysis had not been in favour of the "direct" ZnO. In the manufacture of "direct" zinc there enter undoubtedly several secret processes which are unknown to the uninitiated. These secrets unquestionably lie in the special gauging and composition of the fusion layers, and I know this is practised in Europe in well-organised factories with consummate care, whereas in America little or no attention is paid to it, and it seems evident to me that great improvements could be effected were it not that in America the main object is the spiegel and not the ZnO. Many of you gentlemen will imagine that I hold a brief for "direct" ZnO, but I can assure you that such is not the case: if I have focussed your attention on the merits of this product I have done it with a disinterested motive.

It is the humanitarian point of view principally which has led me to think that the supremacy of harmless zinc oxide over poisonous white lead can best be obtained by comparing it with "direct" zinc, which is better in colour, better in body and covering power, and practically as cheap (in fact, in some cases it might be cheaper) than by comparing it with "indirect" zinc, which is much dearer. Having touched on the humanitarian side of the question, I cannot help saying a few words as to its importance. That white lead is a most poisonous substance will not stand any argument. Statistics drawn up by various Governments and careful inquiries have established the fact beyond discussion. Other products in



A.—White Lead (English). B.—Direct Zinc Oxide (Dutch). C.—Direct Zinc Oxide (American). D.—Indirect Zinc Oxide (Silesian).

FIG. 8. (See p. 354.)

---

* A paper read on May 12 before the Paint and Varnish Society by Mr. Gaston Depièrres.

daily use, you may say, are poisonous: quite so—that I admit, but probably no substitute has been found for them, whereas such is not the case with white lead, and if to-day its use were completely prohibited the world would still go round, we should be none the worse for it, in fact, much better without it. Already the consumption of white lead in Sweden, for instance, is one-seventh that of white zinc. France has completely forbidden the use of white lead, Switzerland is following her example, and Belgium, Holland, and Sweden have for the last few years opened a most strenuous campaign against white lead; in fact there is little doubt that in a few years' time all the Governments of civilised nations will follow the good example set by France.

Gentlemen, I emphatically declare that it is possible to do without white lead, and any man who doubts this is certainly twenty years behind his time.

### *Combination of Zinc with Linseed Oil.*

A chemist of great renown, who has carefully studied the subject, said to me that it was an admitted fact that zinc in the state of oxide enters into combination with linseed oil, not only in the state of zinc salts, but also as an organo-metallic compound in which the zinc combines with the double combination that linoleic acid possesses. Moreover, to saponify linseed oil, the theoretical quantity of zinc oxide required is 14.1 per cent. of the oil employed, but really it is possible to arrive at incorporating 20 per cent. of ZnO in the said oil. This excess of zinc combining with oil cannot possibly go and fix itself elsewhere than in the double combination of the linoleic acid. That zinc in the state of oxide under certain conditions combines itself with linseed oil as zinc salts or organo-metallic combination, no doubt can exist. This combination is almost instantaneous when oil is carried to 590° Fahr. and already begins at 450°; at this temperature the reaction is already fairly active. In the cold the same thing most probably happens, but much more slowly, and one may attribute, no doubt, the hardness of zinc paint to this reaction, which in the cold is more rapid when the paint is exposed to the outside, and subject to aqueous condensation and sudden changes of temperature which facilitate the rapidity of the reaction by the fact that hydrolysis may help the combination of the zinc with the linoxine.

These are the proofs that I can give you of the combination of zinc oxide with linseed oil. I believe this theory to be sufficiently well established to at least engage the attention and careful study of all competent men interested in the subject. With regard to the resistance of zinc paint to salt water, it must be admitted that the saline emanations have a direct effect on the ZnO, because zinc oxide is transformed fairly easily in the presence of sodium chloride NoCl into chloride of zinc. This reaction cannot be very well explained, but has been noticed. I have been unable to turn up the literature dealing with this subject; all I know is this—that there is formation of a double salt fairly complex between the chloride of sodium and the oxide of zinc, and that finally the oxide is changed into chloride which, in its turn, combines itself with a fresh molecule of oxide. Some of these double combinations have been studied and explained by "Mailhe," Bulletin de la Société Chimique de France (Vol. 25, p. 796, 1901); (Vol. 27, p. 651, 1902). These zinc salts vary in their combinations, and their solubility varies likewise.

$$\mathrm{ZnCl,\ 3\ ZnO+3\ H_2O}$$
$$\mathrm{2\ ZnCl_2\ ZnO+3\ H_2O,\ \&c.,\ \&c.}$$

These salts, when crystallised, may be described as having properties similar to plaster, i.e., they become hard and insoluble and more resistent. It is a salt having some analogy to this which is formed on Leclanche's batteries. Many of you who have seen these batteries must have noticed that the zinc of the battery is covered with a white deposit which is very hard and insoluble. It is most probable that by the action of saline emanations there is formation of oxychlorides of zinc. These have the property of becoming very hard, and, as you know, are often employed on that account for luting, chemical apparatus, and for stopping teeth in dentistry. They are also in some cases used in the manufacture of paints. Lead also, I am quite aware, gives oxychlorides. One is obtained by precipitating lead acetate with sodium chloride NaCl, or by digesting lead oxide in a solution of sodium chloride. I have not found that these oxychlorides of lead have the same property of hardening, which is a characteristic of the oxychlorides of zinc. In these facts, no doubt, are to be found the greater resistance of zinc paints as compared with lead paints when exposed to saline emanations.

Personally I quite admit that, with our present physicochemical knowledge laboratory experiments are not an absolute proof, but though results will naturally vary with the different qualities of zinc oxide employed, I feel sure that all practical men will agree with me that—provided a good quality of zinc oxide is used—it will in every case assert by a long way its superiority over white lead.

Gentlemen, what I have just said will, I trust, give you some idea of the extent to which ZnO can be utilised in the paint industry as compared with white lead, and if the work I have done in connection with this subject is of any use to paint manufacturers and users who join hands for their mutual benefit with the co-operation of the Paint and Varnish Society, I shall be amply rewarded for my pains.

*(To be continued.)*

## MANCHESTER SOCIETY OF ARCHITECTS.

THE first of the summer visits of the session, to Gawsworth, in Cheshire, took place on Saturday, May 28. Owing to the wet weather the attendance was small, and outdoor sketching was out of the question. The interior of the church, however, with its unique roof, which retains the original colouring, and the monuments of the Fyttons, were found very interesting, and the exquisite setting of the three old halls, the church and the three lakes among the luxuriant spring foliage was very much appreciated. The great hall of the rectory, with its fine timbering and its roof open to the ridge, was also inspected. A passing visit was paid to Macclesfield Church, which has considerable remains of the original Perpendicular church, some fine Perpendicular and Jacobean tombs in the Savage chapel, and a modern nave by Sir Arthur Blomfield.

On Tuesday evening, May 31, the visit to Bramhall was attended by over thirty members, under the leadership of Mr. Roger Oldham. The church of St. Michael and All Angels, the work of Messrs. J. Gibbons & Son, of Manchester, was first visited. The nave, chancel, and south aisle are now nearing completion, and a portion of the woodwork is in position. The drawings for the complete church, which provide for a tower, a north aisle, and an extension of the nave westward, aroused great interest. On leaving the church the party walked through the woods to Bramhall Hall, where they were met and conducted round the fine half-timbered hall by the owner, C. H. Nevill, Esq., J.P., who described in detail the history of the hall and the restorations which he has carried out. On this occasion the delightful weather contributed in no small measure to a most enjoyable evening.

## THE RESTORATION AND RECENT DISCOVERIES AT THE GUILDHALL, LONDON.

AT a meeting of the Royal Society of Arts on Wednesday, June 1, Mr. Sydney Perks, F.R.I.B.A., F.S.A., read a paper on the above subject. The chair was occupied by Mr. Philip Norman, who, in his introductory remarks, said:—

We all know the Guildhall as a busy centre of civic life, where the Lord Mayor with various leading citizens carries out the most important work, where he exercises unbounded hospitality, and where he gives the opportunity to the great men of the world from time to time of telling us home truths, which perhaps we had better take to heart. (Hear, hear.) But the Guildhall as an actual structure appears to most of us, though we know it more or less, rather modern and perhaps not having any very great interest. That is the first sight. Partly because we are imbued with the idea that all the buildings on the site on which it stands were burned down in 1666. We hardly realise—in short, we do not realise—that not only some but a considerable portion of the Guildhall remaining standing and various other buildings of considerable importance were only damaged in the Great Fire and not destroyed. For instance, the hall of the Merchant Taylors' Company, as regards its walls, is a Mediæval building. Though it has been very much modernised, the kitchen there appears to be partly Tudor in style. There is a crypt there of the fourteenth century. Then, again, various City churches show Mediæval remains. At St. Mary-le-Bow there is a Norman crypt and there are parts of towers of churches. There were also two most interesting crypts of important houses. There was Gerrard's Hall, and there was the crypt of the house of Sir John de Pulteney. The Guildhall has existed on its present site from what I may call time immemorial. The accomplished surveyor of the building, Mr. Sydney Perks, has since his appointment shown great energy and research. He has studied the history of the building, and with his architectural knowledge he has been able to find out very important remains which had practically been forgotten.

Mr. Sydney Perks then read the following paper, which was copiously illustrated:—

It would be no idle boast to claim that the Guildhall is a unique building, for although it was formerly the scene of more historical events of the greatest importance than it is to-day, it is still the centre of great civic movements, and its usefulness has increased in many ways. It has a wonderful record, meetings of citizens to decide even the fate of kings, trials of State, treason, and murder, the reception of sovereigns and statesmen of note from all parts of the world, forming a grand roll of fame. It might be said that Westminster Hall has a history to rival it, but Westminster has lost even its courts of law, a footfall echoes in it, and it lives almost only as a monument of the past, whereas the work and importance of the Guildhall increase from day to day, it throbs with life and is the hub of a city far mightier than it ever was. The old order gives place to new, the work and usefulness being ever adapted to the moment.

But it is not the historical or political record of the Guildhall that we are interested in to-night; it is the story of the building. A book by J. E. Price was published in 1886; it is entitled "A Descriptive Account of the Guildhall of the City of London." With a large part of that work I am not concerned, but I think Price is incorrect in certain statements he makes about the building, and I do not agree with him that the entire main hall was not built at one time. My belief that he was wrong has come about gradually. I think he jumped at conclusions without proper investigation, and he was certainly handicapped by not having had the training of an architect, as even an elementary knowledge of building construction is so useful when tracing the history of a building.

I believe the Guildhall was built at one date, and that no portions of former buildings were incorporated with the structure. My belief is based upon conclusions I draw from the writings of Stow and others, from the examination of old maps, plans, and views, and from the recent exposure of parts of the old building in connection with which I have had the honour to be associated; I propose placing my evidence shortly before you.

Little is known of any Guildhall erected before the present building; there was a previous structure apparently with a frontage to Aldermanbury, and I have heard it suggested that the west portion of the crypt was part of that Guildhall. This matter I deal with later, but it is well to note that the present Guildhall was considered a remarkably big building at the time it was erected, and the cost crippled the finances of the Corporation for several years. It is about 160 feet long, the west front is about 150 feet from Aldermanbury, the west portion of the crypt is about 79 feet long; consequently, if the old Guildhall buildings extended from Aldermanbury to half-way along the present building, the length was no less than 229 feet, or 69 feet longer than the existing building. This is hardly in keeping with the record in Fabyan's "Chronicles," which states:—"In this yere (1411) also was ye Guyldehall of Lodon begon to be newe edyfied, and of an olde and lytell cotage made into a fayre and goodly house as it now apperyth."

Again there is an interesting reference to the new building in the "Calendar of Letter Books," edited by Dr. Sharpe, of the Guildhall. On page 3 of Book I. it states that the new work of the Guildhall had ceased; it was commenced, as we know, in 1411, and the entry is dated 1413; it speaks of the scandal and disgrace to the City not to be able to continue the work, and to find a remedy; the important part is this:—"The Mayor . . . and the Aldermen . . . in their Common Council assembled in the Upper Chamber of this Guildhall"; this must refer to the previous Guildhall. How could they assemble in the present building in 1413 when we know it was not completed until about 1422, the year when the executors of the celebrated Dick Whittington contributed towards "the paving of this great Hall twenty pounds, and the next year fifteen pounds more to the said pavement with hard stone of Purbeck; they also glazed some windows thereof and of the Mayor's Court, on every which window the arms of Richard Whittington are placed"?

Surely the extract of 1413 seems to imply that the Common Council decided, as sensible men, to keep the old building up while the new one was being erected, and if they did that how could the west end of the crypt have been part of the previous Guildhall that "olde and lytell cotage" we have already heard of?

Again, Stow, who wrote in 1598, states:—

"This olde Bery Court or hall continued, and the Courts of the Maior and Aldermen were continually holden there, until the new Bery Court or Guildhall that now is, was builded and finished" and "I my selfe have seene the ruines of the old Court hall in Aldermanbury streete, which of late hath beene imployed as a Carpenters yard etc."

Maitland, in his book of "The History of London," writes:—

"The Mayor and Court of Aldermen considering the many inconveniences arising from, and great Obstructions given to, the public Business of the City, which daily increased with Inhabitants, occasioned by the Want of Room in that despicable Cottage the Guildhall in Aldermanbury, set about erecting the present Guildhall; which is a spacious Structure, well accommodated for the transacting of all publick Affairs belonging to the City."

This extract is certainly in keeping with the idea that the old Guildhall had a frontage in Aldermanbury, and that the present building was erected independent of the old structure.

The Guildhall appears in several old views and maps. Van den Wyngarde's View of 1543 shows a building without louvres or buttresses, and with a battlement; these old views are obviously sketchy, and too much reliance must not be placed upon them. The same artist's view of 1550, which is preserved in the Bodleian Library, and Agas's Map in the Guildhall Library, are both illustrated in Price's book. Norden's View, of 1600, indicates that the parapet to each gable was ornamented with crockets, a common feature in the fifteenth century, but not reproduced when the building was restored in 1876. Visscher's View, of 1616, also shows crockets and the two flèches. A plan made by Overton in 1666 shows, by the clear white spaces, the buildings destroyed by the Great Fire, and the line of limit is clearly marked. This plan is most valuable, as it indicates a building at the east end of the great hall. Pricke's plan of 1666 is similar to Overton's map and is of the greatest interest. In Leake's Survey of 1666 the buildings are, unfortunately, not shown, but the "Back Passage to Guild Hall" is marked; the map is valuable, as it confirms statements made by Stow and Maitland which I refer to later. John Overton's map of 1676 also shows the back entrance from Basinghall Street, and for the first time we see King Street, which was constructed as an approach to the Guildhall in 1666. The plan taken from Rocque's map of 1737-46 is more carefully prepared than those of an earlier date; it shows the back entrance to the Guildhall, and also indicates the steps down from Guildhall Yard to Cut Throat Alley. Nearly all these illustrations are part of the Crace Collection at the British Museum; several of them can also be seen in the Guildhall Library.

The old views of the exterior show that the appearance was roughly similar to what it is to-day. After the Fire Wren added a storey and provided the hall with a flat ceiling, and there are many views both of the interior and exterior showing the appearance of the building until the present open roof was built by Sir Horace Jones in 1864. He followed, as far as possible, old traditions, but in place of two small ventilators, he fixed one large *flèche*. Although this is very effective from a distance, it is open to criticism in that it has the effect of somewhat dwarfing the appearance of the front or the Guildhall Yard.

The views of the Guildhall, prepared by Ralph Agas in the reign of Queen Elizabeth, and Hollar in 1647, show the Guildhall had two ventilators, dividing the ridge into three lengths; these were given by William Hariot, mayor, and cost 40*l.* Visscher's and Norden's views also show these two *flèches*.

I have prepared plans of the crypt and Guildhall above, showing them, as far as I can judge, as they were when first built in the early part of the fifteenth century. With regard to the crypt, the eastern half, by far the most elaborate portion, is very little different to-day from what it was nearly 500 years ago. It has quite recently been restored; until then the walls and vaulting were covered with dirt and grease, the shafts supporting the vaulting were quite black, and it was only after the removal of the grease and dirt that the colour of the blue Purbeck stone shafts could be seen. This eastern crypt was more expensively constructed than the western portion, it was probably used for certain meetings, and its importance was emphasised by the fine entrance, which is quite as elaborate as the fifteenth century porch. Until about two years ago it was boarded up and completely obscured, the upper half by a lavatory, while the lower portion of the doorway formed the side of a perfectly dark lumber hole, only accessible through a trap door. Now a new staircase gives easy access to the crypt, and we can see the fine mouldings of the piers, the niches, that no doubt held statues, and many other interesting details. Massive iron hooks still remain on which the heavy doors were hung. The bar that held them in position swung back heavily when unhooked, for a circular line was worn on the stone jamb, and can be seen to-day. This doorway was about 7 feet 10½ inches below the level of the Guildhall yard, and approached by a flight of steps, no doubt of stone. Excavations have been made recently, but no traces of these steps could be found; it was hoped there might be some lines showing where the stones were built against the outer wall of the porch, but none appear. The excavations were, however, only made along a small portion of the wall, and there may be traces along the remaining part. We are more fortunate with the indications of the access from the crypt door level to the floor of the crypt, for the old stone lines may still be seen, and the new staircase was kept well clear of them.

The question of the date of the eastern and western crypt is of the greatest interest, and, as Price states the eastern crypt was the crypt of the old chapel, it may be useful to criticise the evidence he lays before us. He states that a chapel was built about 1280, and used as a chapel until 1429; it was then discovered it "had become too small for the requirements of the citizens flocking to hear divine worship," and that Henry VI. accordingly "granted letters patent to pull down the old chapel, but as the crypt beneath the old chapel was substantial, it remained, and is the present eastern crypt." But surely he forgets the Guildhall was commenced in 1411, paved in 1422, and glazed in 1423, and the porch erected, "last of all," in 1425. How could the chapel above the crypt have existed where the Guildhall is now until 1429 when the entire Guildhall, on the same site, was finished about 1425? When Price suggests that this portion of the crypt belonged to an early chapel, we cannot help thinking it seems unlikely that a little cottage, like the previous Guildhall, should have so large a chapel, and further, does it not seem strange that if this portion was incorporated in the Guildhall in 1411, having an area of 5,291 square feet, that the new chapel erected in 1429 should only have an area of 4,234 feet, or 1,057 feet less? Let us also face the fact that the old chapel "had become too small for the requirements of the citizens to hear divine worship."

There is a theory that this eastern crypt was used as a chapel, and a little recess at the eastern end may have given rise to that idea. A few weeks ago, brickwork that had been built across the doorway opposite the main entrance was removed, and the steps and other details uncovered. These steps, which were also covered up, probably led to some official portion of the building.

It is often suggested that the cross wall, which divides the crypt in two parts, was not built at the same time as the vaulting was constructed in one of the two halves. This has been used as an argument by those who have advocated the theory that a part of the crypt formerly belonged to a previous building.

The western half of the crypt is supposed to have collapsed during the Great Fire, and Wren is credited with the restoration. This theory is no doubt correct. The architect, whoever he was, proceeded to rebuild the vaulting necessary to support the floor of the hall. He did it in the quickest way possible; he did not replace the old stone vaulting, but simply built a brick wall at each end of the space to be covered, and just inside the old stone walls, one being the cross wall and the other the west external wall, and in doing so he built up all the old stone responds, &c., and they have been hidden from 1666 until a few weeks ago. Wren then built a series of brick arches, similar to a range of railway arches. He filled up the haunches and replaced the floor. The workmen filled in with any stone or brick débris handy, and hundreds of beautiful Gothic fragments exist to-day in these brick walls. While removing the brickwork to uncover the Gothic work a very large number of the fragments have been carefully removed and labelled, and are ready for depositing in the museum. Of course it was a great pity the Gothic work was bricked up, but in a certain sense it is to our advantage to-day, now that these links with the past have been brought to light, for the bricking up process has preserved the stone and also the ironwork of the windows; the work is now exposed after a lapse of 240 years, and we see the sharp edges of the stone-work, &c., which we could not have done had the work been handy for mutilation and exposed to the atmosphere. Consequently, I think in a certain sense we may be grateful to the City authorities of centuries ago for their vandalism.

When clearing out some of the débris filled in just below the paving of the hall, I found a few pieces of stone, smooth and well worn on one side, tooled and rough the other side. They are portions of paving stones, and are Purbeck, and no doubt formed part of the paving of the hall, paid for in 1422 by the executors of the celebrated Dick Whittington, and referred to above.

To return to the cross wall of the crypt. An examination of the responds at the angles of the western half shows each cap is formed of one stone, and beyond the stone the return faces are built so as to bond into the stonework. The square line of the cap stone is fair with the face of each wall, clearly showing that the cross wall was built when the east portion of the crypt was built. Another proof is the fact that the wall ribs of the vaulting are quite different from the main ribs at the crossing between the piers. In the latter case the face of the rib is 2½ inches wide, but where it is built into the cross wall it is 13 inches wide. I think these two facts clearly show that the eastern part of the crypt and the cross wall were built at the same time.

The next step is to prove that the cross wall was built at the same time as the vaulting in the western half. This was not so easy, because Wren's brick wall hid all the old stone work. I had some of this brickwork removed at the points where the old stone ribs must have joined the cross wall, hoping to find some link still existing if the work was carried out at one date. In order to do this a small portion of the paving of the great hall had to be removed. Afterwards I opened up below and found the old springers of the cross and diagonal ribs; all of them are there, built in and forming part of the old cross wall, and they will not be bricked up again. The discovery of these springers has revealed the necessary clue; they are of the greatest importance, for they prove conclusively that the whole crypt of the Guildhall, from end to end, was built at one date.

I found one other interesting point when opening up at the side of one of the piers in the main hall: the floor level was originally 6 inches lower than the existing floor; these 6 inches must have been very useful in adding to the effect of the bases which are now rather squat in appearance.

In the crypt where the wall is thickened, being the wall under the doorway between porch and hall, and the fourth bay from the west end, there are some springers that puzzled Price, and as he could not understand them he assumed they formed part of an earlier building. The ribs are similar to the remains of other ribs, and the reason they spring from the main wall without any respond as in other cases is because the wall is so much thicker here; they are also of necessity wide apart, as the line of junction with the wall is at a plane in advance of all the other points of springing.

One very remarkable feature is the vaulting in the centre bay at the eastern end of the east crypt. This is much higher than any other portion of the vaulting, and certain opinions are given at length in Price's book; his theory was that the floor above was originally higher, and that every bay, except the one in question, was lowered in order to have the floor of the Guildhall about 1 foot 9 inches lower than that of a previous building. Unless the previous vaulting had collapsed, it is hard to understand why such expense should be incurred for so trivial an object. We know it was usual in mediæval halls to have the daïs higher than the remainder of the floor, and bearing that in mind, the builders may well have raised the vaulting in this one instance to clear a high door which we see at the eastern end to-day, knowing that the difference in level would not affect the structure over as the daïs would in any event be higher than the body of the hall. The windows in this eastern half of the crypt differ in some respects from those in the western half, and just as the vaulting was more expensive and the whole construction of a more ornamental character, so we find the windows in the eastern half were glazed, while those in the western half were not glazed, but they had stout stay-bars outside, and the usual rebate for internal shutters.

With regard to the western half of the crypt from the time of the Great Fire onwards, this portion of the building has not been treated with the kindness it had a right to expect. It was always evident, from the responds along the side wall, that this portion of the crypt was vaulted. Price quotes an opinion that "of any columns to support the centre of the floor we were unable to discover a trace."

Last December I took up some paving in a direct line between two responds, and one-third of the way across the crypt. I carefully cleared away the earth, and just below the surface I found the foundations of a pier that supported the vaulting; at once I opened the paving in the corresponding positions, and in every case—there are eight in all—I found the foundations I wanted. The result is we now know exactly where the piers existed and the number of them, we can tell from the responds that the vaulting ribs spring direct from the shafts without any caps, as at Fountains Abbey, and every detail is at hand to enable the Corporation to restore the entire west end of the crypt so that we could see it as in the fifteenth century. I also cut away the brickwork at the west end and was delighted to find the two responds I wanted in an excellent state of preservation.

Another very interesting discovery was a three-light window in the west wall of the building; this was entirely bricked up. It was, apparently, the only three-light window n the west end of the crypt. A portion of the cill remains. This is yet another link in the chain of belief that the building was an independent structure. Had the Guildhall been an extension of a previous building, we might have looked for a loor here, but according to this discovery, apparently, there was no communication from the west end of the crypt. The doorways show communication, north, south and east. The east doorway shows a rather peculiar state of things: apparently the opening was first intended to be of the width shown, and then it was decided to make it narrower, and build the dividing wall between the crypts across part of the jamb; this was done, and on taking away this portion of the wall the old structure, covered up since it was built in 1411, shows as sharp an arris as if it had been worked to-day: in other words we see the jamb of the door which has been hidden for 500 years.

There is a very interesting staircase from the crypt to the side of the porch, which is almost entire. Needless to say it was partly bricked up until a few months ago. The entrance at the crypt level still has stout hooks, and the ceiling is simply vaulted by stones leaning against one another, a straight joint running from end to end.

As stated above, the whole of the western half of the crypt was constructed in a much less expensive manner than the eastern half. The windows have simpler heads, and were not glazed—glass was a luxury in those days; the piers of the vaulting were in ordinary stone and not Purbeck as in the eastern half, and there were no caps. It seems to me a possible reason for the difference is that the eastern half was constructed for ceremonial purposes, and the western half for muniment purposes or domestic work. This may or may not be so, and I advance the theory as a practical solution of a difficulty. We get the magnificent entrance to the eastern half of the crypt, and we get the narrow little staircase of the side of the porch to the western half. This at once suggests what is now known as a trade entrance, and the two doors close together on the north side indicate that access was sought to one portion of the crypt by persons who did not wish to pass through the other portion. In 1501, kitchens were erected at the north side of the building, opening off the western portion. Later on, the western end of the crypt was used for stables, for we read in 1683 that two aldermen were requested to report upon the "mischiefs arising from the keeping of a stable and a coach-house under the Guildhall."

The vaulting in the western half of the crypt is not planned conveniently for the main shafts above; in other words, the responds for the vaulting are not under the piers in the hall, but along each side wall there are other responds which are immediately under the piers of the great hall.

It has been suggested that this part of the crypt, being a portion of an earlier building, was retained when the great hall was erected, consequently it was necessary to add responds to support the piers above, cutting through the vaulting of an earlier date.

This theory is I think incorrect. I had the necessary brickwork cut away and the stonework cleaned, and it was seen that the wall rib of the vaulting and a portion of the additional pier adjoining have been cut out of one stone, in other words the vaulting and all responds were built at the same time. I have tested this in more than one place.

I had been puzzled for a very long while about the two stone staircases found in the thickness of the wall at the east end of the crypt. They start from the level of the east doorway, which was about 5 feet above the floor of the crypt, and turn outwards at a height of about 15 feet above the floor of the crypt. Nowhere have I seen any explanation for them. Price simply states that they communicated with the hall above the crypt. He evidently did not go up the stairs; had he done he would not have made such a mistake, for he would have found they turned outwards at the top, and not inwards. A possible solution seems to be this. I found at the British Museum in the Crace collection the maps of Overton and Pricke; these have been referred to above and clearly show a building, apparently about 50 feet by 50 feet, at the east end of the Guildhall. These stairs built, as was often the case, in the thickness of the wall, clearly show a connection between a building joining the east end of the Guildhall and the crypt. If a building did exist on that site in the fifteenth century built apparently at the same time as the Guildhall, it seems likely that some connection should have existed between the main hall and that building. The plan of the hall shows a circular staircase at the north-east corner. Until a few weeks ago this was blocked at the foot by a boiler and had not been used for very many years, the dust and débris being many inches thick on the treads. But on going up I found a doorway, bricked up as usual, opening outwards into space; this probably communicated with some building.

There is a similar doorway in the south-east turret leading into a complete small room. There was no staircase in this angle, consequently this room could only have been approached from a building at the east end of the Guildhall. In the circular staircase, about the level of the great hall, there is also a doorway; this was bricked up, and on removing the brickwork I came upon a passage about 23 feet long, 3 feet wide, and 8 feet 5 inches high, which was also blocked with stone work, but the filling in was removed with great care, and it was found the passage led into the great hall, passing through a buttress on the way. At a little expense, this ancient way can be restored, and communication opened up between the hall and the crypt, which will be very useful for entertainments, &c.

The following extract from Maitland's History, Vol. II., may be of interest:—

"More to the south is Guildhall Court, which is well built and inhabited by the chamberlain, town clerk, and some other officers chiefly depending on the city business transacted in Guildhall. This court has a thoroughfare into Guildhall Yard, that opens between the hall and the chapel, and it leads into the great hall by a back stairs."

There is further proof of a building or buildings at the east end of the hall, for there is evidence in the records that a house was approached by the lower gate. We read on February 20 in the fifth year of the reign of King Henry VI. that "John Penchricke, the mayor's esquire, should have and hold the house or mansion situate above the lower gate of the Guildhall of the said city, and which John Merchaunt late held and inhabited, to have to him so long as he shall have behaved himself in his office, &c., without paying for it any rent."

This lower gate is possibly the smaller entrance door on the south front shown on the illustrations previous to Dance's work, or more probably it was the entrance already referred to from Basinghall Street which Stow calls "the backe gate of Guild-hall." To quote Stow again, we read:—"The foundation of the Mayor's court was laid in the thirde year of the reign of Henry the sixt, and of the porche on the south side of the Mayor's courte, in the fourth of the said King. Then was builded the Mayor's chamber, and the Council Chamber, with other rooms above the staires." We also read, "for a further monument of these late times, men may behold the glass windows of the Mayor's Court in the Guild-hall above the stairs." It seems likely that the stairs in the thickness of the walls and in the north-east corner are the stairs, or some of them, that Stow refers to.

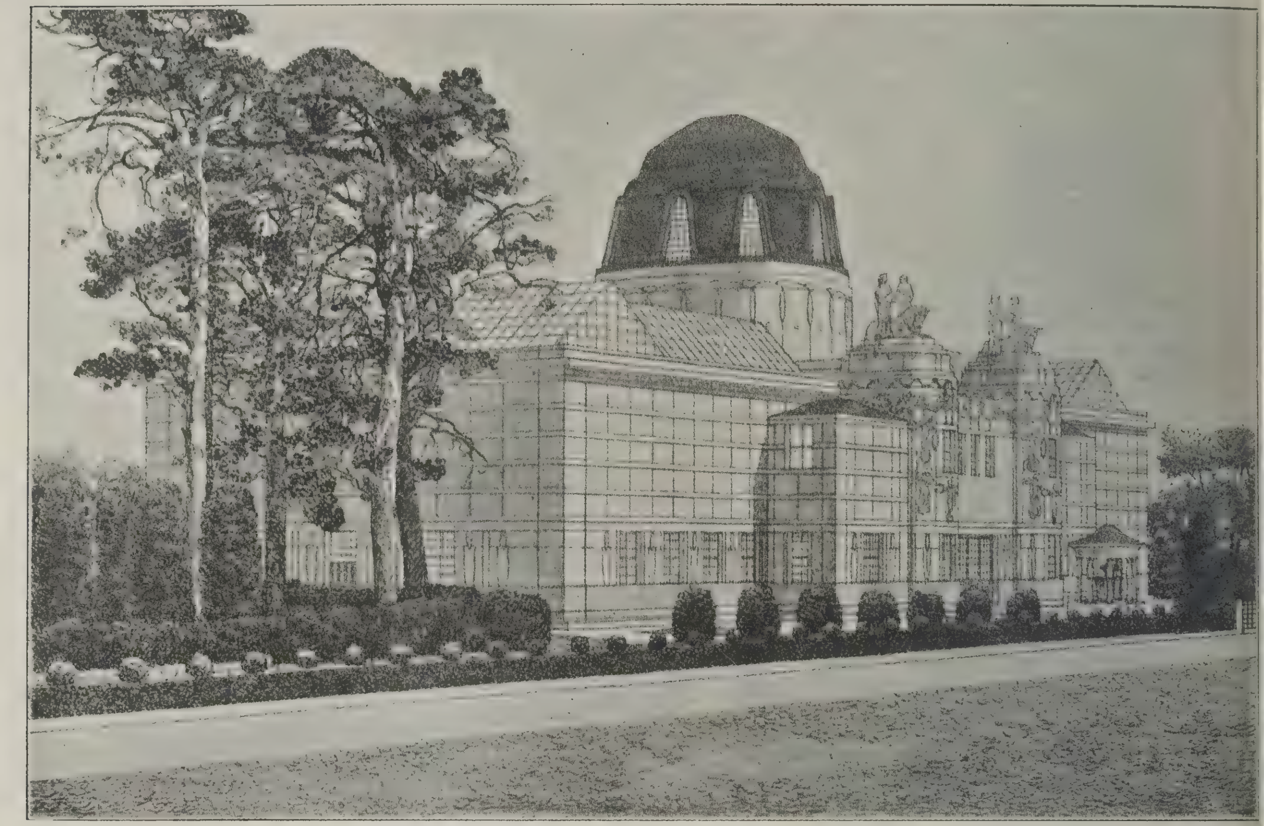
It will be seen that two porches were referred to by Stow, one being the main entrance and the other the porch to the Mayor's court, &c., the latter being built slightly earlier than the main entrance. We know also that the windows of the Mayor's court were glazed in the same year as those of the great hall; consequently it is clear that when the Guildhall was being erected other important buildings were being constructed at the same time. A large scheme was evidently in hand, and it is also obvious that the great work of the Corporation could not have been carried on in the large hall and crypt, for in addition to the Mayor's court there were several other courts.

Richard Blome, who wrote shortly after the Great Fire, states "the roofs, floors, and what else was therein were consumed. These rooms, courts, and offices are appropriated to the same place, wherein they were kept formerly, but much more regular and loftier and more substantially built."

There is quite an interesting little history in connection with the east end of the ground floor of the building. Slide A shows the window as it is to-day with three main divisions, heavy transom, &c. Slide B is an old view showing the window as now and with Wren's flat ceiling and extra tier of windows. Slide C shows the interior at an earlier date with the lower part of the west window filled in with stonework and a monument against it. Slides D and E are photographed from prints in the Guildhall library. It will be seen the window is quite different in these illustrations; there are seven lights and no transom, consequently I naturally thought that the window had been renewed at some time, but I could find no reference to the cost. However at the British Museum I traced two views of a State lottery held at the Guildhall, shown in

## MODERN EUROPEAN ARCHITECTURE.

### AUSTRIA.



[From *Der Architekt.*

DESIGN FOR A PICTURE GALLERY AT REICHENBERG.—By Herr H. Ried, Architect.

slides F and G. Apparently the illustrations are about the same date as slide E, and the illustrations are referred to in "Political and Personal Satires," Vol. III., part 1, No. 2,435. These lottery views show the window as it exists to-day. I hacked a little of the cement work away outside the window and found the old stone cills, mullions and transoms underneath. The result proves that although the old window has been practically renewed, it follows the lines of the original. I have also seen at least one other incorrect view of the window, apparently made during the eighteenth century. These inaccurate old illustrations often give one a lot of trouble, for it is not advisable to rely upon their evidence alone. The stonework was very much decayed inside, and elaborately pieced about the year 1870.

Just under the great window there is a very fine stone canopy; this delicate piece of work can only be properly seen from a ladder, as the projection of the canopy of the wood screen below hides the view of it except from a distance. About the same level as the top of the wood panelling there is a horizontal line at the springing of the stone canopy. It is probable that tapestry was hung below. Stow relates that "Nicholas Alwyn, mercer, Mayor 1499, deceased 1505, gave by his testament for a hanging of tapestrie to serve for principall dayes in the Guildhall 72*li.* 6*s.* 8*d.*" There are also other references; one relates to the "hangyng and garnysshyng of the over and higher parts of the Guildhall." Consequently, there seems little doubt that the hustings were formerly hung with arras. Slide E shows the stone canopy at the back of some wood panelling which Wren erected, and his screen across the hall. Wren had the good sense to design his panelling so as not to obscure the stone work, which, unfortunately, is so hidden to-day.

In 1838 there was evidently a Gothic revival, for Wren's work was swept away, and William Montague, the City surveyor, or "clerk to the City's works," prepared an excellent "design for finishing the east end of Guildhall." I have the drawing in my office. The design was prepared to include three figures from the exterior of the Guildhall chapel which are now in the Guildhall museum. It is rather difficult to tell if the niches were altered by Montague; on the drawing, entire canopy is coloured with a different tint to the port below; the colours are, however, very faint, but in c sequence of the State lottery views and the excellence of work, which is very similar to portions of the crypt entra I am inclined to believe the canopy dates from the erection the building. It is beautiful work.

Now we come to what we see to-day. The east end two return sides on the hustings are panelled in oak. panelling was copied from a screen in Newark Church, I think it was a great mistake to destroy Montague's des in stone and erect a copy of work which, although excelle was erected under entirely different conditions. Again, proportions of the panels, &c., have been altered to make fit in, and the effect is much inferior to the original screen Newark.

It will be seen that the woodwork has a heavy project canopy, and this is immediately under the stone canopy. result is that not only does the wood canopy prevent any near the east end from seeing the stonework above, but we two heavy horizontal lines immediately under the wind which have the unpleasant effect of dwarfing the end of hall. It is apparent to the most casual observer that woodwork forms no part of the original design, for we see canopy immediately under another, a senseless arrangem very detrimental to the dignity of the hall.

Personally I should very much like to see a return to arrangement of hanging tapestry round the east end, w return ends as far as the steps of the hustings. I think woodwork should all be removed and the arras hung, as doubt it was in the fifteenth century. At present the space the back of the panelling is a receptacle for an enorm amount of dirt and dust, which cannot be cleared away wi out taking down the screen.

Last autumn I had a small portion of the panell removed and some hangings submitted to members of City Lands Committee, and the result was favoura received. As there was so much work in hand the matter not pressed, even by members most in favour of a return the old state of things, but the subject is well worth care consideration and might well be brought up again.

(*To be concluded.*)

DESIGN FOR A SUBURBAN HOUSE AT SIEVERING.—By Herr RUDOLF EISLER, Architect.

## SOCIETY FOR THE PROMOTION OF ROMAN STUDIES.

THE inaugural meeting of the Society for the Promotion of Roman Studies was held in the lecture theatre of the Civil Service Commission, Burlington Gardens, W., on Friday, June 3. The chair was taken by Dr. F. G. Kenyon.

The first resolution was, "That a Society be formed for the Promotion of Roman Studies." Dr. Kenyon in moving its adoption, said that in October last a letter appeared in the Press signed by the President and Honorary Secretary of the Society for the Promotion of Hellenic Studies, asking for help towards the establishment of a similar body for Rome. Sufficient response was given to encourage them to go forward. A number of meetings had been held since then by persons interested in the project and different people expressed different views as to its realisation; but there was no difference of opinion as to the desirability of such a step being taken. One of the practical difficulties was the multiplication of societies which more or less appealed to the same class of people. But none of the existing societies provided exactly what was required, more especially the publication of a journal devoted to the study of Roman art and antiquities, a library and a place where lantern slides could be stored. In the end a unanimous agreement was arrived at that an independent society should be formed for the promotion of Roman studies, independent, but at the same time working in friendly co-operation with other societies of a kindred nature. In coming to this agreement the champions of union and concentration among the different bodies were not asked to abandon their views. They hoped that this society would promote an interest in Roman studies, at the same time they looked forward to the time when the work may be combined in some general institute of classical studies. For the present their duty was to see that that particular society, whether as a member of a larger one, or as a body distinct in itself should be a healthy one. There could be little difference of opinion as to that fact. Living as we do in the midst of evidences of the Roman occupation of these islands, with Roman law, in part at least, as the basis of our law, and the Roman language, in part at least, as the basis of our language, the study of Roman civilisation must of necessity be of interest. The Roman Empire was an example of Imperial administration with which we naturally contrasted our own experience. In regard to the leaders of this movement the new society could face comparison with similar societies in other countries. All that was wanted was to extend interest and to raise the standard of knowledge among the various workers in Roman research throughout the country. In Rome they now had a British school with a director who had devoted his life to the work; but the possibilities of that school were still far from being fully developed. In England they had a number of workers who lacked a high standard of organised research. No doubt the very greatest scholars might feel they could do their work best in their own way, but the value of the society was co-operation, and co-operation was the distinguishing characteristic of scholars, and it was essential for the production of the best work.

The resolution was seconded by Sir Archibald Geikie, and was carried unanimously.

Professor F. Haverfield moved, "That the object of the Society be to deal with the archæology, art, and history of Italy and the Roman Empire down to about A.D. 700 by publishing a journal, forming a library, holding meetings, assisting (as soon as funds allow) the British School at Rome, and generally promoting the better knowledge and understanding of the Roman world." Professor Haverfield drew attention first to the scope of the new society. It was hoped that in future as a result of recent conferences, the field of classical scholarship would be divided into three parts—the history, art and archæology of the Roman world, which would belong to the new society; the history, art, and archæology of the Greek world, which would, as before, be the province of the Hellenic Society and *Hellenic Journal*; and the literature, philology, and grammar of the Greek and Latin languages, which would find expression in the *Classical Quarterly*, issued under the authority of the Classical Association. There might be—and, indeed must be—occasional overlapping between these provinces, but taken broadly the division would both correspond to the division of students' interests and would save labour and duplication of work. He pointed out why the new society would end its activity with the opening of the Middle Ages. The fields of Mediæval and Renaissance art and history were too wide to be included in the same area as Classical Roman studies; they were well provided with special journals, and the papers of the School at Rome would, as before, be open to articles dealing with them; indeed if these papers dealt with post-classical subjects, and with such classical subjects as concerned more especially the topography, &c., of Rome and its neighbourhood, the harmony between the new society and the School at Rome would be complete. He passed on to explain the scheme by which the Hellenic and Roman societies would (it was hoped) unite to found one library of classical history, art, and archæology. Such union would promote economy and result in the formation of a very valuable collection of books—and he would add the hope that if this collection could by any chance be brought under one roof with the library of the Society of Antiquaries, yet more economy and efficiency would follow. Lastly, he emphasised the need of supporting the British School at Rome, the one representative of British learning in the Italian capital. The Hellenic Society supported the School at Athens; the new society would play a part of almost national usefulness by helping to make the School at Rome more prosperous and efficient. With its field of work thus delimited and its activities thus harmonised with those of other societies, the Roman Society would have a noble opportunity for valuable work. Roman art might be a poor thing, but Roman architecture, archæology and history were three living studies of signal value to the world to-day. As Lord Cromer's paper on "Imperialism, Ancient and Modern," had lately shown, Roman history was full of meaning for modern statesmen. The field of the Roman Society concerned alike the patriot and the professor, and the harvest to be raised from it was in the highest degree both of national and of scientific importance.

Mr. Arthur Smith (Keeper of Antiquities at the British Museum) seconded the resolution, which was carried unanimously.

Professor Percy Gardner moved, "That the constitution follow *mutatis mutandis* that of the Hellenic Society; that the annual subscription be one guinea; and that for the present no entrance fee be imposed." It was, he said, obvious that their society should at all events begin by following the lines of the Hellenic Society. That body since it started has had to incorporate rules which were unknown at the commencement of its activities. Fresh fields were constantly opening out. But even if the Society had a good constitution it was none the less true that it must depend for its success on the efforts of those who are willing to spend time and money. He felt sure that there were a certain number of students who were truly anxious to make the society a success.

Mr. H. H. Statham in seconding the resolution said that while it had to be admitted that Roman archæology when compared with Greek archæology was less inspiring and less intellectual, nevertheless it possessed a very much wider sphere. Moreover, Pagan Rome has come down in a very real way to our own life. It was well to remember that the plan of the western Christian church has grown out of the basilica.

Lord Justice Kennedy proposed, and Professor F. Walters seconded the election of the following as members of a provisional committee, charged with the duty of drawing up a constitution:—Mr. S. H. Butcher, Professor R. S. Conway, Professor F. Haverfield, Mr. G. F. Hill, Mr. D. G. Hogarth, Mr. T. Rice Holmes, Mr. H. Stuart Jones, Professor J. S. Reid, Mr. A. H. Smith and Mr. H. B. Walters. This was agreed to. The hon. acting secretary is Mr. G. D. Hardinge-Tyler.

Mr. S. H. Butcher moved the following resolution:—"That it be an instruction to the Council of the Society, when appointed, to approach the Hellenic Society, the Classical Association, and the Schools of Athens and Rome, with a view to arranging—(*a*) for the conduct of the periodicals controlled by these bodies as friendly and allied publications normally occupying distinct provinces of learning; (*b*) for reciprocity with the Hellenic Society in respect of library, collections of lantern slides, and the like; (*c*) for the establishment of such further co-operation between the societies as may seem desirable and possible." He said that there were no fewer than five societies by which they were at present immediately served; these were the Hellenic Society, specially allied with the School at Athens; the new Roman Society, similarly in alliance with the School at Rome; and the Classical Association, which is not concerned with Greece or Rome exclusively but covers the whole field and has now fourteen or fifteen hundred members spread over the British Empire. Obviously it was a matter of great importance that they should do all that was possible to avoid waste, overlapping and duplication of material. It should be borne in mind that four archæological societies have each their own journal, and the Classical Association had three periodicals. It was desirable that the editors of these journals should meet or hold communication, and mark out the boundaries of their respective journals. With regard to a common library, they had already existing a very good library in that of the Hellenic Society, and it would be foolish to duplicate the costly works of reference therein. The main object of the resolution was to draw the union as close as possible betweeen the different societies. They did not want to have a number of disconnected bodies, and in the interests of learning as well as of economy they ought to establish an alliance. Fifty years ago it was the dream of Classical scholars to present Greek and Roman antiquities in the same building. Nowadays they had become aware more of the diversity of these great civilisations than of their unity. Beyond all doubt high specialisation is necessary to-day. But in spite of the different characteristics beween the two civilisations there is also a certain unity between the two. We ought and might look forward at no very distant date to a big work of reconstruction. In their own generation at any rate the members could help to form a society which will bring it about. They hoped to see formed an Institute of Classical Studies, and that in forming a new society they would at the same time be bringing together existing bodies.

Mr. St. John Hope, in seconding the resolution, uttered special warning at the danger of embarking on the formation of an expensive library. He knew of more than one society which had found the task to be a mill stone round their necks

Lady Evans moved as a rider that it should be an instruc tion to the new Council that they should consider the advis ability of approaching the Council of the Royal Numismatic Society with a view to the mutual use of libraries.

The rider was accepted, and the resolution with this addi tion was agreed to.

## OUR CONTEMPORARIES FROM OVER-SEAS.

The *American Architect* (New York) is devoted to the work of Mr. J. A. Schweinfurth, who also contributes the leading article on "Certain Requirements of Architectural Practice," which is, in effect, a short sketch of the writings of Vitruvius. The chief work of Mr. Schweinfurth's illustrated is the Wellesley College, Mass., where the architect has indulged in a variety of treatments in different buildings of the group, starting from Jacobean and following with adaptations of subsequent styles down to the twentieth century. Mr. Schweinfurth's work is based on that of many past periods and diverse localities, and is most successful when it approaches closely to its prototype.

*La Construction Moderne* (Paris) commences a description and gives several illustrations of the Oceanographic Museum at Monaco, of which M. Delefortrie is the architect, and which is remarkable not only for its position but also for the character of its detail.

The *Architectural Record* (New York), in its series of articles on the architecture of American colleges, now deals with Columbia University and other colleges in New York City. An interesting article is that on "Public School Architecture in Chicago," which is illustrated by plans as well as by photographic views.

*Berliner Architekturwelt* (Berlin) contains quite a number of competition designs this month, the subjects being the grand Opera House at Charlottenburg and the extension of A. Wertheim's Stores at Berlin. The Schloss Kniegnitz, by Herren Dinklage, Paulus & Lilloe, is symmetrical on plan, and dignified as well as picturesque in treatment.

*Engineering Record* (New York) has a description of the substructure and foundations of the Bryant Building, a New York skyscraper of thirty-one storeys on a quicksand foundation. The action of seawater on Portland cement is the subject of an article by Mr. J. M. O'Hara, of the Southern Pacific Laboratory, San Francisco, and is a useful contribution to research on a very difficult question.

## Correspondence

[*The Editor will not be responsible for the opinions expressed by Correspondents.*]

### Garden Cities, Suburbs, and Villages.

Sir,—These terms are often loosely used by our public Press, thus confusing some vital issues.

A "garden city" is a self-contained town, industrial, agricultural, residential, planned as a whole, and occupying land sufficient to provide garden-surrounded homes for at least 30,000 persons, as well as a wide belt of open fields. It combines the advantages of town and country, and prepares the way for a national movement, stemming the tide of the population now leaving the countryside and sweeping into our overcrowded cities.

A "garden suburb" provides that the normal growth of existing cities shall be on healthy lines; and when such cities are not already too large such suburbs are most useful, and even in the case of overgrown London they may be, though, on the other hand, they tend to drive the country yet further afield, and do not deal with the root evil, rural depopulation.

"Garden villages," such as Bournville and Port Sunlight, are garden cities in miniature, but depend upon some neighbouring city for water, light and drainage, have not the valuable provision of a protective belt, and are usually the centre of one great industry only.

Will you, in the interest of accuracy and of social progress, kindly assist in keeping these distinctions clear?—

Yours faithfully, Ebenezer Howard,
Director of First Garden City, Ltd.,
Letchworth, Herts.

## FORTHCOMING EVENTS.

*Monday, June 20.*

Royal Institute of British Architects : Presentation of the Royal Gold Medal to Mr. T. G. Jackson, R.A., M.A. (Oxon), F.S.A., for his executed work as an Architect.

*Tuesday, June 21.*

Institution of Heating and Ventilating Engineers : Summer Meeting at Bournemouth, and on Wednesday.

*Wednesday, June 22.*

Institution of Civil Engineers : Annual "James Forrest" Lecture.

Northern Architectural Association : Students' Sketching Club Annual Excursion.

*Thursday, June 23.*

Society of Architects : Visit to Japan-British Exhibition.

*Friday, June 24.*

Royal Sanitary Institute : Provincial Sessional Meeting at Dublin; and on Saturday. Discussions on "The Water Supply of Irish Towns" and "The Bacteriological Standards of Potable Waters."

## STUDENTS' DRAWINGS AT THE ARCHITECTURAL ASSOCIATION.

With the exception of the measured drawings of old work the competitive productions of the members of the Architectural Association cannot, on the whole, be regarded as satisfactory or as approaching the average standard of excellence of the past. In every case the prize has been easily won by drawings or designs that fall very far short of perfection or even creditable attainment. We are inclined to think that the day-school system of a two-years' course is to some extent at least responsible for this. Students now learn a great deal more of architecture in two years than they ever did before, but the inevitable result of forcing follows—the fruit is produced earlier, but it lacks flavour.

Another result of the school system is seen in the paucity of competitors for many of the prizes. The daily contact with each other in a school reveals to the students the identity of the probable winner before his drawings are even started, hence very often there is a feeling of despondency and hopelessness in the majority, and they either abstain or compete half-heartedly. The prizes of life, whether in school or in the world, are never won by the man who does not make his best effort with the sanguine feeling that his best stands a reasonable chance of success. These annual competitions at the Architectural Association are scratch races, not handicaps, and when the superiority of the scratch man is realised, as it must be in a school, the backmarkers stand down or are only out for an airing.

The A.A. Travelling Studentship (value 25*l.* and silver medal) has been awarded to Mr. V. O. Rees, whose draughtsmanship gives promise of future excellence, but is at present in the melting-pot, fusing the merits of English and French styles, but falling short of either. The measured drawings of the church of St. John the Evangelist, Westminster, are thorough and a good study of a design that is remarkable in plan and composition, but not to be admired in detail. Of the designs submitted by Mr. Rees that for a Renaissance pavilion and fountain is the best, but the elliptical staircase for a town house does not fall far short, and shows both adequate study and commendable invention. Mr. H. A. Ross has worked diligently, his measured subject being Gibbs's work at Trinity College, Cambridge, but both his draughtsmanship and design are markedly inferior to those of Mr. Rees.

The A.A. Silver Medal (together with prize value 10*l.* 10*s.*) has also been won by Mr. V. O. Rees for a design for a memorial archway and screen to a public park. This is arranged on a semicircular plan with three radiating roadways, one central and the others in the middle of the quadrants. The archway adorns the central roadway, and is treated by Mr. Rees with three equal-sized openings surmounted by an attic, which is rather too high for the arches. The minor entrances are kept quite subordinate and the semicircle terminates in pylons. The scheme is well conceived, and the author has a good idea of the use of detail. Of the other two designs submitted for the medal, that of "Olympius" is the better, but neither in general conception, in detail nor in drawing is either of these within measurable distance of the winner.

The Henry Saxon Snell Scholarship (value 50*l.*) has attracted the largest number of competitors, and the prize has been awarded to Mr. E. F. Ferry. Quantity rather than quality is the characteristic of the competition, and none of the competitors has given an ideal solution of the problem—a small convalescent home at the seaside for fifty children. The winner's design is the best, and, whilst the general arrangement of the various departments is good, the plans possess such grave faults as infants' dormitories looking south-west and beds poked into dark corners without ventilation. Attempts at prettiness rather than planning mar too many of the designs, and more attention has been given to the arrangement of gardens and even of paving stones than to considerations of service, control and aspect.

The competition for the Banister Fletcher bursary (value 25 guineas), awarded to Mr. B. F. Matthews, has brought out the finest set of drawings in the room, for which the author has measured the Queen Mary block at Greenwich Hospital in a most admirable manner, and rendered the results of his measuring in capitally prepared drawings, the full-size details and the half-elevation, half-section of the dome to half-inch scale being especially remarkable. The only other set of drawings in this competition, representing the Strand entrance to Somerset House, submitted under the motto "Jointing," is quite worthy of the prize, but has been unfortunate in meeting so strong a competitor as the work of Mr. Matthews.

The Architectural Union Company's prize (value 20*l.*) has also produced a spirited competition and excellent drawings. Mr. P. D. Hepworth has been successful with a very fine set of drawings of the Abbey Gateway at Bury St. Edmunds, in which the author has charmingly conveyed the spirit of mediæval English architecture, particularly in his delineation of carved ornament. A good, careful, and effective set of drawings of Sompting Church, by "Saxonia"; measured drawings of Horham Hall, near Thaxted, Essex, by "Persiste"; of Borwick Hall, Lancashire, by "Weaver," are all worthy of recognition for painstaking and thorough work, even though

AT BRUGES.—From a Sketch by Mr. J. Grey West

they must justly give place to the winner, either for importance and value of subject or for excellence of draughtsmanship.

The work of the first and second year divisions of the school, exhibited in the gallery, shows the maintenance of the style of pretty drawing that is characteristic of the Architectural Association present-day teaching. There is a great deal of very creditable work in the direction of design, for which the instructors appear to aim at novelty of subject, with perhaps too much persistency, for as the students of the school are perpetually changing it is scarcely necessary to depart extensively from the beaten track and set young fellows fresh from school to disport themselves in the by-paths of architecture and attempt to design Byzantine domes. Study of English stonework treatment is far preferable, but purity of taste should be one of the qualities that young students should be assisted to develope, which can hardly be done if they are fed on Byzantine, German Renaissance, or Buddhist design.

## NOTES AND COMMENTS.

In the case of the Guardians of the Poor for the Parish of Leicester *v.* Trollope, the latest proceedings in which we report elsewhere, a very important point for architects is raised, as to how far the architect of a building can be held responsible for negligence in the event of the duties of the clerk of works not being properly and sufficiently performed.

The credit that should be given to the author of a work of art is but too frequently withheld in the notices of such works that appear in the daily Press. Of this a remarkable instance occurs in the account in the *Times* of the unveiling of the memorial reredos to Canon Fleming in the church of St. Michael, Chester Square. We are told the cost of the reredos, the names of the gentleman who performed the ceremony of unveiling, of the officiating clergy and of several prominent members of the congregation present. The materials and subject of the reredos are described, and then we are told:—" The work has been carried out from the designs of Mr. E. Evans Cronk, and the modelling of the figures in the reredos was executed by a gold medallist of the Royal Academy on the staff of Messrs. Underwood & Co., who carried out the work." We cannot suppose that the omission of the sculptor's name is due to any other cause than the recognition of the fact that the readers of the *Times*, representative of the general public of Great Britain, are more interested in the cost of the memorial and in the materials of which it is made than in the identity of the artist to whom its beauty is due. Such is the love of art amongst the British public.

Birmingham is very much in earnest in town planning, and the City Council have not only adopted the report of the General Purposes Committee, that authority should be given to the committee to serve and publish the necessary notices of the intention of the Council to apply to the Local Government Board under Part II. of the Housing, Town Planning, &c., Act, 1909, for authority to prepare a town-planning scheme for an area comprising the parish of Quinton and parts of the parishes of Harborne and Edgbaston within the city and a portion of the parish of Northfield within the King's Norton and Northfield urban district, and to take all the steps in relation to such intended application as are required by Articles I., II. and III. of the Town Planning Procedure Regulations (England and Wales), 1910, but has resolved that the committee be requested also to consider whether a town-planning scheme should not be made for Saltley, Washwood Heath and Ward End.

The Town Planning Conference to be arranged by the Royal Institute of British Architects will be held from October 10 to 15 next. The President of the Local Government Board, the Right Hon. Mr. John Burns, has accepted the position of Hon. President of the Conference. Mr. Leonard Stokes will be the President and Mr. John W. Simpson Secretary-General.

At the opening of the centenary exhibition of the Liverpool Academy of Arts the President, Mr. J. Y. Dawbarn, M.A., drew attention to one very important aspect of the encouragement given to art by the British public. He urged upon his audience that, if they only considered for a moment, they would be compelled to admit that the Academy had a real claim upon their patriotism, interest, and support. For if local art, which was undoubtedly an industry as well, was not to be supported, whatever manner of good did the citizens expect to reap from an expenditure of something like 22,000*l.* on the mere extension of their school of art, and thousands more yearly upon its staff and maintenance, if they were going to allow their living artists and sculptors to starve? Why, in the name of common sense, go to the useless expenditure of educating more for such an unhappy fate? An architect told him the other day that he paid an educated sculptor capable of designing and executing figure subjects and artistic ornaments a considerably smaller wage than an ordinary trade-unionist mason.

The experience that has been already obtained in their own city, and the results seen by some members of the City Council of Birmingham on their recent visit to Berlin, have convinced the municipal authorities of the wisdom of their Gas Department in adopting the system of high-pressure gas supply both for public lighting and for private requirements. The City Fathers were particularly struck by the lighting of Berlin, where already the municipality have 25 miles of streets lighted with high-pressure gas. The Berlin authorities have, indeed, for the last two years been installing the latest patterns of high-pressure gas lamps with inverted burners in lieu of the existing gas and electric lamps. The change is being effected in execution of a scheme which involves the expenditure of 350,000*l.* at the rate of 50,000*l.* a year for seven years. The lamps used are graded according to the importance of the thoroughfare. At junctions of main streets lamps of 4,000 candle power are erected, lamps of 2,000 candle power illuminate main thoroughfares, and in other streets lamps of 1,000 and 600 candle power are used.

As compared with the ordinary system of gas supply, it may be mentioned that, ordinarily, the pressure of the gas produced for lighting and heating is at a maximum of three or four inches water pressure. It is forced into the mains through the governors and distributed through the district of supply by the weight of the gasholders. High-pressure gas differs only from the ordinary low-pressure product in that it is taken from the outlet pipe of the gasholder and passed through a compressor, by means of which it can be raised to any pressure desired. Under the Birmingham scheme it is not intended at present to raise the pressure at the works beyond 5 lb. or 6 lb. per square inch, or about 120 or 140 inches water pressure. For lighting purposes this pressure will be reduced to about 60 inches, and there will be reductions to other pressures according to the requirements of consumers. Having regard to the reinforcement of the ordinary supply to outlying districts, and the connection of branch pipes with the trunk high-pressure main for this purpose, governors will be placed at the district junctions in order to reduce the pressure to the normal. One special feature of the installation is that much smaller mains are required for the high-pressure system than for the distribution of the low-pressure gas. For factory purposes, especially in such trades as are particularly represented in Birmingham, high-pressure gas has many advantages.

In his valedictory address Mr. C. F. Beckett, President of the Architectural Association of Ireland, administered what is likely to be the *coup de grâce* to the suggested scheme for amalgamating the Association with the Royal Institute of Architects of Ireland, a scheme not too well considered in detail, by which the Institute would swallow up the Association and incidentally raise the subscription of its own members.

## MODERN COLD STORAGE AND REFRIGERATION.

By W. S. Douglas, B.Sc.

### XI.—METHODS OF COOLING (*continued*).

### *Cold Air Blast.*

Cooling on this system is also effected mostly by direct expansion of the gas; but instead of the pipes where the expansion takes place being fixed round the walls and on the ceilings of the rooms themselves, they are built into stacks in a separate insulated chamber. Sometimes brine is circulated through the pipes, and we have then a modification of system 1, although it is preferable to have direct expansion if possible. The same arguments apply in comparing the two as were used when discussing system 1 and system 2. That is to say, on the side of direct expansion we have the low first cost and a smaller coal bill, and on the side of brine we have storage of "cold" and even temperatures.

The cooling apparatus in the separate chamber is known as the "air cooler," of which many different forms have been devised, and these may be divided into two classes—first, wet air coolers, and second, dry air coolers. In the latter, the pipes are either built into stacks by themselves, or immersed in a bath of still brine; in the former, they stand in a shallow receiving tank, and from that tank a pump is continually elevating the brine to a split distributing pipe above the coils, whence it falls over the pipe surface to the bottom. Modifications of both these systems are found, but it is common to all to have a powerful fan, by means of which hot air is sucked from the cold rooms, and returned to them when it has been chilled.

Wet air coolers have been used by Messrs. Haslam for many years, and have formed the subject of letters patent. Their system involves connecting up the compressor and condenser to an evaporator or large brine tank containing the evaporating coils. A circulating pump is provided, and the cold brine is circulated to and from the air cooler chamber, which is quite separate from the cold rooms. Inside the chamber are located corrugated galvanised iron sheets, surmounted at the top by a storage tank, from which cold brine continuously trickles over the sheets. Being broken up in its passage, it offers a large cooling surface to the air, and at the same time adds to this surface by chilling the metal sheets themselves. The air is therefore cooled quite rapidly.

Another apparatus frequently used for wet air cooling is a "rotary cooler"; this consists of many discs mounted on a slowly revolving shaft, which is supported on a tank half filled with brine, and containing the evaporator coils. Air is circulated through the apparatus in the usual way by means of a fan, and, coming in contact with the wetted discs, has its temperature quickly reduced, owing to the large surface available. In Messrs. Borsig's design the evaporator coils are also placed at the bottom of the cooler, and immersed in brine, but the extended cooling surface, instead of being provided by wetted discs, is attained by allowing the brine to trickle continuously from the top over shelves.

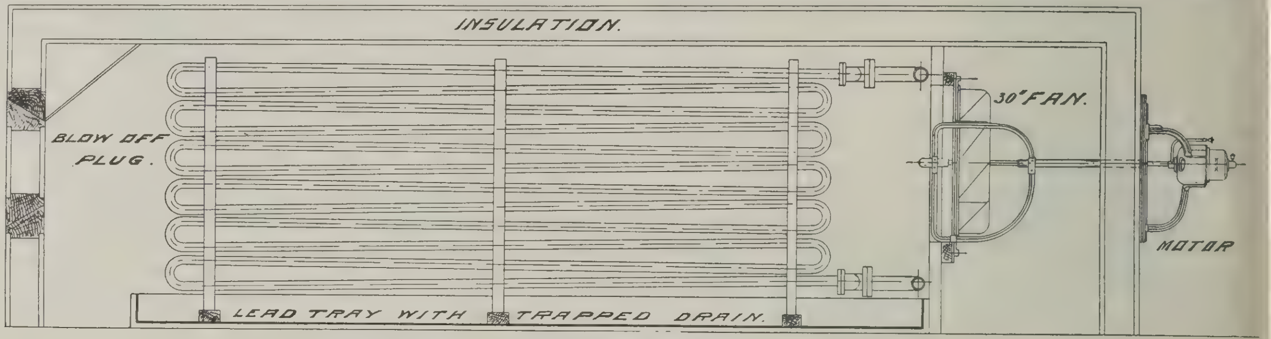
Messrs. Douglas have adopted a wet air cooler which does not necessitate an evaporator; the compressor and condenser are connected up directly to stacks of coils in the air-cooling chamber, and over these the slightly warmed air from the cold rooms is blown in the usual way. The coils stand in a shallow tank, and above them is fixed a distributing trough or split pipe, according to the size of the cooler. Brine is raised from the tank by a small circulating pump to the distributing apparatus, and is then allowed to trickle over the pipes, inside which the refrigerant is being vaporised. In this way it becomes thoroughly chilled, and offers the required surface to the air which is to be cooled. The advantage of the arrangement is that it is to all intents and purposes direct expansion, as the vaporising gas extracts its latent heat immediately from the air itself, the cooling surface being increased by the trickling brine. Higher working economy is accordingly obtained, as before demonstrated, and a simpler plant.

The object in installing a wet air cooler is to obtain a very low temperature, and at the same time to retain the advantages of the separate cooling chamber and cold air circulation. The air blast, in the ordinary way, is not adapted for exceptionally low temperatures, but, with the very much larger surface afforded by the addition of trickling brine, and the rapid cooling obtained, it is found to be quite as efficient as piping the room itself. Each of the wet coolers described is found to give every satisfaction in practice, but the last named is by far the least expensive to instal, as the evaporator is entirely eliminated, and the arrangement is so extremely simple. It is also rather more economical in working, owing to the higher back-pressure allowed by direct expansion.

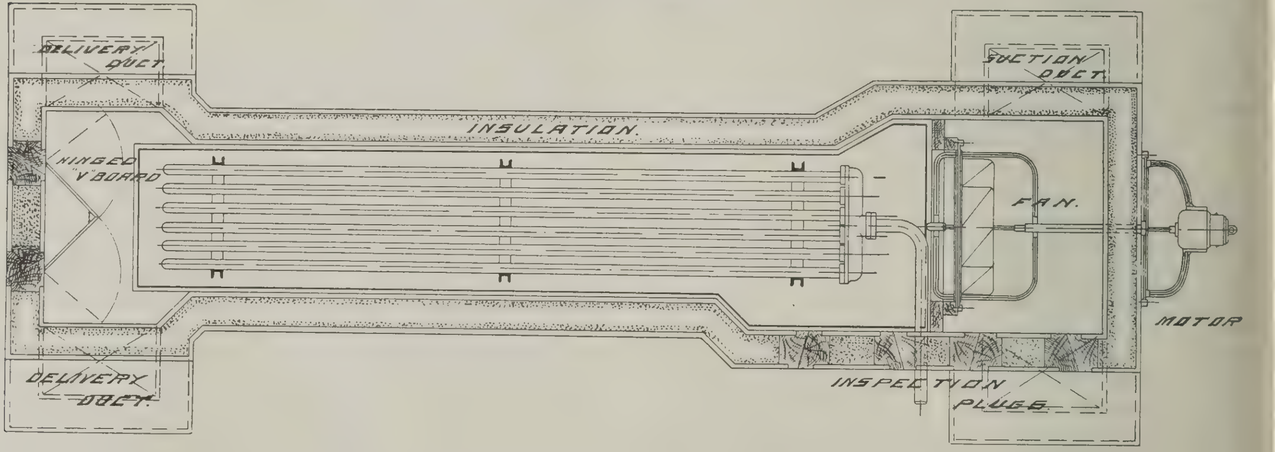
Fig. 33 shows a cooler on the dry air system. It is advisable to employ this arrangement wherever possible in preference to the wet coolers, as, with the latter, specks of brine are frequently carried out by the blast into the cold rooms, and deposited on the goods which are being stored, with bad effect. Only when very low temperatures, and at the same time air circulation are required, should a wet cooler be used.

Referring to the figure, it will be seen that the pipes are in six sections, supported by channel irons, which rest on hardwood blocks. The sections are connected at their terminals by cast-iron headers or "manifolds," by means of which the gas or the brine is evenly distributed and collected. In this case brine is used, but for directly expanding gas the design would be precisely similar, except that the length of piping for the same storage capacity would be only about two-thirds of that shown in the drawing. The air-circulating fan, 30 inches in diameter, is seen at one extremity of the cooler; it is directly coupled to a motor of about one-horse power, which is supported on the outside of the chamber, and controlled from the engine room in another part of the building. The spindle connecting the two is carried right through the insulation.

Close to the fan are the terminals of the two main suction ducts, each 24 inches by 16 inches, giving a combined cross-sectional area for the two, which is rather more than equal to that of the fan. These ducts are led one to each of the two large rooms which are served by this cooler, and are carried along the roof in the corner. At intervals in their length regulating slides are inserted, by means of which air is sucked from all parts of the rooms, and the cross section of the ducts is diminished by suitably tapering them at such a rate that the suction area, counting the slides, is always approximately constant. The two delivery ducts are located at the opposite end of the cooler, and are each of the same area as the suction passages. They are also led away, one to each room, but, instead of being carried in the upper part, should always run along the floor, where space permits. The remarks as to adjusting cross-sectional areas and supplying regulating slides apply to the delivery ducts equally with the suction.



ELEVATION.



PLAN.

FIG. 33.—DRY-AIR COOLER.

It will be noticed that, at the suction end, two inspection plugs are fitted, and that a blow-off plug is fixed near the delivery. The purpose of the former is to provide ready access to the fan and to the headers respectively, and the latter is used for "defrosting." This operation becomes necessary when the plant is started after a long interval of rest, and also, occasionally, when it is running. It consists simply in thawing out the snow which accumulates on the pipes, due to the condensation and freezing of the air moisture, and is accomplished by sucking in warm air from the atmosphere through an inspection plug, and discharging it by the blow off. Th snow then melts and trickles down to the lead tray beneat the coils, whence, by a trapped pipe, it is led away to th nearest drain.

The insulation of this chamber should be carried out wit the same thoroughness as that of the rooms. No pains shoul be spared, as it is here, if anywhere, that leakage would tak place, owing to the very low temperature. The ducts shoul also be insulated if there is space intervening between th cooler and the cold stores, but if, as in this case, the cooler i built actually on the roof of the stores, the necessity does no arise.

To show how the air is distributed to the rooms and col lected again, we reproduce in fig. 34 a plan of a fair-size Irish butter store. There are five rooms with a total storag capacity of 52,300 feet, and all are served by a common ai cooler, built on the cold dry air system. It may be noted, b the way, that the span roof is supported on cast-iron columns and that these, where they come inside the rooms, had to b carefully insulated to prevent leakage of heat.

From the cooler suction and delivery ducts are carried t each of the five rooms, and the air is passed in and out of the by suitable slides. The ducts, as will be observed, are tapere to keep the suction cross section constant, and the area of each duct, except in the case of the largest room, where there are brine pipes in the roof, is to be proportional to the capacity of the room, or rooms, which it serves. That is to say, it is proportional, if the temperature is to be the same all over. If the temperature in different rooms varies, then the duct area must be increased for those where it is lowest.

The exact amount of the increase could be calculated, but is more safely taken from experience. For instance, it is found that to maintain a given room having the same insulation efficiency, and having the same amount of goods brought in daily, at 24° Fahr., the refrigerating tonnage taken would be practically double that required for a similar room storing goods at 35°.

The large increase is due to three causes:—Lower suction pressure (hence less weight of gas passing), higher radiation losses, due to greater temperature difference (these might be eliminated by increasing the thickness of insulation in proportion), and the fact that the moisture in the goods, being frozen at the lower temperature, requires the extraction of latent heat. Consequently a room of 5,000 cubic feet maintained at 24° Fahr. would require a duct twice as big as one of the same capacity maintained at 35°. At other temperatures there is a different ratio, which can be determined from published tables, and which will be investigated in these articles at a later stage.

It may be well at this point to show briefly how duct areas are calculated. As a numerical example, let us take the stores in fig. 34, and let it be assumed that there are no brine pipes to help the cold air in room No. 1, also that the temperature in rooms 1, 4, and 5 is to be 35°, and 24° in rooms 2 and 3. We have three ducts; the first serves room No. 1 at 35°, the second rooms Nos. 4 and 5 at 35°, and the third rooms 2 and 3 at 24°. Our fan is 48 inches in diameter, and this gives us a cross-sectional area of 1,809 square inches. Now 24,500 cubic feet are served by the first duct, 8,600 by the second, and 19,200 by the third. But the third carries air to a room maintained at 24°, and must, accordingly, be doubled in importance. This is equivalent to saying that it serves 38,400 cubic feet at 35°, which puts the third duct on an equal basis for comparison. Their areas, we now see, must be in the proportions 245, 86, 384, and combined they should theoretically come to 1,809 square inches. Actually, however, we shall add 25 per cent. to this, as the friction in small passages is so much greater, and this gives us, for the total area, 2261 square inches. Dividing this up in the specified proportions, we find that the first duct should have an area of 775 square inches, the second 272, and the third 1,214. Convenient sizes to give these areas would be 23 inches by 34 inches, $13\frac{1}{2}$ inches by 20 inches, and 28 inches by 43 inches, and the ducts would then be made to these measurements between the cooler and the rooms, tapering down gradually, after their entry into a room, as the distance from the cooler increases.

The calculations for the amount of taper given to that part of a duct which is in the room, and the size of the slides, are very similar. Referring again to our numerical example, let us take duct No. 1, serving room No. 1 on plan, the length of which is 112 feet. It will be supposed that slides are placed every 7 feet, which gives us, counting the first and last, seventeen openings. The area of the duct is 775 square inches, hence each of the slides should be, theoretically, 46 square inches, but, as some of the slides will be partially closed when working, it is wise to make another increase of 25 per cent. This gives us an area of 58 square inches, which will be approximately obtained by making the slides 10 inches by 6 inches. The taper of the duct is very simply found; at its entry to the room its area is 775 square inches, and at the other end at least $\frac{1}{17}$th of this, or 46 square inches, giving a cross section of say 10 inches by 6 inches, the 10 inches being vertical. The size of the duct at entry is 34 inches by 23 inches, and, consequently, the diminution in the vertical dimension is 24 inches, in the horizontal 17 inches. This is equivalent to a taper of 1 in 56 vertically, and 1 in 79 horizontally.

Owing to the friction the blast will be more powerful at those slides which are nearest to the fan, and usually, in practice, these will be kept partially closed, to reduce the draught to a more even value. Friction, indeed, plays a very important part in the design of trunking and ducts. To avoid it, all the passages should be of ample area, there should be no constrictions, no sharp edges or bends, and the cross section should be nearly square. This shape, next to the circle, gives the least friction surface per unit of area. Unfortunately, however, it is not always practicable, owing to the obstruction of the hanging space which would be caused, and the dimensions of the ducts are more commonly arranged in the ratio of 2 to 3.

Turning once more to fig. 34, it will be observed that the shape of the insulated space, as viewed in plan, is very unlike a square. The reason for this is the disposition of the build-

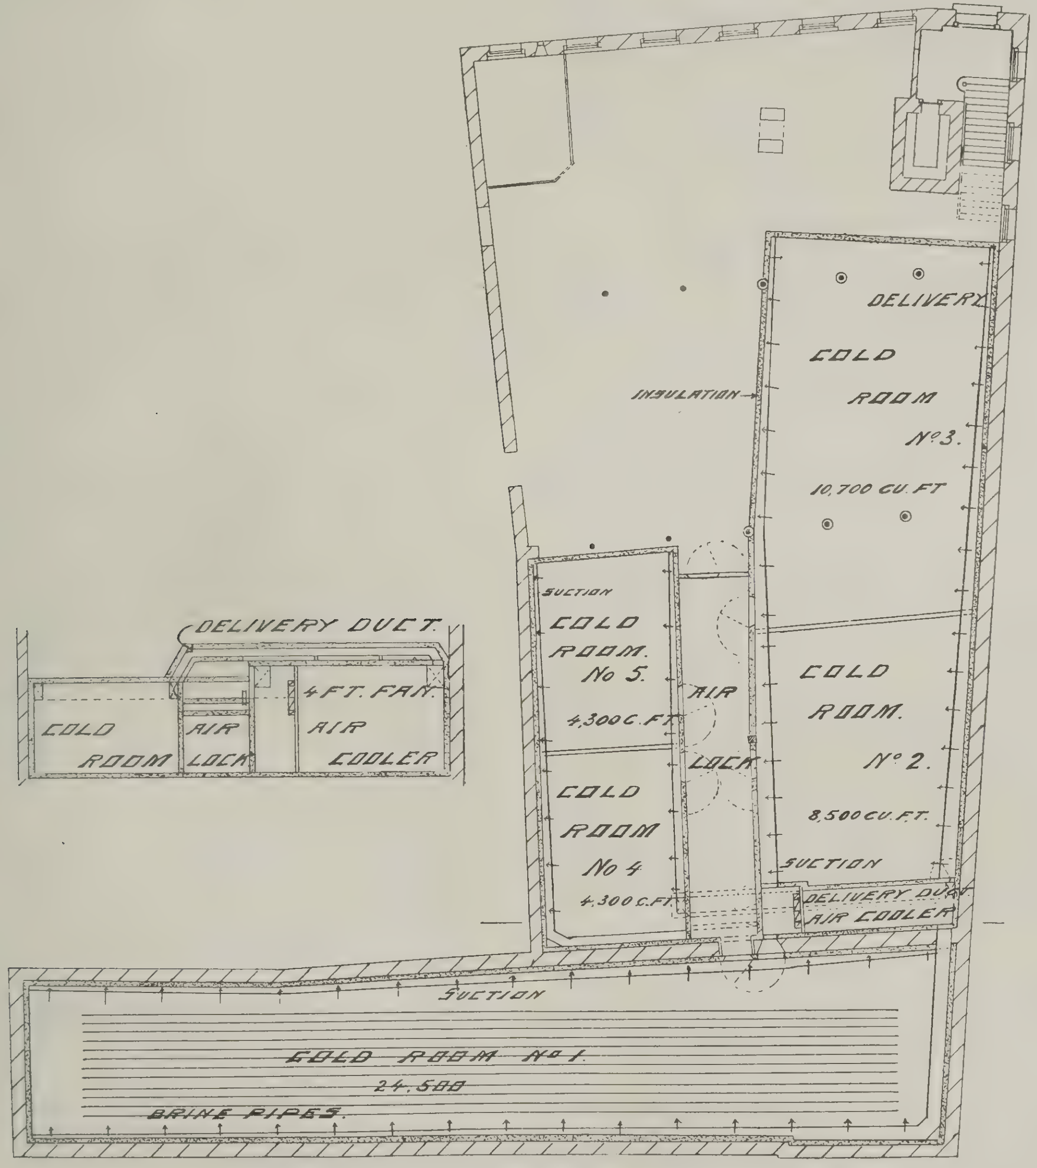


Fig. 34.—BUTTER STORAGE ROOMS COOLED BY COLD-AIR BLAST.

ings, which were in existence before the cold stores were contemplated. Otherwise, such a bad design would certainly not have been adopted. Room No. 1 is particularly awkward, as not only is the ratio of radiating surface to volume excessive, but cooling is rendered extremely difficult by the long and narrow shape.

The air cooler, which is on the roof of the stores, is very similar to that shown in fig. 33, and is also on the brine circulation principle, being connected to the evaporator of the refrigerating machine, and to the brine circulating pump. These and the rest of the machinery are located in a separate engine room.

The type of air cooler which we have been discussing is the best possible for large stores, and if on the direct expansion principle, is comparatively inexpensive to instal, and also fairly economical in working. But, when we come down to small single rooms up to 2,000 cubic feet capacity, it is inadvisable and sometimes impossible to put in a separate chamber for the cooling coils. In such a case, it is quite sufficient to partition off the cooler from the rest of the room by a diaphragm of wood. Air is sucked in by a fan through a hole in the top of the diaphragm, and, after passing through the cooler, is discharged cold by suitable apertures in the bottom. Trunking, where the room is long and narrow, or otherwise awkwardly shaped, is led from the apertures, and delivers the cold air to goods in all parts of the store.

Frequently with these small plants the machine can be run only for a certain number of hours in the day. It then becomes necessary to have not only extra thick insulation, but also some means of storing up "cold" when the compressor is shut down. This is best attained by partially immersing the air-cooler coils in a bath of cold brine, which, being heavy, and having a high specific heat, offers the required storing capacity. No objections can be raised to the brine tank, such as were brought up in connection with the wet air cooler, as the brine, not being sprayed, is never carried over into the chamber with the air. It is even an advantage, as the calcium chloride solution being hygroscopic has a beneficial drying action on the air, beyond that which is exerted on it by the quick chilling.

This property of calcium chloride has been utilised by Mr. Madison Cooper, U.S.A., in his cooling system for egg stores. The air in these stores must be of a certain exact degree of humidity, and must also, in common with the air in any store, be exceedingly pure. To attain the latter object, Mr. Cooper passes the air through a small tower before it reaches the air cooler. From the top of this tower, water or brine is trickling continuously in a fine spray. The air ascending is closely intermingled with it, becomes washed, and also to a certain extent cooled. Refrigerated brine must be used, unless the air is freshly taken in from outside. It then passes through the cooler which is connected to the freezing machine, and finally through another tower, in which is located a quantity of calcium chloride, or other hygroscopic agent (such as concentrated oil of vitriol—sulphuric acid). There the absorption of moisture is regulated by dampers, or other means, and the humidity of the air can be adjusted to a nicety.

## RENAISSANCE MONUMENTS IN THE ROMAN CHURCHES, AND THEIR AUTHORS.*

(*Concluded from last week.*)

FROM St. Marco we pass to the ancient basilica St. Clemente, and, having in mind the characteristics exhibited by Dalmata in the crypt, we examine the tomb of Cardinal Roverella in the choir to the right of the high altar. The cardinal died in 1476, just about the time when the tomb of Paul II. was completed, if Vasari is right in assigning two years for its execution. Here again two artists have been at work, one of them undoubtedly Dalmata, but his collaborator is not either of the Minos. He is probably a sculptor who elsewhere worked with Mino da Fiesole, or called in Mino to assist him, one Andrea Bregno, to whom I shall come by and by. His share in this monument consists of the fine recumbent portrait figure, the Apostles, and the little angels at the base. The rest of the monument—the Madonna and attendant angels, the dignified figure of the Father, and the angels at the ends of the sarcophagus holding back the curtains, a Renaissance adaptation of an old Gothic motive—can be assigned to no other hand but Dalmata's. A Pieta, evidently his also, a fragment from some monument now broken up, may be seen in the porch of the church of St Agostino. Herr von Tschudi has pointed out his marked manner in certain portions of the Tebaldi monument in th church of the Minerva. This prelate died in 1466. It doe not follow that the tomb was constructed immediately afte his death. We may, however, assume that Dalmata worked in Rome for about fifteen years. Of his subsequent career some records have been discovered by Fabriczy and others He was summoned to the court of Matthæus Corvinus, King of Hungary, who ennobled him and gave him a castle in Slavonia. His work may be traced in Venice and Vienna and finally in Ancona, where the tomb of the beatified Girolamo Gianelli, a work of his later and failing years, was executed as late as 1509.

And now to return for a moment to Mino da Fiesole Another important work which must have been put in hand about the same time as the tomb of Paul II. is that of Cardinal Forteguerra in Sta. Cecilia. The fragments of this monument, which had been broken up, were only put together again in 1891, and it has suffered from injudicious regilding. The Madonna and Child is his work, as also is the recumbent figure of the fighting cardinal, which is treated in the same manner as his presentation of the Count Ugo in the Badia at Florence. It does not lie on the sarcophagus, but on a sort of shell or bier raised above it. The other figures were probably contributed by Andrea Bregno, the angels in the lunette being characteristic of his manner. In the sacristy of this church there is also a Madonna from Mino's workshop.

A year before Cardinal Forteguerra, died Pietro Riario, Cardinal of San Sisto, the favourite nephew who was called by Sixtus IV. from a Franciscan monastery to become a prince of the church, and who, after a meteoric career of wild excesses, died only two years after his elevation. His monument, one of the most interesting in Rome, is in the Church of the Holy Apostles. The relief of the Madonna and Child appears to be the work of Mino in one of his happiest moods. The saints in the upper niches of the pilasters are also his. One, at any rate, of the lower ones I should attribute to another hand, and the groups on either side of the Madonna have been, I think, with justice given to Andrea Bregno. So, also, the sarcophagus and the recumbent figure have hitherto been. With this attribution, however, I venture to differ. The portrait figure is treated in the same manner as in the Forteguerra monument. The face is strong, highly finished, and polished like ivory. The sarcophagus is the most beautiful example of such work in Rome. The heads of the sphinxes are reminiscent of those on the Tuornabuoni monument in the Minerva. The little putti between the garlands are masterpieces of decorative workmanship. It was copied some twenty years later for the grave of Cardinal Savelli in the Aracœli Church, which comes no doubt from Andrea Bregno's workshop. There was evidently here no question of casting and accurate reproduction. It is a mere copy, with all the essential differences of the two manners. The one is individual and full of charm, the other characterless and mechanical.

And now we have to consider the problem of an artist whose individuality has only recently been disengaged and re-established, though he worked for at least forty years in Rome and perhaps much longer. The name of Master Andrea appears first, chronologically speaking, in an inscription on the old high altar of Sta. Maria del Popolo, erected by Cardinal Roderigo Borgia (Alexander VI.) in 1473, and now preserved in the sacristy. The inscription states that while Andrea was at work on it, fate cut the thread of life of his beloved Marcantonio at the age of seven, owing to the carelessness of his attendants. The boy had probably climbed the scaffolding to see his father's work, and fell from the top, therefore the inscription on the altar. It is clear that the sculptor of this altar was also the author of two tabernacles in the first chapel to the left of the door, and it is also clear, though I cannot here explain all the chain of proof, that he is identical with the Andrea Mediolanensis, of Milan, who inscribed his name on the great Piccolomini altar in the cathedral at Siena. Now with regard to this altar we have a letter from the illustrious Platina to Lorenzo di Medici, recommending to him one Andrea, an eminent sculptor, his neighbour in Rome and intimate friend, who wished to bring marble through Tuscan territory from Liguria for an altar on account of Cardinal Piccolomini. In a contract which Piccolomini made in 1501 with the great Michel Angelo for the completion of this altar with certain additional figures, Andrea is again referred to. Milanese, who edited this document, obscured his individuality by adding the name Fusina. The Lombard sculptor, Andrea Fusinæ, is, however, a very different person, and quite rudimentary powers of critical observation suffice to show that our Andrea has nothing to do with him. Once more our Andrea is mentioned in the rhyming chronicle of Giovanni Santi, Raphael's father, who speaks of "the eminent Andrea Verrocchio, and that other Andrea who at Rome is such a master of composition."

---

* A paper by the Right Hon. Sir Rennell Rodd, G.C.V.O., K.C.M.G., P.C., His Majesty's Ambassador to the Court of Italy, read before the Royal Institution of Great Britain on June 3.

Who, then, was this master who stood so high in the esteem of contemporaries? The clue is afforded by a monument, long lost sight of in a corridor leading from the church of the Minerva, which is now incorporated in the Ministry of Public Instruction. The inscription tells us that it was erected to the memory of Andrea Bregno, of Osteno, in the territory of Como, a very celebrated sculptor, known to contemporaries by the name of Polycletus, who first restored to use and application the lost art of chiselling (*artem celandi*) as practised by the ancients. He lived eighty-five years. It was erected in 1506 by Bartolomeo Bolli, controller of the Papal records, and Catherine, his wife, Bregno's wife, that is; for another document discovered by Bertolotti shows that Andrea di Brignonibus, a sculptor of the diocese of Milan, who lived in the Rione Trevi, made a testamentary disposition on July 8, 1503, of a part of his house to his wife, Catherine. This will thus refers to him as of Milan, though he was born at Como, where the Bregno family produced at least four members who became eminent in the story of art. Round the circular niche, containing the bust, and in the pilasters are shown all the tools and implements of his craft. The words "*artem celandi*," the art of chasing or chiselling, which he is said to have revived, have, I believe, a special meaning, and the phrase is not merely complimentary. A strict Latinist would maintain that *celare* should signify the chasing of metals, but we find in the Latinity of this period such phrases as *celatorius marmorum*. I have found no record in any of the Papal registers of Andrea Bregno as a goldsmith, and had he revived any lost art in working precious metals, he could hardly have failed to receive commissions from Paul II. or Sixtus IV. He is only referred to as *sculptor marmorarius* or *statuarius celeberrimus*, and I believe the meaning to be that he was the first in Rome to reintroduce the art of decorative marble-cutting on incised surfaces, after the manner of the ancients. A study of his works shows that he was indeed the chief initiator in Rome of Renaissance surface decoration, ornamenting pilaster and frame with delicate candelabra and foliage and armorial design—and I believe it can fairly be established that it was after his acquaintance with and association with the Roman Andrea that Mino da Fiesole applied such elaboration of ornament to his own monumental work.

Andrea was born about 1421, and we have no evidence as to how the first forty years of his life were spent. If I may hazard a conjecture, it would be that he worked with Paolo Romano and Isaiah. There is no time to examine the evidence in support of this theory. It must suffice to say that his first tombs follow the model established by the latter, and I should attribute to him the restorations to the tomb of Eugene IV., or shall we say, the portions which are evidently not by Isaiah himself? Andrea's angels have their prototype in those of Paolo Romano in the shrine of St. Andrew in the crypt, and a third lunette, differing in some respects from the other two, may be his work. In his native Osteno are two tabernacles closely resembling those of Sta. Maria del Popolo; they are dated 1464, and were probably executed in Rome. For his earlier work here we must go to San Pietro in Vincoli, where the monument of Cardinal de Cusa is no doubt rightly attributed to him, and to the church of Aracœli, where the grave of Cardinal d'Albret (Lebretto) demands particular attention. Lebretto died in 1465, and if this was one of the first independent commissions obtained by the Lombard artist, it might account for the exceptional care and finish bestowed on the figures, before great press of work compelled him to leave execution to pupils. The St. Peter and St. Paul, rendered on the lines laid rudely down by Paolo Romano, fixed the type ever afterwards followed in Rome. The reliefs in the niches are among the most beautiful works of the Renaissance in the city. The St. Michael is a little masterpiece, both of design and execution. The recumbent figure is evidently an excellent piece of portraiture. At present there is little ornamentation. Eight or ten years later Bregno had learned to cover base and pilaster and architrave with every elaboration of arabesque and floral design.

In the Salviati chapel of St. Gregorio there is an altar erected by an abbot of the church in 1469, the manner of which suggests Lombard traditions. It is now generally attributed to Bregno, and a comparison of its details with those of the great altar of the Madonna della Quercia at Viterbo, carried out by him some twenty years later, is, I think, convincing. Next in chronological order comes the altar of Sta. Maria del Popolo, executed for Roderigo Borgia in 1473, and about the same time are the tombs of Pietro Riario and of Cardinal Forteguerra, where I have little doubt Bregno was the artist who collaborated with Mino da Fiesole, as well as the Roverella grave in St. Clemente, where he worked in combination with Giovanni Dalmata. The scheme of the Lebretto grave was reproduced in that of Cardinal Alanus in S. Prassede in about 1475, but the two female saints in the pilaster niches seem to be by another sculptor, who is responsible for a good many of the figures in the Roman graves, but who remains for the present unidentified. Some of Bregno's best work in design and portraiture belongs to the years 1478-9. The fine tomb of Cardinal Cocca in the Minerva, and the beautiful monument of Cardinal Cristofero delle Rovere in Sta. Maria del Popolo, are of this period; the Madonna of the lunette in this last, however, once more by Mino da Fiesole. Some of the decorative work in this monument repeats motives found in the Piccolomini altar at Siena. The very dignified figure of the cardinal is a little soft for Mino, and is no doubt rightly attributed to Bregno, of whose manner the angels on either side of the Madonna are typical. This monument was so much admired that it was constantly reproduced. In one instance, in that of Cardinal Ferici, in the cloisters of the Minerva church, the Madonna also appears to be from a design by Mino. Other instances are the tombs of Cardinal Superanzi in the Minerva, of Cardinals Rocca, Pallavicini and Giustiniani in Sta. Maria del Popolo, and that of Cardinal Diego Valdez, who died in 1506, carried out in his lifetime, in Sta. Maria in Monserrato. All these copies are, with the exception of the first, very inferior in execution to the original. There are a great number of other monuments of this period of active production when the nepotism of the Popes filled Rome with wealthy and ambitious prelates, which are properly traceable to the workshop of Andrea Bregno. The latest, perhaps, in which his direct influence may be traced, is the Savelli grave in Aracœli, which cannot be dated before 1495, when Bregno was already a man of seventy-five. In design it is practically a remodelling of the Lebretto grave in the same church, with a lunette superadded above the architrave. The saints below the pilasters have their prototypes in those of the tabernacles of Sta. Maria del Popolo. The sarcophagus is a copy, vastly inferior in workmanship and delicacy to that of the Riario grave in the SS. Apostoli, which I have given my reasons for attributing rather to Mino da Fiesole's inventive genius than to Andrea. The Madonna and Child of the lunette belong to the type produced by Luigi Capponi of Milan, who, it would seem, succeeded to the direction of the great workshop.

From an inspection of the various monuments to which I have referred it is possible to derive some idea of Bregno's manner. His recumbent figures are finely executed, suggesting able portraiture, without the strength and delicacy of Mino's. He created the types of saints, in the subordinate parts of these Roman monuments, which were reproduced by numbers of contemporaries and successors, whose work it is not easy to differentiate from his own. They display much skill and facility without strong individuality of style or the impression of a dominant personality. They remind us rather of the art of the ivory carver, complete within its limitations. Above all, Bregno was a master of ornament, and if he lacks great originality he taught many others the rules and methods of a charming art of surface decoration.

The great activity which the nepotism of Sixtus IV. provided for the sculptor's bottega, which produced the monuments of the Riarios, the delle Roveres, and the Bassi, was continued through the pontificate of Innocent VIII., to which belong a whole series of kindred pieces. In this and the following reign, moreover, a French prelate, Guillaume de Périer, who became very wealthy as auditor of the Rota, erected a whole series of altar-pieces which bear the stamp of the same workshop. From the mass of craftsmen who must have been employed it is difficult to disengage distinct personalities. But I am inclined to think that students of the work of Cristofero Romano, the son of Isaiah of Pisa, in the Certosa at Pavia, will see in details of not a few of the Roman monuments evidence of a similar hand, and it is legitimate to assume that before going north, in or about 1491, he was one of the numerous band of assistants of Bregno. The name of Jacopo di Andrea of Florence is also preserved to us in a record as the author of the beautiful tomb of Marc Antonio Albertoni in Sta. Maria del Popolo. This is one of the first instances of a somewhat different type of smaller monument which came into use towards the end of the fifteenth century (1489), and it seems probable that this Jacopo of Florence was, as his appellation suggests, a pupil of Andrea Bregno.

There is, however, an artist of considerable merit and achievement whom we are able to identify, thanks to the preservation of two contracts, and with a brief notice of his work I will conclude. The restoration of Luigi Capponi to his place in the history of art was first due to the critical investigations of Conti Gnoli. But I do not think the full catalogue of his work in Rome has yet been compiled.

The first of these documents is a contract of the year 1485, made with Luigi Capponi of Milan and Giacomo di Domenico della Pietra, for a marble tomb to be made for Brusati, Archbishop of Nicosia, nephew of Cardinal Roverella, by the side of whose tomb it stands in San Clemente. It was to be completed in four months at a cost of 60 ducats. It resembles the monument of Cristofero delle Rovere on a smaller scale. Certain characteristics of the ornamentation, such as the candelabra of the pilasters, the tazzas, and the little flaming lamps, the strings of beads festooned or dependent should be noted. These are a sort of hall mark of Capponi. The drapery is academic, the folds are deeply and straightly chiselled, and there is a geometrical correspondence of angles in the sleeves. The second document which has come to light is a contract between a certain Michele Buttaroni and Master Luigi, this time alone, for a marble Crucifixion to be made for the church of Sta. Maria delle Grazie. The relief to be enclosed in a frame for an altar. The Crucifixion has now been moved to a ward in the hospital of the Consolazione behind the church, and is therefore difficult of access; the frame is still in the sacristy. The reliefs on the pilasters are almost identical with those of the Brusati tomb. Over the pediment are the arms of Innocent VIII. In this contract no mention is made of Giacomo di Domenico, who we may assume was only the marble mason. The figure on the cross in the relief is rather inanimate; on the other hand, the figures of the Virgin and St. John on either side are full of expression; the sense of grief in the faces is powerfully rendered, and all the workmanship is good down to the minutest details, the hands especially being rendered with delicate care in execution. The St. John is tolerably well represented, though much less fine in execution, in another relief representing Pope Leo I. kneeling in adoration before the Evangelist, and which may be seen in the baptistery of St. John Lateran. The figure of the St. John is here turned to the left instead of to the right, as in the Crucifixion, but the whole manner of treating the drapery, and the characteristic corded long hair flowing down over the neck, leave no doubt as to the identity of authorship. You should also notice the flaming lamp suspended from a nail, holding up festooned garlands, for this also we shall find elsewhere. Now observe the kneeling pope, whose name is inscribed near the feet. The drapery here is treated in quite a different fashion, is undulatory, and natural rather than academic. Characteristic is the facial angle, and the great length from the point of the nose to the chin. Having these points in mind, we go to the church of San Gregorio, and find in a chapel of the transept an altar with a marble front divided into three compartments, illustrating the miracles of St. Gregory. In the compartment on the left, Pope Leo of the Lateran reappears as St. Gregory, and we find throughout all the profile faces of the three reliefs the same curious facial angle and disproportion between the upper and lower portions of the face. The St. Sebastian of this compartment and the San Rocco of the corresponding are very near relations of the St. John of the Lateran relief. There are several other points of analogy, notably the strings of beads which appear on the pilasters attached to the flaming lamps like those of the Lateran relief and the Brusati tomb. They reappear in festoons on the architrave. Under one of the pilasters are the initials M.B. inserted in a kind of cabalistic emblem, under another a wheel with rays, and under a third the Florentine lily.

An explanation of these emblems is afforded by a monument now in the courtyard in front of the church, to which it was removed from the chapel when the church was redecorated. This monument reproduces nearly all the characteristic features of Capponi's work which have been noticed. In it we find again the Florentine lily, the eight-rayed wheel, the armorial bearings of the Bonsi family, and the inscription tells us how Michele Bonsi initiated the idea of erecting the monument in his lifetime, and his brother Antonio, though the elder of the two, afterwards joined in the scheme. From the archives of the Bonsi family in Florence we learn that they erected a chapel in San Gregorio in 1470. Antonio was sent as orator of the republic to Rome in 1498. He was apparently a merchant of brocades, as large purchases of materials from Antonio Bonsi & Co. figure in the coronation accounts of Pius III. Michele had been established already earlier as a banker and agent in Rome. In this monument the recumbent figure is replaced by two portrait busts, inserted in circular niches. It appears to be the first example in Rome of a manner frequently adopted afterwards, which Luigi Capponi no doubt introduced from Lombardy, where we are familiar with it in the Certosa of Pavia and elsewhere. It is repeated in the tomb of the brothers Antonio and Pietro Pollaiuolo, in San Pietro in Vinculi, which I also attribute to Capponi, as, I think, we may also do the monument of Andrea Bregno.

Having fixed certain mannerisms of style, and certain specific characteristics of Capponi's treatment of decorative work peculiar to himself, wherever we find these repeated in other examples during the last twenty years or so of the fifteenth century we may safely assign them to his workshop. Thus there are several ciboria, or tabernacles for holy oil, which may be catalogued under his name. One of these is in the hospital, close to his remarkable relief of the Crucifixion. The most interesting and elaborate of them is in the church of the Quattro Coronati. All his own peculiar paraphernalia of ornament are found here: the hanging lamps, the cornucopia of the Bonsi tomb, the candelabra and the strings of beads. The angels resemble those of the tomb, and the chiselling of the wings shows the identity of workmanship in both. A Virgin and Child over the door of the hospital of the Consolazione, where there is so much of his work, resembles that of the Bonsi tomb so closely that it must also be assigned to him, and from these two Madonnas we are able to identify others in other monuments of Rome, of which, however, it would be unprofitable to trouble you with a list. There is, however, one important attribution which I have been enabled to make, and which is, I believe, entirely new. In the crypt of St. Peter's are many fragments of a tabernacle made in the reign of Innocent VIII. to contain the relic of the Holy Lance. The three sides represent doors guarded by angels. The figure of the Saviour over the central doors reveals the same hand as the crucified figure in the hospital relief, and the angels, though executed by different marble cutters, are all designed by the artist of the ciborium.

In the brief time available it has only been possible to deal with a small proportion of the great quantity of sculpture produced in Rome during the second half of the fifteenth century. If it was not all of the highest quality, it has at any rate the interest of remarkable decorative workmanship, and includes a great number of first-rate portraits. With the close of the century the sense of restraint gave way to extravagance and over-elaboration, and the devotional and reverential quality disappeared. I should like, in conclusion, to show you one last example, which has a particular interest for Englishmen, because it is the monument of Cardinal Bainbridge, Archbishop of York: a most truculent and quarrelsome prelate, whose ungovernable temper brought him to an untimely end, being poisoned by a servant he had castigated. An unknown artist has, however, made his effigy immortal in the little church of the English college, where he lies an embodiment of saintly repose.

### HOUSE AT KILMAURS, N.B.

THE house was designed by Mr. JAS. B. FULTON, A.R.I.B.A., to meet special requirements. The walls are brick with rough-cast and red stone dressings. The tiles are Messrs. S. & E. COLLIER'S, LTD., Reading. The builder is Mr. HUGH JOHNSTON, Irvine.

### TWO DRAWINGS BY MR. G. E. KRUGER.

THESE two pencil-portrait studies or sketches by Mr. GEORGE E. KRUGER were exhibited last year at the New Gallery.

### OXFORD COLLEGE SERIES, ALL SOULS.—CHAPEL—LIBRARY.

WE this week continue our series of views of All Souls College, which we shall complete next week.

A SOUTHERN district meeting of the Institution of Municipal Engineers will be held at the committee room, Royal Pavilion, Brighton, to-morrow, the 18th inst. The following papers will be presented for discussion:—"Some Aspects of the Housing and Town Planning Act, 1909," by Mr. T. C. Barralet, surveyor to the Godstone R.D.C. (member), and "Notes on the Use of Concrete," by Mr. Spencer Sills, assistant city surveyor, Rochester (member). The adjournment for lunch will take place at 1.30, and after lunch specially conducted visits will be paid to the Corporation destructor works and the Falmer waterworks, by permission of Mr. H. Tillstone, the borough surveyor, and Mr. J. Johnston, M.Inst.C.E., the borough waterworks engineer.

## ZINC OXIDE.*

(*Concluded from last week.*)

THE following discussion took place after the reading of Mr. Gaston Depièrres's paper on the above subject before the Paint and Varnish Society on May 12 (Mr. Cruickshank Smith in the chair), a report of which appeared in *The Architect* on May 28 and June 3 and 10:—

The Chairman: There is probably no pigment at the present time which is engaging more attention not only in the paint trade but also among the general public than oxide of zinc. The public are, I take it, becoming gradually educated or trained to look on white lead as a material which, whatever its good properties may be, undoubtedly possesses some disadvantages, and the tendency to use substitutes for white lead has recently been growing very fast. I am quite certain that, having heard the practical and suggestive paper which Mr. Depièrres has delivered to-night, we all appreciate that our knowledge of the fundamental technology of oxide of zinc has been increased to some extent, and it now remains for us to endeavour to carry to some practical conclusion the interesting information he has given us, and to endeavour by means of our discussion here to-night to elucidate some of the difficulties and problems which confront this subject. Perhaps it might simplify matters if we were to consider Mr. Depièrres's paper in two parts. He gave us first of all a very practical and apparently up-to-date description of the metallurgy of the manufacture of oxide of zinc. I have no doubt there are some gentlemen here to-night who can discuss this part from a practical standpoint. To many of us, however, the more interesting portion of the lecture was that devoted to a discussion of the uses of oxide of zinc, and I think the noteworthy points that Mr. Depièrres made were his evident preference for oxide of zinc manufactured by the "direct" process as against oxide of zinc made by the older, or "indirect," process, and his reasons for this preference. That Mr. Depièrres, who has studied this matter very thoroughly, and who has the advantage of possessing practical knowledge as a paint manufacturer of oxide of zinc paints in all their forms, can express an opinion so unreservedly, appears to me to indicate a very important epoch in the history of oxide of zinc, because, some years ago, when oxide of zinc came to be largely used by paint manufacturers, one can remember very well that the direct oxide of zinc of that time was looked upon as rather an unsatisfactory substitute for the material made by the indirect process. Mr. Depièrres now states, however, that direct oxide of zinc not only equals the indirect oxide, but, in many points, surpasses it in value as a paint material.

There are one or two points which I should like to ask Mr. Depièrres. With regard to the covering power tests, may I ask Mr. Depièrres to explain to us in what manner these tests were conducted. Can he tell us if the same weight of pigment has been applied on equal areas in the different tests, or has he simply shown us results of different paints after they have been mixed for use? The difference is rather important.

I do not know whether anyone who will speak later on will discuss the question of the combination of oxide of zinc with linseed oil. This is a point which is exceedingly interesting, and the opinion which Mr. Depièrres quoted as to the combination of oxide of zinc with linseed oil at ordinary temperatures is to many people somewhat startling. That it can be alleged as a fact capable of experimental proof that oxide of zinc actually combines with linseed oil in the cold is a matter which one would like to hear more about.

The question of the specific gravity of different grades of oxide of zinc is an interesting one, as also is the relation between the specific gravity of different grades of oxide of zinc and the oil absorbed in the grinding of the oxides into paint. I do not know whether Mr. Depièrres can give us any figures which will indicate the variation of specific gravity in different receptacles of the depositing chambers of an oxide of zinc plant. Can he tell us the specific gravity from the highest to the lowest grade, and the proportion of oil that the various grades will absorb in grinding?

With regard to the latter part of the paper, in which the lecturer dealt with the probable formation of oxychlorides in the presence of salt water, that appears to be a somewhat abstruse chemical point on which someone might be able to give us further information. Might I suggest that a complex chemical action such as this taking place in a paint film might conceivably cause strains and stresses in the film which might result in fissuring owing to the change in volume of the products of the reaction?

Mr. Depièrres made a passing reference in his paper to grey zinc. I am anxious to know whether that material is likely to be employed in this country to any extent. On the Continent it is held in high repute. It appears to me that grey zinc may have certain good points. As to the presence of lead salts (which I take to mean basic sulphate of lead) in oxide of zinc Mr. Depièrres pointed out that up to a certain limit no poisonous properties were communicated to oxide of zinc, but that after this limit has been passed the pigment may be poisonous. I certainly think a limit must be stated, and that the lead salts should not exceed this limit.

Mr. W. F. Reid: It is rather difficult to discuss fully this paper, because it covers the whole ground, and there is little room for anything to be added to it. I have had some personal experience in the production of zinc oxides, and have used a very large quantity of zinc white. With regard to the direct process as shown on several of the diagrams, that is the American process. I do not think that that particular plant is used in Europe, at least not to my knowledge. The ore which Americans use, as has been very clearly stated by Mr. Depièrres, is Franklinite, and it has a great advantage, because it has no volatile impurities. Americans have an ore which is composed of zinc and oxide of iron with manganese, and the residue from this production of zinc white by the direct process is used straight away in the blast furnaces for the production of spiegeleisen. I do not know of any ore in Europe which can be used in the same way. No smelter that I know of will take the residue from the distillation of zinc ores from any district. Americans have a great advantage over us, and that naturally reduces the price of the zinc oxide they can send us, and makes it very difficult for us to compete with them. In Europe the ores are contaminated with a considerable quantity of volatile impurities, and naturally the most injurious of these from the zinc oxide maker's point of view is lead. It is not impossible to get rid of this lead. You cannot take ore direct and distil over the oxides without distilling over the lead and both the oxides condense together in the chambers. You can deal with the mixture in two ways; you can either re-distil it with pure fuel (and I would remark that lead as an impurity in this zinc oxide is not present in the form of sulphate, but in the form of oxide), or you can dissolve the mixed oxides in sulphuric acid and precipitate the zinc in the form of white oxide, or crystallise the sulphate and get pure zinc crystals. With regard to what Mr. Depièrres calls the indirect process, it depends upon which way you look at it. If you start with the production of the oxide, really the direct process is the burning of the metal into the oxide, but if you start with the ore, then, of course, it is the indirect process. The method of collecting this oxide is a matter which affects the user of the oxide very much indeed. The fume chambers with bags, which they have in America, are not in such extensive use in Europe. The reason for the bags is a very obvious one, it is to filter out all the oxide that can be retained. You can do a great deal by proper arrangement with precipitating chambers. One point I think has not been fully worked out by manufacturers working the indirect process, that is, they always use anthracite where they can get it. From experiments I have made myself I find water gas can be employed to produce a better article than you can get with anthracite, it being quite free from ash. With regard to precipitation, I agree with Mr. Depièrres. I have never yet found zinc oxide made by any precipitation process that has anything like the covering power of the distilled oxide. Zinc oxide fixes from 8 to 10 per cent. of ammonia, and, therefore, the loss of ammonia is considerable. With regard to the electrolytic process in connection with carbonate of lime, I cannot follow this, and do not see how it could work so far as the production of zinc white is concerned. Mr. Depièrres asked most of the paint manufacturers here whether they would not prefer an absolute white pigment if they could get it. No doubt they would, but it adds considerably to the cost. On the other hand, I think, when the processes are more fully developed by the production of zinc white in this way, we shall get practically a snow-white oxide in most cases. With regard to the percentage of lead, I do not think it is from a sanitary point of view that it is objected to. I think it is because lead after a time darkens, and darkens more in proportion when in combination with zinc oxide, at least that is my experience. I think when there is a small percentage of lead oxide in the zinc white that the darkening is more in proportion to the percentage of lead than it would be under other circumstances; therefore, I think the objection to the percentage of lead in many specifications is not only due to the sanitary idea but also to the effect of darkening, and you will also find in many cases that this darkening is increased owing to the percentage of lead in the driers put into the oil. There is certainly a little bit of red tape and a great deal of conservatism in some of the specifications of the Government and some public bodies. I can see no reason why the one process should differ from the other. Both are based on exactly the same principle. Great care is required in the second part of the direct process; the point is to burn off at a certain rate the fumes that are evolved. With regard to the treatment of those ores in the furnaces, I did not know there were supposed to be so many secrets about it, but the fact is the process of the reduction of the ores and the distillation of the zinc depends on local conditions. For instance, in Upper Silesia, where coke can be had for 6*s.* per ton, that fuel is naturally used.

Dr. BLACKLER said: Everyone will agree with me that Mr. Depièrres has given us to-night a most interesting lecture, and has elucidated many points of numerous interest; and from what has been said by the lecturer, we are given to understand that a small percentage of lead salts, say 2 to 4 per cent., is not an impurity calculated to reduce the value of zinc oxide when considered as a paint pigment; and Mr. Depièrres has given us most convincing proofs that, on the contrary, this small percentage of lead salts brings about a molecular disposition highly beneficial to the physical state and pigmentary value of this zinc oxide. I quite agree with him in this respect, and my experience as a paint manufacturer and chemist enables me to endorse in full what Mr. Depièrres has said with reference to this much disputed point. The best zinc pigments I have ever handled, as far as body, covering power, and resistance to atmospheric influences are concerned, have been zinc oxides containing a small percentage of Pb, which Mr. Depièrres describes as "Direct Zinc Oxides." I know that the colour of this lead zinc oxide is not quite as good as those manufactured from the metal, but this small disadvantage is more than made up by the qualities which lead zinc possesses; and I feel confident that when all the ridiculous clauses now inserted in many specifications have been altered, we shall find in direct zinc containing from 2 to 4 per cent. of lead salts the most perfect substitute for white lead. Mr. Depièrres has proved to us to-night that he has accumulated much knowledge, and possesses a valuable experience of the subject under discussion; and I am sure that paint manufacturers and those who buy ZnO will be much interested if he will kindly tell us which are the impurities found in ZnO which are injurious to paint and should be guarded against. I am sure his opinion on this most important point will be much appreciated by many manufacturers who buy ZnO largely, and still have much to learn on the subject.

Mr. JENNINGS said: I would just like to say on behalf of painters that they would certainly welcome a pigment in place of white lead for various reasons. Firstly, because of the rate of insurance now owing to the new Act, which is 5*s.* per cent. higher for painters than it is for any other branch of the building trade; and this I am informed is because white lead is used by painters and not by ordinary builders. This is the first point which seems to be of importance. Then, again, the question of poisoning, which is of vast importance. It appears that pretty well every European country has recognised the fault, and has endeavoured to deal with it, but England has left it severely alone except with regard to pottery. It is hoped something will be done before long in that respect. I read to-day for the first time, with a great deal of interest, the text of a Bill which has been introduced in the House of Representatives in the State of Missouri, in which they propose to do all manner of things, and among other things they intend making them put a picture of the skull and crossbones on every package they sell. There are other very excellent provisions in that Bill which may be very well carried into effect. I would like to ask Mr. Depièrres whether, in his reply, he will be able to say something about that which is alleged against zinc oxide, particularly as to its being hard and having a tendency to chip. This is a point which is very interesting. It is not advisable to use zinc oxide by itself as a paint, but it should be mixed with one-third white lead. The durability of the material, I presume, we cannot touch upon to-night, but hope to at some future time. Personally, I think that zinc has a great future before it in this country, but many painters condemn it either because they have never tried it, or because they have tried it many years ago and have used it under unfavourable conditions and mixed it in an improper way.

Mr. MCINTOSH said: Mr. Depièrres, in trying to prove the superiority of zinc oxide over white lead, appears to me to have proved too much, and after having severely condemned white lead and its poisonous nature, tells us that a good zinc oxide cannot be made without the assistance of the poisonous lead salts. Here again my theory that white lead is not, after all, such a bad pigment is proved by the lecturer, who himself admits that lead salt must be present to secure a good white zinc. I am sorry that Mr. Depièrres is not of the same opinion as I am on some of these points.

Mr. WILKINSON said: I should like to say that I approach this subject this evening rather prejudiced against the value of zinc oxide. That prejudice was formed some years ago when I tried zinc oxide, and had the material made up in accordance with the best instructions, but it turned out to be viscous, livery, difficult to manage and difficult to work, and the painter did not make a good job of it at all. I noticed in the course of a year or so that fissures were noticed on the surface which certainly would have spoilt the reputation of any master painter. In those days one could not possibly compare zinc oxide with white lead. I am led to understand, and I quite believe that very great improvements have been made now, and are still being made every day in the manufacture of white zinc, which tends to make it a more suitable pigment for paint making. I am not looking at white zinc at all from the humanitarian point of view, this being a subject on which most authorities appear to agree; and I should say from the very admirable lecture we have received this evening that it is very probable we have now arrived at a state of things where a better article can be produced, and I am convinced that it is incumbent to all paint users to take up the subject again, and personally I intend to go into the matter most seriously.

Mr. DAVIDSON said: Mr. Depièrres emphasises, and rightly, I think, that of the properties sought after in a pigment, chemical purity is of minor importance, whereas the possession of those physical characters which render it suitable for the production of protective and decorative coatings is of paramount importance. This fact ought not to be forgotten by those chemists who may have to examine and select such raw materials. Only those methods of testing should be selected which have a direct bearing upon the purpose for which the raw material is intended to be used. It is getting to be recognised more and more every day, in the paint and varnish trades, that there is a limit to the value of chemical analysis, and that the determination of physical constants is of greater importance. Mr. Depièrres does not give us much information about the testing of oxide of zinc, what tests he would recommend, and how they ought to be carried out. Such information would add to the completeness of his paper. One would be interested to hear, for example, what tests he would propose to apply in selecting a zinc oxide for enamel making; and would a sample which is suitable for grinding into a paint be equally suitable for making an enamel, or *vice versâ.* The combination of zinc oxide with linseed oil has been referred to. I see no reason to doubt the possibility of such a reaction taking place. In the "splitting" of fats by the autoclave process (for the preparation of glycerol and fatty acids) zinc oxide is sometimes used to accelerate the reaction, which takes place under conditions of high temperature and great pressure. While the conditions under which a zinc paint film may be exposed are very different, still the possibility exists of some interreaction between oxide of zinc and the oil or its products of oxidation. If such a reaction takes place, then the product of the reaction must be somewhat inelastic and brittle, judging by the hardness of zinc paint films.

Mr. DEPIERRES replied to the points raised in the discussion as follows: Our Chairman, Mr. Cruickshank Smith, has brought out all the salient points of my paper in a most excellent manner, and his criticism is an important one when one takes into consideration his very special knowledge on the subject of zinc oxide, he being the author of several works on this subject. The Chairman has asked me to explain how the covering power tests which I have made on the experimental board you have in front of you were carried out. The four materials were ground in exactly the same proportion of refined linseed oil, they were then mixed to a proper consistency with thinners composed of three parts boiled oil and one part of turpentine, three parts of pigment being used for one part of the thinners. They were applied carefully on the surface of the board, in each case the material being quite unknown to the man who carried out the test. To ascertain the spreading power of these various paints, I had three different tests made on wall surfaces of 25 square yards, the average spreading power being obtained by taking the average in each case, which I may say was practically the same in each case. The calculations gave the following results:—

One gallon of paint made with white lead covered 77.45 square yards; one gallon of paint made with the zinc manufactured in Holland covered 98.87 square yards; one gallon of paint made with the American zinc covered 99.10 square yards; one gallon of paint made with the Silesian of zinc covered 100.20 square yards. As you will see, the spreading power of the white zinc is practically the same, whereas that of the white lead falls a long way behind, and if one can establish some sort of calculation in which spreading power, obscuring power, durability and cost of the material are all taken into consideration, we find again here that the lead zinc easily demonstrates its superiority over all the others in every case, the white lead being a much more expensive pigment to use.

With regard to the combination of zinc oxide with linseed oil, what I have stated is not absolutely my own theory, but one expounded by a chemist of renown, who has made special studies on the subject. Personally, with the experiments I have made, I have been unable, up to now, to get 20 per cent. of zinc oxide to assimilate with linseed oil; the maximum amount I have obtained being 2½ per cent. Here is a bottle of oil containing this proportion.

With regard to the use of grey zinc, that is to say, the produce collected in the chamber "A," plan 1, which, as I have said, contains metallic zinc, zinc oxide pure and agglomerated, I am fully aware that it is held with some appreciation on the Continent, and has been recommended on account of its supposed anti-corrosive properties. I have made several experiments to ascertain whether this was the case, but up to the present I have been unable to arrive at a satisfactory conclusion, and I have not so far found that it possesses any good points in this direction.

With reference to lead salts contained in zinc oxide, Mr. Cruickshank Smith is perfectly correct in saying that it consists principally of basic sulphate of lead, and there is no doubt that the small proportion contained cannot be dangerous at all to health. I have visited factories where a large number of men are employed in the manufacture of lead zincs, and have been told that a case of lead poisoning had never occurred there; several men examined did not exhibit any sign of plumbism. Mr. Cruickshank Smith asked me what I considered should be the limit of lead salts in lead zinc which I recommended, and I will again say that I consider 2 to 4 per cent. is a limit that should not be exceeded.

Mr. Reid is quite correct in saying that the furnaces I have shown you are used in America in the Wetherell (?) process, but they are also used in Europe, and the plans you see here to-night have been taken from European factories. No doubt the manufacture of direct zinc originated in America, but I know a few factories in Europe who are now manufacturing by this method, and producing what might be almost called irreproachable products. With regard to the removing of the impurities contained in lead zinc, I know experiments have been made in that direction, and no doubt it would be possible to remove the traces of lead oxide, but it would be more difficult to remove the traces of basic sulphate of lead. In any case I do not think that this process can be a commercial success, as the expense would be too great for what I should term an illusory advantage. With regard to the darkening of zinc oxide containing lead salts, if the proportion of 2 to 4 per cent. is not exceeded and the greater portion of these lead salts are composed of basic sulphate of lead, I am quite sure this objection is of no importance, basic sulphate of lead being a very staple pigment. In conclusion I will say that I am most gratified to see that a gentleman possessing such a great knowledge and experience as Mr. Reid should agree with me that the chemical purity of zinc oxide is any indication of its value as a paint pigment.

It is most gratifying for me to find that a man like Dr. Blackler, possessing not only a perfect chemical knowledge but also having excellent technical and practical experience in paint making, should agree with me in the opinion I have expressed as to the undoubted value of lead zincs containing from 2 to 4 per cent. of lead salts. What he has said will strengthen my belief, and help, I hope, to eradicate many of the absurd prejudices now existing in many public bodies, and perhaps induce them to alter their antiquated and unreasonable specifications. Dr. Blackler has asked me to give you my opinion as to the best method of selecting a ZnO for use as a paint pigment. Gentlemen, this is a most difficult question, and one I quite expected a man like Dr. Blackler would ask. It is absolutely impossible to define the quality of a ZnO by estimating the amount of chemical impurities. But reverting to what I have already said, lead salts not exceeding 2 to 4 per cent. should not be considered as harmful impurities; in fact, on the contrary, it is beneficial. $ZnSO_4$ is no doubt a most undesirable impurity which has a very bad effect on the oil affecting the vitality of the paint film. The presence of $SO_2$ sulphuric dioxide and $SO_3$ trioxide is also injurious in ZnO, and especially when there are no salts of lead present, as you will quite understand that $SO_2$ and $SO_3$ is capable of combining with basic oxides, the first to form sulphites, the second to form sulphates; therefore, if lead is present you will have $PbSO_3$ and $PbSO_4$, two very staple pigments. But if you take ZnO free from lead the same thing does not happen, and the $SO_2$ and $SO_3$ combine with the zinc to form sulphate and sulphite of zinc, which are soluble and have a bad effect on the paint film—one more good point for lead zincs. But I will end by saying that the chemical test must always be made in connection with the practical test; and there again, as in many instances in our industry, the chemist and the practical man must go hand in hand, and each has work of equal importance to do.

Mr. Jennings has mentioned an interesting fact in connection with the insurance rate being 5*s.* per cent. higher for painters than for any other branch of the building trade, and I am quite sure that if the use of white lead was prohibited in England this difference would not exist. With regard to the supposed drawback of zinc paint becoming very hard and chippy, I think this has undoubtedly occurred in many cases, but in my opinion this is always due to the imperfect preparation of zinc paints. A properly prepared zinc paint will last longer, will not chip or chalk as quickly as white lead. This has been demonstrated in all the tests that have been made in Holland, Belgium, France, America and elsewhere.

I am astonished to see Mr. McIntosh, a man possessing such an excellent chemical knowledge, stating that after having condemned white lead I am obliged to go back to a poisonous substance to obtain a good zinc. I will only remark to Mr. McIntosh that often poisonous substances in small doses have their uses, and one or two grains of calomel may have a most beneficial result, whereas 20 grains would be absolutely disastrous. I think this simple illustration will prove to Mr. McIntosh that my theory is, after all, a good one.

Mr. Wilkinson has told us to-night that some years ago he had carefully tried zinc oxide, and found he could not possibly get satisfactory work from it. I know this has been the case with many master painters, but I am glad to see that he is again to-day ready to give this admirable pigment another chance, and I am sure that if his paint is properly prepared, and the zinc oxide he uses a good one, he will soon be convinced of the superior qualities of this pigment. I have purposely avoided to-night, in my paper, giving special information as to the mixing of zinc paint. Several books have recently been published dealing with this subject at some length, and our chairman, Mr. Cruickshank Smith, has himself published one quite recently, where some valuable information can be obtained on this subject.

Mr. Davidson's remarks have been most interesting, and with regard to the testing of zinc oxide, what I have said in answer to Dr. Blackler's remarks will also apply to Mr. Davidson.

Mr. Depièrres thanked everyone very much for the very kind reception he received, and was accorded a hearty vote of thanks for his paper.

## ELECTION OF LICENTIATES, R.I.B.A.

At the Council Meeting of June 6 the following candidates, having been found eligible and qualified under the Charter and By-laws, were elected Licentiates of the Institute in accordance with the provisions of By-law 12:—

ABERDOUR, James Gordon; ALLEN, George Pemberton; BAILEY, William Henry (Maritzburg); BARNARD, Leonard William (Cheltenham); BELSHER, Bernard James; BENNETT, John (Bolton); BETENSON, Frederic Roger, F.S.I.; BISSELL, George Ernest (Colchester); BOURNE, John Charles; BRIGGS, George Hamilton; BROOKS, Stanford Morton (Glasgow); CALLCOTT, Charles William; CHURCH, Arthur Harold; CLARK, Charles Richmond Rowland (Basingstoke); CLAY, George Felix Neville, B.A.Cantab; COLERIDGE, John Duke; COLVILLE, Hubert Leonard; COOK, Ellis Taylor (Rotherham); COX, Bernard Joseph Farrar; CREIGHTON, Henry Richard; DAVIDSON, William, *Owen Jones Student* 1904 (Edinbro'); DAVIES, Ivor Samuel (Bangor, N. Wales); DAVIS, George Walesly (Darlington); DEWES, Walter; DIGHT, Alfred Henry (Birmingham); DUFF, John (Rephad, Stranraer); FRY, Peter George (Weston-super-Mare); GEORGE, Allan; GILBERTSON, Alfred (Liverpool); GRIFFITH, Edward Henry Herbert (Ringwood); GUNSON, Ernest (Manchester); HARBER, William Francis; HAVERS, Albert Charles (Norwich);

HEATHCOTE, Charles Harold (Manchester); HEATHCOTE, Ernest Grigg (Manchester); HEWITT, Stanley Goodison (Liverpool); HOOK, John; KEMPSTER, Fred; LAING, Henry George Malcolm; LAWRENCE, Joseph Thomas; LUCAS, William Louis, B.A.Cantab; MARTIN, Robert (Manchester); McLACHLAN, Herbert Guthrie; NEWMAN, Charles James (Rugby); NORTON, Charles Harrold; PARTRIDGE, Sidney Herbert (Newton Abbot); PULLIN, Charles Henry; ROBERTSON, George Birrell, *President of the Institute of Architects of N.S.W.* (Sydney, N.S.W.); SCRIVENER, Harold Moore (Northampton); SHANN, Frank Halliwell; SHARPE, Thomas William; SHELMERDINE, Edmund John; SIDWELL, Henry Thomas (Rayleigh, Essex); SINCLAIR, Colin, M.A., F.S.A.Scot. (Glasgow); SKIPPER, Charles Frederick (Cambridge); SMITH, William Auger (Nottingham); TANNER, Douglas George (Eastbourne); TATCHELL, Sydney Joseph; TAYLOR, William (Aylesbury); TOOMBS, Edwin Ashley; TOWNSEND, Charles William; WATERWORTH, John Halsted; WEBB, William Herbert; WILLIAMSON, Walter (Bradford); WINDER, Thomas, Assoc.M.Inst.C.E. (Sheffield); WINDSOR, Frank; WIRE, Wilfred Travers.

## ARTESIAN WELLS IN THE CITY OF LONDON.

THE revised charges for water supply made by the Metropolitan Water Board are frequently so onerous on property in the City of London that many owners have been tempted to sink wells of their own, and a full inquiry on the subject has been made and an exhaustive report presented by the Medical Officer of Health to the Court of Common Council, from which we extract the following:—

The water supplied to the City of London by the Metropolitan Water Board is obtained from the following sources:—

(*a*) The New River District (formerly the New River Company), the sources of supply being from Chadwell Spring, the River Lea, and eighteen chalk wells. (*b*) The Eastern District (formerly the East London Water Company), the sources of supply being from the River Lea, the Thames at Sunbury, and chalk wells and springs.

The New River District embraces the whole of the City with the exception of a few supplies in the parishes of St. Botolph, Bishopsgate, and St. Botolph, Aldgate, which are in the Eastern District.

It will be seen that both districts are dependent for some part of their supply upon water derived either from the River Thames or the River Lea. Although every effort is made by the Water Board to ensure that the water supply under their control is free from impurity, the fact remains that no navigable stream, passing through thickly populated areas, should be used as a source of public water supply if other and better sources are available.

In making these observations no condemnation of the Water Board's methods is implied, but they bear upon the question under consideration.

Taking all the circumstances into consideration, I concur in the conclusions of the Royal Commission on Metropolitan Water Supply of 1892:—

"That the water as supplied to the consumer in London is of a very high standard of excellence and of purity, and that it is suitable in quality for all household purposes. We are well aware that a certain prejudice exists against the use of drinking-water derived from the Thames or the Lea, because these rivers are liable to pollution, however perfect the subsequent purification, either by natural or artificial means, may be; but having regard to the experience of London during the last thirty years, and to the evidence given to us on the subject, we do not believe that any danger exists of the spread of disease by the use of this water provided that there is adequate storage, and that the water is efficiently filtered before delivery to the consumers."

It is the qualification in the last sentence that influences me in preferring a water that is of unquestionable character at all times. Even admitting that the citizens have no reason to take exception to the quality of the water sold to them by the Metropolitan Water Board, there can be no question that they complain bitterly of the charges levied on them for an indispensable element. It is therefore not difficult to account for the great increase in the number of artesian wells sunk within the City during the last two years, it being most unlikely that property owners would fail to avail themselves of a water supply of the highest quality lying beneath their feet.

This method of obtaining a water supply in the City is by no means a novel one, since an artesian well, sunk at No. 20 Old Broad Street (formerly the site of the Excise Office), is described in the Transactions of the Institute of Civil Engineers, vol. 1, p. 155, published in 1836. (This well became subsequently contaminated with polluted surface water, and a new boring was made, in 1908, on the old site.) One well was also sunk in the City in each of the following years, viz., 1851, 1874, 1883, 1885, 1887, 1891, 1892, 1901, 1902, 1905, and 1907; two were sunk in 1903; and eleven each in 1908 and 1909. It will be seen that fourteen wells were sunk during the seventy-one years 1836-1907, the remaining twenty-two, or 61 per cent. of the whole number, being made in the years 1908 and 1909.

With regard to their purity, Dr. Teed reports that:—"The waters are highly pure so far as organic contamination is concerned, they are soft, but on the other hand they are somewhat saline. The total solids average 49 grains per gallon, whereas London water runs about 20 grains to the gallon. The London deep well waters contain fair amounts of bi-carbonate of soda and sodium sulphate, which I have known to be a source of considerable trouble to steam raisers."

"Lead and copper were absent in all cases."

Figures have been published in the Press claiming that, in consequence of the present high charges of the Water Board, great economy can be effected by sinking an artesian well and drawing water therefrom.

An example which may be quoted is that of a large West End hotel which was paying 900*l*. a year water rate. A well and pumping plant was installed at a cost of 800*l*., and the total cost of running this plant, including repairs, has been found to be 200*l*. a year. Thus a saving of about 700*l*. appears to have been effected by a capital expenditure of 800*l*. It is obvious, however, that if the yield of water proves later insufficient for the intended service the Water Board's supply will have to be laid on to the premises and the money sunk in the well written off as a loss. This leads to the consideration of the question of the fall of water level in the London basin, which is the geological formation upon which the City is situated.

Much difficulty has been experienced in getting reliable information in the City upon this point. While it is generally admitted that the water level is falling, the rate of fall does not appear to be uniform. This discrepancy would probably disappear if the normal rest level of the water in each case could be determined with accuracy.

In many wells the depth at which the water stood in the bores when completed can be obtained from the well sinkers, but except in those cases where a well shaft has been sunk before commencing the bore hole it is difficult to ascertain the water level at the present day. A disturbing factor it is impossible to eliminate, in making exact estimates, is the proximity of the wells to one another in the City, and the intermittent character of the pumping.

In the City alone there are thirty-six of these wells in use, all being supplied with water from the same source. Moreover, the Metropolitan Water Board largely tap the water supplies before it reaches the City, and there are now no less than forty-nine wells belonging to the Board drawing upon the water in the chalk. This depletion cannot be expected to continue indefinitely without seriously affecting the interests of well owners.

On this point the views of Mr. W. Whitaker, B.A., F.R.S., taken from the Memoirs of the Geological Survey of England and Wales in the first volume of the "Geology of London and part of the Thames Valley, 1898," p. 508, may be quoted:—

"In London and the neighbourhood the increased demand for water led to the increase in the number of wells and to the comparative exhaustion of the limited supply in the Tertiary sands. Many wells were therefore deepened to the chalk, and new wells were made to that foundation, and the large quantity of water taken from these wells, amounting to several million gallons a day, has lowered the underground water level in the chalk under London until it becomes questionable whether further well sinking in most parts is likely to be successful, though there are still overflowing wells in suburban spots."

Although, as I have pointed out, there are difficulties in measuring with exactitude the rate of fall in the water level, a fair approximation can be arrived at.

Messrs. Le Grand & Sutcliffe have kindly favoured me with figures relating to seventeen wells sunk in the Metropolis between the years 1883 and 1889. These show an average annual fall in water level of 3.18 feet.

Measurements have been made at a well belonging to the Corporation of London sunk to supply water to several "blocks" of artisans' dwellings in Stoney Lane, Houndsditch.

The late Colonel Haywood reporting on this well in 1893 gave the normal water level at 123 feet from the surface. From recent measurements made under the direction of the City engineer it is shown that the level has fallen on the average 3.37 feet per annum.

It will be seen from the foregoing that there is an element of speculation in investing money in well sinking in London. In the first place, owing to unforeseen circumstances, they may be costly investments, the City well at the artisans' dwellings referred to above costing no less than 5,610*l.*, while the cost of pumping alone costs 5½*d.* per 1,000 gallons. This is allowing for all contingencies except interest on capital outlay and depreciation of plant, &c. It must be pointed out, however, that this particular well was an exceptional case. Since it was commenced, twenty-three years ago, far less costly methods of construction have been generally adopted.

The practice of commencing the well with a shaft upwards of 200 feet deep, and lining the same throughout with impervious material to avoid dangerous leakage from contaminated surface water, and commencing the boring at the bottom of such shaft, is now rarely followed. The progress of the work on the City well was at times very slow, Colonel Haywood mentioning that 110 working days were occupied in passing through 5 feet 10 inches of conglomerated rock. Commenced in 1887, the well was not finished until 1891.

Further, when the work is completed, the supply of water yielded may be so scanty as not to be worth spending money on pumping, labour, and maintenance. This latter has actually been the case in at least two cases in the City, but I have no means of knowing how many other wells in the City have been abandoned for the same reason.

When the well at the Manchester Hotel, Aldersgate Street, was sunk in 1891 the water level was 133 feet from the pavement level. This distance was reported to be 172 feet on a Monday morning in May 1908, a drop of 39 feet in seventeen years, showing an average lowering of the water level of 2.3 feet per annum.

Again, at a well sunk at Salisbury House, London Wall, in 1901, the water level fell 19 feet in seven years, or 2.7 feet per annum.

In the course of the inquiry conducted by the Royal Commission on Metropolitan Water Supply, appointed in 1892, many experts gave evidence regarding the falling of the water level in the chalk beneath London. Thus, Professor W. B. Dawkins gave an illustration of a well that had fallen 18 inches a year for many years, and stated that beyond all doubt the water level was falling, but that the rate of falling was extremely irregular.

Mr. J. Francis (chief engineer to the New River Company) was of opinion that under London there was a fall of nearly 18 inches a year, and that he attributed the lowering of the water level under London to the increased pumping that had taken place under London itself. Mr. A. R. Binnie, chief engineer to the London County Council, said there had undoubtedly been a general fall in the water level in the chalk under London of about one foot per annum. It does not fall regularly, and there may have been rises at intermediate periods owing to wet weather. Further, that the quantity of available water in the immediate neighbourhood of the basin of the London chalk was becoming exhausted.

This last view is not quite so disquieting as it appears. This falling of a water level does not necessarily lead to the immediate abandonment of a well. The simple expedient of lowering the pump will give the well a new lease of life, and as many well-makers put the pump 100 feet below the water level, the well will last for some years at the present rate of fall of water level. Further, by deepening the bore a well may give an increased yield.

It hardly falls within my province to express any opinion as to the advisability or otherwise of attempting to secure an economical water supply in the City by means of artesian wells. As before stated, there must be an element of speculation in the matter, and the only persons qualified to answer the question authoritatively are geologists and hydraulic engineers who have made a special study of the subject.

When it comes to the question of the quality of the water obtained from this source of supply there can be no doubt that it is of unquestionable wholesomeness, and that from the fact of its being very "soft," it is better suited for domestic and manufacturing purposes than that delivered by the Metropolitan Water Board.

In this connection I may fittingly conclude by quoting from the Report of the Rivers Pollution Commission previously referred to:—

"Of the different varieties of potable water the best for dietetic purposes are spring and deep well waters. They contain the smallest amount of organic matter, and are almost always bright, sparkling, palatable, and wholesome, whilst their uniformity of temperature throughout the year renders them cool and refreshing in summer, and prevents them from freezing readily in winter.

"Such waters are of inestimable value to communities, and their conservation and utilisation are worthy of the greatest efforts of those who have the public health under their charge."

## ACTION FOR NEGLIGENCE AGAINST AN ARCHITECT.

In the Court of Appeal on Wednesday, June 8, Lords Justices Vaughan Williams, Fletcher Moulton, and Buckley had before them an appeal by the plaintiffs in the case of the Guardians of the Poor for the parish of Leicester against Trollope, from an order of Mr. Justice Bucknill. There was also a cross-notice by the defendant.

By their action the Guardians sued Mr. John E. Trollope, the sole surviving partner of Messrs. Giles, Gough & Trollope, architects, of 28 Craven Street, Strand, for damages in respect of alleged negligence on the part of the defendant as architect to the plaintiffs, and for alleged breach of agreement to carry out certain work at Evington, in the county of Leicester. The plaintiffs appealed from an order of Mr. Justice Bucknill, whereby his Lordship directed that the action should be referred to an Official Referee, and refused to order that the question of the alleged liability of the defendant should be heard first and all other questions reserved.

Mr. Trollope cross-appealed, asking that, in the event of the plaintiffs' appeal succeeding, the venue should be changed from Leicester to London, on the ground that the matter had been much discussed in Leicester, both in the Press and on public platforms.

It appeared that in 1900 the Guardians contemplated the erection of infirmary, epileptic, and imbecile blocks and other buildings at Evington, and, in pursuance of that scheme, entered into a contract on November 20, 1900, with the firm of Messrs. Giles, Gough & Trollope for them to prepare plans, specifications, &c., for the work and to superintend the erection of the buildings, the firm to be paid 5 per cent. upon the total outlay. Tenders were invited, and that of Messrs. William Moss & Son, Ltd., of Loughborough, accepted. After the final certificate had been paid, the plaintiffs discovered that dry rot had set in, and they claimed against Mr. Trollope on a contention that the firm were liable for damages for not having properly superintended the work. The defendant entered a denial of this allegation, and counterclaimed on a plea that, if the Guardians established their claim to damages, he was entitled to a similar sum, the defendant complaining of the manner in which the duties of clerk of the works had been attended to. It was to this source that Mr. Trollope wished to trace the cause of complaint.

Mr. Hugo Young, K.C., was outlining the nature of the appeal on behalf of the plaintiffs when, upon a suggestion from the Bench, he and Mr. Pollock, K.C. (for the defendant), had a consultation.

Subsequently it was announced that an order had been agreed upon as follows:—

"By consent, the case to be tried before a Judge alone in London, the question of amount not to be tried in the first instance, but in such a way as the Judge might direct, the costs of the summons and of the appeal to be costs in the cause."

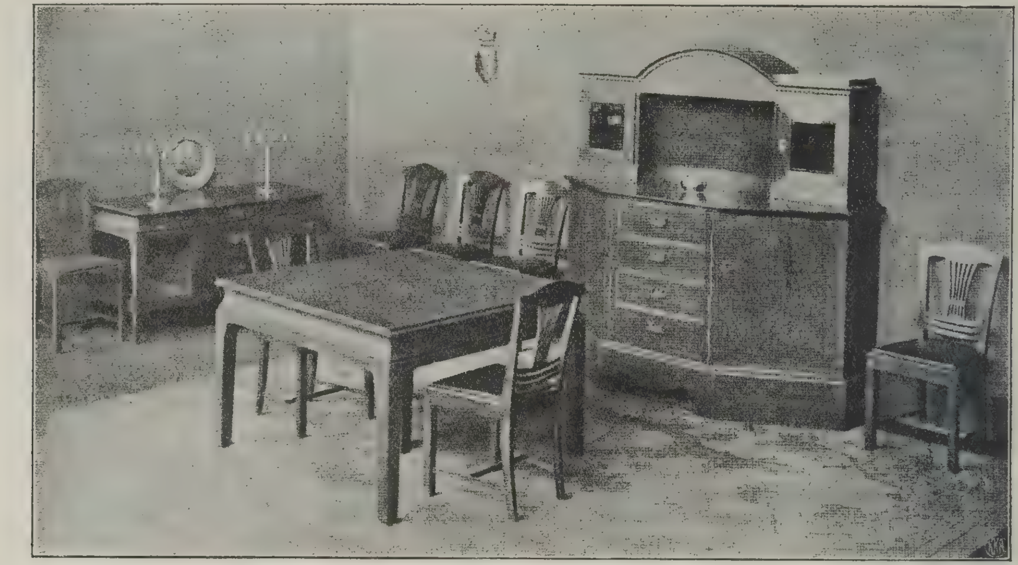
## THE ILLUMINATION OF INTERIORS.

### LECTURE I.—PRINCIPLES AND DAYLIGHT ILLUMINATION.

A lecture under the above title was given last Wednesday evening at the East London College (University of London) by Professor J. T. Morris, M.I.E.E., and some very interesting facts were brought out. In his opening the lecturer remarked that although so familiar in a general way there is probably no subject on which so many erroneous ideas exist as on illumination. For instance, if the average person was given a piece of print to examine first in an average lighted room and then in broad daylight, and asked to state how much brighter he considered the illumination in the second case was than in the first, it is probable that he would consider ten times as bright a very generous allowance. As a matter of fact, the number should be from 100 to 10,000 times. Similarly, the huge variations which take place in

## MODERN EUROPEAN ARCHITECTURE.

### NORWAY.



[From *Arkitektur og Dekorativ Kunst.*

DINING-ROOM FURNITURE.—Designed by Mr. H. Bull, Architect.

daylight are very little realised. As an example the lecturer showed a curve plotted from readings taken during the afternoon and evening of June 7 last, which would be considered an average bright day. When the sun was obscured for a short time the intensity of illumination fell off to one-third of its maximum value, while at 6.30 the light had only about $\frac{1}{200}$th of its value at 1.30. It may be mentioned that at this latter time the intensity was about 3,500 candle feet.

By 9 P.M. the light was not much more than $\frac{1}{20000}$th of the midday illumination. On the grounds being lighted up with arc lights the illumination rose to 0.1 candle feet, which can be compared with the figures already given. Turning to the question of the ratio of indoor to external illumination, some interesting figures were given, obtained both at the East London College and in several well known buildings by Mr. Waldram. The latter showed that the intensity of illumination inside to outside was:—

| | |
|---|---|
| In a new elementary school, desks ... | 0.0025 to 0.008 |
| Ordinary offices, average ... ... ... | 0.001 |
| House of Commons, Speaker's chair ... | 0.0009 |
| ,, ,, members' seats ... | 0.0003 to 0.0007 |
| Charing Cross station, booking-hall ... | 0.0001 to 0.0003 |

These ratios will, of course, depend on the ratio of area of windows to area of floor. The reasons for the eye being unable to judge these huge differences were then explained. It is partly owing to the contraction of the size of the pupil. The results of a number of experiments on this variation were given and illustrated by curves.

The photometer used throughout the tests was that devised by Mr. A. P. Trotter, and the principle of the working of this instrument was explained and demonstrated by the lecturer. The next two lectures of this series (which are free) will be on "Illumination by Gas and Electricity," by Professor J. T. Morris, and "Illumination by Petrol Air-Gas," by Professor C. A. M. Smith, B.Sc.

## THE RESTORATION AND RECENT DISCOVERIES AT THE GUILDHALL, LONDON.

(*Continued from last week.*)

IN the old views of the Guildhall which we have seen, the banners hanging from the walls were taken at the battle of Ramillies in 1706. There were sixty-three colours, and upon application by the Lord Mayor in November 1706, the Queen "was graciously pleased to declare she would bestow" them "to be hung up in the Guildhall of this city," and the Duke of Marlborough was invited to dinner. I have been unable to find the date of the removal of these banners, and all traces of them have, unfortunately, been lost. Although they were brought to the hall with much pomp and circumstance they have vanished—nobody knows when or where.

You are no doubt aware that the work of restoring the porch to the Guildhall is now well in hand. The original porch, known as "The Guildhall Gate," was erected in 1425, and was very different from what we understand as an ordinary porch, for it was the full width of the Guildhall yard, about 63 feet wide; it had two doorways in it, and was in part certainly three storeys high. The upper portion of the porch suffered considerably at the Great Fire of London, and was restored by Wren in 1669. He rebuilt the destroyed portions in a severely Classical manner, the central feature reminding one somewhat of Temple Bar. Below Wren's work there were six of the original statues erected in the fifteenth century; these were only removed when Dance's front was erected in 1789, and they are traceable down to 1846, when they were sold for 100*l*. to a Mr. Henry Bankes, M.P. for Corfe Castle. I have tried to ascertain if they are still in existence, but up to the present I have failed to get any information. These statues are often confused with those from the Guildhall chapel; these three are in the Guildhall Museum.

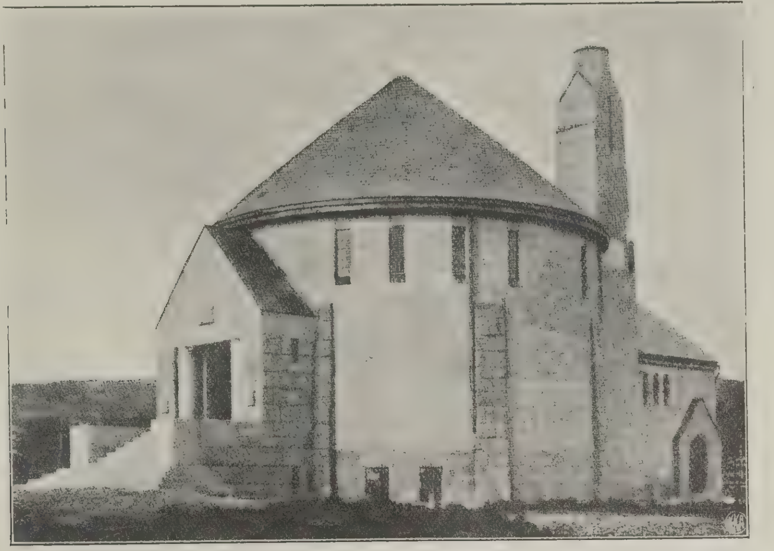
The small doorway gave access to steps that must have led down to the crypt entrance, which was about 7 feet 10½ inches below the level of the Guildhall yard at that date. I had an opening made to examine the foundations before commencing the present restoration, and was delighted to find one stone of the jamb of this original smaller entrance; this is about 2 feet 3 inches by 1 foot 8 inches by 12 inches, and is deposited in the crypt and labelled.

The original porch, with Wren's alterations, was pulled down in 1788, a fact which is ever to be regretted. Dance's porch was very nearly treated in the same way, and a modern porch erected by Sir Horace Jones, but let us be thankful that did not happen. He pulled a third of it down and died.

For a moment let us consider Dance's work. In the first place we must remember he was a very good architect; he was one of the first Royal Academicians, and Professor of Architecture at the Royal Academy; he was the architect for Newgate, a grandly designed prison, which unfortunately had to be pulled down a few years ago, as it was not suitable for modern requirements. Dance was trained on Classical lines and had studied in Italy; it is quite clear to anyone that he had no knowledge of Gothic architecture, and he attempted to build a Gothic porch. The result is of the greatest interest to students. In the first place I know of no other attempt on his part to carry out Gothic work. What did he do? To begin with he was very careful that his building should be similar to the old porch as far as the line and extent of frontage were concerned. Next he divided his building into three parts, the centre portion being higher than the two sides. This, again, as far as we can tell, was following the lines of the old building. His design was well-balanced and quaint in the extreme; it has an Eastern influence about it, and as we see it to-day it is a beautiful piece of colour. Horace Jones wanted to pull it down, and so did a few men recently,

## MODERN EUROPEAN ARCHITECTURE.

### NORWAY.



[From *Arkitektur og Dekorativ Kunst.*

CREMATORIUM IN THE OLD CEMETERY AT CHRISTIANIA.—Mr. Oscar Hoff, Architect.

when the question of dealing with this part of the Guildhall was discussed last autumn. To me it seemed it ought not to be criticised solely from an æsthetic point of view ; it is something more than a piece of architecture, it has the right to be considered as a landmark in the City ; it has been reproduced on menus, programmes, gold caskets, &c., which are to be found in all parts of the world ; it seems in a sense to be a trade-mark of the Corporation, and good architecture or bad architecture, it seemed to me a pity that the Corporation had allowed one wing to be pulled down for the purpose of exposing quite a modern casing to an old building. The architectural Press carefully considered the matter, Mr. Thackeray Turner, Mr. St. John Hope, and Mr. Ernest George, A.R.A., wrote most valuable letters in favour of the restoration and against further mutilation. These letters were laid before the Court of Common Council, and coming from such eminent men, they naturally had great influence upon the Court which decided in its wisdom that Dance's work was not to be destroyed, but that the missing portion should be restored. The work is well in hand, and should be finished this autumn.

The doorway to the room over the porch is part of the original structure, the brickwork, &c., around it has just been cleared away and the big splay exposed, the corbelling out has also just come to light. I traced the splay through the stone casing of the exterior of the hall, and the history of this part of the building is now clear. Originally the stairs were in the thickness of the wall, over them there was a big relieving arch ; the springer at the lower level is seen, this arch being carried right across the wall where the window now is. It is obvious there could have been no window there, such as we see to-day, and the line of the old wall is still distinctly seen at the top and at the bottom of the staircase, which was partly at the back of the fine entrance to the crypt. At a subsequent date the window was inserted, and the wall thickened, but this meant infringing so much on the width of the stairs that they would become useless. Consequently the outer wall or face of the crypt entrance was mutilated and partly removed, and the steps, as existing to-day, were forced more to the south. This window was seen from the Guildhall Yard, and if Horace Jones had in view the exposure of the window when he pulled down Dance's work, it is clear that he was bringing to light something very modern. The casing and old face at the back are now exposed, and I hope always will be.

Until last summer almost the entire wall surface of the Guildhall was covered with a preparation of cement about one-sixteenth of an inch thick. This had been painted and distempered, with the result that the sharpness of the mouldings had disappeared, and it was very difficult to distinguish between the original Gothic and the imitation work which has been carried out from time to time. I will be quite candid, and say that although as a casual observer I used often to enter the Guildhall previous to my appointment, with exception of the porch I never considered the building genuine ; but as soon as I studied it I found out my mistake and I had small portions carefully cleaned off right down to the stonework and these were inspected by members of the Corporation. This plaster and paint work is said to have been started in Wren's time, the object being to paint the new stone used in restoration work after the Fire, and also the stone blackened by the flames, so that the whole should have what was considered a pleasing and uniform appearance. When I first brought this matter forward I was asked if it was not a fact that portions of the stonework were damaged and greatly discoloured by the flames, and my reply was that as the Corporation apparently owned the only building in existence showing traces of the Great Fire of 1666, this was the very reason for showing the large number of visitors a sight unique in London. That view was adopted and as you are no doubt aware, the work was carried out last August. The result is very interesting. We can see clearly the line of the old walls raised upon by Wren, we see the clean stone of the modern windows at a glance, the wheat is separated from the chaff, a stone building is on view in place of one of plaster and paint, so that he who runs may read. One point may be of interest : it was handed down by tradition that the Fire was most fierce along the eastern end of the southern wall ; that tradition proved true, for that part of the old stone is blacker than any other portion of the Guildhall, and the contrast with the light grey of the west end of the north wall is very great.

Two years ago the crypt was in a still worse state, and it was fitted up with gas pendants, common T pieces hung from the vaulting ; these have all been removed, the gas-stoves are going, and the whole crypt has been lighted by electricity. I wanted to get a strong and well-diffused light, but I did not want to use pendants ; I particularly wanted the vaulting to appear as it was in the fifteenth century, and any line of pendants must have formed a perspective to detract from the line of the main ribs of the groins. Consequently, I had some simple shaded lights made in the form of a scoop ; one is fixed on the wall in each bay. There is ground glass below and looking glass at the back, the light is directed upwards and the crypt has the effect of being lighted by reflected rays, for there are no burners to catch the eye.

When Wren rebuilt the roof after the Great Fire he raised the walls as described by Richard Blome, who states :—

"The great hall being formerly in height up to the upright of the walls, not above 30 foot, which now are raised 20 foot higher on either side and at both ends, where there are fair windows, and eight large windows on either side, of 16 foot high each window, where there were none before, and over all the flat roof and platform leaded, with battlements abut it ; whereas before the roof did meet at the top as in common buildings."

This refers to the storey with circular-headed windows which we have seen, and which remained until the present roof was erected in 1865.

A report made to the Guildhall Improvement Committee in 1864 (with reference to the side corridors below the circular leaded lights, which light the hall on both sides), states:—"The original windows still exist intact, by which light was obtained through the lateral walls of the hall, beneath the level of a continuous cornice covering a wall-plate." These windows had been bricked up so as to provide convenient wall space upon which the portraits of twenty-two judges were hung, who settled disputes that arose in consequence of the destruction of property by the Great Fire. Their portraits were painted by Michael Wright; the price was settled by tender, 36*l.* being paid for each of them; the table used by the judges is still to be seen in the Guildhall Museum. These side windows were opened up in 1864, and all of them have been renewed; the end windows have been hacked and cemented over outside and pieced inside, consequently the only window now to be seen as it was when constructed in the fifteenth century is the newly discovered window, which I deal with later. Again, with the exception of a certain amount of stonework in the lower portions of the buttresses, and small portions of stonework in other parts, no portion of the exterior of the great hall dates from the fifteenth century, while most of it is quite modern.

(*To be continued.*)

## OUR CONTEMPORARIES FROM OVER-SEAS.

The *American Architect* (New York) has an interesting account of the American Academy in Rome, by William Walton, with views of the various houses in which the Academy has been successively located, the Villa dell' Aurora, the Villa Mirafiori, and the Villa Aurelia. Our contemporary's illustrations include the Institute of Musical Art, New York, by Mr. Dann Barber, a refined design based on Italian Renaissance, and several works by Mr. Valentine B. Lee, in and around Philadelphia.

*La Construction Moderne* (Paris) continues its illustrations of the Oceanographic Museum at Monaco. There is a scathing article on the vandalistic desecration of the Palace of the Popes at Avignon, by the display of vulgar advertisements.

*Arkitektur og Dekorativ Kunst* (Christiania) describes and illustrates the new church at Aalesund, recently completed from the designs of Mr. Sverre Knudsen, which were selected in competition.

*Der Architekt* (Vienna) is very new-arty this month, with a design for a private house in Buenos Aires, by Otto Schöntal and F. Perez-Sacre; a church at Bodenbach by Heinrich Ried, a "study" by Karl Ernstberger, of the Wagner school, and some smaller domestic work. As a relief two views are given of barock doorways at Linz.

*Engineering Record* (New York) contains an interesting account of a series of tests on the permeability of concrete, with and without the addition of various substances intended to give waterproofing qualities. These were made for the Commissioners of Sewerage of Louisville, Kentucky, under the general supervision of Mr. J. B. F. Breed, chief engineer, and Mr. Harrison P. Eddy, consulting engineer to the Louisville Commission.

## Correspondence

[*The Editor will not be responsible for the opinions expressed by Correspondents.*]

### Ashbins versus Ashpits.

Sir,—I should like the opinion of and a few questions answered by the readers of your valuable paper on the above subject.

Which do they consider the best system for removing house refuse under *practical* circumstances, and what has been their professional experience whether the present bin or the old covered ashpit is the most sanitary under *practical* circumstances?

What is included in refuse? Are ashes, kitchen waste, lawn-mown grass, and refuse and rubbish after general spring cleaning, including old crockery, pans, mugs, &c.?

Are the Urban District Council or Corporation compelled by Act of Parliament to clear all refuse, including the above items?

I am of opinion that local authorities or corporations should clear all rubbish, whatsoever it may be, free of extra charge.

What is the law on this?

How often are ashbins intended by law to be removed?

Ashbins undoubtedly are the most sanitary from the *theoretical* point of view if the bins are removed every morning.

But when they are removed only once a week or a fortnight in some districts the bin becomes too full and overflows, and the remaining refuse is allowed to accumulate in sundry corners of the yard, which is worse than no bin at all, and therefore the old covered ashpit would have been the best.

I have in my mind a district where the local authority refused to remove the garden refuse, &c. Burning it was the simplest and most sanitary, but it could not be done, as probably the individual would have been summoned for creating a smoke nuisance.

Now what is to be done in a case of this kind?

Property and householders are greatly handicapped by theoretical *sanitary* improvements, and it would greatly simplify matters if corporations and urban councils would supply each householder and tenant with proper printed instructions as to how they require the refuse to be divided, and how disposed of and how often the bins and refuse will be removed.

*Theoretically.*—I am in favour of bins.

*Practically.*—Undoubtedly give me the covered ashpit.

Cleanliness.

### The English Memorial to the Late King in Berlin.

Sir,—The English colony in the capital of Germania are proposing to place in the vestibule of the Rathaus a bust of his late Majesty King Edward VII. It will be from the hand of Professor Oscar Alexander Young, who has been *persona grata* in the Germanic artistic centre since the Drei Kaizer Jahr (circa 1888); he is, by the way, a grandson of Captain Robert Benjamin Young, H.M.S. *Entreprenante* (cutter), which was at the battle of Trafalgar.—Yours, &c.,

The Britannic Atelier, L. Davis, Lieut. R.N.
Kensal Green, W.: June 14, 1910.

## GENERAL.

The British Government has decided to build new legation houses at Mexico and Sofia, at a cost of between 22,000*l.* and 23,000*l.* each.

Mr. S. Segar, architect, has prepared plans for a new wing to the workhouse infirmary at Newton Abbot to accommodate 60 patients. The plans have been approved by the Guardians, and will be submitted to the Local Government Board.

A new museum is to be erected in Broad Street, Spalding, for the Spalding Gentlemen's Society, one of the oldest antiquarian societies in the kingdom. There will be a museum on the ground floor, and a spacious library on the first floor. The cost is estimated at 1,500*l.*

The number of visitors to the Horniman Museum at Forest Hill, London, S.E., last year totalled 207,304, an increase of 16,465 compared with the previous year. The London County Council have accepted an offer made by Mr. E. J. Horniman, son of the late founder, to provide a lecture hall and library, at a cost of about 4,500*l.* The hours of opening the museum have been re-arranged on the lines of the daylight saving system. On week-days between October and March, three hours of daylight have been substituted for three hours of artificial light; and during the other six months three hours of daylight take the place of one hour of (mainly) artificial light. The change has been appreciated by the public, as shown by increased attendances.

The Heriot-Watt College committee of George Heriot's Trust recommend the Trust cordially to co-operate with the College of Art, Edinburgh, in the institution of a diploma in architecture, and to institute day classes suitable for architectural students in mathematics, mechanics, descriptive geometry, geometric drawing, graphic statics, and mechanics of structures, the students to attend the evening classes in building construction and the allied subjects. It was explained to the committee that the teaching can be undertaken by the existing engineering staff, with the exception that it will involve the appointment of an additional assistant in the mechanical engineering department, with a knowledge of architectural engineering, to devote his time from 8 to 11 A.M. to the teaching of architectural students, and in the later hours of the day to assist generally under Professor Stanfield. The salary for this post was fixed at 150*l.*, and the clerk was directed to communicate with the Scotch Education Department for approval before making any appointment.

## FORTHCOMING EVENTS.

*Saturday, June* 25.

Royal Sanitary Institute : Provincial Sessional Meeting at Dublin. Second Day.

Edinburgh Architectural Association : Visit to Gullane.

*Wednesday, June* 29.

Rural District Councils' Association : Annual Meeting at Caxton Hall, Westminster, S.W.

*Tuesday, July* 5.

Royal Society of Antiquaries of Ireland : Summer Meeting at Douglas, Isle of Man. Closes July 8.

*Thursday, July* 7.

Society of Architects : Visit to Messrs. Ingham, Clark & Co.'s Works, West Ham.

## CITY OF EDINBURGH.

### NEW MARKETS AND SLAUGHTERHOUSES.

An important addition to the number of modern abattoirs and cattle markets in Great Britain has been made by the opening yesterday of new Markets and Slaughterhouses for the City of Edinburgh. For sixty years the Corporation of Edinburgh has had the monopoly of slaughterhouses under the provisions of the Edinburgh Slaughterhouses Act, 1850, but the slaughterhouses erected in consequence of this Act were not merely at a distance from the markets, but were in a crowded part of the city, and their removal has for many years past been recognised as essential to the improvement of the district and the adjoining area of the canal. The markets also were at a distance from a railway station, and had the further disadvantage of being scattered in different parts of the city.

It was obviously desirable to get a site upon which the cattle markets, the auction marts, the slaughterhouses, the corn market, and the allied trades, which are more or less dependent upon the frequenters of these, could be concentrated and situated conveniently near a railway station, on both railways, with access by tramways to the city. There was great difficulty in obtaining a site possessing these requisites, but at length, in 1901, certain lands at Gorgie were acquired by the Town Council as Governors of Trinity Hospital, and in the following year the Town Council resolved to feu these lands from the Governors of Trinity Hospital and to establish the markets and slaughterhouses upon a portion thereof, a site of about 25 acres in extent.

The scheme includes (1) the slaughterhouses, (2) the building of the St. Cuthbert's Co-operative Association, in connection with the butcher-meat or flesh department of their business, which is an extensive one; (3) the Corporation cattle market and accommodation connected with it; (4) ground reserved for future extension and for implement stands or miscellaneous purposes; (5) a restaurant, with access roads on the north and south sides, leading to the cattle market in the rear; (6) the corn market, with a wide roadway to the north, separating the markets from the auction marts; (7) the extensive buildings forming the auction marts of Messrs. John Swan & Sons, Ltd., and Messrs. Oliver & Son, Ltd.; and (8) ground reserved in the meantime, and roads connecting the Corporation markets with the private sidings and loading banks which are in course of formation on the east side of Chesser Avenue, connecting by private railway with the North British Railway at Gorgie.

The cost of the new buildings may be approximately stated as follows :—

| | £ | s. | d. |
|---|---|---|---|
| Cattle Market . . . . . . . | £30,000 | 0 | 0 |
| Corn Market . . . . . . . . | 12,000 | 0 | 0 |
| Slaughterhouses . . . . . . . | 50,000 | 0 | 0 |
| Restaurant . . . . . . . . | 7,500 | 0 | 0 |
| Chesser Avenue and Bridges . . . . | 7,000 | 0 | 0 |
| Railway Sidings . . . . . . . | 20,000 | 0 | 0 |
| Electric Tramway . . . . . . . | 12,000 | 0 | 0 |
| | £138,500 | 0 | 0 |

The buildings, so far as erected by the Corporation, have been carried out to plans prepared by Mr. James A. Williamson, A.R.I.B.A. The drainage arrangements in the feuing roads have been made by Mr. J. Walker Smith, the Burgh engineer; and the construction of the roads has been carried out by Mr. James Sim, City Road Surveyor.

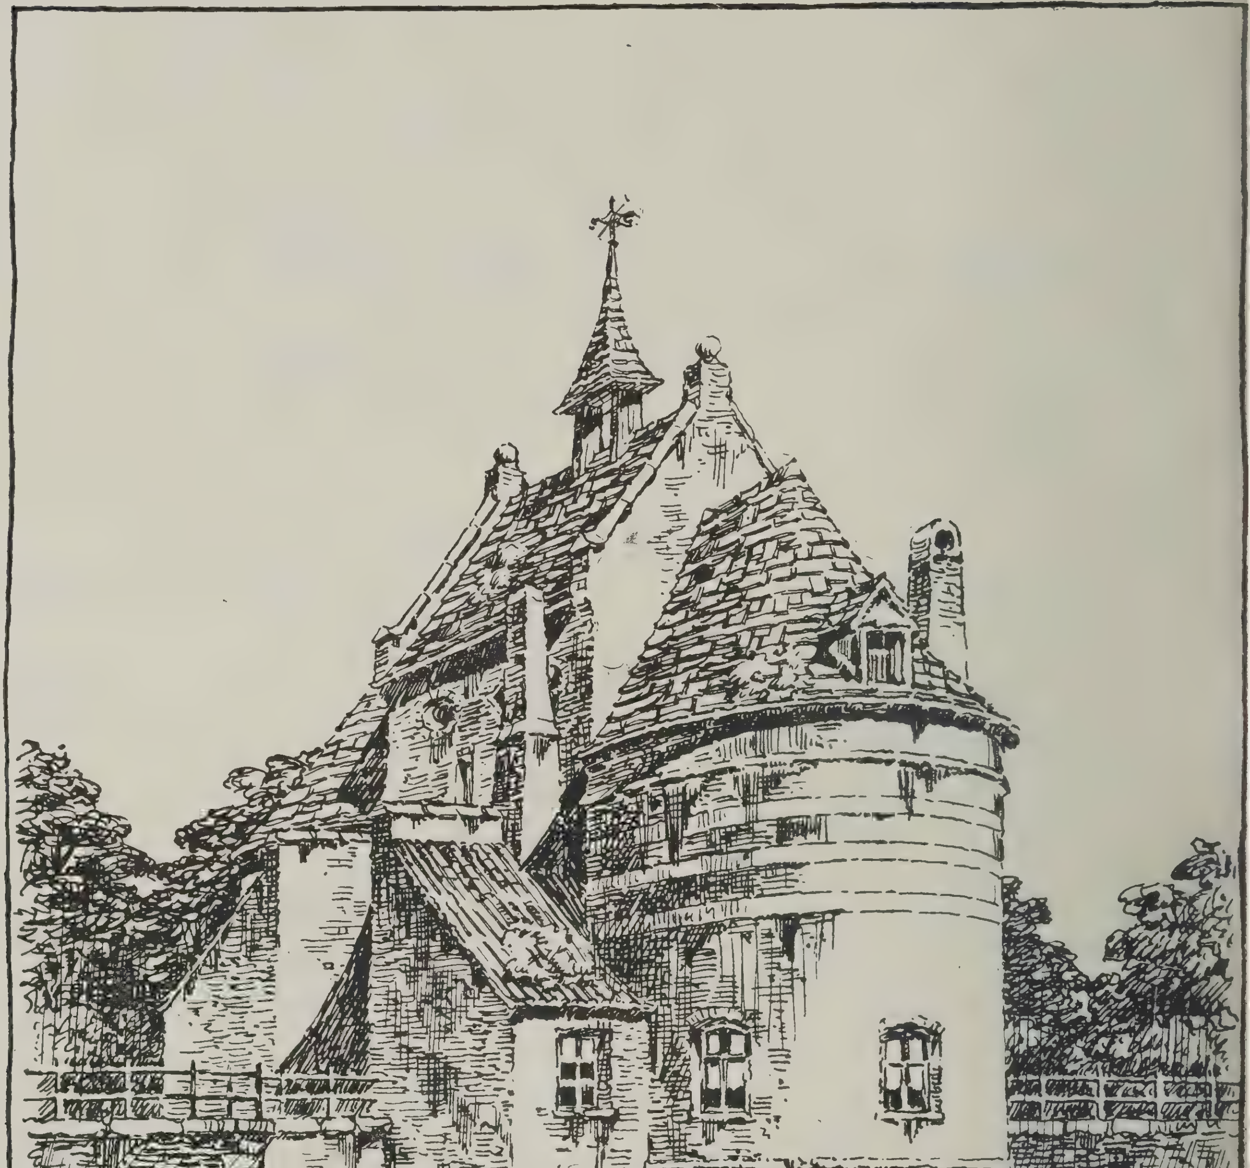
The slaughterhouses occupy the southmost of the various sites, and have along the south side the main line of the Caledonian Railway Company. In levelling the ground for the site it was formed at a higher level than the remainder of the areas by about nine feet, thus ensuring exposure to the fresh breezes from the west.

With a view to embodying the latest ideas in abattoir planning, the Corporation appointed a deputation to visit the Continent, and this deputation on its return presented a valuable and interesting report on the whole subject.

The buildings and appliances which are appropriate in Continental cities require considerable modification to meet local customs and circumstances. The new slaughterhouse buildings therefore, as now built, have been arranged and equipped to meet the views of the master butchers of Edinburgh, and it is believed they will efficiently meet the requirements of the trade. They have been constructed on clean and sanitary lines, with a thoroughly efficient system of drainage and water supplies, and are fitted up with the best type of machinery and appliances available. Ample ground has been reserved for future extensions, and the grounds have been laid out with grass plots, trees, and shrubbery by the City Gardener.

The constituent buildings comprise the following :—Entrance lodge, superintendent's lodge, lodges for gatekeepers, killing and cooling halls for large cattle, pig-slaughter hall, sheep-slaughter hall, tripery, dung house, fat searching house, boiler house, premises for condemned meat plant, &c., and premises for the treatment of blood, gut, and fearns.

In addition there are restaurants and recreation rooms for male and female workers, and there is at present in course of construction a block of buildings intended for



J. GREY WEST.
12·8·08.

AT BRUGES.—From a Sketch by Mr. J. GREY WEST.

the teaching of meat inspection to veterinary and other students, including lecture theatre, bacteriological laboratory, professors' retiring room, place for the detention of diseased carcases, and the dressing of fallen animals.

Private buildings have been erected by several hide, skin, and tallow companies and others.

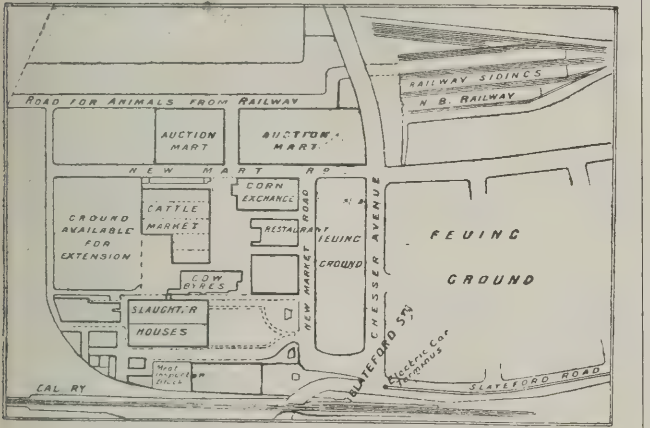
The whole of the buildings are built of brick of good facing quality, with dados on the exterior walls of salt-glazed bricks for cleanliness. All salient and re-entrant angles are formed of rounded or hollow bricks, or tiles, &c., right-angled junctions of walls and ceilings and floors being thus avoided. The roofs of the slaughter halls are of ferro-concrete. The large slaughter hall is a building 300 feet long by 80 feet wide, divided lengthwise to form slaughtering and cooling halls.

The slaughter hall is divided longitudinally into fifteen spaces of 20 feet each, thus giving room for two killers in each, or thirty in all. The spaces are separated from each other by ferro-concrete and tiled partitions about 7 feet high, and the level of the top of these partitions is carried round all the walls of the hall as a tiled dado.

The hall is lighted along its whole length by patent glazing, resting on louvred lanterns. Windows are also placed along both walls, those on the south side of the slaughter hall being clerestory lights, formed above the roof of cooling hall, the latter being at a lower elevation than the slaughter hall.

Corresponding in length, and in the rear of the slaughter hall, are the pennages for cattle and sheep. These are of iron, and are covered with steel roofing and heavy corrugated sheeting. The lighting is by patent glazing on upright louvred lanterns.

The cooling hall has the walls tiled the whole height, and is top-lighted on the north only. The hall is furnished with cubicles of vertical iron grilles nine feet in height, to contain the dressed carcases. These cubicles will be 10 feet by 15 feet, each having a self-locking sliding gate, and will be allocated to the master butchers as required.



Block Plan of Markets, &c., Edinburgh.

The pig slaughter hall consists of a sub-division into pennage for the animals, space for slaughtering (which will take place on a bench about 2 feet 6 inches above the floor level), and hanging. The carcase is lifted by means of an iron gate or grille on the bench, and discharged into one of the seven scalding tanks with which the building has been fitted; from thence, after plotting, the carcase will be drawn on to scuttling tables, and thereafter will be treated and dressed.

The roof of the slaughter hall is kept higher than the hanging space to permit of the steam and vapour escaping from the plotting tanks being carried off without penetrating the latter. The construction and lighting is similar to the large animals' hall. The centre part of the hall is furnished with overhead tracking.

The sheep slaughter hall is in most respects similar in construction to the former, there being the usual lairage for the animals, and the slaughtering and hanging hall. Both buildings are specially fitted up for hanging the carcases after slaughter.

The large killing hall is fitted up with an extensive system of overhead railways or tracking, which conveys the carcase after being dressed into the cooling cubicles and thence outside to the front of the cooling hall, where it is lowered by special lowering gear into the vans, lorries, &c. The overhead tracking couples up the other slaughter halls, and will ultimately be taken to cold storage and the meat-teaching block. The tracking is what is known as the twin-bar type, the carrying hooks being suspended to broad flanged carriers or trollies with ball bearings. There are fixed junction points, thus permitting the load to be conveyed to any part of the premises desired. The cost of this installation, including relative plant and machinery, is over 7,000*l*.

From the boiler house, which is fitted with a double-flued Lancashire steam boiler, hot water is generated and supplied to all the buildings. This plant will cost about 1,200*l*.

Where carcases are unloaded there are projecting verandahs, and in conveying carcases to the various parts of the premises the tracking and machinery is covered by glass verandahs.

The tripery is a large, well-lighted building, fitted with all the most modern appliances for the preparation of tripe, &c. It is arranged so that the material is received at one end, and after going through the various processes is turned out as a finished article at the further end and stored in water in large white enamelled storage tanks previous to delivery to the master butchers.

The new cattle market covers an area twice as large as the present market in Lauriston Place. This gives an area of about 4½ acres, but ground has been reserved by which other 3½ acres can be added as business increases.

The constituent buildings are:—(1) Markets and slaughterhouse superintendent's office; (2) cattle and sheep pennage; (3) milch-cow byres for 240 animals; (4) auction sale ring; (5) premises for dealing with milk; (6) sheep dipping bath, foot bath and lairage in connection therewith; (7) premises for generating hot water, &c.; (8) licensed drovers' shelter; (9) office and lavatories, &c.; (10) three implement halls.

The cattle and sheep pennage covers a space of about 7,000 square yards and provides for 800 head of cattle and 6,000 sheep. This space has been roofed over with steel roofing, corrugated sheeting, and patent glazing, at a cost of 12,000*l*. The remainder of the space for the exhibition and sale of cattle is in the open, with pennage at certain parts.

The milch-cow byres have been constructed on very complete lines, the exterior walls having a glazed brick dado for cleanliness, the remainder of the walls being of brick and stone dressings with rough-casting. The hall is 174 feet in length by 80 feet in width.

The roofs are of steel and slated. Both top and side lighting have been introduced, the former being by upright lanterns and patent puttyless glazing. Ventilation has been specially considered, and steam heating has been arranged controlling the building in sections, so that the temperature can be regulated and adjusted to suit the varying number of cattle housed in the building. This arrangement is considered of great importance in the case of milch-cows, which are more delicate in their constitution than other classes of cattle.

The sale ring is at the east end of the byre and connected thereto. It is staged for the buyers, having a stout fence next the ring. The building is top lighted, is lined with glazed bricks, and is fitted with a rostrum for the auctioneers.

Adjoining is an office for the dealers, having suitable lavatory accommodation.

The corn market, which is situated at the corner of New Market Road and New Marts Road, is conveniently placed to permit of the business being carried on in conjunction with the cattle market, which adjoins in the rear.

It is a stone-built structure, the front entrance being approached by means of a handsome loggia of Doric columns.

The building covers a little less than an acre of ground, the extreme dimensions being 245 feet by 123.6

feet. The exchange hall is 165 feet by 92 feet 6 inches, and has a range of offices down each side and at one end. Stalls for merchants are placed along the walls.

There are a large settling and business room, and a room of corresponding size for trade meetings. Four branch banks also abut on the entrance corridors.

At the north-west corner there will be a postal telegraph office, access to which can be gained both from the corn market hall and from the outside.

At the south-west corner will be a series of telephone call offices, working through an internal branch exchange, which will give very ample telephone facilities to all parts of the markets, as well as to the Central Telephone Exchange.

The hall has been arranged to give ample lighting, so that the inspection of sample grain may be facilitated. It is heated by means of steam radiators served from a steam boiler in the basement.

## NOTES AND COMMENTS.

THE Corporation of Glasgow, in pursuit of their laudable efforts to promote smoke-abatement in their city, are arranging to hold, from September 16 to October 8 next, an exhibition of the latest and most scientific devices in connection with smokeless heating and lighting, embracing the most up-to-date methods and contrivances for the complete combustion of fuel, as well as the most modern developments in heating, lighting, and ventilation by means of gas and electricity.

THIS method of education is pleasanter and goes further than the prosecution of offenders against the existing law, which is not altogether adequate for effective smoke-abatement. With respect to such prosecutions in Glasgow Mr. PETER FYFE, the chief Sanitary Inspector for Glasgow, states in his report for 1909 that convictions were obtained in forty-eight prosecutions, the average fines for first offences being 11*s*. 3*d*. and for second and subsequent offences 31*s*. 8*d*. The improvement in the factory chimneys previously referred to had been fully maintained during 1909. Eighty-six improvements were effected in furnaces, and in twenty-six of the cases these consisted of the application of mechanical stokers in lieu of hand firing. Considerable complaint was made by citizens as to the nuisance caused by the heating of tar and asphalte in the public streets. Much carelessness on the part of the men in charge, in conjunction with the persistent use of coal in the furnaces, was the main cause of the nuisance. As a result of the Sub-Committee on Air Purification conferring with the heads of departments, particularly as to the desirability of burning gas coke, a considerable diminution had been effected in the smoke produced.

WE regret to have to announce the decease of Mr. T. J. BAILEY, who, only at the end of last year, retired from the position he had held for many years as architect to London's educational authority, originally the School Board for London and latterly the London County Council. Mr. BAILEY had brought the adopted type of London's elementary schools, the central hall system, to as near perfection as seemed possible, and he has enriched London with many examples of excellent architectural design.

THOSE British delegates who, under the auspices of the National Housing and Town Planning Council, took part in the ninth International Housing Congress in Vienna, found the Congress in favour of the general acceptance of the principle that municipalities should undertake the building of dwellings for the working classes in default of adequate provision by private enterprise. The Englishmen stoutly upheld the superiority of the cottage type to the block of flats, and in this were supported by Professor FUCHS, of Tübingen, who has himself seen what is effected in our own country in this direction and its influence on the family life of the artisan. It was, however, admitted by Mr. T. H. MAWSON that the block building helps to make a city, whilst the cottage restricts a town of any size to the character of a village.

THE grand manner in town planning is, we fancy, impossible of maintenance in Great Britain. The exigencies of modern improvement will never be allowed to remain unsatisfied, because they interfere with something that has been done in the past more or less architecturally impressive. Of this fact the action of the Governors of GEORGE HERIOT'S Trust in Edinburgh affords an illustration. In connection with the plans of alterations proposed to be made by the Edinburgh School of Cookery and Domestic Economy on the property Nos. 3 to 6 Atholl Crescent, the Clerk intimated that the Cockburn Association had requested the Governors to receive a deputation from the Association. It was agreed to receive the deputation, who consisted of Professor BALDWIN BROWN, Mr. JAMES BRUCE, Mr. ADAM SMAIL, and Mr. GEORGE J. WOOD. Professor BALDWIN BROWN said the older buildings in the central part of the town were under the protection of the Town Council, and the Association considered that the examples of neo-Classic architecture in which the city was so rich were just as important in their way as were the older buildings. He emphasised the fact that the design of the buildings in Atholl Crescent was complete, each part balancing with another, and said it stood to reason if they altered the proportions, if they thrust out an excrescence or altered the sky-line, they would destroy the effect of the whole. The thrusting out of the large portico seemed to the Association to be an architectural enormity, especially as there did not seem to be any special use for it. The addition of an attic storey would break the sky-line. Everybody had the greatest sympathy with the work of the School of Cookery. All one wished was that it could be in a situation where it would be able to expand as it desired. It was urged that the application should be granted on account of the good educational work done by the institution. That introduced rather a dangerous principle in regard to the conduct of public affairs, which might open the door in the future to a good deal which was very carefully and scrupulously avoided by Parliamentary Committees. They asked the Governors even at the eleventh hour to step in and save that conspicuous monument of the great modern period of Edinburgh architecture. The Governors, in spite of this protest, resolved to confirm their approval of the plans of the proposed alterations, with the exception of the portico, the suggestion for which had been deleted from the design.

MR. T. C. HORSFALL, in a letter to the *Manchester Guardian*, well points out the mistake that is being made in the starving of the Art Gallery Committee by the Town Council when he says:—"Art is for Manchester not a luxury. It is unquestionably a necessary of health, because only by the help of art will it be possible to displace the drinking and gambling which are ruining us, body and soul, by modes of spending leisure time which will really re-create our almost exhausted powers. Every attractive picture, every attractive work of art of whatever kind, which the Art Gallery Committee buys and places where it can be easily reached by the mass of the people will do something to keep down the rates and to restore to the community the intelligence and the vigour of body and mind which will enable it to pay its rates."

PROFESSOR GARSTANG, of Liverpool University, has last winter made some remarkable and interesting discoveries on the site of Meröe, the ancient capital of Ethiopia. He has unearthed the remains of the famous temple of Ammon and the temple of the Sun, with the wonderful table mentioned by HERODOTUS. Although rifling had occurred a few very beautiful jewels were discovered, and the Professor was able to correct some of the inaccurate descriptions of the Ethiopians given by HERODOTUS.

THE offer of Mr. WILLIAM BANKS to bear the cost of erecting a crown on the Old Steeple of Dundee has been accepted by the Town Council in response to the following

THE NATIONAL ART GALLERY, SYDNEY.

letter from Mr. BANKS's solicitors, which explains the matter clearly:—"As you are doubtless aware, about the year 1873, when the Old Steeple was restored, there was a proposal that the tower should have a crown placed upon it, and the architect, Sir GILBERT SCOTT, drew a design for such a crown, photographs of the south-east view of which exist. The proposal to place the crown upon the tower was departed from at that time, but it has been raised on more than one occasion. We are now instructed by our client, Mr. WILLIAM BANKS, 3 Hyndford Street, to approach the Town Council, and make an offer that if the Town Council will carry out the crowning of the steeple, Mr. BANKS will provide the funds necessary for the purpose up to 2,500*l.*, which was the sum the late Sir GILBERT SCOTT estimated would be required to carry out his design, and which estimate has recently been confirmed to Mr. BANKS by Mr. J. OLDRID SCOTT, architect, London, Sir GILBERT SCOTT's son, who is familiar with the whole matter. On hearing that the Town Council are agreeable to the proposition and to the work being proceeded with forthwith, Mr. BANKS will furnish you with a letter of obligation from the Commercial Bank, Dundee, undertaking to provide the necessary funds up to 2,500*l.* for the work. Our client understands that your Council would employ Mr. SCOTT as architect to carry out the work."

FROM the *Dundee Advertiser* we learn that, from time to time during the past few years, much has been done for the preservation of the existing ruins of Balmerino Abbey, and extensive excavations have laid bare much of the foundations of the walls and piers of the choir, transepts, and nave of the church. The whole edifice was about 206 feet in length within the walls—a few feet longer, though of less width, than St. Giles's Cathedral, Edinburgh. These operations have been carried out by the Hon. MORTON G. STUART GRAY, proprietor of Balmerino—now Earl of MORAY—under the advice and superintendence of Mr. F. W. DEAS, F.R.I.B.A., Edinburgh. Among other things, it may be mentioned that the double doorway in the west front of the nave, which was formerly hidden by mounds of earth, has been opened up, and also a smaller doorway leading from the cloister through the west wall of the north transept. The chief portions of the existing buildings are the chapter-house, with its piers and partly vaulted roof; on its south side a vaulted apartment—the sacristy—and its doorway leading into the church; and on the north side of the chapter-house another vaulted apartment, which was evidently the slype, or entrance into the cloister.

## NOTES ON BOOKS.

"Simple Jewellery: a Practical Handbook dealing with certain Elementary Methods of Design and Construction, written for the use of Craftsmen, Designers, Students, and Teachers." By R. Ll. B. Rathbone. (London: Constable & Co., Ltd. 6*s.* net.)

WE have read with pleasure Mr. Rathbone's informative articles on "The Artistic Training of a Jeweller" and the processes of simple jewellery work in the *Art Journal*, and are glad to have them before us in book form with additional matter and illustrations, thus producing a manual of instruction both in craftsmanship and in design of simple jewellery which is useful for the young professional jeweller as well as for the amateur who would make a hobby of jewellery work. True that the author's teaching does not take the student very far beyond the limits of filigree work, but at least he gives some idea of the infinite variety of beauty that can be attained by the use of simple elements of wire and grains. The illustrations are combines of designs by the author and examples of old work, and the points in the teaching are elucidated by reference to both old and new examples.

The technical processes of handicraft and the tools required in the making of simple jewellery are clearly explained, and so far as such processes can be taught from a book without personal instruction we fancy that a careful study of the author's words, combined with patience in the practice of his precepts would enable any enthusiast to attain a considerable amount of skill in the fascinating craft of simple jewellery.

"Stresses in Masonry." By Herbert Chatley, B.Sc. (Engineering). (London: Charles Griffin & Co., Ltd. 3*s.* 6*d.* net.)

The study of stresses in masonry has been very generally neglected, chiefly by reason of the superabundant mass of material that considerations of æsthetic fitness and exclusion of weather have led architects and builders to observe until the regulation of sizes has become traditional rather than scientific.

Hence the remarkable discrepancy that has arisen between the attention that has been given and the books that have been written on stresses in steel or even timber and those in stone. It does, however, sometimes occur even in masonry that the stresses in a column, a corbel, or an arch approach within measurable distance to the theoretically safe stress, and hence Professor Chatley has done good service to the architectural student in providing this little book which clearly explains the stresses that may occur in masonry and the methods of calculating them. The student will find that there are many important points that have not occurred or been previously pointed out to him, as for example the greater importance of the shearing stress in stone columns beyond the direct compression. Every architectural student therefore should read Professor Chatley's book.

---

"Papers of the Paint and Varnish Society, 1908-1909." Edited by the Secretary.

The papers read before the Paint and Varnish Society are full of valuable information and though some necessarily deal with the manufacture of painter's materials, there is much that is useful to the architect in helping him to a knowledge of the practical working of paint and varnish, materials that are perhaps more difficult of supervision than any others with which we have to deal. We should advise every architect to get a copy of this useful book.

---

"The Sketcher's Oil Colour Manual (Oil Colour Technique)." By H. Macbeth-Raeburn. (London: Winsor & Newton, Ltd. 1*s.*)

This is one of Messrs. Winsor & Newton's shilling handbooks on art, and whilst it can scarcely teach the whole or any large part of the technique of oil painting it contains useful hints for the guidance of the amateur or the novice. The greater part of the book is in the form of an alphabetical guide to the nature of the various pigments ordinarily used and of the mixture of pigments that may be employed to render the appearance of definite objects, but reliance on such directions must be tempered by the author's advice to the student to "paint masses of colour and form as they appear to him."

---

"Engineering Construction in Steel and Timber." By William Henry Warren. Second edition. (London: Longmans, Green & Co. 18*s.* net.)

During the fifteen years that have elapsed since the publication of the first edition of Professor Warren's book on "Engineering Construction in Iron, Steel, and Timber," great advances have been made in the science of testing materials and in the accumulation of an enormous amount of data on the physical properties of the materials of construction. Hence the second edition is considerably enlarged and partly re-written. American and Australian experience are brought into consideration, as well as the experiments and investigations of French and German authorities and British engineers and physicists. Thus we have brought before us a cosmopolitan field of view. Especially valuable are the modern results of experiments in the modifications in the limit of proportionality and the yield-point, caused by repeated stresses in steel.

The author's treatment of the subject of timber is largely based on experiments with American soft woods, and therefore British students must be careful in their adoption of the figures given, but the short account of seasoning and preservation is universally applicable.

Methods for the determination of the stresses in structures, the investigation of bending moments and shearing stresses, of influence lines and moments of resistance are well explained, and in connection with these the effects of unequal and variable loading are excellently expounded. The book being intended primarily for engineers, much space is devoted to problems of bridge design, but the chapters on the stresses in roof trusses, and the strength of columns would be valuable also for architects.

---

"The Book of Decorative Furniture: Its Form, Colour, and History." By Edwin Foley, Fellow of the Institute of Designers. (London and Edinburgh: T. C. & E. C. Jack. To be issued in 17 parts at 2*s.* 6*d.* net each.)

A cheap book for the value that is given appears to be the book on decorative furniture, of which the first part has just been published by Messrs. Jack. The whole work is to contain reproductions of one hundred coloured sketches by the author and artist and one thousand illustrations in the text. The author states that in the colour illustrations he has aimed at "the happy mean between an insistence upon detail, so exacting as to destroy the real appearance of the example, and an impressionist sketch expressing details so vaguely as to be void of informative value." The same qualification applies also to the black and white illustrations, in which a somewhat conventionalised style of drawing is adopted, eliminating halftones.

The author's aim is clearly to give a general view of the subject of decorative furniture as developed throughout the ages from the earliest work of Assyrian and Egyptian civilisations to the beginning of the nineteenth century. His book is therefore suited for the general public rather than for the connoisseur who is concerned with the minute differences that distinguish the productions of schools and craftsmen closely allied in time. From this point of view the work seems admirably adapted to fulfil its purpose.

---

"The Law and Practice of Rating and Assessment: a Handbook for Overseers, Members of Assessment Committees, Surveyors, and others interested in Rating and Valuation." By Clarence A. Webb, P.A.S.I. (London: Crosby Lockwood & Son. 7*s.* 6*d.* net.)

This book makes its appearance at an opportune moment, when quinquennial valuations for rating are troubling many owners of property, and owing to a very general depreciation during the last four years, differences of opinion between owners and assessment committees are of frequent occurrence. Although the primary basis of valuation for rating may seem simple, the subject really bristles with difficulties from the multiplicity of points determined more or less satisfactorily by an appalling volume of statute and case-made law, and as some guide is absolutely necessary for both owners and members of assessment committees, not usually selected for their expert acquaintance with law, we welcome so clear an exposition of the law and practice as is given by Mr. Webb.

The scheme of the book deals in separate parts with the law of rating, rating powers of local authorities, making and correction of valuation lists, and valuation for rating. A list is given of the numerous cases to which reference is made and an excellent index gives every opportunity for looking up any particular point. Although a careful study of the book will furnish the serious and professional student with a thorough grip of the law and practice of rating and assessment, the effect upon an inexpert owner of property must be, we think, to convince him of the intricacy of the subject and the desirability of obtaining expert assistance and guidance in his contest with an assessment committee.

---

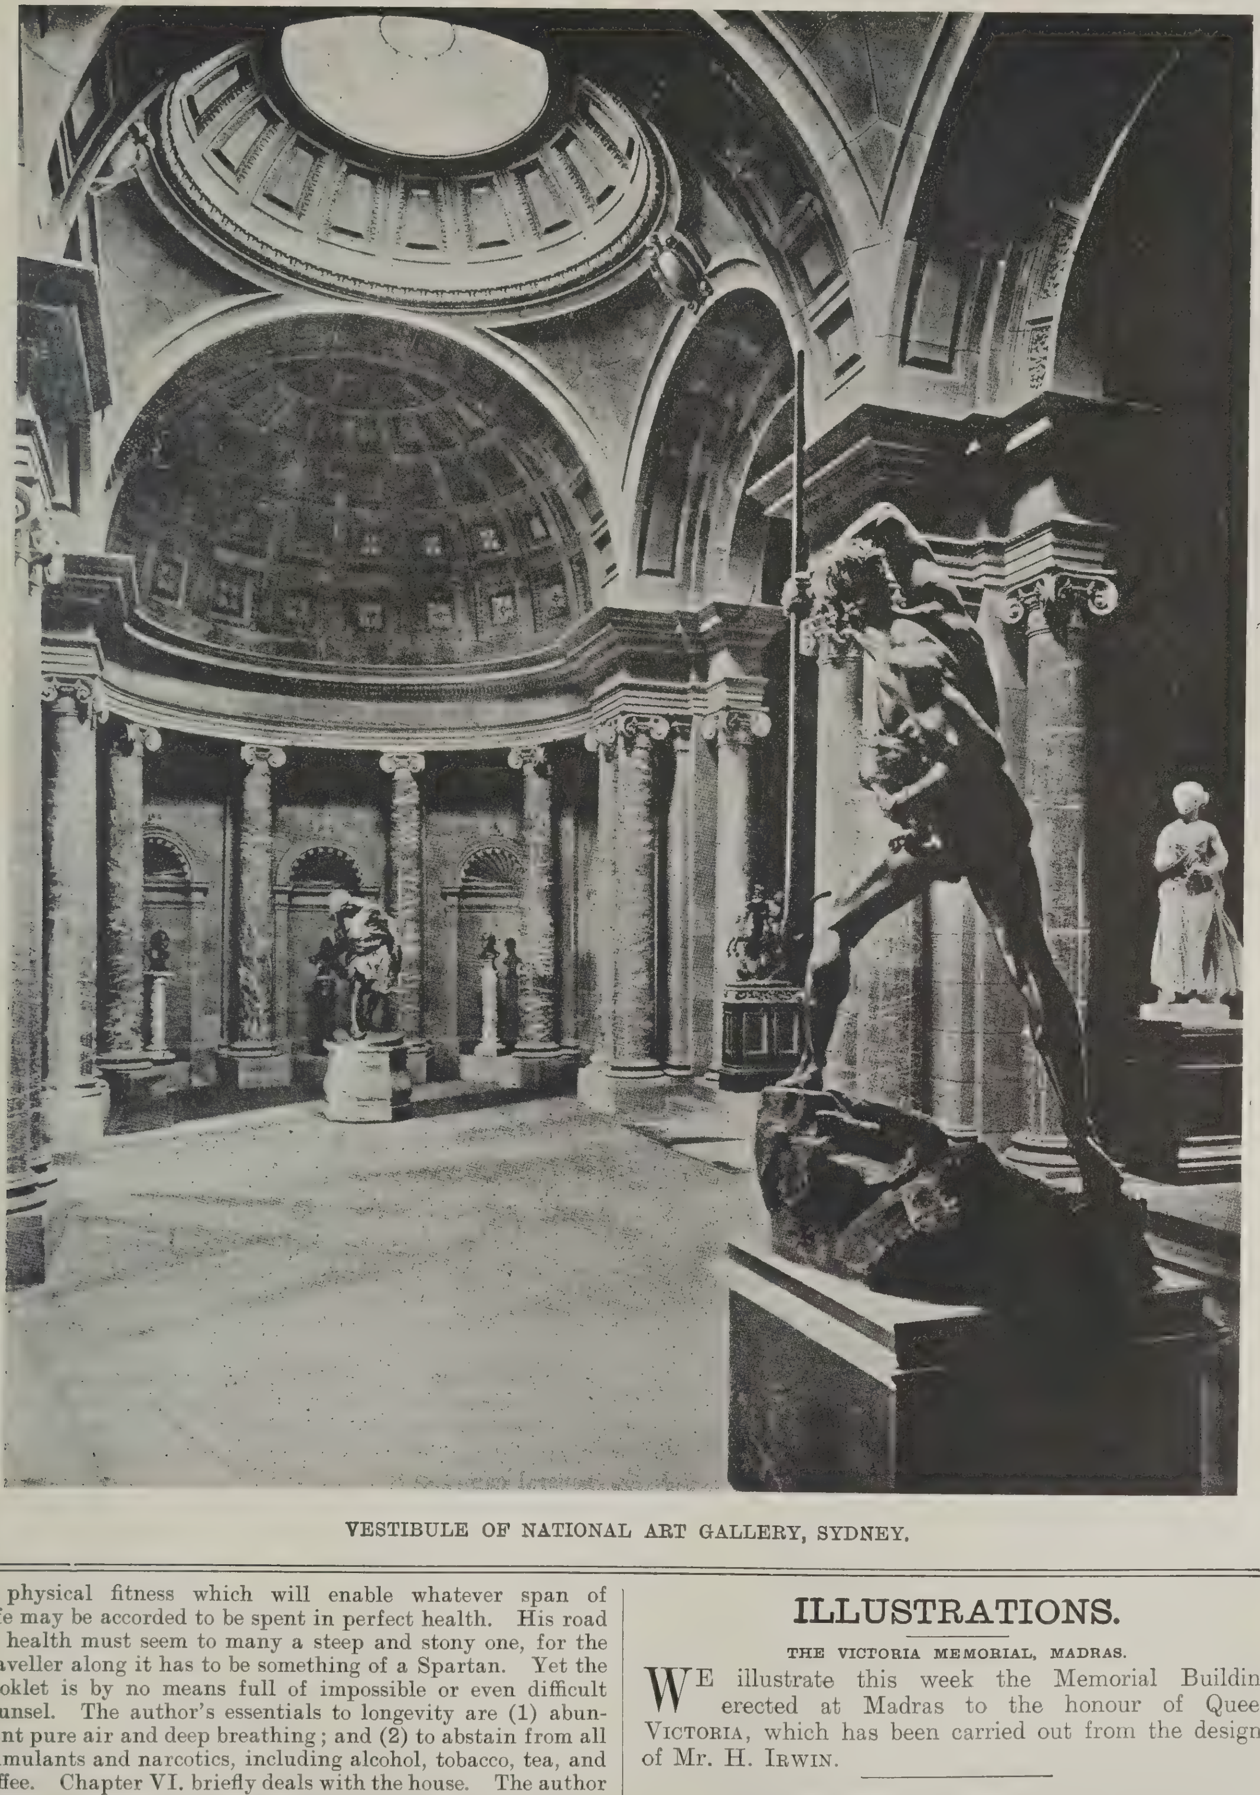
"Antiquity of Cremation." By Albert C. Freeman, M.S.A. (London: *Undertaker's Journal* Offices. 3*s.* 6*d.*)

If there are people, as Mr. Freeman suggests, who believe that the burning of the dead is a modern innovation, they will be convincingly shown to the contrary by this reprint of articles which have appeared in a trade paper. Instances are given of it from all quarters of the globe and from the heroic days of the Iliad. A check came with Christianity, for the doctrine of the resurrection of the body was prohibitive of cremation. However, Mr. Freeman contends that present-day graveyards are the darkest spots in the purity of our Christian profession of hope in death. "Can anyone imagine," he asks, "a more dreary and pagan practice, and a less beautiful and Christian custom, than the incessant repetition of the present burial symbols?" It is to be inferred that the author can only tolerate cremation. If this is so he does not advocate his views very forcibly, for the book is faithfully described by its title as "Antiquity of Cremation and Curious Funeral Customs." Many of the savage races, it appears, bury their dead, and generally to the accompaniment of much ceremony. The author covers a very wide range, and must have been at great pains to collect such a considerable amount of (rather loosely arranged) information.

---

"How are You? The Problem of Health." By L. Henslowe. (London: John Long, Ltd. 6*d.*)

It used to be said that an ardent theorist who produced a book called "How to Live to be a Hundred" died very shortly after at the early age of thirty-five. Whether this be true or not, it brings out the fact that man may try as much as he likes to be master at all points of his destiny, and all to no purpose. But the author of "How are You?" explains that the object of his book is not primarily to produce longevity, but rather to produce



VESTIBULE OF NATIONAL ART GALLERY, SYDNEY.

a physical fitness which will enable whatever span of life may be accorded to be spent in perfect health. His road to health must seem to many a steep and stony one, for the traveller along it has to be something of a Spartan. Yet the booklet is by no means full of impossible or even difficult counsel. The author's essentials to longevity are (1) abundant pure air and deep breathing; and (2) to abstain from all stimulants and narcotics, including alcohol, tobacco, tea, and coffee. Chapter VI. briefly deals with the house. The author is quite justified in protesting against the small window and low ceiling too often found in the modern artistic dwelling. He would like to see the former replaced by French windows reaching from ground to ceiling; while the hall, dining-room, drawing-room, and breakfast-room of the small house are rolled into one good-sized apartment, furnished only with well-designed necessities. All this has been tried before, and successfully tried too; and the author will have the sympathy of most architects.

## ILLUSTRATIONS.

### THE VICTORIA MEMORIAL, MADRAS.

WE illustrate this week the Memorial Building erected at Madras to the honour of Queen VICTORIA, which has been carried out from the designs of Mr. H. IRWIN.

### BILLIARD ROOM, BRAMERTON, TULSE HILL.

THE billiard-room, which forms an additional wing to the residence of J. F. PERCIVAL, Esq., is built in brickwork faced with malms, the dressings being of Portland stone.

Internally the walls are panelled in oak to a height of 8 feet 6 inches, above which they are covered with pig-skin secured to grounds by large-headed brass nails arranged to form a simple design. The plaster ceiling was modelled by Mr. Gilbert Seale. The general contractors were Messrs. St. John & Sons, and the architects Messrs. Hall-Jones & Cummings.

### OXFORD COLLEGE SERIES, ALL SOULS.—QUAD, SHOWING RADCLIFFE LIBRARY.

THIS illustration completes our series of views of All Souls College.

### RADCLIFFE LIBRARY, OXFORD.

THE first stone of the Radcliffe Library, Oxford, was laid on June 16, 1737, and the building was opened with much ceremony in April 1749. Its founder was Dr. John Radcliffe, the remarkable English physician who was as indifferent to the feelings of royal patients as to those of anyone of the lower orders. He had gone to University College, Oxford, at the age of fifteen in 1665 and got an M.A. degree seven years later. He commenced practice as a doctor in the University town, and almost at once made himself prominent by the originality of his ideas and by his method of treatment, which was often directly opposed to the prevailing theories. He, however, was sometimes so startlingly successful that his reputation grew apace, and it was not long before he came to London, where he won high fame and fortune and from whence he finally fled in disgrace. He remained all his life an enthusiastic college man. He gave a considerable sum for the rebuilding of the inner quadrangle of University College, of which he had been senior scholar, and the work was completed in 1719. Queen Mary's statue is to be seen over the entrance gateway in High Street, and that of Dr. Radcliffe faces the quadrangle. But his greatest bequest was that of 40,000*l.* for the erection of the Radcliffe Library (first called the Physics Library), together with its endowment of 150*l.* per annum for a librarian, 100*l.* per annum for repairs, and 100*l.* per annum for the purchase of books. The work was not begun for some years after his death on account of the stipulation in his will that the building should not be proceeded with until his two sisters, to whom he had left generous annuities, had died. All the trustees were able to do in the interval was to purchase piecemeal such parts of the sites as had been mentioned by Dr. Radcliffe in his will.

A design was prepared by Hawkesmoor for the building, but it was never realised. The work was entrusted by the trustees to James Gibbs. About the time of its completion the architect brought out his "Bibliotheca Radcliviana" as a complete account of the library. The book is illustrated with twenty-three large copper plates by Foudrinier, and of these the text is descriptive. In his dedication to the trustees Gibbs says:—"I must in justice say that in all business of this sort in which I have been engaged I never observed a trust discharged with greater urbanity, integrity, and candour during the whole time I had the honour of serving you from the laying of the foundation stone of this fabric to its finishing. And all persons employed by you therein do honour you for your punctual payments and great diligence in seeing every part put in execution with honesty, economy, and equity. I wish you may be a pattern to posterity to follow your laudable example on any occasion of a like nature."

Fergusson thinks that Gibbs cannot be congratulated on his choice of a circular or domical form for the purposes of a library. But he adds that, if his employers were willing to sacrifice the lower storey wholly for the sake of giving height to the building, and if they approved of a form by which hardly more than half the possible accommodation was obtained, Gibbs perhaps was scarcely to blame for the choice made, seeing that it enabled him to produce one of the most striking and perhaps the most pleasing Classical buildings to be found in Oxford. Fergusson concludes by saying that its great fault is that nothing in the design in the least degree indicates the purpose to which it was to be applied, and that even after all the sacrifices had been made for effect Gibbs had to introduce two ranges of windows between the columns. He considers that the proportions of the whole are good, the details appropriate to the places and well drawn, so that the monument has a monumental and elegant look of which its architect might well be proud.

A more detailed account is given by Professor R. Blomfield in his "History of Renaissance Architecture in England." He says:—"The design consists of a great rotunda with a rusticated plinth, above which are sixteen piers of engaged Corinthian columns carrying a continuous entablature and a balustrade with pedestals and urns above the columns. The great sweep of the unbroken entablature and the genius of conception displayed throughout this building show Gibbs at his best had some of Wren's happy faculty of designing in the grand manner. Set back a distance of 17 feet 6 inches from this balustrade comes an upper circular storey which forms the drum of the dome. This storey has eight buttresses 5 feet thick, with a cornice pedestal and urns above the buttresses. . . . The buttresses to the drum of the dome come between the pedestals above the lower order instead of opposite them; a complete variation on conventional design fully justified in perspective. The general plan is exceedingly simple. An oval staircase reaches the first floor, and small newel staircases indicate that the galleries are run round the circular spaces beneath the dome. Gibbs's inferiority to Wren is evident in the interior of the building. The drum of the dome starts from an unbroken entablature on modillions, and the arcade under this entablature is circular in plan, with the result that the arches are inwinding and the mitres to the return to the entablature are violently exaggerated. Moreover, the pilasters to the drum are out of proportion to the small Ionic order of the arcade below; and Artari's plaster work is rococo and florid to the last degree. . . . Wren's influence is evident in the general design of the Radcliffe Library, and, in fact, it is very probable that Gibbs took his idea from Wren's design for the mausoleum of Charles I." The architect himself was apparently very proud of his building. In the "Bibliotheca Radcliviana" Gibbs thus describes the interior:—"Plate B is the plan of the library over the stone porch, consisting of two circles one within the other. The diameter of the inner circle, which supports the cupola, is 48 feet, but the extent of the diameter of the outward circle, against which the presses of the books are placed, is 83 feet 6 inches. When you stand in the centre of the room you see the bookcases through the seven great arches of the inward circle, which bookcases are curiously framed of right wainscot and their mouldings underneath carved. The room where they are placed is of a circular form, going from one round staircase to the other, 15 feet broad and 12 feet high, raised 6 inches above the floor of the middle circle and floored with right wainscot boards all laid to the centre of the building. Its ceiling is handsomely adorned with fretwork and the whole room lighted by seven windows. The floor of the middle circle is paved with Portland stone intermixed with red Swedish stone drawn from several centres." He says in another place that it was first proposed that the pavement should be in black and white marble, but this was rejected as being unsuitable, "because the air condensing, occasioned by its hardness, (which commonly, though improperly, is called sweting) it makes the place damp, especially where no fire is kept, and is fitter for churches, porticoes, common hall, and passages than a library."

---

In the series of Church Art Handbooks which Henry Frowde is publishing, a second volume of "Wood Carvings in English Churches," by Mr. Francis Bond, is nearly ready; this deals with stallwork, chairs, and thrones. A third volume, for church charts, almeries, organ cases, doors, alms and collecting boxes, is in preparation by Mr. P. M. Johnston; and a fourth, relating to bench ends, poppy heads and pews, is being prepared by Mr. Alfred Maskell. In the same series will be issued "The Architectural History of the English Monument," by Mr. James Williams. A volume uniform with these handbooks, now being prepared by Mr. A. Hamilton Thompson, is entitled "Military Architecture in England."

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday, June 20, Mr. Ernest George, A.R.A., president, in the chair. The proceedings were opened by a special general meeting, when the following resolution was adopted :—" That this meeting, summoned in accordance with clause 22 of the Charter, hereby confirms the resolutions passed at the special general meeting of June 9, viz. :—(1) That the Council be empowered to purchase all the shares in the Architectural Union Company not now in the possession of the Royal Institute. (2) That the Council be empowered to pay to Mr. Edward Freeman the sum of 1,250*l*. in compensation for the eventual loss of his office as secretary of the Architectural Union Company."

Mr. Henry T. Hare (hon. secretary) announced the decease of Mr. Matthew H. Holding, of Northampton, who was elected an Associate in 1881; and of Mr. Thomas Jerram Bailey, elected an Associate in 1881 and a Fellow in 1893. Mr. Hare mentioned that Mr. Bailey had only survived by five months the resignation of his appointment as architect to the Education Department of the London County Council—an appointment which he had held for twenty-five years. A vote of condolence was passed to the relatives of Mr. Bailey.

Mr. Ernest George, A.R.A., read a letter from Sir William Emerson in which he offered to the Institute a sketch-book that had belonged to Mr. William Burges, and which Sir William had purchased at an auction.

### The Royal Gold Medal.

Mr. ERNEST GEORGE, A.R.A., president, in his address said:—We have the privilege, and at the same time the important trust and responsibility, of electing a recipient for the Royal Gold Medal; it is destined for one who by his life has advanced the art of architecture either by building, by writing, or by research. The last presentation was to Dr. Arthur Evans, in recognition of his valued contribution to our knowledge by the unearthing of Knossos, throwing light on an early phase of architecture. To-day it is the accomplished architect and man of letters that is chosen by his brother architects, with Royal approval, for the distinction of the King's Gold Medal for architecture. Mr. Thomas Graham Jackson, upon finishing his University course, became the pupil of Sir Gilbert Scott, thus beginning his career in the heat of the Gothic revival; and he acquired a knowledge of the mediæval methods of building which has served him well, for I think the Gothic inspiration is felt in most of his works, though they may be clothed with forms or detail of other origin. Mr. Jackson is an artist of strong individuality, with an intimate and practical knowledge of material, and he has helped much to bring together the several arts; he was an active member of the Art Workers' Guild, of which he was some time master. Mr. Jackson has had the satisfaction of making his impress especially on one city, with which his name will always be associated. Oxford, almost unique in its survival as a mediæval city, was bound to move with the times, and we might have feared the result of changes that must come. But, by good fortune, the modern growth of that city has been generally under wise direction: the spirit of the old has been preserved, while there is freshness, originality, and beauty in most of the schools and colleges that have risen in our own time, and that harmonise happily with the works of the pious founders, and for very much of this work Mr. Jackson is responsible. He is a Royal Academician, a Fellow of the Society of Antiquaries, and an Honorary Fellow of Wadham, Oxford, while Cambridge has just honoured him with the degree of Doctor. He has a secure place among men of letters; I think his first book appeared nearly forty years ago, and it has been followed from time to time when he had wisdom to impart.

As architects we are glad to honour those among us—a small minority—who can set forth our aims and explain our cause to a world that has been rather heedless of our art; when wrongs have been contemplated Mr. Jackson's voice has always sounded clear. Architectural education is a matter in which he has always taken keen interest, and he has been a valued member of the Board of Architectural Education. His interest in this education is not limited to the architect; he would have the principles of our art understood once more by the craftsman, the builder, the employer, and the public; then we architects would be forced to do only our best. I hope most of us feel, as I believe Mr. Jackson does, that the advancement of architecture is of vastly more importance than the prosperity of the architect.

Mr. Jackson has made repeated visits to the Nearer East, especially to the Balkan States, where he has studied the Romanesque in its home, acquiring such intimate knowledge of the traditional mode of building that the Dalmatians sought his help to build the campanile of their cathedral at Zara. Of the many works of Mr. Jackson, I suppose the Examination Schools at Oxford stand out most distinctly, and we remember the interest they caused at the time of their building, inaugurating in some respects a fresh departure. To Mr. Jackson we owe modern buildings for Brazenose, Lincoln, Corpus, Trinity, Balliol, and Hertford, the new Radcliffe Library, Somerville Hall, the City High School, and the High School for Girls; also the restorations of the Bodleian Library, St. Mary's and All Saints churches. At Cambridge we owe to him the new Law Library and Law School, as well as the Sedgwick Memorial Museum amongst other buildings. From the same hands we have the restoration of many precious relics, among them Eltham Palace, Great Malvern Priory, Bath Abbey, Christchurch Priory. His also is the anxious work of maintaining Winchester Cathedral against the threatenings of underground forces. We might make a long list of churches built or restored, as well as of important additions to Eton, Westminster, Rugby, Harrow, and most of the seats of learning—a grand record of scholastic work which at the same time is scholarly work, and which will always be honourably associated with the name of Thomas Graham Jackson. He will gratify us now by coming on to the list of Royal Gold Medallists, and allowing me the honour, in your behalf, of placing upon him the blue riband of our calling.

Mr. T. G. JACKSON, R.A., after receiving the blue riband and medal, said he was certain he need not say how deeply sensible he was of the great honour just conferred on him. To an artist no appreciation can be so welcome as the appreciation of his brother artists. Architects lived indeed on the patronage of the public, who on the whole were able to form a right estimate of the merits of those whom they employed. The public were perhaps too liable to be influenced by fashion and blind obedience to be always right at the moment. They were certainly more likely to be shocked than pleased by anything in the way of originality. It was therefore rather to the judgment of those who followed the same calling as himself that the artist looked for due appreciation of his work. It is the knowledge that he has secured this in spite of his many shortcomings that gives value to any honour conferred on him. Mr. Jackson said that he was particularly touched by the fact that the Institute had bestowed its highest honour on one who was not only not a member of their Society, but on one who at times had been even an opponent of their policy—an opposition, however, that had never caused any interruption of the friendly relations between them. He had received many kindnesses from the Institute; he had in the past been nominated by their Presidents for competitions, and he had often listened on their invitation to able papers. He rejoiced to think that the matters on which they differed were in very small proportion compared with those on which they agreed. He had to confess that he still remained a hardened unbeliever in the possibility of discovering an artist by a process of examination. But however much they differed on those points he felt sure that they were all equally devoted to the art which they professed, and equally anxious for its interests. Architecture should not be called the greatest of the arts, for in true art there was no "greater" and no "less"—the only distinction being between good and bad. The one claim that he made for architecture was that it is the only necessary art, and as such it must always be of supreme importance to human society. It had been compared to frozen music; it might also be described as the poetry of construction. It resembled poetry by the varied and indescribable manner in which it affected the mind. Everyone remembered certain lines of poetry which touched them in some unaccountable way, and awakened a thrill within them which they found it very hard to explain; yet that very passage might leave another lover of poetry quite untouched. It was the same with music—some cadences may move a soul to ecstasy which leave another unaffected. And so with architecture. It appeals to different people in different ways, and to the same people differently at different times. To his mind the most sympathetic interior he knew was that of Exeter Cathedral, and he had often tried to explain to himself why it was so. It was as impossible to say why certain lines and proportions, certain arrangements of void and solid, certain refinements of detail should awaken a feeling of pleasure as to say why certain sensations will leave us unmoved. To an architect this is poetry; for architecture touches in an especial way the poetic sense. A poet is a creator, a maker, whatever his material may be, whether words or bricks. It is his power of doing this that distinguishes him from other men, and that power can never be imparted where it does not exist. Like the poet, the artist must be born and not made. There is no use in encouraging a young student who has not within him that power. He was therefore glad to see that in the scheme put forward for the education of young architects it had been suggested that the students who showed no special turn for art should be advised to take their abilities to some other pursuit. More fortunate than other men the calling of an architect is not only his means of livelihood, but also his supremest pleasure. The architect must indeed be unfortunate who cannot leave behind him some work that will do him honour.

Mr. John Slater said that as that was the last time on which their present President would occupy the chair (and perhaps as an old member of the Institute he might interpolate a feeling of regret that that was perhaps the last time in which the chair would be occupied in that room), he knew they would not be satisfied unless they passed a vote of thanks to Mr. Ernest George for the way in which he had occupied the chair during his tenure of office. It was no secret that Mr. George had had a great deal of hesitation in accepting the post, and it was only after a good deal of persuasion that he was induced to occupy it. He hoped that Mr. George would never regret having taken that step, and that he would carry away with him many pleasant recollections. They could claim that in one branch of architecture England held the palm, and that was in domestic work. There would therefore be something lacking in the history of the Institute if a man so eminent in this branch had not been on the list of Presidents. The annals of the Institute would be the poorer if it were not for those addresses by Mr. George which are replete with common sense and excellent advice, and which were enlivened by a quiet play of humour which is the President's own. These were positive merits; but there were what he might call negative merits which had been equally estimable. Mr. George had individual views, and he had known how to press them at Council meetings; yet he was essentially a man of peace, to whom polemics were distasteful. With regard to the personal relations between Mr. George and the Institute, he will carry away with him the heightened esteem of those who knew him before he occupied the chair, and he had made for himself a warm place in the minds of those who did not. While speeding the passing President, he would like to express his satisfaction that Mr. George will be succeeded by Mr. Leonard Stokes, and also to express a hope that the latter will have a happy and successful year of office.

Sir Aston Webb said that as he had had the honour of speaking the first words of welcome to Mr. George, it was appropriate that he should say the last at the time when he was leaving, and to express their great obligation for the work that he had done as President. It was understood when Mr. George took the chair that he had some hesitation as to the way in which he would occupy it. But no one else had the least hesitation in the matter. They were proud to think that so distinguished an artist had been at the head of affairs for the last two years. Sir Aston said that as he was no longer in the firing-line he could not claim to have seen Mr. George in the Council meetings, or with his coat off in the arena as had been suggested, so that he had nothing to say on that side. But he did know that as Mr. George was leaving the chair he was leaving behind him an aroma which will always be pleasant to those who follow; an aroma of kindliness and sympathy and of good humour and good feeling. Mr. George had made no enemies, and only won friends; while at the same time he had always done his duty. He begged to second the motion that the very best thanks of the Institute should be given to Mr. George for his notable services as President.

Mr. Ernest George, in replying, confessed that he had accepted the presidency feeling that it was not in his line at all. It had been a great pleasure to him to be associated with men who were giving their time for the common good of the profession. He also had to thank the very efficient staff, more particularly their secretary. He was convinced that the Institute was doing very useful work. Before he accepted office he had not realised how much quiet work there was to be done, and how many important things occurred. Mr. George said that he had tried to do his best according to his lights, and that he would like to thank everybody for their help. It was pleasant to know that he was being followed by a man like Mr. Leonard Stokes.

---

The Christian Science Society, Swansea, have purchased a site on Walter Road for a church and lecture hall; the latter is to be built immediately. The cost of the buildings when complete will be 10,000*l*. Mr. Glendinning Moxham, F.R.I.B.A., Swansea, has been appointed the architect to carry out the work.

---

## THE ARCHITECTURE OF LONDON HIGHWAYS.

By "Viator."

### II.—THE STRAND.

In an article contributed to the columns of *The Architect*, we ventured to criticise the art of Fleet Street in what purported to be a humorous vein; but it is possibly preferable to exchange this for a style at once thoroughly serious and seriously thorough, as being more in accord with the claims of architecture. It is necessary also to bear in mind that any criticism, however honest it may be, must insensibly be slightly tinged—we would not say tainted—by the personal tastes of the critic; but after conceding that point, it is hoped that the general tenor of what follows will be accepted as the result of carefully based and impersonal views.

In the short walk between Trafalgar Square and Chancery Lane, a most heterogeneous display of frontages meets the eye of the spectator, more varied, we surmise, than can be provided by any other main artery of the metropolitan system. In our view, this is preferable to the co-ordinated architecture favoured on the Continent, though it may be granted that such a view is one of individual nature; and yet, there is reason in this preference, if only on the plea of consulting various individual tastes, for co-ordinated architecture can appeal merely to those who are adherents of the particular style, whilst the English method endeavours to provide at least a modicum to satisfy all tastes.

In the first half of the nineteenth century the Strand was "improved" under the artistic guidance of John Nash and (at a later date) of Sir James Pennethorne. Modern commercial stress has caused those improvements to be unavailing and a modern scheme is in slow process of development; the result is displeasing, pending the completion of the scheme, the varied widths between curbs and building lines proving offensive to the eye and obstructive to the traffic. But we dread the day when further widenings shall entail the disappearance of some of the old frontages that possess a merit apart from their antiquity. Regard, for example, Nos. 229 and 230 on the south side, near the Griffin; their picturesqueness arises undoubtedly from the simple art displayed in their design, and not in any degree from age, which would merely provide antiquarian value. The Great Fire spared these and a few other still-existing premises; in days of pretentious design the sight of these two façades is restful in the extreme. In the march of progress, however, the coved overhanging superstructure of the one, and the angular bay of the other will doubtless disappear. There are many old buildings still left in the Strand, some ante-dating, others post-dating A.D. 1666, but the mere age of them causes no quickening of our artistic pulse. Coutts's old premises possess nothing but the historic interest; on the opposite side of the thoroughfare, however, next the Adelphi theatre, and over against the Tivoli theatre, there stands a building whose interest is at once antiquarian, historic and architectural—in the days when Cromwell protected England the house was occupied by that eminent Jew, Menasseh Ben Israel, whose efforts brought about the readmission of the Chosen People into the land of Liberty, to the reciprocal advantage of both. A curious old façade is this, with its oddly variegated symmetry, with the well-projected bays and cornice, the latter finely carved, the egg-and-tongue and the modillions standing out boldly.

It is but a few years ago that a critic on architecture had to proceed on the lines of lamentation for the lost glories of the past in view of the then existing state of poverty of design. We may be thankful that the nadir is receding from view (the imperfect simile may be condoned), and that words of praise can be accorded to the current architectural trend, not merely to selected buildings. Bearing this in mind, it may perhaps be the best method of treatment to discuss the buildings with some regard to their period of erection, and this method brings next under our notice three churches, whose interest architecturally is due in the main to one architect, viz., James Gibbs. The church of St. Clement Danes is, we grant, the work of Sir Christopher Wren, for the most part, and very indifferent too, the sole feature that we can commend as out of the common and as at all pleasing being the hemispherical domes over the wings flanking the tower; the latter, which provides the attraction towards this building, is the work of Gibbs (A.D. 1719), and the attraction is justified by reason of the good proportion, varied unity, skilful design, and pleasing adornment. And these criticisms are equally due to the church of St. Mary-le-Strand (A.D. 1714-17)—a gem, some of whose facets are perhaps imperfectly cut, but none the less a gem; the tower, it is true, suffers when viewed (or more correctly the spectator suffers when viewing) from the north, as the stages look so attenuated and contracted; but the architect is not to be blamed really, as the north and south aspects were not designed for observance from a distance, as may be seen by viewing the tower from the south side of the Strand, no unpleasant effect resulting. We must grant that the extravagant use of broken pediments and the elaboration of niches never intended for occupation are deplorable, here as on St. Paul's Cathedral and elsewhere, but in other respects we doff our hat to the church for all its merits, amongst which the segmental colonnaded portico raised on nine steps is notable. The ornament, too, is pleasingly varied—the Ionic order being used for the ground storey, and carried up as Corinthian, with composite inter-columnar treatment for the window-cases. The carved panels on the piers of entrance gateway are reminiscent of the ubiquitous Grinling Gibbons (obiit 1721). Space will not permit of exhaustive treatment of the merits of this church, and in passing to the consideration of St. Martin's (erstwhile situated in the Fields) the same inventive genius is apparent here as in St. Mary's; less elegant than the latter, it is true, yet there is a sterling solidity about St. Martin's that has its own merits. This church (1721-26) was evidently designed for a more open site than either of the two previously discussed, and we may justly take pride in the magnificent colonnaded portico that stands so nobly on its broad flight of steps at the west; we object to the restless cutting-up of the window architraves by means of projecting blocks and voussoirs, but the church in general is a fine instance of early eighteenth-century architecture.

The present situation of St. Mary-le-Strand is different to what it originally occupied, the cause of removal being the high and puissant Protector, the Duke of Somerset. This nobleman desired to erect for himself a palace on the banks (*i.e.*, the Strand) of the Thames, and to this end he laid violent hands upon various properties—principally ecclesiastical—amongst these being the church of St. Mary-le-Strand, which was subsequently rebuilt on its present site.* The new palace reverted to the Crown after Somerset's attainder, and after various vicissitudes the property subsequently known as Somerset House was appropriated by Act of Parliament for the purposes of Inland Revenue and the Navy. Sir William Chambers was called in, in the year 1775, to prepare a scheme for new buildings and for embanking the Thames, and for fifteen years (1776-91) matters proceeded, Chambers's original estimate of a quarter of a million sterling for a complete building being exceeded for merely a portion of it to the extent of 50 per cent. Sir Robert Smirke and Sir James Pennethorne respectively added to and completed the buildings, but we are here concerned only with Chambers's Strand block. The severe criticisms to which the new buildings were subjected in contemporary journals were as inappropriate as the milder animadversions of recent years. The work exhibits the qualities of restraint, good proportion, dignity, and a quiet suitability that should secure for it our hearty approval. It is true that the ornamentation might have been increased without raising a charge of overloading, but Sir William Chambers was satisfied to gain his desired effect otherwise. The sole adverse criticism we would offer is in respect to the illogical and tame equality of the three arched openings; the carriageway entrance should assuredly have been treated on the same generous principles as might be seen in the old City Gates, though it may be that the architect did not wish to lessen the apparent importance of the wings, devoted to the Royal Academy of Arts (on the right), and to the Royal and Antiquarian Societies (on the left).

An architect whose work commands respect—the late Edward M. Barry—has helped to adorn the Strand with two, nay with three, buildings, one being merely a replica of Queen Eleanor's Cross erected at the village of Charing, but forming (whether in the original or in the copy) a very interesting spectacle for passers-by. Charing Cross Hotel is expressive and dignified, and is also one of those buildings, too few in number, of such a quietly satisfying aspect as to receive approving notice without fixing the attention. The same criticism applies to other work by Edward Barry—a notable member of a notable family. We may instance Cannon Street Hotel (which is outside the range of this article's criticism) and the premises in the Strand for the Art Union of London. The latter has a pleasing façade, but is subject to certain animadversions—(1) that there is at least a tendency towards excess of ornament; (2) that the rustication should, by preference, not be carried up the whole height of the façade; (3) that the spandril figures give the effect of slipping away from their uncomfortable perch. But the façade is quite architectural in the best sense of the term, and a specially satisfactory feature is the carved tympanum over the entrance. Lettering at a great height is always to be deprecated as a wasted effort, and the motto "L'Union fait la force" on the architraves of the second-storey windows is barely readable, only submitting itself to the diligent searcher.

The Temple Bar Memorial—the dragon rampant—calls for passing notice. The griffin (as the figure is generally called) is disproportionately large for its pedestal, and the latter is not sufficiently subdued in treatment, the best portion being the base with its simple contours and quiet bronze panels. Some slight idea as to whether it is or is not an architectural improvement upon the old barrier may be gained by the gilded likeness of Temple Bar projected from the façade of the restaurant of that name. A journey to Theobald's Park might result in a comparison with the actual structure re-erected there by Sir Henry Le Meux. But reference having been made to Temple Bar Restaurant, we may express our strong approval of this façade, the inset bowed treatment over shop level, varied again near the roof by a concave sweep, being distinctly attractive. The old-style shop front is good; and if objection is taken to the use of Labrador granite as providing too great a contrast in tone with the white stone superstructure, there is no desire to insist too strongly upon the criticism.

The next buildings that demand our notice are the Law Courts, the great Mid-Victorian failure in regard to appearance, acoustics and convenience. That it is a monument to Mr. G. E. Street's personal activities we all know, as also that it is evidently the work of a man whose knowledge of Gothic was only equalled by his love for it. But we cannot profess to admire these buildings merely because a large number of the British public admires them. The screen wall is distinctly good, the clock and stair towers are very passable, and the ironwork is satisfactory; but it is curious in the extreme that of the various phases of Gothic, Street failed to use the only one that was suitable, and that is the Perpendicular style We regret too the parsimony that we must suppose dictated the use of red brickwork in combination with stone for the eastern wing, and for the eastern wing alone. We may contrast these buildings in regard to the dubiety with which a stranger might view them as to their purport with the fine expressive Central Criminal Court, the outcome of the late Mr. Edward Mountford's genius. It is interesting to note how often buildings contrast unfavourably with those designed by the late Alfred Waterhouse, and this is one more instance, the Gothic office-block of New Court being a magnificent scheme and tending all the more to cast into the shade the Law Courts on the opposite side of Carey Street. Much of the detail of Street's work is naturally of a high order, but we are justified in objecting to buttress-supported square (or other) bays. We will hope that the Law Courts extension in Strand Park will make some amends for the defects of the original building.

Nine big hotels, if not more, within this one short thoroughfare, are but a sign of the times, a sign too that meets with the approval of those architects who make a specialty of this class of work; and within the last few years the Strand has been very much transformed by the erection of these palaces for a floating population. We wish to draw attention to four hotels—one truly not in the Strand, but at present forming one of the features of the thoroughfare, as there is but waste and desolate land between it and the Waldorf Hotel; the others referred to are the Savoy, the Gaiety, and the Strand Palace.

The Savoy and Strand Hotels are instances of the successful employment of Carrara ware, whilst the Gaiety and Waldorf are stone-fronted to satisfy the requirements of the London County Council. Whereas the green bands on the chimney stacks of the Savoy are an eyesore, the green Doulton ware used for the main entrance of the Strand Palace Hotel is very effective. As Gandy-Deering's fine Exeter Hall façade had to disappear, we may be glad to have such an adequate substitute as is here provided. Carrara ware (Doulton ware) has an effect of interfering with architectural design; this is to an extent to be noted in the Savoy Hotel, but the narrow frontage of the Strand Palace has been well managed, both in regard to decorative ornament and colour treatment; the dull green massed around the entrance is very different in effect to the green bands before-mentioned.

---

* The other properties seized were part of the church of St. John of Jerusalem; the tower, cloister, charnel-house, and chapel on the west side of St. Paul's Cathedral; the episcopal palaces of Chester, Llandaff, and Worcester, and the Strand Inn (Chancery). Westminster Abbey is said to have escaped only by means of the Chapter making contributions to appease the Duke's rapacity. An anecdote is related of the Bishop of Llandaff, appointed shortly after the depredation; he remarked that as the *land* was denied him he was only Bishop of "aff" (half). The palace was commenced in 1549, Somerset being executed a few months later under a warrant of Edward VI., and his property was seized by attainder.

But the Savoy Hotel is good design, with its shallow continuous bays, its circular domed angle blocks and its restrained use of decorative ornament, and the low-crowned wide-spanning arched entrance to courtyard is very effective. The historical interest of the site of this hotel is set forth in a series of panels, to which reference should be made. Before leaving the subject of Carrara ware, reference may be made to Romano's Restaurant, situate opposite the Hôtel Cecil; the buff faïence there used as a facing is as practically useful as Doulton ware, but is thoroughly inartistic and uninteresting. The Hôtel Cecil itself does not merit notice, merely supplying unrealised possibilities.

For the sake of disposing of the hotels, the chronological sequence has been temporarily set aside, and in reverting to the Gaiety Hotel we are setting back the hands of the clock very considerably—such a commonplace structure! until the eye travelling upwards reaches the sculptured frieze, which must not be too closely examined for significance, but must be accepted as sounding together with the well-projected but insufficiently deep cornice a pleasant note of relief. And this brings us to the last hotel of which we desire to take notice in this article. Messrs. A. Marshall Mackenzie & Son may be heartily congratulated upon the satisfactory design that they have evolved for the Waldorf Hotel; if a colossal order may be held justifiable anywhere, it may be certainly welcomed here. The detached Ionic columns running through three storeys are varied in the pavilionated wings by Ionic pilasters. The elevation is well-proportioned, and it is to be regretted that such a fine building should be lowered by possessing such an extremely silly series of carved frieze-panels; no plea of precedence or custom can render them pleasing. The completion of the Waldorf block by a theatre wing at either end, whilst satisfying the artistic sense in the method of treatment, is to be deprecated here, as elsewhere in Shaftesbury Avenue, where two theatre exteriors are replicas on either side a central block for the sake of artistic symmetry. No two theatres, no two buildings ought to present an exact presentment of each other.

And this brings us to the consideration of the Gaiety Theatre, which has been not inaptly dubbed the "New Bailey." We are aware that in this building and the adjoining hotel there were limitations in the way of the architects' freedom of treatment; but assuredly the latter might have been less unsatisfactory. The theatre is a mass of massiveness—Blunderbore unredeemed by any graces, except such as may be provided by the loggia treatment; for certainly the green bands of the ground storey provide no redemption. The dome is very unpleasing, and the crowning figure of Fame is unsteadily poised in appearance upon her golden ball, though as she possesses wings, the importance of a gravity-support is minimised.

This building, intended as a home of light opera, and so far from expressing its purpose, may be contrasted to its own disadvantage with the new premises for Coutts's Bank, occupying the site of the old Lowther Arcade. The banking establishment has an historical reputation to preserve and an ever-present business importance to make manifest, and it would be more than pardonable to express all this by a severe exterior. But Mr. J. Macvicar Anderson has produced a building that, discarding severity, has been satisfied with restraint, with a result wholly pleasing. Objection may be taken to the projecting voussoirs of the semicircular arches, and it would have been an improvement if the columns to the window-cases had been left plain instead of being rusticated. The Doric recessed entrance is good, and the recess carried up through first and second storeys gives a pleasing variety to the façade. There is a fine cornice and attic over all, and the discerning public may be congratulated on the exchange of an indifferent arcade for such a fine bank.

What shall we say of the *Morning Post* buildings? If we represent it as a huge architectural sham, it is a crime that is too common nowadays, and by repetition it renders each criminal less criminal than would otherwise be the case, and we may add that similar limitations may have affected the design as in the case of the Gaiety Theatre and Hotel. If the theatre possesses a bloated dome, no such charge can be levelled against the dome over these buildings, for it is meagre in the extreme; indeed, the whole building acts as a foil to the theatre, though we fear the latter is not in a condition to benefit as much as we would desire.

But a contrast may be more advantageously instituted between the *Morning Post* offices and Mr. H. T. Hare's design for the United Kingdom Temperance and General Provident Institution—a contrast wholly to the disadvantage of the former, for Mr. Hare's building can stand upon its own positive merits. How very skilfully he has dealt with the concave sweep, where the *Morning Post* treatment is quite ineffective. The Institution offices form one of the finest of modern buildings; there is artistic regard for light and shade, proportion, mass and ornament. It is an interesting feature and one worthy of note that with very little actual ornament there is an effect of a highly ornate building; but perhaps this is due to the groups of sculpture (the vivid sculpture, as it may well be termed) and the mezzo-relievo figures over the first floor. The sculptured figures seem to lack merely the colour of life to be enabled to leave their posts, for the breath of life they seem to possess already; indeed the figures on the angle of the building are uncomfortably vivid in effect for the spectator's peace of mind. Broken-based pediments are deplorable, but the broken-flanked pediment at the angle looks well in this instance. The angle treatment might have been advantageously carried somewhat higher, but these are at least trifling in view of the effect of the whole building.

The vivid and well-modelled sculpture contrasts favourably with the groups upon the Gladstone Memorial opposite the Institution offices. The bronze figure of the statesman is very dignified, and the pedestal itself is good, but the groups are very spiky and restless in effect. We have but two more buildings to which we desire to refer. The offices of the British Medical Association situated near Charing Cross raised a small tempest of discussion at the time of their completion, for it seems that Mrs. Grundy was wofully perturbed at what she saw when she applied powerful field-glasses in order to view the sculptured figures along an upper storey of the block. Let us at once say we consider the outcry unnecessary, for the morals of ne'er an individual will be vitiated by the ghastly sculpture offered to inspection, and the whole building is vapid and uninteresting to a degree, and quite unworthy the name of architecture.

It is with some pleasure we approach consideration of the last building that we propose to discuss, as we fear that this article may be considered tediously drawn out, though we might well have extended it still further by considering other buildings. The offices of the Government of Victoria (Australia) have an interest that may be mentioned in passing, namely, that they are the first erection on the waste land facing the Strand, the land made desolate by a costly scheme of improvement, for which the recoupment is being so long deferred. Mr. Alfred Burr, the architect, has produced a very architectural building, wherein a great deal of the expected effect lies dormant, pending the completion of the block by an eastward extension; in fact, these offices form but the narrow western wing of the whole scheme. The co-operation of Mr. Norman Shaw was invited by the London County Council, and his artistic powers are in evidence here as they are elsewhere in London, but the main credit is due to Mr. Burr. As the building is at present, the heavy cornice under the gable does not look well, but in the finished scheme it will serve to carry through the lines of the heavy entablature over a colonnade. Still, it would have been an improvement had the cornice been omitted here, for it is a misplaced feature as it stands; a light string-course would have been much better. Again, the arched window-treatment of the ground storey is of insufficient importance; in other words, it is not properly proportioned to the superstructure. But the whole conception is fine; and day by day, as we pass along the Strand on the way to our office, we eagerly scan the vacant site to see whether a board has been erected announcing the approaching erection of the centre and east wing of a block of buildings that will still further help to roll away from our country the reproach that we are but a nation of shopkeepers, with our eyes nailed to our ledgers and a soul dead to the claims of art.

## R.I.B.A. TOWN PLANNING CONFERENCE, OCTOBER 10 TO 15, 1910.

THE exhibition committee would be glad if architects and others possessing drawing or models illustrating town-planning design, which they would be willing to lend for exhibition, would send particulars thereof to the undersigned at as early a date as possible.

The space at the disposal of the committee being limited they are unable to accept illustrations of buildings other than such as have a definite connection with the subject of town planning.

John W. Simpson,
Secretary-General of the Conference,
9 Conduit Street, Regent Street, W.

## THE ILLUMINATION OF INTERIORS.

### LECTURE II.—LIGHTING BY GAS AND ELECTRICITY.

THE second lecture of a series on the "Illumination of Interiors," was given at the East London College (University of London) under the above title, by Professor J. T. Morris, M.I.E.E.

The lecturer stated that before coming to the subject proper, he wished to correct a mistake which had crept into the last lecture on the subject of "Daylight." The Trotter photometer used for the tests was graduated on the assumption that the light from all parts of the sky was the same. This is by no means the case, and from direct experiments carried out by the lecturer since the first lecture, he had arrived at the conclusion that the figures given last week for outdoor illumination should be divided by about five. This for instance, would make the maximum intensity of light on a bright summer's day of the order of 3,000 to 4,000 candle feet, not 17,000 to 18,000, given previously. Similarly the average ratio of inside illumination to external illumination should be about 0.01 instead of 0.002. Coming to the lecture proper the lecturer first summarised the methods of using gas and electricity in various types of lamps. Referring to the first method of illumination the lecturer pointed out the vital importance of calorific value. In testing a Keith high-pressure burner under identical conditions in East London and North London, the candle power in the latter case was over fifty per cent. more than in the former. On the question of intrinsic brilliancy (i.e., candle power per square cm. of illuminant), some interesting figures were given for different sources of light. Comparative figures were:—Arc lamps 16,000 candle power per square cm., Tungsten lamp 150, high-pressure gas 25, carbon filament lamps 16, &c. Anything more than, say, five is very trying to the eyes if viewed direct. Hence Tungsten lamps and high-pressure gas lamps especially should never be viewed directly. The question of fluctuation of source was next discussed, and a large number of figures and curves exhibited to show the variation of light on the electric railways and tramcars of London. This fluctuation, which is far greater than generally imagined, is much greater on some railways than others, and much worse where carbon lamps are used rather than metallic filament lamps.

Speaking of the general distribution of the light in a room a curve was exhibited from special tests, to show that in one case where an arc lamp was employed the effect of lowering the lamp was actually to decrease the light where it was most required, although the illumination immediately below the lamp was, of course, considerably increased. The final lecture of the series on "Petrol Air-Gas," by Professor C. A. Smith, B.Sc., will include a working exhibition of several plants by leading makers.

## MANCHESTER SOCIETY OF ARCHITECTS.

ON Saturday, June 11, nearly thirty members of the Manchester Society of Architects visited Peover Hall, near Knutsford, Cheshire, under the leadership of Mr. Isaac Taylor. By the courtesy of Sir H. S. Mainwaring, Bart., arrangements had been made for the members to be conducted through the Hall and adjoining buildings. The main portion of the Hall, a red brick building of Georgian date, is hardly an inspired piece of work, although it has a very simple and effectively treated staircase. The large Elizabethan wing, however, containing a huge kitchen and five upper rooms, is of the most delightful charm; the lovely colour of the old brickwork and stone, the fine stone mullioned and transomed windows, the grouping of the chimneys and sharply pointed gables, all contribute to an effect of the utmost beauty. It was this portion of the group of buildings that figured most prominently in members' sketch-books. The stables are extremely interesting, especially the earlier block containing Jacobean stalls sumptuously adorned with oak columns and the characteristic strapwork of the period. The adjacent church contains in the side chapels some fine tombs of the Mainwarings. Mr. Isaac Taylor was the leader.

On the Tuesday evening following, a large number of members visited Middleton, and inspected two elementary schools, by Messrs. Edgar Wood & Sellers, under the guidance of Mr. Sellers. While it is quite the usual thing nowadays to find elementary schools planned with every requirement and convenience, duly supplied with good lighting and proper aspect, it is rarely that one finds these qualities combined with so serious an attempt at fine architectural expression as in the case of the Elm Street and Durnford Street schools. At Elm Street the treatment of the entrance court, with groined cloisters at the sides and a semicircular sweep of low buildings in front of the central hall, and the striking treatment of the interior of the central hall and its fenestration are the outstanding features of a remarkable design, while at Durnford Street, where the plan is on more usual lines, the building towers up in great masses the dignity of which is immensely enhanced by the severity and restraint of the design.

## THE RESTORATION AND RECENT DISCOVERIES AT THE GUILDHALL, LONDON.

*(Concluded from last week.)*

CONSIDERABLE interest was taken by the Press and by the public in the discovery last autumn of the one and only original and complete window in the great hall. It has been stated that the discovery was "accidental," as if a plumber wanted to fix a waste pipe, and cut into the walling and found some fifteenth century work, but there was nothing in the slightest degree accidental about it.

The hall had just been cleaned, and you can now distinguish between old stone, new stone and cement with the greatest ease. Here is a slide showing the window in question and also the adjoining bay which has a blind arcade into which a bronze memorial has been fitted. The bay, at the back of which existed the window, presented an almost identical appearance; the centre portion was divided into three parts, but there was this difference, the mullions of the bay in front of the old window were of cement and those of the bay containing the statuary were of stone. At first I naturally thought that the stone work in one bay had been damaged by the Great Fire and made good in cement, the adjoining bay being taken as a model, but a close examination showed that the main moulding that runs around the opening has a perfectly smooth face at the points of junction with the tracery. Now, had the entire original tracery been stone, the moulding would, in all probability, have been rough and indented, showing fractures at those points. This was the first indication that there might have been no tracery when the building was erected. I followed up this idea by having a small hole 4 inches by 4 inches made at the side of the moulding; had the stone been embedded in the wall, and formed portion of a continuing wall, it would probably have been somewhat rough, and certainly would have had the return face at right angles to the main face. Instead of that it was smooth and splayed. This showed at once there was a recess of some sort in the original structure; the small opening was driven through until the jamb of the window appeared, then the whole of the brick and cement filling were removed and the window appeared as you see it on the screen. It seems that the window had twice been blocked out, for just inside it and at the back of the recess there had been fixed some wood framing; this had been lathed and plastered, and then at a subsequent date, in front of this lath and plaster work, the brick filling had been inserted so as entirely to block up the recess, and make the face level with the wall adjoining.

The recess opposite was treated in exactly the same way, but here the window was found much mutilated. I hope, however, it will be restored as soon as accommodation can be found for the occupants of the office at the back of it.

After the discovery I naturally referred to old plans and views. I find one window is shown upon a plan prepared about 1750, but there is no trace of a record of the other window.

With regard to the south window this has received further attention, and the brick wall on the outer side has been removed.

Without doubt this is an extremely interesting window. In the first place we find the two window seats, one on each side of the opening; these are frequently seen in early domestic work, and fine examples exist at Stokesay and Alnwick, but no examples exist as far as I know in ecclesiastical work.

The next thing to notice is the right-angled rebate formed for the shutters. A similar rebate exists in the windows in the crypt. At the lower portion of the window the old hooks can be seen on which the shutters were hung. There are no traces of any hooks to the upper part, so probably these lower shutters were about 2 feet 2 inches high; but apparently the upper part of each window had a movable shutter similar to those frequently fitted to shop windows; each of these rested on the hinged shutter below, and holes in the stonework above were probably used for the insertion of a wood shutter-bar. When we see stout stay bars and stanchions for protection the use of the shutter seems unnecessary, but we must also consider at the same time the glazing. In the western part of

## MODERN EUROPEAN ARCHITECTURE.

A COUNTRY HOUSE, GROSS LICHTERFELDE OST.—Herr Sepp Kaiser, Architect.

the crypt there are no signs of any glazing, and the shutters were necessary as protection in bad weather. But when we see, as in the great hall, a groove in the stone for glazing, stanchions and also shutter rebates, then it would seem that either originally there was no glazing and the shutters were necessary, and the glazing subsequently added, or else the shutters were used as we use blinds to-day.

Now with regard to the glazing, in 1422 the executors of the great Dick Whittington glazed some of the windows of the great hall, and also of the Mayor's court. In 1643 certain aldermen were instructed to examine the windows and have them destroyed if they considered "the pictures and figures in the glass windows within the Guildhall and Chappell idolatrous." This they considered they were, and they were destroyed. It is obvious that the windows had to be reglazed, and apparently some of the glass now in the window is the glass that was then fixed.

Only a portion of each light opened, this had an iron casement and frame; the remainder of the windows had the lead work fixed into a groove in the stone work. The iron latches, although very rusty are charming in design, and I believe they are the original fastenings that were fixed at the time the hall was first glazed. Each is fitted with a spring very similar to the thumb latch of a cottage door of to-day, and not much like a modern casement fastening.

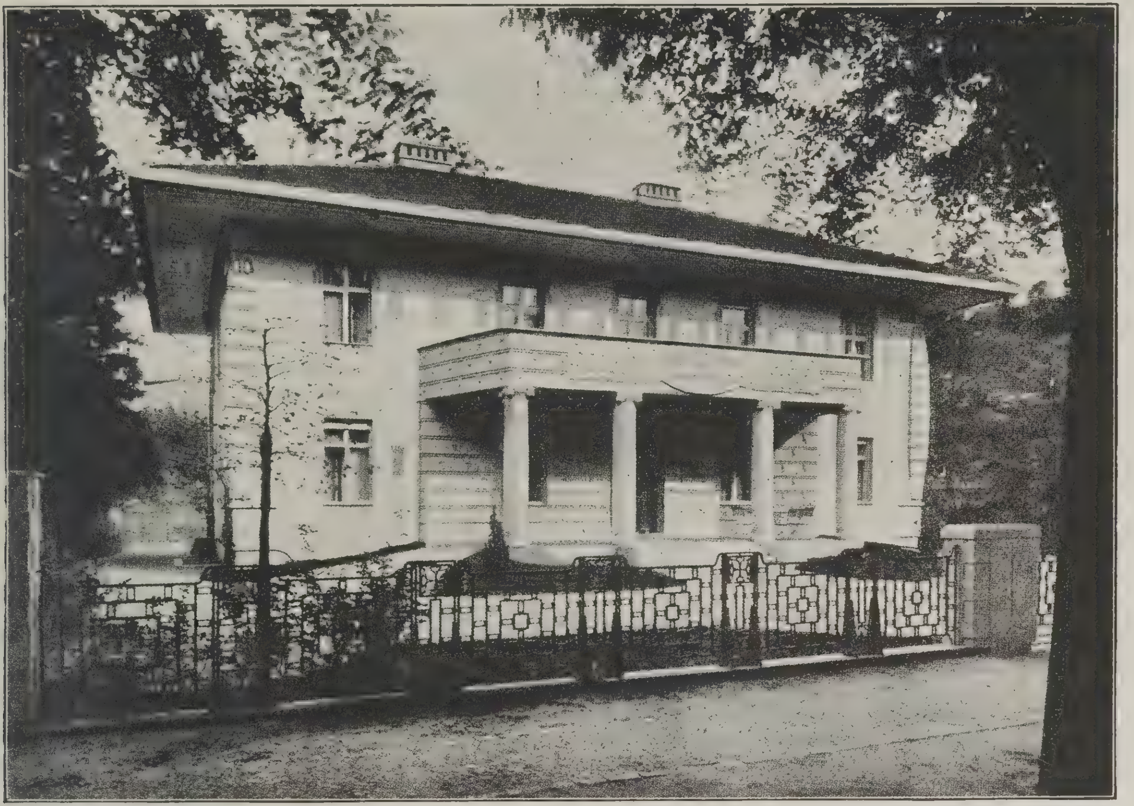
I stated at the commencement of my paper that the Guildhall was commenced in 1411, consequently next year is an important one in its history, for it is the quincentenary or 500th anniversary of its foundation. What would be a more fitting way of celebrating the event than by restoring the western portion of the crypt? We know that the scheme now in hand will add the eastern end to the museum and open it up free to the public, and this good work might be continued next year. It would have to be taken in hand with other alterations, as the western part is now occupied as cellars, furnace rooms, &c., but the scheme is quite practical.

I know you will be glad to hear that the members of the Corporation take the greatest interest in the building, and in the opening up of old portions. The committee dealing with the structure is known as the City Lands Committee, and is the premier committee of the Corporation. Last year Mr. W. H. Pitman was the chairman, and he visited the building constantly, coming up to London to meet me during August and September, and helping in every way the good work so dear to him. This year the work is being energetically carried on by the chairman, Mr. Deputy Painter, who took his committee over the crypt only a few weeks ago. Do not think past neglect implies future negligence. Every member of the Council is anxious to do the right thing, and no fitter motto could be quoted in conclusion with reference to the restoration than that of the Corporation, "Domine dirige nos."

The Chairman said he was sure they had all been exceedingly interested in the paper which Mr. Perks had read to them, and in the fine lantern slides which illustrated it. He felt Mr. Perks had combined in his paper very skilfully the study of old documents bearing on the subject of the old Guildhall, and, what was more important, the study of the actual structure, which, with his expert knowledge, he had managed to make very complete. Mr. Perks had certainly shown them that while Mr. J. E. Price was honest and very learned, he had made in his book various important mistakes. The speaker said he would like to say on the part of his old acquaintance that he felt a singular regard for his memory, and therefore he wished to state that Mr. Price was an enthusiastic antiquary who did much good work, but he was more particularly a student and expert on the subject of Roman remains. He wrote some interesting papers on Roman remains in London, but as regards the architecture of the Guildhall he was rather out of his element, because he was not a man possessing great knowledge of Gothic architecture. Still his book would stand as one of no small value. Mr. Perks, in his paper, had recorded some most important discoveries. One was the way in which he had worked out the dates of the two crypts—the eastern and western—and made them correspond with old documents. Fabyan spoke of the ancient Guildhall as a little cottage. Stow stated that it faced Aldermanbury; but Mr. Perks had worked it out that the building then would have been 229 feet long instead of 150 feet long as at present. The lecturer had also found out how the vaulting of the western crypt was built, and he had proved to most of them that the eastern and western crypts were of the same date, *i.e.* commenced in 1411. It was rather remarkable that the two should be so different in construction, but it was clear to the Chairman, he said, that the eastern crypt was an important sub-hall where particular meetings were held, and the western one was more in the nature of a cellar and not used as a place of meeting. One of the reasons which proved how much care was lavished and how important the eastern crypt was considered by the builders was the very fine approach given to it, and which Mr. Perks had

## MODERN EUROPEAN ARCHITECTURE.

### GERMANY.



[From *Berliner Architekturwelt.*

A COUNTRY HOUSE, GROSS LICHTERFELDE OST.—Herr SEPP KAISER, Architect.

opened up. The approach from the south had a fine door with niches on each side and stone steps down to the floor of the crypt. While Mr. Perks had studied with very great care those two little turret staircases and had discovered several interesting things about them, yet everything had not been explained, but very likely in the course of time he would find out more about them. They were grateful to the author for those interesting discoveries. He had also found the passage to the north which led from the crypt to the hall. Mr. Perks had not said much about the admirable work he was doing in the east crypt, which would restore the building very much to the state it was in soon after it was built. One of the results of his labours, with the co-operation of the City Fathers, was that there was a very good prospect in the near future of the crypt being made easily accessible to the public. With regard to the hall, Mr. Perks had done excellent work in removing the thickness of cement which had so modernised it, and had made him feel, as the author himself had felt, that it was not genuine. That had been the belief of a great many people, and they had not inspected the building with interest because it appeared to be almost a modern one. The author, by his work, was giving the hall a far more agreeable appearance and was adding interesting facts of the history of the building. They could see the action of the Great Fire, and also where the new masonry begins. A few years ago, he believed it was in 1903, they would remember the crypt of the religious house of the Blackfriars was unearthed, and he saw distinctly the action of the fire on the masonry; he chipped off a piece of the stone and found that the fire had penetrated it and discoloured it to the depth of an eighth of an inch. In the other discoveries in the hall the interest was enhanced by the discovery of the window on the south, and of a corresponding window on the north side, which, however, was not in such a good state of preservation. Mr. Perks had quite proved that the glazing and the fittings of the south window dated from 1643, immediately on the destruction of the windows which dated probably almost from the time of Whittington. As regards the stone, Mr. Perks had found examples of the stone flooring, and he showed a piece of Purbeck—green Purbeck, the speaker supposed it was—which had formed a part of the flooring of the hall, which they knew was done immediately after the time of Whittington. It was interesting to recall the fact that when Crosby Hall was pulled down a flooring of green Purbeck was found immediately below the wooden planking which had been put on in modern times. The date of the Guildhall specimen was 1411, and onwards; he imagined it was finished in 1413, while in the case of Crosby Hall it was considerably later, as the building was not begun until 1466. Mr. Perks had referred to six interesting allegorical statues on the porch which disappeared in 1782. From what he read about them they seemed to have been of great interest, and there was an admirable drawing of them in the Gardiner collection. Originally above these six statues was a statue of our Saviour, and William Elderton, a sixteenth century versifier, wrote rhymes about them:—

> "Where Jesu Christ aloft doth stand,
> Law and learning on either hand."

He trusted that Mr. Perks would be able to trace those statues, but he was very much afraid he would fail to do so, because various inquiries had been made with regard to them from time to time, and it seemed as if they had entirely disappeared. In conclusion the Chairman said he was sure all present were extremely pleased to find that Mr. Perks had done such admirable work, and they felt certain that, with the kind co-operation and help of the City authorities, he would be able to bring it to a successful termination.

Mr. Deputy PAINTER (Chairman of the City Lands Committee) said the members of his committee were anxious to do all they could to assist the surveyor in the work he was carrying out so well. He hoped the public would take the opportunity towards the end of June of visiting the crypt, the great hall, and the staircases, because he was sure if they did so they would be deeply interested and would go away with a remembrance which would last for many years. He was pleased to hear Mr. Perks refer to the great disfigurement of the fine stone canopy by the wooden one, which would look well in many places, but not in the Guildhall. They had had a part of it taken down, and most of those who were present on the occasion were very pleased with the effect produced. On account of the expense they did not do more, but he hoped the work would soon be recommenced, because he was sure they would all be delighted to see the fine stone canopy with some good arras hanging beneath it. It was also one of his ambitions to see the west end of the crypt restored, the groining taking the place of the present brick arches.

Mr. W. H. Pitman sympathised with what had been said with regard to the disfigurement of the stone canopy at the eastern end of the hall. It should be hung with arras in the old way, but London smoke was rather a difficult thing to deal with, and he was afraid beautiful tapestry in such a position would not last or preserve its colour. He was sure, however, that the City Lands Committee would take the matter into consideration, because it was their great desire to make the hall as beautiful and perfect as they possibly could on the old lines. Since the author came to the Corporation as surveyor a few years ago he had proved himself to be a man in whom they could repose the utmost confidence, and he had no doubt Mr. Perks would see the matter successfully through.

On the motion of the Chairman a vote of thanks was passed to Mr. Perks, and the meeting terminated.

## OUR CONTEMPORARIES FROM OVER-SEAS.

The *American Architect* (New York) continues the series of articles on "The Origin and Development of Furniture," by M. Stapley, who now treats of Greek and Roman work. The illustrations this week are of two country houses in Pennsylvania, by Mr. Wilson Eyre, which are examples of picturesque simplicity.

*La Construction Moderne* (Paris) illustrates a country house, "Le Clos de l'Archer," at Meulan, by M. Edmond Uhry, and a new church at Bures, of which M. Wilfrid Bertin is the architect, neither of which are extraordinarily beautiful.

*Moderne Bauformen* (Stuttgart) gives us this month examples of modern architecture in and around Hamburg, of course all "new art," and principally the work of Herr Emil Schaudt, of whose designs the most fully illustrated is the building of the North German Insurance Company.

*Zodtchy* (St. Petersburg) contains some excellent views of the Polowzow mansion at St. Petersburg, as well as other good examples of modern Russian architecture.

*Engineering Record* (New York) gives an account of a peculiarly American piece of building operation, the removal bodily of a brick wall 23 inches from its original position. The wall was 150 feet long, 16 feet high, and 21 inches thick, and the removal was carried out at a cost of less than half that of pulling down and rebuilding. The construction is described of the large reinforced concrete grand stand at the Minnesota State Fair race track, St. Paul, which will have a seating capacity of about 30,000.

## Correspondence

*[The Editor will not be responsible for the opinions expressed by Correspondents.]*

### Students' Drawings at the Architectural Association.

Sir,—I have read with much interest the article published in your issue of June 17, on the students' drawings at the Architectural Association, and desire to point out some errors. It is to be regretted that your reviewer did not acquaint himself with the conditions governing the prizes before making statements which are calculated to give a wrong impression. In the first place, the conditions governing the Travelling Studentship prevent students who have passed through the day and evening school course from competing unless they happen also to have attended the Advanced Class of Design, a very unlikely contingency. As a matter of fact in the Travelling Studentship, Silver Medal, and Henry Saxon Snell Scholarship, there are in all only three competitors who passed through the day and evening schools.

In the Measured Drawings prize, on the contrary, upon which your reviewer commented very favourably, the winner of the Fletcher Bursary, Mr. B. F. Matthews, and the other competitor, Mr. Flint Clarkson ("Jointings"), both completed the four year course last year, and I am doing them no injustice when I say that neither of them was a scratch man as far as draughtsmanship was concerned, when in the school.

With regard to the Architectural Union Company's prize, the winner, Mr. P. D. Hepworth, whose very fine set of drawings you commend, is now in the fourth year, while of the three others mentioned by your reviewer, two completed the four year course last year.

It is a fact, therefore, that the work which your reviewer praised was the work of past or present members of the school, while that which he compared unfavourably with former years was the work of men who have not been through the school. Instead of the school course encouraging students to compete too early, it is evident from the foregoing facts that our students have in the first place contented themselves with the continued study of ancient buildings.

It is, I think, quite clear from the above that the criticisms made in the review in question are not based upon ascertained facts, and the bogey set up in the opening sentence is unconsciously killed by the writer's subsequent observations.—Yours faithfully,

Edwin Gunn, Hon. Secretary.

18 Tufton Street, Westminster, S.W.: June 21, 1910.

### Ashbins versus Ashpits.

Sir,—If "Cleanliness" will preserve his theoretical predilection for the bin, he will be well advised. One must not settle the merits or demerits of any system by consideration of chance benefits or defects, but by means of the general results. This being so, there is no doubt that the sanitary portable dustbin inaugurated an era hygienically in advance of that controlled by the ashpit.

It is, I believe, generally understood that garden refuse and spring-cleaning rubbish are not of necessity removable by the local authority, but my own experience is that a courteous request to the surveyor to send specially for removing discarded treasures, such as spring-cleaning connotes, will secure favourable attention. The practice as to removal of refuse is dependent upon the particular local authority. Here the clearance is weekly, elsewhere bi-weekly, in the City of London and other busy centres daily. In some districts the tenants are instructed to place their bins outside ready for clearance; elsewhere the carters themselves fetch and return the bins. Surely local authorities are not to be blamed if householders allow refuse to accumulate in their yards. There is no practicable Act of Parliament conceivable that can render people hygienically perfect.—Faithfully yours,

June 20, 1910. Mens Sana.

Sir,—In answer to "Cleanliness" I would reply as follows:—

1. The ashbin, most certainly.
2. Generally speaking no objection is raised, and two bronze coins of the realm, value 1*d.*, will go a long way.
3. Yes; if there is trouble apply to the surveyor.
4. Yes, certainly; in reason.
5. On this point I am not quite clear, but I believe that a law exists, and the only way the local authority can object is by showing that the rubbish is in the way of "trade refuse," when a charge can be made. See the case of the Westminster Corporation and one of the hotels.
6. I believe at least once a week.
7. I quite agree on that point with "Cleanliness."
8. Try the medical officer of health. I know of no law by which you may not burn your rubbish.
9. "Cleanliness" is quite right; I believe some authorities do. A little quiet talk with the local surveyor would possibly get over the difficulty; and buy another ashbin, "Cleanliness."—Yours, &c., E. S.

London: June 20, 1910.

Sir,—Every week I read with much interest your valuable paper from beginning to end, and was much amused at an item in the issue of June 3, relating to the insane conditions local authorities often impose upon would-be candidates for posts they advertise as being vacant under them. A letter in your issue of to-day, asking for information relative to "house refuse," brings the ludicrous offer of the Ruthin local authority (viz., 80*l.* a year for an officer with requirements such as they enumerate, who should be worth at least 250*l.* per annum) back to my mind. I wonder if they elected the candidate who was willing, amongst other duties, to help collect the house refuse. Surely they would not have allowed such a chance to slip. I am afraid I cannot answer the question of "Cleanliness" myself, but here is a glorious chance of learning what "house refuse" is. I strongly advise him to write to "The Surveyor and Sanitary Inspector of Ruthin" (for I feel sure the authorities must have elected ere this so desirable an officer), and he will, I should think, be able by now to tell "Cleanliness" what "house refuse" consists of in Ruthin, and he can then form an opinion. No doubt he will get plenty of answers, but perhaps, Sir, you will be kind enough to allow him to receive mine through your valuable columns.—I am, your obedient servant,

London: June 17. A Weekly Reader.

## NOTICE TO ADVERTISERS.

**Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.**

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

## TENDERS, ETC.

*** *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

## COMPETITIONS OPEN.

WALES.—Jan. 17.—For erection of a cottage hospital at Pontypridd. Deposit 2*l.* 2*s.* Messrs. A. O. Evans, Williams & Evans, architects, Pontypridd.

WALES.—Jan. 20.—For the extension of Bethany English Baptist Chapel, Treherbert, Rhondda Valley. Mr. W. D. Morgan, M.S.A., architect, 194 Ystrad Road, Pentre.

WALES.—Jan. 21.—For erection and completion of three houses at Pentre. Mr. W. D. Morgan, M.S.A., architect, 194 Ystrad Road, Pentre.

WIGMORE.—Jan. 13.—For new floors, partitions, dual desks, and ventilating hoppers in windows, &c., at the Walsall and West Bromwich District schools, Wigmore, West Bromwich. Mr. J. W. Allen, architect, High Street, West Bromwich.

WOOLWICH.—Jan. 19.—The Council of the Metropolitan Borough of Woolwich invite tenders for painting and repairs at the Public Library, High Street, Eltham. Mr. J. Rush Dixon, M.I.C.E., borough engineer, Town Hall, Woolwich.

WORKINGTON.—Jan. 14.—For the demolition of the Queen's Arms and adjoining cottages, King Street, and rebuilding of the inn on the site. Mr. Edwin J. Knight, secretary and manager, Messrs. Thomas Salt & Co., Ltd., brewers, High Street, Burton-on-Trent.

YORKSHIRE.—Jan. 10.—For the following works for the East Riding of Yorkshire education committee, viz. :— (*a*) Erection of a Council school to accommodate 133 children, and teacher's house, at Stamford Bridge ; (*b*) alterations and additions to the Council school at Burton Pidsea. The Building Surveyor, County Hall, Beverley.

MR. J. R. FINDLAY, burgh surveyor, Leith, in his annual report, states that depression in the building trade still continues, although the year just closing shows a slight improvement on the previous two years. The estimated value of buildings for which warrants were granted was 61,272*l.*, as compared with 56,200*l.* in 1908, 58,674*l.* in 1907, 179,000*l.* in 1906, and 92,000*l.* in 1905.

THE WOOD TRADE OF DANTZIG.—The British Consul at Dantzig reports that, in spite of low freights, the position of those engaged in the wood trade in 1908 was worse than it has been for some time past. There are many explanations of this state of things. In the first place, in spite of the reduced bank rate, Dantzig banking firms have become alarmed by the large failures of the year before, and were exceedingly cautious in giving credit to timber merchants. Among other causes of depression, the strike in the British shipbuilding trade was of importance, several orders that had been expected being after all not placed on account of it. Perhaps, however, the simplest reason for slackness of business was that the railway companies, both in Germany and other countries, finding their takings reduced through diminished traffic, were obliged in consequence to restrict their usual orders for redwood timber, timber ends, and sleepers. The supply of sleepers was, in fact, smaller than in 1907, the large stocks remaining over from that year having caused a fall in prices which discouraged foreign timber merchants from sending their wood to Dantzig. It is, moreover, to be noted that the Russian home demand for wood is constantly on the increase, and this no doubt contributed to a shortage in the Dantzig supply. The condition of the building trade further aggravated the situation. Where any activity for a time prevailed, the competition to supply materials became so keen that falling prices ruled everywhere. In every branch of the wood trade, in fact, the prices had a downward tendency, and were in some cases actually lower than the original cost of production. One satisfactory fact may, however, be noted. The year 1908, though a bad one, was at the same time free from any violent crisis, such as that which was seen the year before. No failures were reported.

# TENDERS.

## CHESTER-LE-STREET.

For making up 15 private streets at Birtley for the Chester-le-Street Rural District Council. Mr. G. W. AYTON, surveyor.

Jos. Burnett & Son, section 1 (*accepted*), 871*l.* 2*s.* 8*d.* ; section 2, 524*l.* 7*s.* 8*d.* ; drains, 113*l.* 19*s.* ; J. W. Henderson, section 1, 894*l.* 11*s.* 6*d.* ; section 2, 429*l.* 14*s.* 8*d.* ; drains, 113*l.* 3*s.* (*accepted*). Geo. E. Simpson, section 1, 922*l.* 18*s.* 5*d.* ; section 2, 451*l.* 0*s.* 5*d.* ; drains, 122*l.* 10*s.* J. W. White, section 1, 960*l.* 15*s.* 10*d.* ; section 2, 435*l.* 7*s.* 2*d.* ; drains, 122*l.* J. Thompson & Son, section 1, 970*l.* 17*s.* 10*d.* ; section 2, 514*l.* 17*s.* 8*d.* ; drains, 141*l.* 7*s.* 6*d.* J. Carrick, section 1, 1,033*l.* 14*s.* 6*d.* ; section 2, 529*l.* 10*s.* 6*d.* ; drains, 94*l.* 4*s.* 3*d.* R. Hudson & Sons, section 1, 1,078*l.* 2*s.* 11*d.* ; section 2, 512*l.* 12*s.* 11*d.* ; drains, 126*l.* 18*s.* J. Hope, section 1, 1,099*l.* 10*s.* 2*d.* ; section 2, 544*l.* 2*s.* 8*d.* ; drains, 128*l.* 16*s.* 1*d.* J. W. Robson, section 1, 1,099*l.* 17*s.* 5*d.* ; section 2, 464*l.* 2*s.* 3*d.* ; drains, 127*l.* 2*s.* 2*d.* Geo. Pickering, section 1, 1,123*l.* 19*s.* 6*d.* ; section 2, 483*l.* 8*s.* 4*d.* ; drains, 132*l.* 16*s.* 8*d.* J. Clark & Son, section 1, 1,154*l.* 3*s.* 2*d.* ; section 2, 475*l.* 1*s.* ; drains, 114*l.* 5*s.* 5*d.* C. S. Bunch, section 1, 1,192*l.* 12*s.* 11*d* ; section 2, 526*l.* 11*s.* 8*d.* ; drains, 124*l.* 7*s.* 9*d.* It was decided to let the work in two sections, and the surface water drains to go with each section according to schedule of prices.—N.B.—Burnett accepted for section 1 ; Henderson accepted for section 2.

| Knell & Sons, Weymouth (*accepted*) | 130 | 10 | 0 |

---

Mr. A. D. Rowe, architect to the Worcestershire County Council and standing, joint and education committees, died last week from heart failure. Mr. Rowe and members of the family have designed many important buildings in the city and county.

Mr. R. T. Blomfield, A.R.A., will commence his Royal Academy lectures on architecture on February 14. The titles of the four lectures are as follows:—(1) Philibert de l'Orme; (2) Jean Bullant; (3) Pierre Lescot and Jean Goujon; (4) French Sculpture in the Sixteenth Century. The lectures on painting will this year be given by Sir W. B. Richmond, R.A., K.C.B., who held the Professorship from 1895 to 1899. His course is entitled "Design and Drawing," and begins on January 13. Mr. W. R. Colton, A.R.A., will again lecture on sculpture.

A new synagogue is to be erected in Commercial Road, E., to accommodate a thousand persons, in place of the synagogue in St. Mary Axe. The joint architects are Mr. Lewis Solomon, F.R.I.B.A., and Mr. Fred Marks, F.R.I.B.A.

The York Corporation have approved the race committee's plan for new stands, subject to the owners undertaking, at their own cost, to test one bay of the stands with a load of 2 cwt. per foot super; such test to be carried out in the presence of, and to the satisfaction of, the City Surveyor or his representative, and prior to the building being brought into use by the public.

Messrs. Lever Brothers, Ltd., of Port Sunlight, have decided to establish a factory at Durban, Natal. Estimates have been received and considered, but the ultimate dimensions of the factory will depend on the growth of the business in South Africa. Building operations will be commenced as soon as possible.

# TENDERS FOR THE YEAR 1909.

THE following are a few of the more important works of which the tenders appeared in our columns in the course of 1909:—

## R.I.B.A. PASS LIST.

### THE NOVEMBER EXAMINATIONS.

### *The Preliminary.*

THE preliminary examination, qualifying for registration as Probationer R.I.B.A., was held in London and the undermentioned provincial centres on November 8 and 9. Of the 123 candidates admitted, claims for exemption from sitting for the examination were allowed to the number of thirty-five. The remaining eighty-eight candidates were examined, with the following results:—

| District. | Number Examined. | Passed. | Relegated. |
|---|---|---|---|
| London | 46 | 26 | 20 |
| Birmingham | 4 | 3 | 1 |
| Bristol | 7 | 5 | 2 |
| Cardiff | 3 | 2 | 1 |
| Glasgow | 3 | 2 | 1 |
| Leeds | 6 | 5 | 1 |
| Manchester | 16 | 8 | 8 |
| Newcastle | 3 | 3 | 0 |
| | 88 | 54 | 34 |

The eighty-nine passed and exempted candidates, who have been registered as Probationers, are as follows:—Samuel William Ackroyd, Walter Alwyn Cole Adams, Walter Alison, Samuel Norman Anglin, Eric Langton Apperly, John Llewellyn Arthur, John Sidney Ashbolt, Philip Hope Edward Bagenal, Charles Bell, Albert William Betts, Sohrab Keikhosru Bhedvar, Charles Kydd Blyth, Frederick Eckersley Boddington, Frank Arthur Broadhead, Percy Norman Brown, Robert Stanley Cobb, Charles Reginald Cook, Harold William Court, Enos James Crabtree, Harry Ewart Crossland, John Spedding Curwen, Thomas Daly, Frank Twydale Dear, Harold Alfred Dod, Benjamin Donaldson, William James Donger, Hywel Carey Edmunds, Sidney James Edwards, Reginald Percy Farr, Donald Fletcher, Walter Ernest Fox, William Hubert Godwin, Stacey Gratton, Hubert Gregory, Thomas Cressey Hamilton, Stanley William Harman, Gordon Hemm, Ernest James Hickman, Harry Armitage Hickson, Frank Holroyd, Alfred William Horton, Sydney Hoten, Arthur Hunter, John Alfred Barnes James, Rees Jones, Walter John Knight, Clifford Herbert Le Grice, Hugh Lennox, Glyndwr Morrison Lewis, Sidney George Lipscomb, Horace Edgar Litten, Duncan St. Clair MacPhail, John Ewart March, Dario Marcucci, Joseph Moore, Raisley Stewart Moorsom, Cyril Savage Morley, William Noel Jobson Moscrop, Walter Norris, Thomas John Orme, Edgar Mainwaring Parkes, Abdulla Bhanji Peermahomed, George Wallace Proffitt, Stantislaus Roarty, Graham John Robinson, Walter Rogers, Andrew Laurence Noel Russell, John Seymour Sawer, Thomas Edwin Thornton Shanks, Cecil George Simmons, Arthur Smith, Thomas Retford Somerford, Thomas Tearle Stevens, John Alexander Chisholm Taylor, William Richard Templar, Cedric Maurice Teulon, George Thomas, William Norman Thomas, Harris Stephens Triscott, Harold Frederick Walker, Henry Welch, Archibald John West, Frederick Ernest Williams, John Gerrard Williams, Henry Roehead Williamson, Kenneth Mark Winch, Ronald Winter, Norman Frederic Woodroffe, Charles Edmond Worthington.

### *The Intermediate Examination.*

The Intermediate Examination, qualifying for registration as Student R.I.B.A., was held in London and at the undermentioned provincial centres on November 8, 9, 11, and 12. One hundred and eight candidates were examined, and the results are reported as follows:—

| District. | Number Examined. | Passed. | Relegated. |
|---|---|---|---|
| London | 69 | 35 | 34 |
| Bristol | 5 | 2 | 3 |
| Cardiff | 4 | 2 | 2 |
| Glasgow | 3 | 2 | 1 |
| Leeds | 10 | 4 | 6 |
| Manchester | 11 | 5 | 6 |
| Newcastle | 6 | 1 | 5 |
| | 108 | 51 | 57 |

The names of the successful candidates are as follows, in order of merit, as placed by the Board of Examiners:—

Frank Wardel Knight, William Arthur Rutter, Edward Ralph Douglas Selway, Bernard Wardlaw Habershon Scott, Harry Dawber Holland, Harold Layton Robinson, Kenneth Stephen Broad, David James Moir, Harry Duncan Hendry, James Grey West, William Wylie Houston, William Brighten Rise Morley, William Voelkel, William Henry Gunton, Ernest William Pedley, Horace Vincent De Courcey Hague, Alec Lowe Macmillan, John Seymour Knyvett, Reginald Shears, Stanley Russell Miller, Albert Henry Owen, Arthur John Knott, Frederick Bayliss Nightingale, Harry Bradley, Walter Llewellyn Clark, Henry Colbeck, Robert Stephen Cowper, Joseph Charles Gladstone Davies, Charles Glynn Evans, Richard William Furniss, Stephen Langton Clowes Gilks, Montagu Ashley Hall, George Farncombe Hallett, Samuel Harrison, Bernard Jessop, Arthur Bedford Knapp-Fisher, Cecil Howard Lay, Robert Lowry, Cyril Frederick Martin, Theodore Nelson Newham, Travers Pickmere, Claud Boileau Reid, Arthur Rylatt, Charles Alfred Smeed, Merwanjee Framjee Surveyor, Arthur Edwin Vey, Richard Walker, Herbert Archibald Welch, Thomas Gustavus Whitehead, John Wilks, Frederick Charles Wylde.

### *Exemptions from the Intermediate Examination.*

The following candidates, who had attended the architectural courses and obtained first-class certificates at the schools of architecture of the institutions mentioned against their names, were granted exemption from sitting for the Intermediate Examination, and have been registered as Students R.I.B.A.:—

Robert William Cable (*P.* 1905), (Architectural Association); George Flint Clarkson (*P.* 1905), (Architectural Association); Harold Alfred Dod (*P.* 1909), (Liverpool University); Cyril Arthur Farey (*P.* 1906), (Architectural Association); Alan Vincent Sutherland Graeme (*P.* 1906), (Architectural Association); Guy Donne Gordon Hake (*P.* 1904), (Architectural Association); Leonard Keir Hett (*P.* 1904), (Architectural Association); Geoffrey Wyville Home (*P.* 1905), (Architectural Association); Thomas Anthony Jones (*P.* 1908), (University College, London); Arthur Louis Levy (*P.* 1905), (Architectural Association); Thomas Arthur Lodge (*P.* 1906), (Architectural Association); Bernard Frank Matthews (*P.* 1905), (Architectural Association); Richard Mountford Pigott (*P.* 1905), (Architectural Association); Charles Edward Fellowes Prynne (*P.* 1905), (Architectural Association); Alfred Douglas Robinson (*P.* 1907), (Architectural Association); Francis Harold Swindells (*P.* 1905), (Architectural Association); Edwin John Tanner (*P.* 1906), (Architectural Association); Charles Voysey (*P.* 1906), (Architectural Association).

### *Final and Special.*

The Final and Special Examinations, qualifying for candidature as Associate R.I.B.A., were held in London from November 18 to 26. Of the 114 candidates examined, forty-three passed, and seventy-one were relegated to their studies. The names of the passed candidates are as follows:—

John Cooper Ainsworth, George Luard Alexander, John Gordon Allen, Robert Atkinson, Josiah Auty, Quentin Mangnall Bluhm, Arthur Francis Bryan, George Herbert Burstow, Richard Thwaite Chapman, Edward Ernest Blunt Claypole, John Adam Davidson, Claude William Davis, Harry Alderman Dickman, Alexander Houston Douglas, Percie Ion Elton, Edwin Finn, William Goodchild, Leonard Rome Guthrie, Noel Waugh Hadwen, Charles Ernest Hanscomb, Robert Edwin Hastewell, Frederick George Hawkins, Francis Henry Hepple, Henry Clifford Hollis, William Charles Maxwell, William Milburn, jun., Arthur Hamilton Moberly, Joseph Fearis Munnings, Robert Wright Orme, Francis Osler, James Page, David John Roberts, William John Roberts, M.A., George Henry Rowledge, William Henry Sagar, Hugh Henry Scott-Willey, George Marrison Stone, Charles Stonehouse, Morris Thompson, Francis Gordon Troup, Vivian Ware, John Woollatt, Cecil Laurence Wright.

The following table shows the number of failures among the seventy-one relegated candidates in each division of the Final Examination.

| | | |
|---|---|---|
| I. | Design | 51 |
| II. | Mouldings and Ornaments | 61 |
| III. | Building Materials | 15 |
| IV. | Principles of Hygiene | 20 |
| V. | Specifications | 27 |
| VI. | Construction, Foundations, &c. | 33 |
| VII. | Construction, Iron and Steel, &c. | 22 |

### *Colonial Examinations.*

The following candidates passed the Colonial Intermediate Examination held in Sydney, November 1908:—

Royston John Keith-Harris, Stanislaus Roarty.

The following candidates passed the Colonial Special Examinations qualifying for candidature as Associate R.I.B.A. held in Sydney last June:—

Hartley Sutcliffe, Edward Alexander Taylor.

The following candidate passed the Special Examination held in Johannesburg in July last:—

Walter John Beall.

## CALENDARS, DIARIES, &c. FOR 1910.

Messrs. Merryweather & Sons, Ltd., as makers of fire appliances for all over the world, are entitled to have the mount of their hanging calendar in a striking "fire" red. Interleaved with the months are illustrations of a few of their apparatus, including a steam motor cesspool exhauster, an electric motor and Hatfield pump, turn-table fire escapes, &c. Messrs. Spottiswoode & Co., Ltd., printers, mean their calendar to be strictly for use rather than for ornament, or, to look at the matter from another light, the space is used solely for showing the dates in big numerals. A brightly coloured sketch of a local Indian railway station serves as a heading for that of Messrs. Peckett & Sons, the Atlas Locomotive Works, Bristol. A calendar setting forth the virtues of "Duresco" ought to be artistic, and this has been realised by Messrs. James Duthie & Co., Glasgow, agents for Scotland, who have produced a very dainty setting to the months of the year. The obvious advantage of a block calendar is that the numerals can be made sufficiently big to be seen at a distance; in that of Messrs. Ashwell & Nesbit, Ltd., for example, the numerals are seven inches high. There is also room for a Shakespearean quotation for every day in the year.

The twenty-eighth annual issue of the "Sanitary Record Year-book and Diary" is full of useful information for medical officers, sanitary engineers, and others. It includes, amongst other things, a short digest of the sanitary legislation of 1909, the Government departments with their officers, a very complete explanatory list of the numerous societies connected with sanitary matters, and useful memoranda for sanitary engineers and surveyors. The bulk of the book is devoted to the diary, interleaved with blotting-paper, and which gives reminders of local government duties.

"The Practical Electrician's Pocket-book and Diary" (London: S. Rentell & Co., Ltd., 1*s.*) is, of course, more pocket-book than diary, in as far as 350 pages are occupied with a closely printed epitome of the subject, while the diary portion is dismissed in fifty-two. But it is for the former that the book has won so much popularity among its subscribers. As usual, the wonderfully diverse contents have been subjected to careful revision by specialists in each particular branch. Among the sections which have received drastic treatment are those dealing with gas, oil and petrol engines, polyphase machinery, osram and tantalum lamps, time switches, &c., whilst additional matter treats of the Siemens O.S. wiring system, auto-transformers, instructions to chargemen, and other subjects.

Messrs. Hudson & Kearns, Ltd., have forwarded to us four of their valuable diaries. No. 9, the smallest, is for universal use; it deals, however, with such special subjects as land registration, London building regulations, law cases, lists of district surveyors and professional bodies, stamp duties, and much else. No. 11 is "The Builder's Diary," and has, in addition to all the above, a rent, insurance and mortgage register, a cash book, a hundred pages of tables, as well as a wages table and a weekly wages table on the fifty-four hours' scale. Nos. 12 and 13 are "The Architect's Diary"—an invaluable adjunct to the professional man. In No. 13, which is the larger of the two, two pages are devoted to each day; one is devoted to the record of appointments made and business transacted, the other to cash items, so that all the entries made on one day face one another. It is followed by a summary of cash transactions, a few pages for notes, register, and twenty-five ledger pages. All the above is in addition to information of special use to architects. Both of the diaries may be obtained fitted with a lock and key.

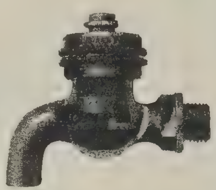
## TRADE NOTES.

Messrs. Arthur L. Gibson & Co. are now well-established at their new factory by the riverside at Strawberry Vale, Twickenham, of which a descriptive account will shortly appear in these pages. To cope with their steadily growing business and for purposes of greater convenience the firm have removed their offices and warehouses also from Tower Street, W.C., to the new Radnor Works at Twickenham, to which they desire that all communications be now sent.

At the annual meeting of the British Uralite Company the Chairman announced that the sales of the company's materials had increased by 21 per cent. during the period July 1 to December 31, 1909.

The extract from the camphor tree is universally known for its medicinal qualities. The tree is now put to other uses as well, for the wood is really a most excellent material for flooring boards and blocks. Of how many varieties of timber now imported can it be said that lengths up to 30 feet are free from knots? But this is true of camphor wood. Possessing the qualities of teak without its expense, this wood is also a germicide, and therefore peculiarly fitted for hospital work. It is also free from that bugbear dry rot. A fine sample has come to us from the China Borneo Company, Ltd., 5 Whittington Avenue, E.C., who state that they have a large assortment of sizes in stock for immediate delivery.

Among the "novelties" of the last Building Trades Exhibition was the tap exhibited by Garratt's Patent Screwdown Valve Company. This patent, as may be remembered, replaced the usual screwed spindle and jumper, with its troublesome washers, by a piston which is raised or lowered in turning the strong coarse screw of the cap. The chances of the tap getting out of order are so minimised as to become almost negligible. In the past few months the company have received many testimonials. A typical one came two or three weeks ago from a civil engineer who fitted twenty-three in his house, and who says after six months' use "they are all giving complete satisfaction. I have them fitted to both hot and cold taps, to all my sinks, both my baths, all my lavatory basins." As "seeing is believing," the Garratt's Patent Screwdown Valve Company are willing to send a sample tap free of charge to any architect, engineer, or builder who applies to their city offices at 11 Queen Victoria Street, London, E.C.



An important book for builders, contractors, and manufacturers is Oxborrow's Combined Order, Prime Cost, Charges to Customer and Summary Book. The system employed is easy to keep, absolutely reliable, and is invaluable to all firms whose business may consist largely of repairs and jobbing work. Many a good paying business has been ruined by the overlooking of small items in charging up items which may turn a job from loss to profit; by the use of this system this is impossible. The cost of the work is only 5*s.* 6*d.*, and may be obtained from Cockayne & Co., Ltd., 185 Walworth Road, London, S.E.

When a firm like Messrs. Chubb & Sons see fit to put a new patent upon the market it may be safely inferred that the novelty is worth serious examination. Their latest lock is called the "Disc" lock, and it is of the springless class. The makers say that the form of construction being simple it allows of the rapid production of the parts by their expensive plant at Wolverhampton, so that the locks are offered at low prices. As the mechanism of the locks consists of nothing more than a number of independent and differently cut discs, an infinite number of variations is obtainable. The "Disc" lock is sold as affording exceptional security, and no greater guarantee can be given by Messrs. Chubb & Sons' Lock and Safe Company, Ltd.

## VARIETIES.

The pier at St. Leonards is to be lengthened at a cost of 17,000*l.*, to facilitate the steamer traffic.

About forty-eight workmen's houses, a large model lodging-house, and two restaurants are to be built at Kinlochleven for the use of the British Aluminium Company. The contractors are Messrs. M'Lauchlin & Harvey, Belfast, who built most of the new town of Kinlochleven.

A technical institute is to be provided at Ponders End, N., at an estimated cost of 6,600*l.* The Middlesex County Council will contribute 4,400*l.*, the Enfield District Council 1,700*l.*, and the War Office 500*l.*

The Court of Arbitration appointed by the Board of Trade to consider the differences between the Glasgow Master Plasterers' Association and the Glasgow District of the Scottish National Operative Plasterers' Federal Union met last week in the Building Trades Exchange, 67 Hope Street, Glasgow. The matters in dispute were a demand by the employers for a reduction in wages of ½*d.* per hour, and a demand by the operatives for a limitation of apprentices. After hearing evidence on the wages question, the Court decided that the employers had failed to prove their case, and the operatives, without prejudice, withdrew their demand for limitation.

A work of considerable importance to all interested in naval history, entitled "Naval Wars in the Baltic," will shortly be issued by Mr. C. Gilbert-Wood, the naval and military publisher of Arundel Street, W.C. It will deal very fully with the history of the navies of all the Baltic Powers during the period of the sailing ship. The author is Mr. R. C. Anderson, M.A., F.R.G.S., an officer of the Naval Volunteers. A great feature of the work is the thoroughness and completeness of the indices and the series of appendices of ships lost in action.

## TRADE NOTES.

The New Year has brought a welcome gift to some half a million of London householders, in the shape of a further reduction in the price of gas by the Gas Light and Coke Company. This time last year the company reduced its price from 2*s.* 10*d.* to 2*s.* 9*d.* per 1,000 cubic feet, and now a further drop to 2*s.* 8*d.* is announced—making a total reduction of 4*d.* per 1,000 feet in the past five years. Gas is so widely used in the home, not merely for lighting—in which field the economy and effectiveness of the inverted incandescent burner ensures its more than holding its own—but also as a cleanly and infinitely convenient substitute for coal, that this steady decrease in price means much to very many people. It will undoubtedly lead to a still greater consumption of gas for fuel, both in the home and in the workshop and factory. In view of the growing volume of testimony from medical and scientific men to the fact that a gas fire, properly designed and fixed and intelligently used, is actually more hygienic than a coal fire (in which unpurified gas is burnt), it is not surprising that the use of gas fires is extending this winter more rapidly than ever; whilst the cleanliness, the saving of labour, the certainty and perfect control of heat ensured by the use of gas for fuel in industrial processes are leading to the displacement of all labour-requiring, dirt, and ash-producing fuel by the heat which is instantly obtainable by the simple turning of a tap and applying a light. The policy which the Gas Light and Coke Company has adopted of late years seems destined to bear even greater fruit in the future.

Messrs. Austin & Co., lift builders, Newcastle-on-Tyne, have recently been instructed by the North-Eastern Railway Co. to erect two of their patent automatic push-button lifts at Sunderland passenger station; also two of a heavier type for the Middlesbrough passenger station. These orders have been placed with them chiefly on account of the great satisfaction that previous lifts of this type have given the North-Eastern Railway Co. Messrs. Austin & Co. have also in hand automatic electric passenger lifts for the North-Eastern Banking Co., South Shields; Lloyds Banking Co., Newcastle; the Alliance Insurance Co.'s new buildings, Newcastle; the Liberal Club buildings, Newcastle; and for John Grabham & Co., Newcastle. One automatic push-button electric passenger lift and two automatic electric goods lifts for Messrs. Tilley & Co.'s new premises, Newcastle; one electric lift for the Glasgow Corporation Electricity Works, and two for the Co-operative Wholesale Society's new banking premises, Manchester. They have also just completed an order for six electric high-speed lifts for the Co-operative Wholesale Society, Ltd., Newcastle, and one 20 cwt. electric passenger lift running at a speed of about 300 feet per minute. It is worthy of note that the Co-operative Wholesale Society have had over thirty electric lifts installed by Messrs. Austin & Co. at their different branches within the last few years, which alone should testify to the excellent satisfaction the lifts must be giving.

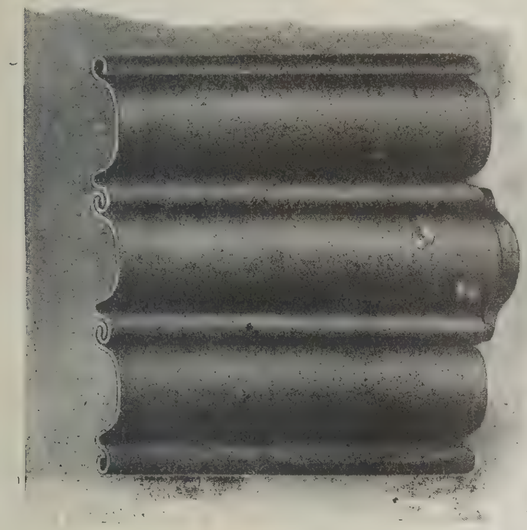
Messrs. E. H. Shorland & Brother, of Failsworth, Manchester, have just supplied their warm-air ventilating patent Manchester grates to the new Council schools, Kirby Muxloe. Amongst other recent contracts are the following:—The Sanatorium, Aldenham School, Herts., is being warmed and ventilated by means of patent Manchester stoves with descending smoke flues, patent Manchester grates, exhaust roof and special inlet ventilators; the extensions to the small-pox hospital, Wakefield, are being warmed and ventilated by means of their double-fronted warm-air ventilating Manchester stoves and Manchester grates; the extensions to the Victoria Hospital, Accrington, are being warmed and ventilated by double-fronted patent Manchester stoves with descending smoke flues, Manchester grates and ventilators.

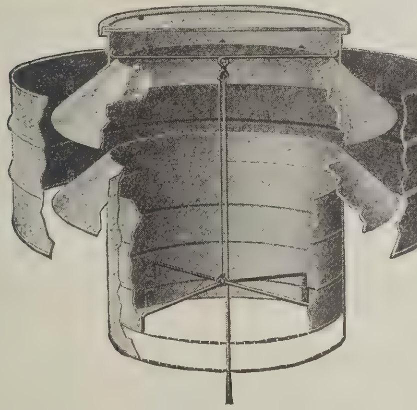
## NOTES ON INDUSTRIES.

During a period of trade depression, such as has been experienced more particularly in the building trade during the past two or three years (which now happily seems to be at an end, for the outlook is certainly brighter), it is a curious fact that in each section of manufacturers or suppliers of goods or materials there are to be found one or two firms who, while their competitors are mourning a decrease in the volume and value of their trade, continue to be fully occupied with orders, and even increase their output and in some instances find it necessary to extend their premises to meet the demand.

A solution to this may be found with very little consideration, however. In the first place these periods of depression chiefly touch those firms who depend upon supplying goods for the cheaper and smaller classes of buildings which are the first to be affected adversely, while advantage is taken of the lower cost of construction to put in hand buildings of a more important character, and goods of a higher grade are therefore in good demand to the advantage of the manufacturers of these.

But there is a further reason. In every branch of manufacture connected with the building trade will be found one or more firms who by the extra care given to the production of their goods, superiority of the workmanship and materials, combined with a justly earned reputation for reliability in the carrying out of orders entrusted to them, obtain an always increasing clientèle. When trade is brisk firms who make a similar class of goods, but are not in the above happy position, get their share of business, but as soon as the volume decreases they are the first to suffer, for when orders are scarce they are naturally placed where they will be best carried out.





A firm that has found it necessary to equip works in order to cope with increasing trade is Messrs. Arthur L. Gibson & Co., of Radnor Works, Strawberry Vale, Twickenham. Since they first introduced the Kinnear Patent Steel Rolling Shutters in this country, the demand has so steadily increased and has attained such dimensions that it could only be efficiently dealt with by the entire manufacture being under one control in works capable of meeting the rapidly growing output, and at Radnor Works these conditions are fulfilled.

The Kinnear steel rolling shutters answer all the purposes of revolving shutters hitherto in use, and in addition have been adopted for every class of opening. They are made in all widths up to 40 feet, and to any height, while the ease and speed with which they are manipulated, combined with economy of space, speedily proved their usefulness when applied, inter alia, to tramcar depots, generating stations, boiler houses, engine sheds, goods sheds, and warehouses.

Fourteen British railways have been supplied, as well as many Indian, Colonial, and foreign railway companies, tramway companies (including the London County Council tramway system), and numerous firms of the highest standing at home and abroad. On the occasion of our visit cases containing these shutters were being loaded into railway vans for despatch to various parts of the world.

An important use to which the Kinnear shutters are applied is for fire protection purposes in division walls. They have been examined and passed by the London County Council as meeting all the requirements of the Building Act, and are superseding in many instances iron doors hitherto in general use. For instance, they are fitted throughout Messrs. Selfridge's premises in Oxford Street, and are in use at Messrs. T. Wallis & Co., Ltd., Holborn; Messrs. Nicholson's, Ltd., St. Paul's Churchyard, &c.

They were tested by the British Fire Prevention Committee to illustrate the use of suitably constructed light steel revolving shutter doors in large vertical openings in checking the spread of fire. Two tests were made (*a*) with a set of two steel rolling shutter doors fitted on either side of a 14-inch wall, as for party wall door purposes, (*b*) with a single steel rolling shutter door, fitted on the inside of a 14-inch wall. To quote from the committee's report as published in their Red Book:—"The double shutter doors withstood the four hours test, remaining intact and workable at the conclusion of the test, no flame having passed through or around them. The single shutter door withstood the 2½ hours test, no flame having passed through or around it.

"Owing to the committee's testing plant sustaining damage during the conduct of these tests they had to be interrupted, whereupon water was applied on both sides of the shutters. The tests were subsequently continued, and the shutters which had already undergone an exceptional strain by fire and water, were again subjected to fire, and at the conclusion to water under pressure, with satisfactory results."

This result is principally due to the manner of construction. The old method of constructing revolving shutters was by connecting separate slats by hinges. As will be seen by the accompanying illustration, in the Kinnear shutters (formed of slats rolled out of light sheet steel), the slats form in themselves an interlocking hinge of extreme flexibility throughout their entire length, and possess great strength and rigidity with the least possible weight. Attached to the slats are malleable-iron end-locks to prevent lateral movement, and provide an excellent wearing surface.

The claim of the makers that the Kinnear shutter is fireproof, easily operated, simple, durable and efficient, appears to be well founded.

Another specialty of Messrs. Arthur L. Gibson & Co. is the Burt combination sky-light and ventilator, which we illustrate. The top is formed of heavy wired-glass, below which runs a trough to carry off and pass outside the ventilator any water caused by condensation. But the special feature consists of the sliding-sleeve damper which, when closed to prevent the outside atmosphere entering the building in times of storm, fog, or cold, still does not obstruct in the slightest degree the passage of daylight.

We have no space to describe more of this firm's specialties, but may mention the Cabot quilt, an effective sound-deadener and non-conductor for lining walls and floors.

To those who believe, and who now does not? that best results are only to be achieved in suitable surroundings, Radnor Works may be cited as ideal. They are well lighted and airy, in a great measure due to the Burt skylight and ventilator, well planned, and equipped for the work carried out there. We give a view inside one of the shops. Their position on the banks of the Thames in Teddington Reach ensures open, healthy and pleasant conditions for the workers.

## THE WARMING AND VENTILATION OF PUBLIC BUILDINGS AND FACTORIES.*

By T. W. ALDWINCKLE, F.R.I.B.A.

WHEN I received the honour of an invitation to read a paper on "The Warming and Ventilation of Public Buildings," I was encouraged to accept, for the reason that what I had to say on this very important subject would be addressed to those who, as engineers-in-charge, were thoroughly conversant with all the practical details of working, heating, and ventilation plant in public buildings, and that a very interesting discussion might result therefrom.

The subject of the paper is necessarily a very wide one, and the author's aim will be to deal mainly with general principles, taking typical cases to illustrate them, without attempting anything in any way to exhaust the subject.

Ventilation and warming are to some extent inseparable, and we shall have occasion during the course of this paper in many instances, to deal with them as one and the same subject; but ventilation, if not more important, is certainly a more difficult matter than its sister subject, and we shall deal with it separately in the first place, without necessarily excluding the subject of warming when the consideration of the latter is intermixed with that of the former.

### *Ventilation.*

It is, fortunately, unnecessary in these days, with an educated public opinion, to dwell upon the importance of ventilation in relation to health and personal comfort. The necessity for breathing pure air is now universally acknowledged, and all we have to consider to-night is what are the best and surest means to attain an end so generally desired.

Ventilation may be briefly described as the removal from a room, hall, or place of public assembly of the used or vitiated air, and the replacing of the same by pure external air. When this change is effected without draughts or other personal inconveniences, so that the air in the apartment remains pure, according to a standard varying with the nature of the occupancy of the room, that room is said to be efficiently ventilated, provided that a suitable temperature has been maintained therein.

At the outset we approach a matter of difficulty which must be adjusted before due consideration can be given to the subject, and that is the matter of climate. We must think of the subject from our point of view of ventilating and warming buildings in this country. The principal textbooks on the subject are either American or German, and we are apt to be guided by those textbooks, without remembering that the climate in those countries is very different from our own. In the first place, the climate in those countries is dry, whilst ours is humid. One result of this is that the internal temperature of the rooms is with them about 70° Fahr., whilst with us it is about 60° Fahr. With a humid climate such as ours, an internal temperature of 70° Fahr. is distinctly uncomfortable. Then again, the winter temperatures are different. It is usual in America, in calculating heating surface for warming apparatus, to assume the winter external temperature at the zero of Fahrenheit, or 32° of frost, and in Germany at 4° below zero. Now the English winter is not a pleasant one; it is long and disagreeable in a variety of ways; but we are not subject to very low temperatures, and in designing heating apparatus it is certainly not necessary to allow for an extreme external temperature of lower than 20° Fahr., if indeed so low. Thus we see that we must adjust the American and German systems to the conditions of our own climate before they can be serviceable to us.

As the primary object of ventilation is to provide pure air in rooms and halls, it is necessary to find some standard or standards of purity. The usual standard is a certain proportion of carbon dioxide ($CO_2$). Normal air contains three parts in 10,000 of $CO_2$ in the country, and about four parts in large towns. As human beings give off a certain quantity of $CO_2$ per hour, it is obvious that the number of parts in 10,000 will be increased in an inhabited room, and the object of ventilation is to prevent such an increase as shall be unhealthy or uncomfortable. There are other impurities produced in an inhabited room, such as watery vapour ejected from the lungs, dust particles, and exhalations from the skin and alimentary canal. There are also the products of gas combustion when the same is used as an illuminant.

It is generally accepted that to ensure a perfectly healthy room the added impurity of $CO_2$ should not exceed two parts in 10,000, making a total of 6 parts per 10,000. There are, however, many conditions in connection with inhabited rooms or halls, which render it well-nigh impossible to attain such a result, and we have then to be content with a standard which is not so good. This is generally the case with theatres and similar buildings, school class-rooms, and crowded factories.

The amount of $CO_2$ given off by persons is shown in cubic feet per hour in the following table:—

| | In repose. | In gentle exercise. | In hard work. |
|---|---|---|---|
| Adult male . . . | 0·6 | 0·9 | 1·8 |
| Adult female . . | 0·4 | 0·6 | 1·2 |
| Children . . . | 0·3 | 0·45 | 0·9 |

Gas as an illuminant produces in combustion a little more than ½ cubic foot of $CO_2$ for each cubic foot of gas burnt, and about double this quantity of aqueous vapour. Gas combustion also produces other impurities, such as carbon disulphide, &c. The introduction of the incandescent gas mantle, however, by reducing the amount of gas burnt per candle-power, has considerably reduced the impurity from this source, while there are no impurities resulting from the electric light.

Human beings produce a certain quantity of heat, which is expressed in units of heat per hour, and this is, according to Pettenkofer, about 400 units for adults, and 200 for children in an atmosphere of 70°.

From these tables it will be apparent that the occupants of a room exercise a very considerable influence upon the purity of the air, and upon its temperature.

As to the amount of fresh air per head which should be supplied, authorities differ somewhat, some of the suggested quantities being quite impracticable; but the following may be taken as reasonable, and capable of being put into execution under normal conditions.

| Class of building. | Cub. ft. of air per person per hour. |
|---|---|
| Hospitals (ordinary) . . . . . | 3,000 to 5,000 |
| ,, (fever) . . . . . | 6,000 |
| Workshops . . . . . . | 1,000 |
| Theatres . . . . . . . | 500 to 1,000 |
| Halls of assembly . . . . | 1,000 |
| Class-rooms (elementary schools) . . | 1,000 to 1,500 |

In deciding the amount of air to be provided per head, regard should be had to the period during which the room or hall will be occupied. Thus hospital patients occupy the ward by day and by night, and therefore require a higher standard of purity in the air than the audience at a theatre or concert-hall, who are only in the building about three hours.

The cubic space per head is not so important as might be imagined, so long as the requisite amount of fresh air is supplied without draughts and at a suitable temperature. A room may have a large cubic space per head, and yet, from imperfect ventilation, the amount of $CO_2$ may be found to be unusually high. An interesting illustration of this is to be found in Haldane's Departmental Report on the Ventilation of Factories and Workshops (CD 1302), (1902). The instance quoted was a cotton spinning mill, having a cubic space of over 10,000 feet per worker, where, owing to the absence of suitable ventilation, the $CO_2$ rose to 16.5 parts per 10,000, and this with a high internal temperature, viz., 92° Fahr., and without gas lighting.

Now, the aim of a designer of a system of ventilation is to produce good results, having in view the figures contained in the foregone tables, and we must bear in mind that no rigid system can be successfully applied to all buildings alike, but that the nature of the building, and the purposes for which it is intended, must be separately considered in each case, and as there are numerous methods of ventilation, both natural and mechanical, we have several good systems from which to make a wise selection.

Systems of ventilation may be divided into two main classes—natural and mechanical. Natural ventilation is

TRADE MARK

¶ FIRECLAY is the finest material in which Baths, Sinks, Urinals, and all large pieces of Sanitary Ware can be made, providing it possesses a non-absorbent enamelled surface of the requisite hardness and durability.

¶ This result can only be obtained by firing the ware to an extremely high temperature, as in the case of TWYFORDS' "ADAMANT" FIRECLAY.

¶ Inferior fireclay goods, fired at comparatively low temperatures in order to reduce cost of production, are neither sanitary nor durable, although often of excellent appearance when new.

Catalogues, and sample of "Adamant" Fireclay
for testing purposes, free on application.

**TWYFORDS, LIMITED**
Cliffe Vale Potteries and Enamelled Fireclay Works,
**HANLEY, STAFFORDSHIRE**

**WARING'S**

(WARING & GILLOW, LTD.)

Beg to intimate that they are prepared under the personal direction of Architects, to

**BUILD, ALTER OR ENLARGE**

Hotels, Public Buildings, & Town & Country Houses of any size.

**The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.**

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

## The Leading Welsh Slate Quarry Owners

Architects are asked to specify Welsh Slates, the finest in colour and durability. The following are the leading firms:

**The PRECELLY GREEN SLATES**
— and —
**The PRECELLY RUSTIC SLATES**
Made in Randoms and Peggies.
**A Welsh Slate of unique appearance.**
For particulars apply to
**DAVIES BROS., Portmadoc, N. Wales.**

**MAENOFFEREN SLATE QUARRY CO., Ltd.** **OLD VEIN** and other **BLUE SLATES** from their own quarries at Blaenau-Festiniog.
— *Address:* —
**Portmadoc, N. WALES.**

**THE ALEXANDRA SLATE CO., CARNARVON.** [Ltd.,
Manufacturers of high-class
**ROOFING SLATES**
machine dressed, uniform in thickness & free from faults.
Telegrams: "ALEXANDRA, CARNARVON."
National Telephone: No. 23.
Managing Director—A. W. Kay-Menzies.

**Craig Ddu Slates.**
*STRAIGHT, STRONG, — and DURABLE. —*
Slabs for every description of work.
Craig Ddu Slate Quarries Co.,
Blaenau-Festiniog, North Wales.

**THE LLANBERIS SLATE CO., CARNARVON,** [Ltd.,
Manufacturers of strong and durable **ROOFING SLATES,** are always in a position to supply large orders at short notice for **BLUE PURPLE, RED and GREEN, —— and WRINKLED SLATES. ——**
Telegraphic address:
"SLATE, CARNARVON."

**J. W. GREAVES & SONS, Ltd.**
PORTMADOC.
ESTABLISHED 1830.
**Best Old Vein Slates**
Sole producers of
GREAVES DEEP VEIN SLATES.
Managing Director—R. M. GREAVES.

**Blue and Purple**
FROM THE FAMOUS
PENRHYN SLATE QUARRIES,
PORT PENRHYN, BANGOR.

**RHIWBACH SLATE QUARRY OWNERS.** Genuine Festiniog District Portmadoc Slates—noted for their Density, Tenacity, lack of Porosity, and a low degree of Corrodibility
*Blaenau-Festiniog, N. Wales*
Our Quarry was ESTABLISHED in the year 1812.
For further particulars apply to—
H. HUMPHRIS, Blaenau-Festiniog.

**THE DINORWIC or VELINHELI QUARRIES.**
Best, Second, and Third Slates.
**BLUE, RED AND GREEN.**
The World-famed New Quarry Slates.
Apply to ERNEST NEELE,
Director & General Manager,
Port Dinorwic, Carnarvonshire.

**THE PARK & CROESOR SLATE QUARRIES COMPANY, LIMITED,**
*Park & Croesor Quarries, Penrhyndeudraeth, N. Wales*
Telegrams—"Kellow, Portmadoc."
Telephone—P.O. No. 10, Portmadoc.
**Parcro** "OLD VEIN" Roofing Slates

**Bwlch-y-Slater Quarry Co., Ltd.**
**BLUE SLATES**
in all sizes and thicknesses.
Absolutely permanent in colour and imperishable.
Apply to RICHARD BOWTON & CO.,
Blaenau-Festiniog, North Wales.

and secure the
BEST of EVERYTHING IN SLATE

*Prices on application to the Publisher, Room 6, Imperial Buildings, Ludgate Circus, —— London, E.C. ——*

understood to be that which is produced by open windows, skylights, vertical ventilating tubes, and open fireplaces or radiators, or, at all events, where any movements of the air are due to natural causes, and not to mechanical power. Mechanical ventilation, on the other hand, comprises all those systems by which the movements of the air are due to mechanical power of some kind or another. There is a tendency nowadays to take sides on this subject, and to be an enthusiastic supporter of one or other of these two main systems, without reference to the varying classes of building, but this does not help us to arrive at a correct decision.

Our climate lends itself to natural ventilation because it is a temperate one, admitting of open windows, and this system of ventilation, which is the cheapest of all systems, is suitable for most domestic purposes—for offices, committee rooms, entrance halls, corridors, staircases, and factories and workshops having a large cubic space per worker. For rooms and offices open fireplaces are much preferable to radiators as a means of warming, as they are exhaust ventilators, and induce a current of air to flow in through the open windows. Nothing is more oppressive than to have to sit for some hours in a room where there is a radiator and no open fireplace. As regards staircases and corridors, it is not necessary to put them under a plenum or exhaust system. Radiators with open windows will be quite sufficient for all purposes. Generally speaking, with a climate favourable to natural ventilation, I think that every effort should be made to use this system wherever practicable.

The so-called natural ventilation with vertical pipes and cowls, or other terminals, is not to be relied upon, as these are all dependent upon the action of the wind to produce an upward current, and are, therefore, perfectly useless when the external air is still and close.

A hospital ward is also an instance where our climate lends itself to natural ventilation. I believe that the great majority of medical superintendents of hospitals will tell us that there are from 300 to 330 days in the year when the windows of a ward can be opened without injury to the patients. This at once obviates the necessity for close mechanical ventilation. I will just describe to you the ideal ventilation of such a ward. In the first place you have good cross ventilation. The windows will be on both sides, and will extend from 2 feet 6 inches above the floor to close up to the ceiling. There will be double-hung sashes, finishing at the top with a transome, and a hopper ash, to open in glazed cheeks. Thus the rate and position of the admission of the fresh air can easily be regulated. There will also be cold, fresh air inlets in the external walls at the floor line to prevent the accumulation of vitiated air at that level. There may be also supplementary inlets in the side walls admitting air, to be passed through low-temperature, hot-water radiators, for use in very cold weather. Lastly, you have the large open fire-places in the centre of the ward radiating heat, a bright and cheerful view for all the patients, and withal powerful exhaust ventilators, removing the vitiated air at a velocity of about 6 feet per second, close to the floor level. Some may say that this is not scientific ventilation and warming. It may not be, but its results cannot be challenged.

In this connection it may not be out of place, although anticipating a little, to consider the alternative of mechanical ventilation in relation to a hospital ward. I regard the plenum system as entirely unsuitable, for the following reasons:—As the air will have to travel a considerable distance from the fan to the several inlets to the ward, it has to be warmed to a high temperature to start with, in order that it may enter the ward sufficiently warm. Then it has to pass along a series of ducts difficult of access for cleaning purposes. Anyone conversant with the plan and section of a ward pavilion will understand this. Exhaust ventilation is more suitable for a ward than the plenum, but it is not equal to natural ventilation, on account of the absence of open fireplaces and the necessity for closed windows. This system was adopted at the South-Eastern Hospital carried out by me in 1905, in deference to the wishes of the Committee, who desired to dispense with open fireplaces, so as to avoid the expense of labour in attending to them, and the dust arising therefrom. The extraction is by means of propeller fans in vertical shafts removing 6,000 cubic feet of used air per bed per hour. The inlets for fresh air are in the side walls under the windows, and the air is warmed in winter by impinging upon low-pressure, hot-water radiators enclosed in removable cases, the inlets being capable of regulation. The heating surface of the radiators on the east, or colder, side of the ward is 10 per cent. in excess of that on the west side. One important matter must be borne in mind in relation to an exhaust system of ventilation in a ward, and it is that the extracting power of the fans may draw in the air from undesirable inlets, such, for instance, as from the sanitary turret. To obviate this at the South-Eastern Hospital I provided a separate fan to extract the air independently from the sanitary turret, of sufficient power to resist any pull in the direction of the ward.

*(To be continued.)*

## CALENDARS, DIARIES, &c. FOR 1910.

THE "Therol" system enables electricity to be supplied at competitive prices for everything; the "Therol" calendar illustrates ten uses including for cookers, boilers, sewing machines and hair curlers. Calendars also come from the Central Fire Insurance Co., Ltd., 1 Cornhill, E.C., and the *Estates Gazette.*

MESSRS. GEO. ROWNEY & Co. have issued the thirty-fifth "Artists' Almanac." It contains its usual very complete list of fine-art galleries, museums, societies, &c., in London, and the provinces. The compilers state that they have taken great pains to procure for intending exhibitors correct information respecting the dates of taking in pictures, and the opening of the different exhibitions. Messrs. Rowney & Co., act as London agents and will collect, pack, and forward pictures to any part of the country.

"WILLING'S Press Guide for 1910" (1*s*.), is something more than a reprint of that for the previous year. It has been both revised and enlarged, though the edition of 1909 was so exhaustive and so accurate that it was only necessary to make very slight alterations. The name of Willing is itself a guarantee of practical utility.

THE Sussex Portland Cement Co., Ltd., of Newhaven (makers of the well-known "Cathedral" and "Newhaven" brands), issue a wall calendar for 1910, which should prove acceptable to all. The design is a striking one, and includes a view of Arundel Castle, the residence of the Earls of Arundel for 800 years. The massive keep contains Saxon work, and stands on an artificial mound, 76 feet high. The castle generally was rebuilt in the style of the thirteenth century under the late Mr. C. A. Buckler, architect, of London. The restoration of the keep, which extended over several years, was completed in 1905; large quantities of "Newhaven" brand of Portland cement were used. The "Cathedral" quality cement, of which this company make a special feature, is acquiring a reputation for the restoration of historical buildings; it was recently selected for important work at Canterbury Cathedral. Copies of the calendar may be had on application to the head office of the company, at Newhaven, Sussex.

THE Wouldham Cement Co., Ltd., undoubtedly determined to do things on a big scale when they arranged that their block wall calendar should measure in all 24 inches by 14 inches. The actual numeral for each day of the year is 9 inches high, and it stands out boldly in red against a white margin 6 inches broad on either side. It is worthy of note that the company restrict their own announcements to a headpiece, and a narrow strip at the foot. The Wouldham calendar certainly eclipses any that we have seen this year in forcibleness.

## VARIETIES.

THE surveyor to the Maidstone Urban District Council is preparing plans and estimates for a strong room at the town hall and at the museum.

WE hear that the Pearl Life Assurance Company have purchased land in Kingsway and are about to erect handsome offices.

IT is understood that large cutlery works are to be erected at Tees-side by a firm of Sheffield manufacturers, at a point between South Bank and Grangetown.

A NEW higher grade school is to be erected at Banff, N.B., as soon as possible at a cost of over 6,000*l*. The plans have been approved by the authorities.

THE Berkshire local education authority propose to provide a new public elementary school (by enlargement of the existing Council school) for about 120 children at Lower Sandhurst.

THE Horwich District Council propose to provide an open-air bath, 100 feet by 40 feet, with dressing-rooms, bandstand, &c., on the site of the Old Mill, in Mill Lane. The total cost, inclusive of the site, is estimated at 2,050*l*.

THE Northamptonshire education committee recommend the County Council to agree to an expenditure of just under 10,000*l*. on a girls' Secondary school for 215 pupils, to be erected at Wellingborough.

Messrs. Potts, Son & Hennings, architects, Bolton and Manchester, have designed large extensions for the premises of the Bolton Operative Spinners' Association. The main improvement will be the provision of two halls, one for 750 people, the other for 400.

At the last meeting of the executive of the buildings committee for the upper district of Renfrewshire, plans were approved of several buildings of the total value of 22,058*l.* The value of the linings granted in the corresponding period of last year was 10,260*l.*

Urr School Board have decided on a large extension of Dalbeattie School. The new building will consist of three class-rooms to accommodate 130 pupils, with hall, teachers' room, &c., and the estimated cost is at the rate of 10*l.* to 11*l.* per pupil.

The Gillingham Council have informed the owners of a new estate at Wigmore that they were prepared to accept their offer of a park and to fence it in, but that they could not agree to form roads as suggested or bind themselves as to laying out the ground.

The Kirkby-in-Ashfield Council are applying to the Local Government Board for permission to raise the following loans:—Public offices, 1,750*l.*; market hall, 1,000*l.*; parks, 500*l.*; sewage, 3,000*l.*; water works, 1,500*l.*; contingencies, 250*l.*; total, 8,000*l.*

The Autolock Safety Cock and Bolt Company, Ltd., 317 High Holborn, W.C., have put on the market a gas cock that cannot be accidentally turned on, a window-fastener that cannot be shot back from the outside, and a door bolt that automatically and securely locks itself. All three are "Visor" patents and make highly useful fittings.

A Local Government Board inquiry was held last week at Belfast by Mr. P. C. Cowan, M.Inst.C.E., into an application for sanction to loans of 62,200*l.* and 20,000*l.*, for (1) the extension of the electricity works, and (2) for footpaths and street improvements. The present electrical plant is capable of producing 4,000 kilowatts, and the application was to extend the plant, taking the total capacity to 5,500 kilowatts.

With the first number of the New Year the price of the *Guardian* was reduced from 3*d.* to 1*d.* The editorial note says:—"We do not desire that the contents of the paper should be less accurate or less learned than of old, but we recognise that those contents should be so set forth as to make a quicker appeal to a larger and more comprehensive audience."

The Consett Urban District Council have instructed Messrs. D. Balfour & Son, civil engineers, 3 St. Nicholas Buildings, Newcastle-on-Tyne, to prepare a scheme of main sewerage for the Park Road and Templetown districts, the sewage from which is to be conveyed by main outfall sewers to the disposal works, which are to be enlarged.

The Nottingham City Council, by 31 votes to 19, carried the following resolution:—"That it be an instruction to the finance committee to consider and report as soon as possible upon the possibility of fixing the next general rate at such a figure as will admit of a preference of 10 per cent. being given to all ratepayers who remit the amount of their rates to the rate office within one month after demand has been made."

The Zoological Society of London have just issued the seventh edition of the Official Guide to the Society's Gardens. It consists of 112 pages and contains 51 illustrations, and index, railway and street map, showing points of access from different parts of London, and a ground plan of the Gardens. Copies in stiff covers can be had, price with postage 7½*d.*, or in green cloth, price 1*s.* 2*d.*, on application to the offices, 3 Hanover Square, W.

The Local Government Board have written to the Worcester City Council declining to hold an inquiry as to the desired extension of the city boundary until they are satisfied that the sewerage disposal works are working satisfactorily. The Council's sewerage works, which cost 100,000*l.*, are at present ineffective, and it was proposed at the last Council meeting to put in a deep sewer at an additional cost of about 10,000*l.*

Negotiations are proceeding between Earl Carnarvon and Mr. Banks-Crawford, of Hill Croft, Nottingham, for the purchase by the latter of Bretby Hall and a portion of the estate. Should the terms be arranged Mr. Banks-Crawford will take the hall and the agricultural portion of the estate on the south side, leaving the collieries and other mining property still in the hands of the earl. A condition of the purchase is the expenditure on the hall of 30,000*l.*

A party of Germans interested in refrigeration processes recently visited Liverpool for the purpose of studying the methods adopted in that city. The party consisted of editors of technical journals devoted to refrigeration, engineers, architects, cold storage builders, and merchants. They are all members of a society recently formed for promoting the interests of refrigeration. Their intention is to visit several towns in England in which refrigeration plant on a large scale is in use. Liverpool, being prominent in this respect, was the first provincial town to receive their attention.

The Electric Picture Palaces (Midland), with a share capital of 50,000*l.* and debenture stock of 16,500*l.*, has been formed to erect and operate a number of electric picture theatres in the Midlands. The company proposes to commence with the erection of six "living picture" theatres. Options for leasing sites for five of these have been acquired in Walsall, West Bromwich, Smethwick, Darlaston, and Wolverhampton, and negotiations for a suitable site at Handsworth are pending. The architects are Messrs. Hickton & Farmer, Walsall, and Martineau Street, Birmingham.

It is proposed to erect a permanent church (St. Augustine's) at Belvedere for the mechanics and artisans at Woolwich Arsenal and neighbouring works. The population numbers nearly five thousand. Plans have been prepared, and the estimated cost is 7,000*l.* The building committee are anxious to start the first portion, which will include the chancel, choir, and clergy vestries, and four bays of the nave and aisles to accommodate five hundred. The cost will be 4,050*l.*

The Haywards Heath Urban Council at their last meeting considered a letter from Mr. J. Bradford, J.P., of Brighton and Haywards Heath, offering to build a block of six attractive-looking almshouses and to endow them with a sufficient sum to keep them in repair, for the use of old, respectable inhabitants of Haywards Heath, of sixty-five years of age, preference being given to the members of the Foresters' Order, other things being equal. The offer was conditional upon a site being given for the purpose or sold to him for a nominal sum. The Council decided to ask the Local Government Board to sanction their giving a piece of land.

Mr. A. B. Holmes, the consulting electrical engineer, in a report to the Liverpool Corporation on the charges for electric supply, calls attention to the reduction of the supply to private houses arising from the adoption of the metallic filament lamp. This reduction, he suggests, can be met by encouraging consumers to instal the electric light throughout their houses (instead of only partially as is frequently the case), and also to make use of electric radiator irons, kettles, cooking apparatus and other domestic appliances which are supplied at power rates, but the use of which has hitherto been almost prohibited by the cost of a second meter and independent system of wiring for the power rate supply. He recommends the trial for a period of twelve months of charging for private houses of not less than 20*l.* rateable value a fixed quarterly payment of 3 per cent. on the rateable value of the house and 1*d.* per unit on each unit as measured by the meter.

The Decorative Art Journals Company, Ltd., have brought out a valuable publication under the title of "The Dining Room" (London: Simpkin, Marshall, price 3*s.* 6*d.*). Its purpose is to show how artistic effects in the decoration of this important apartment may be produced "by simple means within the compass and skill of almost any decorator, and at a cost within the reach of the average householder." An important feature is the six beautifully coloured plates illustrating (1) a Blue Room, by Mr. W. W. Davidson; (2) a Red Room, by Mr. R. G. Barker; (3) a Grey Room, by Mr. R. G. Barker; (4) a Green Room, by Mr. G. M. Atkins; (5) a Brown Room, by Mr. W. H. Gaskell; and (6) a Blue Room, by Mr. W. G. Sutherland, junr. Each is accompanied by a chapter from the artist concerned, giving his views on the elements of internal decoration in general and details of his own scheme in particular. The opening scheme is especially attractive, but Mr. Davidson was thinking surely of somebody more wealthy than the average householder. The requirements of the latter are, however, ably catered for by the other decorators, notably in the Green Room, by Mr. George M. Atkins. Here, as in four out of the five remaining schemes, the walls are divided perpendicularly into panels, and depend for much of their effect upon the deep frieze. Another common characteristic is that the decoration does not follow any of the Period styles, for even the Early Renaissance interior by Mr. W. Davidson has its own personality. The letterpress is no less interesting than the plates and sketches, for each of the decorators has sought to explain his guiding principles, and perhaps, happily, to make converts among those who still remain indifferent to the desire for a beautiful and appropriate environment.

## NOTICE TO ADVERTISERS.

**Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.**

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

## TENDERS, ETC.

*** *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

## COMPETITIONS OPEN.

A MANUFACTURING firm, requiring extensions to their works, comprising dining halls (together with kitchens and stores) to accommodate 3,000 girls and 1,500 men respectively, will be glad to hear from architects who have had experience in designing and executing such buildings. Applicants must state their experience in designing buildings having good acoustic properties, besides being suitable for dining arrangements. See advertisement for full particulars.

BLYTH.—March 12.—The Governors of the Blyth Secondary school invite architects with offices in Northumberland, Durham, or Newcastle-upon-Tyne, to submit plans for a secondary school to accommodate 280 pupils, and caretaker's house. The assessor appointed is Mr. J. A. Gotch, F.R.I.B.A., F.S.A. Mr. Thomas R. Guthrie, Clerk to the Governors, Blyth.

IRELAND.—Jan. 31.—The Pembroke Urban District Council, Co. Dublin, invite schemes and estimates for laying out Herbert Park (35 acres). Mr. J. C. Manly, Clerk, Town Hall, Pembroke, Co. Dublin.

LEEDS.—March 1.—The Directors of the Leeds Co-operative Society, Ltd., invite designs for new business premises and offices. Premiums of 100*l*., 50*l*., and 25*l*. for designs placed first, second, and third by assessor. Conditions and lithographed plans on application to Secretary on receipt of stamped addressed foolscap envelope with deposit, 2*l*. 2*s*. Secretary, John W. Fawcett, 10 Albion Street, Leeds.

MARCH 1.—A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material. Premiums of 100 gns., 50 gns., and 25 gns. awarded to designs and essays jointly. Mr. Max Clarke, F.R.I.B.A., assessor. Apply to Mr. J. Johnston Green, 142 Liverpool Road South, Southport.

OLDHAM.—Feb. 1.—The Town Council invite competitive designs from architects practising or residing within the borough for an extension of the town hall. Premiums of 50*l*., 30*l*., and 20*l*. are offered, together with 5*l*. for every competitor who carries out the instructions. Apply to Mr. E. C. Foote, borough surveyor, Oldham, Lancs.

SHEFFIELD.—March 31.—The Endcliffe Park Church authorities desire plans for church for 650, institute for 150, primary department for 125, junior department for 95, and caretaker's apartments. Premium, not merged in commission, 35*l*. Assessor, Mr. Chas. Hadfield, F.R.I.B.A. Deposit 5*s*. Apply before Feb. 10 to Mr. J. W. Nicholls, secretary, 64 Everton Road, Brocco Bank, Sheffield.

SOUTHAMPTON.—Jan. 27.—The Corporation invite plans from local architects for a pavilion on the Common. Premiums of 10*l*. and 5*l*. Mr. R. R. Linthorne, town clerk, Municipal Offices, Southampton.

WALES.—Jan. 31.—The Council invite designs for a National Library at Cardiff. Three premiums are offered. Assessors, Sir Aston Webb, R.A., Mr. John J. Burnet, A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A. Deposit 2*l*. 2*s*. Apply to Dr. Wm. Evans Hoyle, Director of the Museums, City Hall, Cardiff.

THE DIFFERENCE BETWEEN
DAYLIGHT AND DARKNESS
in buildings is merely the question of the kind of window glass that is used.
SPECIFY "MAXIMUM DAYLIGHT GLASS." It actually increases the daylight from 5 to 20 times.
Stocked in all principal towns. Send for new Illustrated List.
MAXimum LIGHT WINDOW GLASS CO., 28 Victoria Street, LONDON, S.W.
Also Proprietors of "CAT'S EYE GLASS," "MAX SILK GLASS," &c.

| HARDY & Co., Woking (*accepted*) | 2,471 | 8 | 0 |

### TRADE NOTES.

DR. W. P. KLOBUKOWSKI, engineer chemist, of Warsaw, has patented in this and fourteen other countries a fuel economiser or heat increaser for use in connection with English fireplaces, which is well known in Russia and Poland. The invention is along lines that have been successfully attempted in the past, but in its latest form contains many valuable alterations to the original types. All round the base of the grate runs a trough containing a small quantity of water. On each side is an air inlet on the floor level, which conducts the cold air from the room into the hollow space or air chamber at the back of and around the grate, where it becomes heated, and returns into the room through an outlet or outlets at the mantlepiece level. The interior of the grate is made in three grooved horizontal pieces with concave surfaces so as to allow of expansion and contraction. In the previous fireplaces the fire interiors were made in one straight piece, with the result that the iron quickly cracked. The water trough is another important improvement, for it keeps the air continually moist and sweet instead of as before being discharged into the room dry and unpleasant. The draught is regulated by a canopy. The patent is, we understand, shortly to be placed upon the English market.

MESSRS. SETZER & Co. have removed their Manchester offices to 2 Mosley Street. Their telephone number is 3045 City.

### THE STATUS PRIZE.

THE above will be awarded by the Society of Engineers each year for the next four years ending 1913 (if papers of sufficient merit are received) for the best paper written on "How to Improve the Status of Engineers and Engineering, with special reference to Consulting Engineers." The prize will consist of books and/or instruments of the value of three guineas, selected by the author of the premiated essay. The essay shall be written in the third person, and shall contain not fewer than 4,000 nor more than 6,000 words. All essays submitted and the copyright therein shall become the property of the Society, but the donor also shall have the right of publishing them. The Council of the Society may, at their discretion, permit the publication of any essay by its author. The premiated essay shall be read and discussed at a meeting of the Society, and it will be published in the Society's journal. Essays must be received by the Secretary on or before May 31 in each year.

AT a meeting held in the Mayor's Chamber, Guildhall, Newcastle-on-Tyne, last week, it was resolved to form an association to be called the North-East Association of Paint and Oil Manufacturers and Wholesale Merchants.

MESSRS. FOWLER & MARSHALL, surveyors for the Laughton sewage scheme, have submitted to the Rotherham Rural Council fresh plans and estimates, a considerable reduction having been made. The Council decided to forward the plans and estimates to the Local Government Board, and to ask for sanction to borrow the necessary amount over 8,000*l.*

### VARIETIES.

COUNT PLUNKETT, Hon. A.R.I.B.A., lectured last week on "Thomas Frye, the Irish Artist," for the Architectural Association of Ireland.

MR. DANIEL GRIEVE, of Washington Lane, Edinburgh, joiner and builder, who died on August 28, left personal estate valued at 11,568*l.*

THE Ayr Town Council have agreed that it is desirable to erect a pavilion for the use of the public in the town, and a scheme is to be submitted as soon as possible.

THE Association of Master Painters in Ireland held their eleventh annual convention on the 12th inst. in Cork, when Mr. John O'Connell, of Cork, was installed as president.

THE Liverpool finance committee have agreed to the recommendation of the baths committee that an amount for the provision of plant for a supply of sea water to the public baths be included in the estimates for 1910.

ARRANGEMENTS have been made with a firm of manufacturers in Leicester to open a glove factory in Dalbeattie, N.B. A site has been obtained, and on it a building to accommodate fully 200 workers will be erected by a local syndicate.

THE plans prepared by Messrs. Frederick Clark & W. J. Moscrop, architects, Darlington, for a proposed technical and secondary school at Workington, and which were placed first in competition, have been accepted by the Cumberland education committee.

A CONTINENTAL engineering firm have, it is stated, practically completed arrangements for securing a site of fifteen acres at Darlington, on which large workshops will be erected, in consequence of the expectation of tariff reform.

THE Glasgow Dean of Guild Court on the 13th inst. granted the following linings:—The National Telephone Co., Ltd., to erect a building at the corner of Hope Street and Renfrew Street; Govan School Board, to erect a public school at Craigton; Messrs. Watson, Laidlaw & Co., Ltd., 98 Dundas Street, South, to erect an erecting shop in Kinning Park.

AN English company has undertaken the construction and equipment of a market hall at Saratoff, Russia, at a cost of 400,000 roubles (about 42,000*l.*). The hall is to be a lofty building with a full glass roof and one-storeyed shops, the latter fitted with water supply, &c., and cold storage premises beneath the shops.

THE Lancashire and Yorkshire Railway Company have agreed to purchase St. Paul's Church and churchyard, Liverpool, at a cost of 15,000*l.*, for extending the Exchange Station. The church was erected a century and a half ago, and has been closed for the past few years. A number of other properties have also been bought. A Bill to sanction these purchases is to be promoted in Parliament next session.

THE Local Government Board has sanctioned the application of the Llandrindod Wells Urban District Council for a loan of 6,000*l.* for the purchase of Brynarlias and grounds, the home of the late Dr. Bowen-Davies, for the purpose of its adaptation for municipal buildings, offices, fire-brigade station, stables, &c. It is proposed to retain a part of the land for a market hall and free library.

AT the last meeting of the Gainsborough Urban Council a letter was read from the Local Government Board, in reply to the Council's application to erect shops on the surplus land left from the Church Street improvement, stating that they knew of no statutory authority which would enable the Council to build shops. They had, however, no objection, and recommended the Council to pass a resolution and make application to them under Section 175 of the Public Health Act, 1875, for a direction empowering the Council to retain the land. The Council decided to adopt this course.

THE Scarborough Cliff Bridge (Spa) Company have shelved the proposed scheme for the improvement of the Spa at a cost of about 8,000*l.* The main feature was the removal of the present bandstand and the erection of a larger one, and the construction of a combined covered-in and open-air café, with a promenade between the grand hall and the tower. Out of ten sets of plans for the work, the committee selected those of Messrs. Russell & Cooper, London. They have also consulted Mr. James Walker, engineer to the Tyne Improvement Commissioners, as to the proposed widening of the promenade. The scheme will come up for further consideration at the next annual meeting.

A LOCAL Government Board inquiry was held on the 6th inst. into an application by the Scarborough Town Council to borrow 3,000*l.* for the construction of a pavilion in the Alexandra Gardens. Mr. H. W. Smith, the borough engineer, said the building would be 140 feet by 50 feet, with one bay 50 feet by 7½ feet, and two bays 30 feet by 15 feet, the stage and dressing-rooms being 50 feet by 20 feet. The front would be of folded glass screens, which would enable the whole of the front to be entirely or partially thrown open. There was very keen opposition on behalf of the ratepayers generally to this proposal.

Mr. J. Henry Taylor, borough surveyor of Barnsley, has just issued his annual statement as to the number and description of new buildings for which plans had been submitted to the Town Council, and of the number and description of the buildings which had been erected during 1909. The total number of sets of plans submitted was 124, of which 114 were approved, and 10 disapproved. This number included 286 villas, houses, and cottages; 12 shops; four public buildings, including schools; and 11 buildings of other descriptions, including alterations and additions. Last year the sets of plans deposited numbered 107; in 1907 the number was 117, and in 1906 93. The number of buildings erected and certified as ready for occupation during the year was 289.

The Glasgow Corporation committee, reporting on the annual competition by children in Glasgow and district schools of drawing specimens in the Glasgow Museum, direct the attention of teachers and competitors to the following suggestions for further improving the character and quality of the work sent in:—(1) More examples in colour might with advantage be done; (2) in the representation of vases, whether plain or ornamental, the light and shade due to the cylindrical form of the object must be expressed. In many instances the contours of vases were drawn and the ornament copied just as though the surface were flat, like a wall paper; (3) all "tricky" or mannered technique should be discouraged. The essentials of good work are accurate and searching observation of form, light, and shade, or colour, to be expressed by careful and intelligent workmanship in whatever medium may be selected.

The removal of works and factories from highly rated and congested districts to more suitable places is now frequent. Amongst the principal factors determining these migrations are the provisions of the new patent law; the labour question and rate of wages; and contiguity to ports, coal and iron fields, and centres of population. The vital question of economy of output is materially affected by the choice of locality, and it is claimed that nowhere can these advantages be better secured than in the districts served by the Great Western Railway. Full information on the finest sites procurable around London, the West of England, the Midlands, and Wales will be supplied by Mr. T. H. Rendell, chief goods manager, Paddington Station, W.

The central portion of the early sixteenth-century chancel screen of St. Buryan Church, Cornwall, the finest in the county, which has been undergoing restoration, has been completed and refixed in the church, the work being carried out by Rashleigh Pinwill, of Plymouth. Upon the portions of the cornice which remain is a vine pattern, amongst the branches of which is a flight of doves, hunting scenes, fighting animals, birds, and grotesques. Only the lower portion of screen remained, the panels of which appear to be a conventional treatment of seaweed and sunflower. Some beautiful colouring remains on some of the old portions.

Sir Alexander R. Binnie, M.Inst.C.E., &c., has been engaged by the Manchester City Council to examine and report upon the city surveyor's scheme for extending the main drainage of the city. The question of the inadequacy of the existing intercepting sewers of the city has been before the rivers committee for some years, and the insufficiency of the sewers was shown in an alarming manner during the storms of the past year. The present sewers were designed in 1886-7, since when the population has increased from 376,895 to 743,707, and the drainage area from 5,934 acres to 23,420 acres. The committee instructed the city surveyor to submit a complete scheme which would provide not only for the existing city, but for the districts which might probably be added during the next fifty years. The scheme has been prepared, and will take from ten to fifteen years to carry out. The estimated cost is 850,000*l.*

The following particulars of a new process for the manufacture of white lead are from the report by the British Vice-Consul at Detroit (Mr. H. G. Meredith) on the trade of that district in 1908:—The time taken from the entrance of the pig lead into the smelter on the top floor to its reappearance as a finished product at the bottom is six days. After passing from the melting furnace, the lead is sent to a tank on the floor below where it is crushed into a soft blue gritless mass. Thence it goes down into tanks where further agitation with water and steam transforms the mass into a yellow compound of glowing fineness. The product is then sent to another floor, where by a series of rotating cylinders it is treated with carbon-dioxide gas and bleached. From these cylinders, after thirty-six hours' constant agitation, the product is sent to the precipitating tables, where it is washed, the unfinished particles (if any) being sent to the cistern with all refuse water, which is pumped to the top and used over again, every part of the raw material being thus utilised. The moving of the product is done entirely by the force of gravity. From the precipitating table the lead, now a spotless white, is taken to the drying beds—immense shallow pans of white canvas. Not more than six men are required to work the plant, which turns out 6,000 tons of white lead a week.

## THE WARMING AND VENTILATION OF PUBLIC BUILDINGS AND FACTORIES.*

*(Continued from last week.)*

By T. W. Aldwinckle, F.R.I.B.A.

The warming and ventilating of churches and chapels are seldom satisfactory, particularly churches with a lofty nave and clerestory windows. Cold draughts are usually much complained of. This is caused by the very large cooling surface of the walls and windows as well as the open roof. It is a good plan, whatever the warming apparatus may be, to keep it going constantly throughout the winter. If allowed to go down when the building is not in use the walls soon become cold, and the warming process has to be gone over again. Means should be provided for warming the air at the upper part of the building.

We may safely assume that natural ventilation is unsuitable and non-effective in most cases where a considerable number of persons are congregated together in a hall, room, or factory, with a less cubic space per head than 300 feet. This is because it is impossible to put into the room the requisite amount of fresh air, without creating unpleasant draughts, and without lowering the temperature of the room during the winter to a point below that which is requisite for health and comfort.

In dealing with the records of any tests of natural ventilation taken during the winter months, it is advisable to take careful note of the internal temperature of the room. It is a very easy matter to throw open the windows and flood the room with cold air, and thus to produce a low proportion of $CO_2$, but the problem of ventilation is not thereby satisfied. A suitable temperature must also be provided, and this is often a matter of considerable difficulty, and one which is sometimes wholly ignored.

Mechanical ventilation can be conveniently divided into three classes, viz.:—Exhaust ventilation, plenum ventilation, plenum and exhaust ventilation, with a variant upon all three as "upward" or "downward."

Mechanical ventilation is suitable for, and in some cases only adaptable, for the following buildings:—Theatres and concert halls, courts of justice, town halls, council rooms, waiting halls for outdoor patients, crowded factories and workshops, operating theatres, laboratories.

To render any system of mechanical ventilation economical, effective and also comfortable to those who must pass a good deal of their time in it, we should provide large duct areas and low velocities in delivering or exhausting the air, and large heating surfaces and low temperatures in the warming parts of the system. I do not myself consider that air for warming purposes should ever be passed over or through heating surfaces having a higher temperature than 150° Fahr., for the reasons which will be hereafter given.

Exhaust ventilation has usually the advantage of being simpler and more economical in construction than the plenum system, and more easy of adaptation to existing buildings, and it is free mostly from the necessity of long air inlet ducts. With suitable and efficient means of extraction provided, a definite quantity of the vitiated or used air is removed per hour, this operation drawing in a corresponding quantity of external air to take the place of that which is removed. In the old days, and indeed until about twenty-five years ago, the air was extracted by means of vertical shafts, in which an upward current was induced by heating the air to a temperature considerably higher than the external air.

This system of producing an upward current was very

costly, and has been entirely superseded by the use of fans, which, if driven at a moderate speed, are very economical to run. The current of air induced by a heated shaft is at best rather a feeble one, and varies with the temperature of the external air, being the least effective when it is most required, viz., when the external air is warm and close.

Exhaust ventilation is generally of an upward character, the extraction being in the ceiling or roof, and the inlets near the floor or near the breathing line. The arrangement of the extraction is generally a simple matter, if care is taken to provide fans of suitable capacity. Where the resistances are small and the extraction ducts (if any) are short, propeller fans can be used, but where the resistances are high, the ducts long and numerous, and the quantity of air to be removed is large, centrifugal fans are necessary. Generally speaking it may be stated that propeller fans should not be used for a resistance of over ¼ inch of water, as the quantity of air passed will be small against a high resistance. In this connection it should be borne in mind that the work done by an extracting fan consists not only in removing the vitiated air, but also in bringing in the fresh air through the authorised inlets, and that these inlets offer, in many cases, considerable resistance.

When the quantity of air to be removed is large, and coming possibly from several rooms into one extraction shaft, the direction, shape, and size of the extraction ducts require great care and consideration, with a view to reducing the resistance, and to secure that each inlet into the duct shall carry its due proportion of air. It is very important that all inlets into the main trunk should be well curved in the direction of the air current in the duct, and that the duct should be tapered or otherwise enlarged so as to be able to carry the increased volume of air brought in by successive inlets without altering the general velocity. It should also be borne in mind that very high velocities should be avoided, as not only does this increase the resistance due to friction in the ducts, but the horse-power necessary to drive the fan increases as the cube of its speed. Thus, if a fan is running at 400 revolutions per minute, and drawing 4,000 cubic feet per minute through the duct, and taking two horse-power, doubling the speed of the fan in order to draw double the quantity of air through the same duct will require sixteen horse-power, to say nothing of the increased friction in the duct. This means that it is more economical in horse-power, and consequent annual cost, to arrange good-sized ducts, with the air travelling at a moderate velocity. It is also important to have plenty of access doors to the ducts for cleaning purposes.

The extracting arrangements being complete, let us now consider the inlets. The position of these will vary according to the requirements of the hall or room, but it is essential that the external air shall enter as direct as possible from the outside, not near the ground level, and far from any source of air pollution. In a simple system of extraction ventilation there will generally be openings in the external walls, with gratings and channels through the walls, close, if possible, to the floor level. All these inlets should be regulated by dampers, as with a strong wind blowing upon the inlets a large influx of air would be uncomfortable. The net area of the inlets should be such as will admit the necessary quantity of air at a velocity of not more than 3 feet per second. The channels through the walls should be lined with glazed bricks, and means of access should be provided for cleaning purposes. Then the incoming air has to be warmed during the winter. This requires that a radiator should be placed in front of the inlet, with baffles so arranged that the incoming air impinges well upon the surface of the radiator before entering the room. This is preferable to enclosing the radiators in cast-iron cases, as these harbour dirt inside.

The inlets just described we term "authorised" inlets. The suction power of the fan will, however, to some extent be felt all over the hall or room, and a certain amount of external air, not by any means a small quantity, will be drawn in from any point through which the air can enter, such as through external walls, chinks in windows, and the like. These are called "unauthorised" inlets, and must be reckoned with. Care must in the first place be taken that air is not drawn in from any polluted sources. The risk of this is one of the disadvantages of the "exhaust" system. Also in calculating the heating surface for the general warming of the rooms, allowance must be made for the air which will come in through these "unauthorised" inlets. This air will be cold, and will require warming, and this is another drawback to the exhaust system from which the plenum system is free. This inleakage of air through walls, especially in cold weather, is considerable even with natural ventilation, but it is much greater when there is a partial vacuum in the room caused by the exhaust fan.

We must always bear in mind that to render a system of exhaust ventilation complete and efficient, at all events in the winter, the windows must be kept closed, and the air supply obtained from the authorised inlets. It will be obvious that if the extracting fan is efficient the external air will be sucked in at the point of least resistance. If a window 3 feet wide is open, say, to a height of 3 feet, that would be an inlet area of 9 feet, which would be, at least, three times larger than the net area of any authorised inlet, and that the external air will consequently enter through the window and not through the inlet. This can be verified by any one who wisely possesses a Tobin's tube in his own dining-room. In the winter, with a fire going, the air will enter through this tube at a velocity of about 2 or 3 feet per second, but if a window is opened the inlet entirely ceases to act.

The exhaust system is suitable for town halls, council rooms, large city offices and banks, schoolrooms, and under some conditions for factories and workshops.

The primary advantage of plenum ventilation is that it puts into the hall or room a specific and measurable quantity of fresh air, in specific positions, at definite and ascertained velocities, and at definite temperatures, and that this air can be filtered, moistened, and warmed at the main air inlet. No other system admits of these advantages. The exits of air can be arranged at "authorised" outlets, which should be carefully protected against wind influence, but a portion of the air can also escape, and is always pretty sure to do so, through some "unauthorised" outlets. In this case, however, no harm can accrue from any pollution or from any lowering of the temperature of the room.

The main drawbacks to the plenum system are (*a*) that as a rule, long ducts are necessary for the distribution of the air, and (*b*) that as the air has to travel a considerable distance along these ducts, the initial temperature as it leaves the heating battery is generally arranged somewhat high, in order to compensate for the cooling in the ducts. These heating batteries are generally heated with steam from 10 lbs. to 40 lbs. pressure, or at temperatures from 240° Fahr. to 285° Fahr. This causes a baking or drying of the air, and as in our climate we are accustomed to air with a fairly high degree of humidity, the artificial drying of the air causes unpleasant sensations. We constantly hear complaints on this score from those in this country who pass a considerable portion of their time in halls or rooms under plenum systems. One hears of no such complaints in America or Germany, because they are accustomed to a dryer atmosphere. I am strongly of opinion that we can remedy these defects and render plenum ventilation more acceptable, because more comfortable to us, by working upon somewhat different lines in the manner I shall hereafter describe, in connection with a building which I have recently warmed and ventilated upon the plenum system for the Metropolitan Asylums Board.

It is when plenum is coupled with auxiliary exhaust that I consider it most effective. The outlets can be better regulated, and the intended direction of the air currents better ensured. The word "plenum" suggests that the air of the rooms is under a mild kind of pressure, ensuring its equal distribution (assisted by the law of the diffusion of gases) throughout the room, and this is the primary object of all effective ventilation. Care must be taken to avoid short-circuiting of the air, either by having the exhaust too powerful, or by having the outlets placed too near to the inlets. It is desirable for this reason that the power of the plenum fan shall always be in excess of the exhaust. There is no fear of the air not getting out, it will always find a way when necessary.

It is essential that the fresh air should be brought in from a pure and uncontaminated source, and at some height above the ground level, particularly in large towns, and the inlet should be well protected against wind and rain. It is preferable, if possible, to have the air intake on the southern or warmer side of the building. The incoming air generally requires some kind of filtration, if only to remove the particles of dust. It is very important that this filter should be either self-cleansing or easily cleansed. There should also be a good water spray to prevent drying of the air. I have used a filtering screen consisting of a large number of galvanised steel rods placed to break joint about ¼ inch apart, all being removable. A water trough is placed above these, from which water trickles down the rods.

For the purpose of driving the air through the duct a centrifugal fan is almost necessary, a propeller fan being not equal to overcome the resistance. The fan should, for the reasons already given, be driven at only a moderate speed, and should have a fair reserve of power, so that there may be no question as to the amount of air supplied. An electric motor is the best kind of power to drive the fan, and there should be means of speed regulation.

The heating battery through which the air is driven for warming purposes should not, in my opinion, have a higher temperature than 150° Fahr. In order to prevent undue loss of temperature in the main ducts, these latter should have hot water pipes placed in them.

In theory the effectiveness of heating surfaces in thermal units increases with the velocity of the air passing over such surfaces, but there is a limit to this, and it is found in practice that air moving at a very high velocity does not give proportionally high temperatures, as a larger volume of air is passed, and the time of contact is decreased. It was found by experiment that air passed through a battery of 75 lbs. steam at a velocity of 27 feet per second gave a much lower temperature than at a velocity of 15 feet per second.

In order to secure adequate control over the resulting temperature in the rooms, the battery should be so constructed that parts of the heating surface can be shut off by valves. This will enable the room temperature to be regulated to meet the varying temperatures of the external air.

(*To be continued.*)

## THE BUILDING TRADE IN QUEENSLAND.

NEVER perhaps in the history of Queensland has its solidity been better exemplified by the condition of the labour market and the activity of the building trade than at present. Notwithstanding that building material is selling at rates considerably higher than a few years ago, and when timber particularly is at a figure which but a short time since would have been regarded as prohibitive, new buildings and extensions, plans and proposals, are the order of the day. On every hand there are the signs of solid progress. In view of the emigration of bricklayers and stonemasons from this country to Queensland, it is of interest and importance to note that the Minister of Works has given his approval to the following award which has been made by the Wages Board, and which was to come into operation on January 1, 1910.

### *Bricklayers' Trade.*

*Hours.*—The ordinary working hours shall not exceed forty-four in any one week, and shall be confined between the hours of 8 A.M. and 5 P.M. on Mondays, Tuesdays, Wednesdays, Thursdays and Fridays, and between the hours of 8 A.M. and 12 noon on Saturdays, provided that during such ordinary working hours one shall be allowed for a meal on such days, except Saturdays.

*Wages.*—The lowest wages, price, or rate payable to bricklayers shall be 1*s.* 6*d.* per hour, or 3*l.* 6*s.* per week of forty-four ordinary working hours; provided however that when bricklayers are engaged in preparing the brickwork of furnaces and settings in connection with boilers, bakers' ovens, or furnace work of any description they shall be paid not less than at the rate of one and a quarter time the rate therein set forth.

*Apprentices and Improvers.*—The number, or proportionate number of apprentices or improvers who may be employed shall not exceed one apprentice or improver to five, or any fraction of five, bricklayers who are in receipt of not less than the minimum rate set forth in clause 2 hereof. Provided, however, that one apprentice or improver may be employed by any employer. The lowest wages, price, or rate payable to apprentices or improvers shall be 7*s.* 6*d.* per week for the first year, 12*s.* 6*d.* per week for the second year, 20*s.* per week for the third year, 25*s.* per week for the fourth year, and 35*s.* per week for the fifth year. Thereafter, not less than the minimum rate.

*Overtime.*—All time worked in excess of the ordinary weekly working hours before 8 A.M. shall be paid for as follows:—For the first two hours not less than at the rate of one and a quarter time the minimum rate set forth in clause 2 hereof, and for subsequent hours, not less than at the rate of one and a half time such minimum rate.

*Holidays.*—All time worked on any Sunday, Christmas Day, Good Friday, or eight-hour day, shall be paid for at not less than the rate of double the minimum rate set forth in clause 2 hereof. All time worked on any New Year's Day or Sovereign's birthday shall be paid for at not less than the rate of one and a quarter time the minimum rate set forth in clause 2 hereof.

### *Stonemasons' trade.*

The determination for stonemasons contains the following provisions:—For the purpose of the determination the following definitions shall apply:—"Building mason" shall mean a stonemason who has been working not less than four years at his craft in connection with building construction and who is over twenty-one years of age. "Monumental mason" shall mean a stonemason who is engaged in preparing or fixing all stone for cemetery purposes or in preparing marble or cutting inscriptions for cemetery purposes or in preparing marble or cutting inscriptions for cemetery or other work. "Porphyry mason" shall mean a stonemason who is engaged in preparing or fixing porphyry stone for all purposes.

*Hours.*—Same as bricklayers' trade hours.

*Wages.*—The minimum rate of wages shall be as follows:—Building masons 1*s.* 4½*d.* per hour, monumental masons 1*s.* 4*d.* per hour, porphyry masons, 1*s.* 4½*d.* per hour.

There are also special provisions for apprentices and improvers, overtime, and travelling allowances, which would take up too much space to give in detail.

## A BOOK FOR BUILDERS.

"OXBORROW'S Combined Order, Prime Cost, Charges to Customers and Summary Book," is not a technical work, but a much-needed account book, which will doubtless meet with a cordial welcome from thousands of firms whose businesses consist largely of repairs and jobbing work and who are desirous of concisely recording and speedily ascertaining their outlay and income in connection with each order received. The enterprising authors, who are experienced public accountants, have spared no pains to render this system thoroughly comprehensive and intelligible, inasmuch as the printed example and clear instructions are well within the grasp of even those who have given but little study or thought to office routine. Various recommendations are submitted which, if adopted, will practically remove leakages, serve as an effective check on stores issued, and ensure wages paid reaching their proper destination. The book contains 440 pages of red-ink rulings, with practical headings which provide for disclosing total expenditure, dissection thereof, and charges made to customers. For each job there is a numbered order form for issue to the workman, and once an order is entered in the book it cannot possibly go astray, escape execution, or be charged to the customer. These three points are the mainspring of any business. At the end of the book is a printed summary of immense importance to every trader who wishes to see at a glance what orders are unexecuted; the cost of and charge for each finished job, and particularly the folio of the day book or ledger in which the debit is made to the customer, with a view of precluding possibility of work not being charged for. A summary containing this information cannot fail to be exceptionally useful for estimating purposes. The book can be obtained of the publishers, Messrs. Cockayne & Co., Ltd., 185 Walworth Road, London, S.E., for 5*s.*, or 5*s.* 6*d.* post free. As stationery alone it is of excellent value, consequently the purchaser gets a unique and complete system absolutely free.

## THE INSTITUTION OF MUNICIPAL ENGINEERS.

AT the last meeting of the Council of the above Institution held at 39 Victoria Street, London, S.W., thirty-seven applicants were elected to membership, and five to studentship. The roll of the Institution now stands at 679 members and ninety-six students, making a total of 775.

The Secretary was instructed to send to the National Association of Local Government Officers a copy of the following resolution which was passed at a meeting of the Northern District of the Institution, held on December 18:—"That the Council of the Institution be asked to communicate with the N.A.L.G.O., asking them to send a letter to each candidate for Parliament at the forthcoming election, inquiring whether he is prepared to vote for a Bill giving to local government officers superannuation on similar lines to that now enjoyed by poor law officers."

It was decided that arrangements be made to hold the next general meeting of the Institution, if possible, in Manchester in February.

It was decided that any member of the Institution be allowed to attend Council meetings, and that any member so attending may, with the permission of the acting chairman, address the Council on any matter under consideration.

It was resolved that the suggestions made at the joint meeting of the Council and hon. district secretaries on November 27, together with the observations since received on these suggestions, be referred to a committee.

It was resolved that a committee to be known as the revision of by-laws committee be appointed to prepare new draft by-laws.

It was resolved in pursuance of the resolution carried at the last general meeting, "That a committee to be known as the examination committee be appointed."

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

## TENDERS, ETC.

⁂ *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2* P.M. *on Thursdays.*

## COMPETITIONS OPEN.

BLYTH.—March 12.—The Governors of the Blyth Secondary school invite architects with offices in Northumberland, Durham, or Newcastle-upon-Tyne, to submit plans for a secondary school to accommodate 280 pupils, and caretaker's house. The assessor appointed is Mr. J. A. Gotch, F.R.I.B.A., F.S.A. Mr. Thomas R. Guthrie, Clerk to the Governors, Blyth.

IRELAND.—Jan. 31.—The Pembroke Urban District Council, Co. Dublin, invite schemes and estimates for laying out Herbert Park (35 acres). Mr. J. C. Manly, Clerk, Town Hall, Pembroke, Co. Dublin.

LEEDS.—March 1.—The Directors of the Leeds Co-operative Society, Ltd., invite designs for new business premises and offices. Premiums of 100*l.*, 50*l.*, and 25*l.* for designs placed first, second, and third by assessor. Conditions and lithographed plans on application to Secretary on receipt of stamped addressed foolscap envelope with deposit, 2*l.* 2*s.* Secretary, John W. Fawcett, 10 Albion Street, Leeds.

LONDON.—Feb. 8.—The committee of the Architectural Association Play 1910 invite designs for a poster illustrating this year's play. Prize 1*l.* 1*s.* Mr. Percy Lovell, 23 Old Queen Street, S.W.

MARCH 1.—A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material. Premiums of 100 gns., 50 gns., and 25 gns. awarded to designs and essays jointly. Mr. Max Clarke, F.R.I.B.A., assessor. Apply to Mr. J. Johnston Green, 142 Liverpool Road South, Southport.

OLDHAM.—Feb. 1.—The Town Council invite competitive designs from architects practising or residing within the borough for an extension of the town hall. Premiums of 50*l.*, 30*l.*, and 20*l.* are offered, together with 5*l.* for every competitor who carries out the instructions. Apply to Mr. E. C. Foote, borough surveyor, Oldham, Lancs.

SHEFFIELD.—March 31.—The Endcliffe Park Church authorities desire plans for church for 650, institute for 150, primary department for 125, junior department for 95, and caretaker's apartments. Premium, not merged in commission, 35*l.* Assessor, Mr. Chas. Hadfield, F.R.I.B.A. Deposit 5*s.* Apply before Feb. 10 to Mr. J. W. Nicholls, secretary, 64 Everton Road, Brocco Bank, Sheffield.

WALES.—Jan. 31.—The Council invite designs for a National Library at Cardiff. Three premiums are offered. Assessors, Sir Aston Webb, R.A., Mr. John J. Burnet, A.R.S.A., and Mr. Edwin T. Hall, F.R.I.B.A. Deposit 2*l.* 2*s.* Apply to Dr. Wm. Evans Hoyle, Director of the Museums, City Hall, Cardiff.

## TRADE NOTES.

ONE of the burning questions of the political campaign so far as it concerned the building trades has been the possible effects of the imposition of a tariff on imported joinery. The Free Trade argument is that the cost of building small class property would thereby be increased, and in consequence the weekly rent would have to be raised. Assuming this to be true, there remains the fact that the difference between workmen earning no wages and workmen earning good wages is out of all proportion to, say, the difference between the first paying 4*s.* and the second paying 4*s.* 3*d.* a week rent. But as a matter of fact, there is at least one English firm which even under the present illogical conditions compete shilling for shilling against the foreign article. Messrs. C. Jennings & Co., Bristol, have British-made doors from 4*s.* each, and keep 25,000 in stock. In addition they turn out at their joinery works woodwork of all kinds and prices, and for all purposes. Messrs. Jennings pertinently say "support home industries." It has been brought to their notice that on several occasions it has been stated that they supply a lot of foreign doors. This they contradict and state that they have not sold 100 foreign doors during the last five years. All have been their own make. Foreign doors were only supplied when specially requested. Messrs. Jennings used to import large quantities of foreign doors seven years ago, but are now competing with their own make notwithstanding the strenuous competition.

ORNAMENTAL STAIRCASE.
FANCY GATE.

AN economical partition slab is now on the market known as the "Muriblock." It is composed of seven parts of refined clinker (crushed and sifted to a quarter-inch gauge) and one part of the best English Portland cement. The slabs are 27 inches by 15 inches, and are made in three thicknesses, viz., 2¼ inches, 3¼ inches, and 4¼ inches. All the four edges are tongued and grooved, and the faces have a natural key, so that partitions can be very expeditiously fitted together and finished off with a single coat of plaster. The slabs will easily take nails and screws. Their weight is light as they are cored, which also renders them soundproof. This is not at the expense of strength, for according to a recent test by Messrs. David Kirkaldy & Son the crushing stress of a 4¼ inch slab was 28.2 tons per square foot. The slabs finally are fireproof. The makers—the Muriblock (Partition Slabs) Ltd., Wandsworth, S.W.—state that they are cheaper than any other partition slabs on the market. Full particulars and prices will be sent on application.

MESSRS. WITCHELL & Co., Ludgate Hill, E.C., have issued a small combined calendar and stamp case, which in about half a dozen pages gives a lot of useful and interesting information.

## VARIETIES.

THE Manchester City Council have given official notice that they propose to provide a public elementary school for about 1,200 children at Gorton, in the City of Manchester.

THE Caledonian Railway Company have, it is understood, decided upon the much needed rebuilding of their station at Port Glasgow.

HER MAJESTY'S THEATRE, Guild Street, Aberdeen, is to be converted into a music hall at a cost of 5,000*l.* The plans have been approved by the Town Council.

THE Highland Railway Company have made arrangements for building a hotel at Strathpeffer, N.B., at a probable cost of 32,000*l.*

THE Government of India have accorded administrative approval to a proposal to construct a new Customs building at Rangoon, at a probable cost of about 4,50,000 rs. (30,000*l.*).

A PROJECT is on foot for the establishment of a spa at Pöstyén (Hungary). The cost is estimated at 1,500,000 kronen (about 63,000*l.*). The scheme will include the building of an hotel.

THE Coventry City Council on the 25th inst. adopted a scheme for the extension of the electric light department at an estimated cost of 54,000*l.* Plant to the value of 5,000*l.* will be scrapped.

THE plans for a new engineering laboratory to be erected within University College Buildings, Dundee, are under consideration by the Works Committee. The cost of building and equipment will be about 14,000*l.*

THE Liverpool Burials Board have received the approval of the Local Government Board to borrow 12,500*l.* for the erection of three chapels in Allerton Cemetery. The plans are to be prepared at once by the city engineer.

THE Court of the Carpenters' Company, at their last meeting, voted the sum of over 800*l.* in donations and subscriptions to various charitable and other institutions. This sum is quite apart from the amount expended by this Company on education—technical and otherwise.

THE Court of Common Council have directed their General Purposes Committee to consider and report as to the expediency of directing that in future a clause be inserted in all tenders and contracts for the supply of manufactured articles required for the Corporation, that such articles should be of British manufacture.

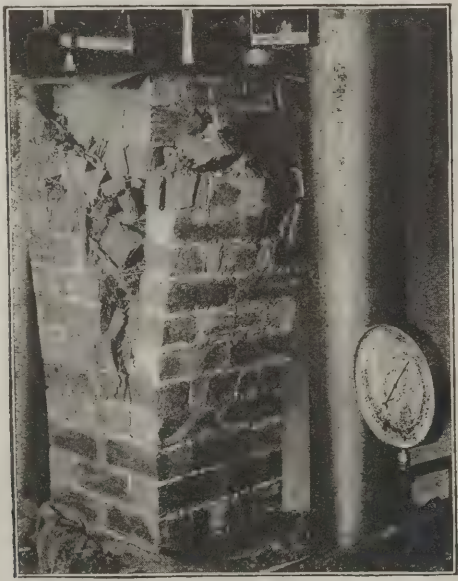
THE Hooton education committee have decided to issue statutory notices for the provision of two new schools in Wirral. One school, to accommodate 170 children, will be erected at Willaston, and the other will serve the parishes of Childer Thornton, Hooton, and Little Sutton. The latter will accommodate 180 children.

THE Tame and Rea Drainage Board have accepted the following tenders:—Messrs. Jones & Attwood, of Stourbridge, for the supply of distributing pipes for the bacteria beds at Saltley, on a basis of schedule of prices; the Staveley Coal and Iron Company, in the sum of 11,441*l.* 11*s.* for cast-iron pipes, &c., for supply main to bacteria beds at Minworth; Clay Cross Company, in the sum of 3,827*l.* 19*s.* 2*d.*, for cast-iron pipes, &c., for sludge main.

MR. W. WADDELL, chief officer of the Glasgow Fire Brigade, has issued the twenty-fifth annual report of the Fire Department. Referring to the question of defective building construction, Mr. Waddell says:—"I regret to record so large a proportion of fires due to defective building construction. The utmost care should at all times be exercised when buildings are being erected to avoid joists or beam ends from running into chimney walls. Fires from such causes occur year after year. Indeed, from such defects no less than 241, or 37.3 per cent., of the total fires appear in the 'causes table.' Four, or 1.6 per cent., of the defects occurred in buildings erected since the passing of the Building Regulations Act, 1892. These defects, as hitherto, have been regularly reported to the Master of Works Department, and all necessary measures for improvement have been taken advantage of during the reconstruction of the buildings." The loss in 1909 amounted to 163,000*l.*, compared with 65,000*l.* in 1908.

## REINFORCED BRICKWORK TESTS.

At the Municipal Technical School in Manchester some important crushing tests were carried out last October in order to ascertain the strength of a reinforced brick pier in comparison with an ordinary brick pier. Two piers were built, both were 18 inches square, and 16 courses (4 feet 7 inches) high, were built of common wire-cut bricks set in 1—1 Portland cement mortar, and were both three days old when tested. The only difference between them was that one was reinforced in every horizontal joint with "Johnson's patent conical mesh wire netting reinforcement." An interesting illustrated leaflet has been issued by Messrs. Rd. Johnson, Clapham & Morris, Ltd., the sole manufacturers of the Johnson patent, showing the behaviour of the two piers. The accompanying block shows the reinforced pier after the severe load of 260 tons had been applied, and had then gradually fallen off.



It will be observed that the top of the pier has formed a kind of pyramid, which in the fashion of a wedge has more or less split through all the courses except the lower four, which remain intact. More important than this, however, is the action of the reinforcement, which, it will be seen, is holding the pier together. The test was continued until the pier stood only 33 inches in height, the crushing being facilitated by any heavy pieces of brick which had partly broken away, being removed. But the four lower courses still held.

In the plain pier the splitting occurred practically from top to bottom with a crushing load of 189 tons; and when the height was reduced by only 4 inches the pier had become the shape of a double cone joined at their apexes.

This test points to the great increase of strength, about 37 per cent., secured by the introduction of the wire-netting reinforcement. Here then is an alternative to the steel stanchions enclosed in some fire-resisting material which are such an unreliable factor in the event of fire. It is acknowledged by all that plain brickwork will resist enormous heat and sudden changes of temperature. The area of the patent reinforcement is so small that its expansion would have little or no effect if introduced. Whereas the expansion and bending of the stanchion, if the protective covering is at all faulty, has been the frequent cause of dragging down whole floors. The opinion of Mr. A. Pordage, the firemaster of Edinburgh, on the subject of fire-resisting construction will be accepted as that of a specialist, and in a recent issue of the *Architect* the following remarks by him on brickwork appeared:—"Brick is least affected of all material, and will withstand the exposure to a fierce fire and application of water many times without detriment to its stability. I have not found in my experience any other form of construction of which the same may be said."

## NEW ADULT SCHOOL, SUTTON, SURREY.

This building at the corner of Benhill Avenue and Lichfield Road, Sutton (the gift of Mr. Thomas Wall), was formally opened on Saturday, the 8th inst.

The area covered by the building is 8,250 square feet. The main hall is 68 feet long by 37 feet wide. Opening from it on either side are class-rooms, which are so arranged that they can, if desired, be divided off from the hall by curtains and from each other by means of sliding partitions. When these are used in connection with the hall there is an auditorium accommodating nearly 1,000 persons each of whom may command a view of the platform. An organ chamber is provided, this being placed in a gallery which forms a feature at the platform end of the hall on the west side. Cloak-room accommodation for both sexes is provided in close and convenient proximity to the principal entrance, while at the platform end there is a vestry and a ladies' parlour. A kitchen is also provided.

In addition to the wide principal entrance and vestibule there are exits at the platform end of the hall on either side so that facilities of egress are ample and convenient.

In addition to the main hall, with the adjuncts mentioned, there is at the rear a gymnasium 37 feet by 20 feet, with separate entrance and lavatory accommodation.

On the first floor are provided a committee room, games room, and reading room, in connection with which also lavatory accommodation is provided. The caretaker will be resident and suitable apartments have been provided with separate entrance.

The building has been designed in the Renaissance style of the seventeenth century; the treatment is simple in character and free from superfluous ornament, its pleasing effect being obtained by means of good proportions and careful choice of materials and colour. The brickwork is in dark red sand faced Ockley bricks, and the roof is tiled to harmonise therewith. The windows are lead glazed. The main entrance from Benhill Avenue is approached by a flight of steps 16 feet wide.

The architects were Messrs. Frederick Wheeler, Son & Searle, of 7 Stone Buildings, Lincoln's Inn, W.C., and the builders were Messrs. F. & H. F. Higgs, of Herne Hill, S.E. Mr. Knight was the foreman.

Special works were carried out by the following firms:—Heating and ventilation, Messrs. J. H. Nicholson & Co., 110 Cannon Street, E.C.; roof tiling and moulded bricks, Messrs. Ames & Hunter, 7 Martin's Lane, E.C.; floor tiling, Messrs. Craven, Dunnill & Co., 37 Maddox Street, W.; electrical work, Mr. William Newton, 58 North Street, Clapham, S.W.; electric-light fittings, the Bromsgrove Guild 82 Victoria Street, S.W.; gas fittings, the Sutton Gas Co.; sliding partitions, the North of England School Furnishing Co., Darlington; special oak doors, the Gilmour Door Co., 51 Berners Street, W.; door furniture (including panic bolts), Messrs. Pfeil Stedall & Co., 3 Broad Street, W.C.; ornamental plasterwork, Messrs. H. H. Martyn & Co., Cheltenham; casements and glazing, Messrs. J. Chater & Son, St. Dunstan's Hill, E.C.; constructional steelwork, Messrs. A. Dawnay & Co., Battersea.

## THE WARMING AND VENTILATION OF PUBLIC BUILDINGS AND FACTORIES.*

(*Continued from last week.*)

By T. W. Aldwinckle, F.R.I.B.A.

As the plenum will be required without warming during the summer, a bye-pass duct should be provided by which the air driven by the fan can enter the main duct without passing through the heating battery. One reason for this is that these batteries offer considerable resistance to the air, and thereby increase the work of the fan. In America the main ducts are frequently in duplicate, one for warm air and one for cold air, with mixing chambers and regulating dampers at the base of each vertical air-shaft. This admits of the temperatures of the air entering the room being well regulated. In that country they use, however, as a rule, small ducts with high velocities of air. There is no room for this duplication of ducts upon the principles proposed in this paper.

The general arrangements of the main and branch ducts will depend upon the nature of the building, the number of floors, and the purpose for which the rooms or halls are used. But one general principle should be followed, viz., that of large sectional areas and low velocities as already explained. Another good reason is that the ducts should, as far as possible, be large enough for access for cleaning purposes. This is of the highest importance, as, without the means for frequent and thorough cleaning, these ducts can, and indeed frequently do, become very dirty and foul, and as such are a source of danger to health. As a matter of sound principle there should be no portion of any ducts

**The Principles of Architectural Design**

**By PERCY L. MARKS, Architect,**

**Author of "The Principles of Planning."**

With 165 Full-plate and other Illustrations, Royal 8vo, 10*s*. 6*d*. net.

THIS work embodies not only a series of articles on Exterior Design, that appeared in the columns of THE ARCHITECT, but includes also a similarly detailed treatment on the principles affecting Interior Design.

There cannot be any dogmatism on the subject of Art; but there are certain underlying *principles*, and the object of this book is to propound these in an easy and argumentative manner on the lines so successfully pursued by the author in his now standard work on Planning.

The study of the principles referred to is aided by illustrations which are for the most part of a diagrammatic character; in which light they are to be regarded, and not as finished illustrations exemplifying the Perfect Design.

The book has been well received and sympathetically reviewed during the short period that it has been issued; and with a view to fostering the growing interest of the general public in the art of Design, it has been kept free from any undue use of technicalities. It should appeal, therefore, to the layman as well as to the architectural student and designer.

or any inlet which cannot be easily cleansed out. This may appear a large order, but it is perfectly feasible and is absolutely essential. This matter of foul and unclean ducts is a strong argument frequently used against the plenum system, and it is one to which the most careful attention should be given.

The velocity at which the air enters the room or hall will vary with the conditions—with downward ventilation, say, in a theatre, with the air entering at or near the ceiling and consequently well above persons' heads, a fairly high velocity is allowable, especially if the air current will have to travel some distance; but where the inlets are near the occupants of the room a velocity of 3 to 4 feet per second will be sufficient, provided that the collective area of the inlets is sufficient to provide the requisite amount of air at such a velocity. The angle at which the air jet will enter has to be carefully considered, according to the circumstances of the case. Each inlet should also have a regulatory valve, as simple and ready control is the essence of all good ventilation. The temperature at which the air will enter the room must be definitely arranged, and must be capable of ready adjustment at the heating battery as already described. This comes to be a matter of much importance in places where large numbers of persons assemble, such as theatres and the like. Each adult person gives off about 400 thermal units of heat per hour, so that an audience in a theatre numbering, say, 1,500 persons, with an air allowance of 1,000 cubic feet per head per hour, will, in one hour, have given off sufficient heat to raise the temperature of the air 22° Fahr. Such being the case, it is obvious that the incoming air would usually have to enter at a temperature lower than that of the auditorium.

One of the most difficult buildings to warm and ventilate is a public elementary school. The cubic space per child in the class-rooms is only 140 feet, and windows are not desirable (for lighting purposes) on both sides of the room. Open fireplaces are almost out of the question. This is an instance when "natural" ventilation fails altogether, the proportion of $CO_2$ with such ventilation often rising to as much as 18 parts in 10,000 during the winter months. Any attempt to improve this by large inlets of air through open windows only lowers the temperature to 52° or 53°, which is much too low for children to sit and work in, to say nothing of the inevitable draughts. Dr. Kerr, the medical officer to the education committee of the London County Council, in his report for the year ending March, 1904, points out the failure of natural ventilation in the case of London schools, and strongly recommends mechanical ventilation, preferably a combination of plenum and exhaust, with an air supply of 1,500 cubic feet per child per hour, which is about eleven changes of the air per hour. The effect of temperature upon the children's work is also dealt with by Dr. Kerr. He says, "From inquiries it seems that the London school child takes little notice of variations in temperature between 56° and 64°, and apparently does its best work at about 58°. A fall below 55° gives rise to comment, and a rise to 65° to unpleasant subjective symptoms, slackness and inattention in some, headaches in others."

As to the relative merits of "upward" and "downward" ventilation, much will depend upon the character and purposes of the building. The exhaust system seems to lend itself to upward ventilation, and provided that the air inlets are not too high above the floor line the arrangement is simple and effective. It is most suitable for council rooms, classrooms, factories, workshops, and the like, where the air is removed at once upwards from the breathing line. It does not appear to be so suitable for any class of building with galleries. There is also this in its favour, that as the vitiated air is warm and tends to rise, and as the convection currents set up by the bodies of persons are also upward, the upward system is following to some extent natural laws.

There are, however, instances of exhaust ventilation, notably the removal of dust, &c., from factories, to be afterwards described, where downward exhaust is far preferable.

Downward mechanical ventilation would seem to be the most suitable for theatres, public halls, and all crowded places having galleries, the system being plenum with exhaust. The warmed fresh air can be driven in at a moderate velocity from the ceiling, or at a level near the ceiling line, without causing any perceptible draughts. The air intake being at the top of the building, the source will be purer than elsewhere. The incoming air will be naturally distributed throughout the whole of the auditorium, and will find its exit at the lower part of the hall, the outlet current being induced by exhaust fans, and the exits being under the seats, against the walls, and in other suitable positions, and not causing any perceptible draughts. This is preferable to bringing in the fresh air under seats and similar positions, as such inlets cannot be kept clean, but will always be clean enough for vitiated air to pass out through. As the audience are, after a short time, as previously explained, practically providing all the warming, it is a great advantage that the entering air, which under these circumstances must be cool, should enter at some distance from the audience, or cool draughts might be experienced. The trouble as to the vitiated air of one tier of galleries being carried up or down to another (a trouble associated with both upward and downward systems) can, to some extent, be obviated by having exhaust outlets in connection with each tier. Theatres and similar buildings are usually free from the down draughts arising from the cooling surfaces of windows and skylights, and this greatly simplifies the arrangements, as these down draughts are very serious and very difficult to deal with.

It is possible to have the plenum upward system without auxiliary exhaust, provided the outlets are efficient in area, in suitable positions, and properly protected against the disturbing action of wind, but downward ventilation with plenum only would not be so successful, as it is impossible to arrange outlets near the floor line without providing some exhausting power, as the downward current is in opposition to the natural upward tendency of the vitiated air, and such outlets would be useless against the wind and would most probably, some of them at least, become inlets. It follows, therefore, that in many cases the plenum and exhaust downward system will be somewhat expensive to instal, but its superior advantages are great, and it is the most complete system of ventilation I know of. The vitiated air is at once removed below the breathing line, the dust caused by work is removed beneath the worker, and the fumes from the laboratory benches are removed beneath the chemist or student. This is particularly the case in factories which are mostly top lighted. Any attempt to get rid of the air at the top is considerably checked by the downward currents of cold air set up by the cooling surfaces of the skylight. It is preferable, therefore, to have the warm air inlet sufficiently high and so deflected that the current of warm air shall travel along or near the ceiling line, and subsequently descend to the breathing line. The downward current will in that case be comparatively pure air.

In this connection it may be mentioned that the "natural" ventilation of a hospital ward in winter, with open windows and open fires, is practically "downward" ventilation, the open fireplaces being powerful exhausts close to the floor line.

Whatever the system of ventilation adopted, be it natural or mechanical, upward or downward, what is required is frequent changes of the air in the room, thus providing a large amount of air per occupant, the movements and distribution of the air being so arranged and controlled that the impurities which are given off shall be removed as soon as they arise without the possibility of their accumulating.

At the new bacteriological laboratories, recently erected at Sutton for the Metropolitan Asylums Board, I provided a system of plenum and exhaust ventilation and warming upon the lines I have here indicated. There are seventeen rooms thus ventilated, varying in size from 13 feet by 10 feet to 17 feet by 13 feet, and all are 10 feet high, and are on both sides of a central corridor. The building is one storey high, with a small basement. The fresh air is admitted through a large louvred opening, passes through a filter screen previously described, and is driven through a heating battery into the main central duct by a centrifugal fan at the rate of 180,000 cubic feet per hour. The heating battery consists of ten two-column radiators, each of 80 feet heating surface, in which water circulates at a temperature of 150° Fahr. Each radiator is controlled by a valve, so that any part of the battery can be put on or off, and thus regulated to suit the external temperature. The central duct is tapered and has low-pressure hot-water circulating pipes in same to maintain the temperature of the air. From this duct rise glazed fireclay branches, leading to the vertical inlets in the room, 18 inches by 9 inches, and 8 feet high, of cast iron, the whole of the front except the air inlet at the top being a door, as access for cleaning. Each inlet has a regulating valve, and is placed against the inner wall opposite to the windows. The air enters the room at a height of 7 feet 6 inches from the floor, at a velocity of 3½ feet per second, and the momentum carries it along the ceiling line to the opposite side, where the cooling action of the windows causes it to descend. It then comes under the suction influence of the exhaust, which is close to the floor level on the same side of the room as the inlet. The air is then drawn into an exhaust duct below the floor, which runs into a vertical brick shaft about 28 feet high, at the top of which is a propeller fan discharging the air into the atmosphere. The power of the exhaust fan is somewhat less than that of the inlet for the reason already stated. The air of the rooms is changed about six times in the hour, and a temperature of 60° is easily maintained when the external temperature is 20°. Owing to the heating surfaces having a low temperature there is a complete absence of that closeness and heaviness in the air of the rooms so frequently complained of in plenum systems.

The ventilation of factories is a subject by itself, as not only have the rooms to be warmed and ventilated, but noxious matters arising from many of the manufactures have to be separately removed, as near as possible at their point of origin, so as to prevent them from mixing with the general air of the room, and this we term "local" ventilation, as distinguished from "general" ventilation, which relates to the removal of vitiated air from the room. As regards general ventilation, the majority of factories are content with natural ventilation, as the results of open windows and skylights with steam heating, there being usually plenty of steam available. This is generally satisfactory where there is a fairly large cubic space per worker, but not otherwise. The Factory Act only requires a cubic space of 250 feet per worker, except during overtime, and the inspectors will pass a maximum of 12 parts of $CO_2$ in 10,000 during daylight, and 20 parts when gas is used as an illuminant. These are not very exacting standards. With a small cubic space mechanical ventilation is absolutely necessary, and according to tests in Haldane's Departmental Report of 1902, very satisfactory results have been attained in many factories where both plenum and exhaust fans have been used.

The removal of local impurities is, however, quite a different matter, and requires special treatment. The impurities to be removed consist of dust, fumes, steam, poisonous spray, sawdust, textile dusts, dust from metal polishing and grinding, and the like. Very interesting particulars of the methods in practice for getting rid of these impurities are given in Dr. Haldane's Second Report on the Ventilation of Factories and Workshops (Appendix), issued in 1907. The general principle is downward exhaust ventilation, occasionally supplemented by a plenum inlet. The point of origin of most of these impurities being at the worker's bench, and consequently below the worker's head, it is essential that such impurity should be immediately removed downward, so that it cannot be breathed by the worker. The introduction of a plenum inlet above the work will emphasise this downward movement, and prevent any dust from rising. In some cases the dust is drawn into a hood on a level with, but in front of the worker, in which case the plenum jet of air is at the back of the worker. But in every case the impurities are at once removed away from the worker. These extraction shafts remove the air and impurities at a very high velocity, much higher than the general ventilation. In the case of noxious fumes, such as those from linotype composing machines, the extraction is upward, there being placed over each melting pot a conical hood connected with a vertical pipe running into a horizontal trunk overhead, at the end of which is placed a powerful exhaust fan. At a very large cabinet-making works near London, where about 2,000 workpeople are employed, I saw an excellent system of both upward and downward exhaust ventilation in connection with the numerous circular-saw benches and other apparatus. The light sawdust was removed from above the bench, and the heavier chips were removed below the bench, all passing into overhead and underground trunks eventually uniting above, the material being driven into a chamber above the boiler house, to be sent through hoppers into the boiler house for use as fuel. The power to drive these fans was about 80 h.p. The whole of the foregoing arrangements are in the interests of the health of the workers. Employers who thus spend large sums of money for such a purpose have their reward in the increased health and vigour of their workpeople, and the improved capacity of the latter for producing good work.

In railway workshops and the like, large galvanised steel trunks run along a little above the springing of the roof, with outlets at regular distances. Fresh air (warmed in winter) is driven by a centrifugal fan through these trunks, and is thus distributed throughout the building. The outlets for the air generally consist of a number of large open doors. This air is generally distributed at high velocities.

Where there are large quantities of steam given off in workshops and factories, its removal cannot be effected by currents of cold air. The air blown in for this purpose must be warmed, at all events in winter.

(*To be continued.*)

## LONDON MASTER BUILDERS' ASSOCIATION.

A MEETING of the Council took place on Thursday, the 20th inst. The agenda was unusually interesting to the trade. The President (Mr. F. G. Rice) presided.

It was decided to distribute to the London members of the Royal Institute of British Architects, the Surveyors' Institution, and the Quantity Surveyors' Association the handbook published by the London Master Builders' Association.

One ordinary member and eleven associate members were proposed and duly elected.

The President (Mr. F. G. Rice) reported to the Council that he, together with Mr. Leonard Horner, Mr. G. Bird Godson, Mr. Frank May, Mr. J. Carmichael, Mr. F. Higgs and the Secretary met in conference representatives of the London Association of Master Masons (Mr. F. Corben, Mr. Walter Tomes, Mr. L. F. Chislett, and Mr. Walpole Collins), on January 18. The possibility of affiliating the two Associations was discussed very fully. The conditions to be observed were carefully considered, and the President laid it down very distinctly that the agreements made by the London Master Builders' Association with the workmen's societies must be strictly and honourably observed.

A Conference was also held with the London Association of Master Decorators when the London Master Builders' Association was represented by the President (Mr. F. G. Rice), Mr. Leonard Horner, Mr. G. Bird Godson, and Mr. James S. Holliday, with the Secretary in attendance, and the London Association of Master Decorators was represented by the President (Mr. H. A. Campbell), Mr. J. Anderson, Mr. F. Dakin, and the Secretary (Mr. A. Davidson). The affiliation of the two bodies was carefully considered and the President of the London Master Builders' Association (Mr. F. G. Rice) drew attention to the importance of strict observance of rules made by the L.M.B.A. with the trade unions.

At both these conferences expressions of sympathy and desire for affiliation were made, and it is hoped that eventually these and other bodies of employers in the building trade will be combined in taking united action in matters interesting to all those engaged in the industry.

An interesting discussion took place on this report, and the Council considered affiliation desirable and appointed a committee to consider what terms to recommend for affiliation to the London Master Builders' Association of other bodies and to report to the Council in due course.

The recommendations of the rules committee as to the amendment of the Association Rules were fully considered. The question of sub-contractors occupied a good deal of attention and several glaring instances were given of what master builders have to put up with from many who are employed on work which could be done more quickly, with less interference with the organisation of the working of the job, and, perhaps, better by the master builder himself. It was felt that some architects do not appreciate the loss of time, money, and, in some cases, the quality of workmanship, by the ever-increasing tendency to foist sub-contractors on those who have all the responsibility on the various works in hand. It was considered to be a great hardship on builders to be responsible for the work of sub-contractors who do the work that they (the builders) have facilities and ability to carry out, and of whom they have no selection, and, although it is admitted in some cases architects cease to employ sub-contractors whose want of consideration to the master builder warrants such a course, great hopes were expressed that architects would revert to the former practice of entrusting the master builder with the whole of the work formerly undertaken by him, and which would undoubtedly give him an added interest and pride in his work.

It was decided to hold the annual dinner on the 24th proximo.

The question of beginning work before the recognised "starting time" was considered.

---

THE Walsall education committee have decided that application be made to the Town Council for their sanction to the erection at Bloxwich of a new public elementary school to accommodate 500 children at an estimated cost of 6,000*l*.

A POLL of Exmouth was taken on Monday, with the result that the ratepayers authorised the Urban Council to apply to Parliament for a Bill to extend the waterworks, some eight miles from the town.

| H. & C. Spackman | 531 | 9 | 4 |
| FLEWELLING, Wootton Bassett (*accepted*) | 444 | 16 | 7 |

## TRADE NOTES.

MESSRS. W. POTTS & SONS, clock manufacturers, Leeds and Newcastle-on-Tyne, are now making and fixing new clocks at the Mechanics' Institute, Marsden, Huddersfield; the Hull Garden City, Hull; Bretton Park, Wakefield, for the Right Hon. Lord Allendale; the new secondary school and technical institute, Cleckheaton, and one for near Oldham, Lancs.

A NEW large clock is to be erected in the St. Luke's Hospital, Halifax, Yorkshire, in place of the electric clock, which has been a failure. The contract has been given to Messrs. John Smith & Sons, Midland Clock Works, Derby, who recently made the great clock and chimes for Selby Abbey.

A NEW tower is being built to St. Peter's Church, Macclesfield, which is to be provided with large striking clock with three dials. The order for this has been placed with Messrs. Joyce, clockmakers, of Whitchurch, who are making a similar one for Sir Robert Harvey, Bart., Dundridge, Totnes. They are also fixing one at Thornton-le-Moors Church, Cheshire, and overhauling the clock and carillon and providing new tunes at the Bell Tower, Evesham.

MESSRS. GEORGE MILLS & CO., LTD., engineers, Radcliffe (proprietors of the "Titan" sprinkler), have received intimation that a fire occurred at the very extensive drapery establishment of Messrs. Jardine & Co., Cape Town, South Africa, on the evening of January 9. The fire originated by the fusing of underground electric cable about 20 feet from the building. The flames travelled along the cable into the building and set fire to the drapery stock. One "Titan" sprinkler instantly came into operation and promptly extinguished the fire before the arrival of the Cape Town Fire Brigade.

MESSRS. D. ANDERSON & SON, LTD., London and Belfast, make their "Stoniflex" felt in three varieties. No. 1 is a roofing felt for permanent use; No. 2 is a sarking felt, and No. 3 is a lining felt for insulating cold stores, lining iron buildings, &c. The Stoniflex felt has now been upon the market for ten years, consequently there has been ample time to prove that it is of a most durable and lasting kind, and that it toughens with age instead of becoming brittle. Its pliability prevents its cracking on settlement if stretched tight and smooth. The manufacturers recommend that after the roof has been covered the whole surface should be coated with their "Stoniflex" mastic, as it will not then require any further attention for years. This last is a most important consideration, for there are some felts that require tarring nearly every year. Stoniflex felt has been used for roofing many of the largest factories in the kingdom, schools, football stands and skating rinks all over the country have been covered with it. Another product of Messrs. Anderson & Son, Ltd., is the nut brown wood preservative known as "Sideroleum," which also has been most favourably known to the building trade, architects, and estate agents for many years past. It is laid on direct to dry timber with an ordinary brush, and requires no skill in applying. Another use for it is as a floor stain, when, if beeswaxed and polished, it produces a most excellent effect.

## THE PAINT AND VARNISH SOCIETY.

AT the meeting of the Society to be held at St. Bride's Institute on Thursday, February 10, at 8 P.M., Mr. J. W. Lovibond will contribute a paper on "Colour Nomenclature."

The present unsatisfactory condition of the nomenclature of the colour and paint industry has become more and more apparent in recent years, and considerable attention has been given to the possibility of introducing such methods of definition and standardisation as have been adopted with success in other industries. There can be no doubt that if a satisfactory nomenclature for painters' material could be devised, so that there could be no misunderstanding as to the quality and properties of any article, both manufacturers and consumers would benefit considerably.

Mr. Lovibond's unstinted labour towards this end for many years past is too well recognised for there to be any doubt as to the interest of the paper in question. All who take a practical interest in the matter, favourable or otherwise, are invited to be present at the meeting, and contribute their views and suggestions. Invitation cards will be forwarded on application to the Secretary, Noel Heaton, 11 Stonebridge Park, N.W.

THE Darlington workhouse is to be enlarged at a cost of over 3,000*l*. The additions will consist of new day rooms and dormitories, isolation accommodation and a bakehouse.

## AN ADVERTISING COMPETITION.

However true it may be that a good wine needs no bush, it is certainly not true nowadays that articles of commerce can be safely left to speak for themselves. If it is desired to win for them a very prominent position it is necessary that they should be in some degree pushed forward and a place forced for them among competitors. The same remark applies equally to men and things. But it is in business above all that judicious pushfulness is essential. This advertising or self-advertising must, however, be carried out cleverly to obtain the best results. The merchant has to attract public attention towards his wares before he can sell them. As the public themselves are presumably best able to tell how this is to be achieved, it sometimes happens that an enterprising firm offers a reward for help on the subject. An instance of this recently occurred when Messrs. Thos. Parsons & Sons decided to offer three cash prizes amounting to 50*l*. for a phrase of not more than twelve words suitable for use in advertising their white enamel "Endelline." The sender of the phrase which, in their opinion, was the best was to receive 30*l*.; the second and third in order of merit being awarded 15*l*. and 5*l*. respectively. The competition was open to everybody (employés of Messrs. Parsons excepted) without entrance fee or other restriction whatever.

The competition has proved a complete success. It was only to be expected that after many hours and days spent in the composition of limericks, jaggles and similar intellectual feats the general average ability should be high. But Messrs. Parsons & Sons were able to select three. The first prize of 30*l*. has been awarded to Mr. Chas. Walter Stupart, 112 The Avenue, Bruce Grove, Tottenham, N.; the second prize of 15*l*. to Mr. Thos. Robinson, 79 Rosegrove Lane, Burnley; and the third prize of 5*l*. to Miss B. Thompson, 35 Grand Parade, Cork.

The winning phrases are to become household words through the medium of advertising. It remains to be seen if they rival in graphic terseness the triumphant despatch sent many hundred years ago, "Veni, vidi, vici."

## VARIETIES.

Mr. Butler Wilson, F.R.I.B.A., is delivering a series of lectures on the arts at the Leeds School of Art.

Mr. B. T. Batsford has taken over from Messrs. George Newnes, Ltd., the remaining stock of Mr. Baillie-Scott's volume "Houses and Gardens," and has reduced the selling price from 1*l*. 11*s*. 6*d*. to 18*s*. net.

Whitley St. Helen's Church, in the parish of Slaley, Hexhamshire, is about to be improved and renovated. Slaley Church was also recently improved by the removal of galleries, &c., under the supervision of Mr. A. B. Plummer, F.R.I.B.A., the Newcastle diocesan architect.

The Savoy Hotel, Strand, W.C., is to be enlarged and improved at an estimated cost of over 100,000*l*. The principal work will be the addition of two storeys facing the Thames Embankment and the erection of a banqueting room.

Mr. F. J. Harrison, of Maer Hall, Staffordshire, and Mr. H. Harrison, of Liss, Hants, have given 15,000*l*. for the building and endowment of a church and parsonage for a new parish to be formed out of the parish of Wallasey, Cheshire.

Mr. James Whitehead, of Oldham, contractor, who died December 4, left estate valued at 22,571*l*. gross. The testator left 500*l*. to the vicar and churchwardens of St. Bartholomew's Church, Marsden, towards the erection of a new tower, and 100*l*. each to his book-keeper and his mason.

The London and North-Western Railway Company have had plans prepared for extensive alterations at their Nuneaton station. Part of the scheme is to take down the existing booking hall, offices, refreshment, parcel and waiting rooms, and build an entirely new block nearer the goods station.

Mr. B. Tabberer, F.R.I.B.A., died on the 26th ult. at Alverstoke, Blackheath, at the age of seventy-nine. He was articled to Mr. Henry Goddard, of Leicester, and subsequently commenced practice in London in 1861. In 1870 he was appointed district surveyor for Greenwich, and in 1902 for Deptford East and Greenwich. He was a Fellow of the Surveyors' Institution, and served on the Board of Examiners of the R.I.B.A. for many years. He was a Past President of the District Surveyors' Association, and for twelve years honorary secretary.

The receiving day for architectural drawings intended for the Royal Academy Exhibition, 1910, has been fixed for Thursday, March 24. Not more than three works may be sent by any one artist. Labels and forms can be obtained (during the month of March only) from the Academy. Oil paintings are to be sent in on March 26 and March 29, and sculpture on Wednesday, March 30.

The Liverpool Cathedral executive committee met on Monday. The auditors' statement of accounts for the year showed the expenditure to amount to about 33,000*l*. The sum of 50,000*l*. is still required to complete the portion of the cathedral in course of erection. Designs were submitted for the Bishop's seat in the Lady chapel, and also seats for the clergy, to cost 130*l*. each. Tenders were also submitted for the choir stalls for the Lady chapel at a cost of 465*l*.

The Wolverhampton and District Architectural Association held their annual meeting in the Wolverhampton Library, Waterloo Road, last week. The following officers for the ensuing year were appointed:—Mr. Thomas H. Fleeming, president; Mr. J. Lavender, vice-president; Mr. A. W. Worrall, hon. treasurer; Messrs. F. T. Beck, W. Edwards and W. J. Oliver, members of the Council; and Mr. William J. H. Weller, hon. secretary. The President at the conclusion of the meeting delivered an address.

The following makers of brass steam and water fittings have amalgamated:—Martineau, Beames & Madeley, Ltd., Birmingham; Gaukrodger, Sykes & Roberts, Ltd., Halifax; Newman, Hindes & Co., Ltd., Woodchester; and J. Storey & Sons, Ltd., Manchester. The combination will trade under the style of the United Brassfounders' Engineers, Ltd., and its headquarters will be at Tower Buildings, Liverpool. The object is to enable the different firms to specialise on certain branches and to improve their works organisation so as to meet foreign competition. There is no intention to raise prices, but merely to produce at the lowest possible figure and to fix prices accordingly.

At the annual meeting of the Liverpool Diocesan Church Building Society it was stated that halls and institutes were projected at Seaforth; Christ Church, Kensington; Christ Church, Bootle; St. Paul, Widnes; St. Andrew, Litherland; St. Catherine, Wigan; Newburgh; St. Augustine, Liverpool; St. John the Evangelist, Breck Road; St. Mary, Wavertree; and St. Anne, Stanley. New churches are also about to be commenced at Orrell, Litherland, and in the Hampstead Road for the Welsh; at Abram, at Whelley, and Hoscar; and the Church of Holy Trinity, Wavertree, is to be enlarged and partially rebuilt.

The Durham County Council have adopted the principle that the proposed training college buildings should be in separate blocks as follows:—A. Education block, including assembly hall, lecture and other rooms devoted entirely to educational purposes. B. Hostel accommodation for 120 women students arranged either in three houses for forty students each, or in four houses of thirty each, whichever may be found by the architect to be most economical and convenient in planning. C. Dining hall, kitchens and housekeeper's apartments. D. Gymnasium, &c. E. Sanatorium. F. Laundry. G. Lodge and entrance gates—and that the hostels be planned on the "study bedroom" system. The County Education architect has been requested to prepare the plans for the proposed college, and arrangements are being made to provide him with additional temporary assistance for the purpose.

Mr. W. Erskine, the acting first secretary of the British Embassy at Rome, in a report on the foreign trade of Italy says that the international depression of trade has pressed less severely upon the iron and steel industry in Italy than elsewhere, and is partly due to the support afforded by the Government, whose policy it is to place as many as possible of their orders with local factories. The principal hope for the manufacturing industries of Italy in the future lies in the development—at present almost in its infancy—of the immense hydraulic resources of the Alps and Apennines. Should the problem of utilising the magnificent stores of energy with which nature has endowed this country be attacked with enterprise and science, the cost of production would be enormously reduced, and there should be nothing to prevent her competing on favourable terms in the markets of the world. So long as her manufacturers have to depend upon imported coal for their source of energy they can hope to do little more than cater for the home market with the aid of a high protective tariff.

# THE WARMING AND VENTILATION OF PUBLIC BUILDINGS AND FACTORIES.*

*(Concluded from last week.)*

By T. W. Aldwinckle, F.R.I.B.A.

### *Warming.*

When we come to deal with the methods adopted for warming buildings, we find that these will vary with the system of ventilation. With the simplest form of natural ventilation we have the open fire, that extravagant, much abused, but really cheerful and healthful method. For the rooms only in a public building they are still the most comfortable and wholesome form of warming, and form excellent extraction ventilators, provided always that there are suitable air inlets, such as Tobin's tubes or partially open windows. No system of artificial or mechanical warming and ventilation will ever be as wholesome and comfortable for such a purpose. This refers to single rooms and offices, and not large general offices, where a good number of persons are congregated, and where open fireplaces would be inconvenient and out of place.

Leaving the subject of open fireplaces we come to artificial warming, and the first is direct heating by hot-water or steam radiators, which in some systems of natural ventilation take the place of open fireplaces. Great improvements have in the past few years been made in the various types of radiators, most of the improvements emanating from America; the heating surfaces have been better designed and their efficiency thereby increased. Whenever possible the radiators should be placed against an external wall, so that an air channel can be formed at the back, and in all cases, whether against an inner or outer wall, a baffle should be fixed to the wall immediately above the radiator to prevent the deposit of blacks and dust upon the wall above, caused by the convection air currents set up. Swinging radiators are very convenient for access to the wall for cleaning purposes, but these are somewhat costly. They should, however, always be used for hospital work. It is preferable in all cases for the radiator to stand on wall brackets and not on feet, so as to leave the floor clear for cleansing purposes. The inlet and outlet branches to and from the radiator should each have a valve, in order that any radiator can be removed without disturbing the general circulation.

Exposed or "direct" radiators heat both by radiation and convection, but principally by the latter, and the efficiency of the heating surface is considerably increased by fresh air currents passing across them. The freer the circulation of air round the surfaces of the radiator the higher is the efficiency, and for this reason low radiators are more effective than high ones, and single-column radiators than those with two or three columns. There should therefore be a good air space between the loops. Ribs or other like extensions of the heating surfaces are of little value, at all events in hot-water radiators. It is necessary to paint radiators, and it has been found that bright and glossy paints reduce the amount of radiation, and that a dull, dark paint is preferable. The colour or brightness of the paint does not, however, affect the convected heat. The best position for a direct radiator is under a window, as being the part of the room with the most cold currents of air.

When radiators are used in connection with authorised inlets in an extraction system of ventilation, the incoming air is generally required to have an upward current. It is not a good arrangement to enclose these radiators in iron cases, as there are difficulties in cleaning the interior. It will be sufficient if removable baffles are fitted to the front of the radiator for about two-thirds of its height. This will give the requisite direction of the air.

Wherever radiators are used, whether for direct or indirect heating, the temperature should not exceed 150°, for the reasons already given.

When the warming is in connection with the plenum system, it is not desirable in many cases to make the incoming air the sole source of means of warming, as in most cases this would necessitate undue heating of the air. It is preferable to admit the air at a temperature not exceeding 10° or 15° above the required temperature of the room, and to supplement this by direct heating by means of radiators.

As to the medium to be used for creating the required temperature in the radiators, pipes or batteries, we have live steam, exhaust steam and hot water. High-pressure steam is a costly medium, as its latent heat is less than that of low-pressure steam, and the latter is therefore more generally used. When exhaust steam is available this is still more economical, as it is to some extent frequently a waste product, but this is only available when there is steam power of some kind on the premises. There are two systems of hot-water heating, viz. high pressure and low pressure. The high-pressure system, commonly called Perkin's system, is a sealed circulating apparatus, in which the water is heated to a temperature of 350°, with a pressure of 135 lb. on the square inch. Small pipes are necessarily used. It is a convenient method of heating in some cases, but from our point of view the high temperature of the heating surfaces is a fatal defect. This system is not very generally used in these days. Low-pressure hot-water gravity circulation is very simple and effective, as it supplies its own motive power for the purpose of circulation, and low temperatures can be obtained for the heating surfaces. Low-pressure hot-water gravity circulation is of two kinds, the one-pipe and the two-pipe systems. As its name indicates, the two-pipe system has a flow and return in separate pipes to each circulation, the branch inlet to the radiator leading from the flow pipe, and the outlet leading to the return pipe. In the one-pipe system the inlet and outlet branches from the radiators lead from the same pipe, which is a flow pipe so long as it is feeding the radiators, after which it returns to the boiler. This system is by far the simplest and most effective, and is free from the danger of short circuiting to which the two-pipe system is very liable. As, however, in the one-pipe system, the hot water having done duty in the radiator, returns somewhat cooler to the same flow pipe (and the radiators may be numerous), the tendency is for the water in the flow pipe to become a little cooler, and to meet this difficulty the heating surfaces of the further radiators should be proportionately increased.

Where there are several floors to a building there should be a separate circulation to each floor leading from two large drums, one for the flow and one for the return, these drums being in circulation with the boiler. A valve placed on each flow pipe close to the drum will admit of the necessary regulation of flow, so that one floor shall not get a better circulation than another. In all gravity circulations great care must be taken in the matter of air pipes, otherwise trouble may ensue. The overhead or drop system is practically the one-pipe system with descending instead of ascending branches. It is useful in many positions where the other systems would be unsuitable.

Whatever the system of circulating adopted, one matter should be borne in mind, viz. that any circulating or branch pipe which is not doing duty, either by radiation or convection, should be coated with a good non-conducting composition, so as to prevent loss of heat.

To surmount the difficulties arising to the circulation from dips and other obstacles, and for other good reasons, several ingenious apparatuses have been designed to force the circulation, three of which I will describe. In these cases pipes of smaller diameter can be used. It must, however, always be remembered that these generally require motive power of some kind, to be represented by steam power or electric motors, and that this has to be paid for in annual cost.

In the pulsial system the hot water is circulated compulsorily in continuous pulsations; the water in an ordinary water boiler being brought to boiling point, and rising in a pipe taken from a boiler is converted into steam, which is used for displacing a body of water in two cylindrical vessels, forming part of the apparatus, and placed in a certain relationship to the supply tank. An arrangement of "syphon" pipe in one displacer is used as a cut-off for the steam in such a manner as to cause alternative displacement of water, condensation of steam and consequent refilling of the displacers with water. The whole of the circulating pipes, radiators, boiler and pulsial displacers form one connected open-bore system, under atmospheric pressure. No sunk boiler-room is required, and pipes of small diameter are used. The apparatus is noiseless, and admits of any desired temperature of the circulating water being regulated, from a low temperature to a high one. It will be noted that no independent steam supply is required, the steam used being generated in the apparatus itself.

The cable system is automatic, using very small pipes, and is a self-contained system without pumps, working with a boiler pressure as low as 1½ lb., or with exhaust steam only. The most important part of the apparatus is a thermo-syphoniser, in which condensation of the steam causes a powerful suction on the return pipe, which draws the water round the system at a high velocity. The boiler can be placed at any level, provided it is at a certain minimum distance below the expansion tank, and basement excavation can be thus avoided. The circulating pipes—flow and return—can be run from the apparatus in any direction up or down and at any desired level. The temperature of the circulating water is automatically regulated.

---

* A paper read before the Association of Engineers in-Charge on January 12.

The turbo system consists of a turbo accelerator, driven by an electric motor, taking ¼ h.p. for the small and ½ h.p. for all but the larger sizes. It is practically a forced circulation, and thus independent of levels and of dips and other obstacles, and admits of the circulating pipes being small. It can be easily adapted to existing circulations.

There is also the ordinary system of forced circulation, suitable for large hospitals and other institutions where there are several detached buildings on the site. For this purpose there is a central heating chamber, preferably close to the boiler-house, in which the water is heated in large steam heaters, from whence it is pumped along circulating pipes in subways, at a velocity of from 3 to 4 feet per second, to the several buildings, with branch gravity circulations into each building. These forced circulations can with advantage be arranged in the method of ring mains—i.e., two pipes running round the group of buildings and thus forming a ring, each pipe starting from the heater and going in the opposite direction, and then returning to the heater. Each circulation starts as a flow pipe, and runs as such for half the journey, when it becomes a return pipe. Thus a fair equality of flow temperature is maintained throughout the ring. But there is another great advantage arising out of this arrangement. The two rings are connected by cross pieces and three-way valves, so that any part of the system can be shut down for repairs, leaving the whole of the remainder of the system in circulation. Care must be taken to provide a sufficient number of expansion joints in these mains. Exhaust steam from the pumps and engines is used in the heaters, supplemented as may be necessary by low-pressure live steam. It is prudent to have a spare heater and the pumps in duplicate. This arrangement of a central heater chamber is much more convenient than having steam neaters in each building, and saves labour on the part of the staff. I wish to emphasise the importance of having the circulating pumps of ample size, in order that the circulation may be efficient without forcing the pumps. This has not always been done with these installations. This question of a comfortable margin of power equally applies to all other parts of a heating apparatus, whether boilers, circulating pipes or heating surfaces.

As regards steam heating I may mention the Webster vacuum system and the Nuvacuumette system, both of which deal primarily with exhaust steam.

The Webster vacuum system uses exhaust steam, supplemented as occasion may require by live steam. The exhaust pipe from the engine passes through an oil-separator, and is carried through a system of distributing mains to the several radiators, which system can be upward or downward, according to the nature of the building. Each radiator has two valves, the outlet or return end of the radiator having an automatic valve designed to pervent the escape of steam into the return main, while freely permitting the discharge of air and water thereto. The return mains lead to a vacuum pump, having first passed through a suction strainer and condenser head for removing any chips or scale that might otherwise enter the pump. The vacuum pump discharges to an air-separating tank, from which the water passes through a sealed discharge pipe to the feed pump. The speed of the vacuum pump is automatically controlled by a vacuum governor. which can be set to maintain any degree of vacuum in the return mains. Low-pressure live steam can also be used with this apparatus.

The Nuvacuumette system is upon somewhat similar lines, but with one important difference. The automatic valves controlling the steam supply to the radiators are placed on the inlets, but the return or condense outlets from the radiators have no valve and are open to the condense main. Thus the vacuum in the condense main extends into the radiators. the radiators being under the same absolute pressure as the condense main. By this arrangement the temperature of the radiator can be regulated by the vacuum maintained. With the usual vacuum of 10 inches the temperature of the steam would be 193°, and this can be lowered to 170° by increasing the vacuum to 18 inches. Thus a fairly low temperature can be obtained for the heating surfaces, although not so low as in hot water apparatus.

There are many public buildings where no steam is required for any other purpose, and in such cases hot-water heating is preferable, as a hot-water circulating boiler requires very little attention, whereas steam boilers require the skilled attention of an engineer.

On the other hand, in the case of factories where there will be a good deal of steam-driven machinery, the heating medium will generally be steam, as there will be a large quantity of exhaust steam available, for which in many cases there would be no other use. In the case of one-storey factories with roofs on the factory or saw-tooth system, the heating is effected by steam pipes running just below the springing of the roof. This prevents undue cooling of the air by the open roof and glass.

In calculating the necessary amount of heating surface in batteries, radiators or pipes regard must be had to, and allowance must be made for, not only the amount of incoming air which has to be warmed, but also to the loss of heat from walls, windows, ceilings, floors or open roofs; and a further allowance must be made for exposed positions and a northern aspect. Allowance must also be made in those cases where the heating apparatus is closed down during the night, during which period the external walls will have cooled down. The loss of heat from these sources is considerable, and in some cases amounts to almost as many units of heat as are required for the purpose of warming the whole of the incoming air.

It is essential that the amount of heating surface should be such that the building can be quickly warmed in the morning, not only for convenience, but as a matter of economy in fuel. It is cheaper to get the heat up in a building in a short time than to have to continue the process for three or four hours.

In conclusion, I have to point out that the cost of working ventilation and warming apparatus should be considered when they are designed, so as to avoid undue expenditure of power in mechanical ventilation and excessive consumption of fuel in connection with warming apparatus, the latter being a matter of the utmost importance.

At the meeting of the Association of Engineers-in-Charge, on Wednesday, January 12, the following discussion on Mr. Aldwinckle's paper took place. The President (Professor Henry Adams) said his definition of a successful system was one about which no complaints were made, but he had not encountered that system yet. The judge at the Hull County Court had caused some sensation recently by sending for a pole and breaking the windows in order to improve the ventilation, for which he was censured by the Corporation property committee. Similar feelings were being expressed about the ventilation of the Central Criminal Court in London, although something like 40,000*l.* had been spent upon the ventilation system there. The members had inspected this apparatus, and there was every appearance that the Plenum system had been efficiently installed. Dr. Parkes, the founder of the Parkes Museum, had said that ventilation required the study of a lifetime, and he was certainly right. Steam heating, which had been referred to, had the disadvantage of charring the organic particles in the air, but it also had the great advantage of containing a large amount of latent heat, which was converted into sensible heat when the steam condensed. It might not be generally known that if a certain quantity of water required 1,000 heat units to raise it from freezing to boiling point, it required 5,359 additional units to evaporate it, and it was this latter quantity which was given off when the steam condensed. With regard to the Perkin system, he believed the original experiments were carried as high as 1,000 lbs. to the square inch.

Mr. H. Capsey did not agree with the author's ideal for the heating and ventilation of a hospital ward. He would prefer to regard the fireplaces as an alternative means to obtaining warmth with hot water. He deprecated the attempt to work a hot water medium and fires together. Under such a combination, provision was made to abstract the vitiated air as near the ceiling as possible, whilst the fireplaces were doing the same thing on the floor level. Consequently, opposition was set up to the passage of the vitiated air rather than direction being given to it. On the other hand with such a dual arrangement, the fire places might have the effect of diffusing the heated air and prevent short circuiting to the window sashes above, if radiators were placed underneath the windows and ventilators placed above. The author had not referred to pipes as compared with radiators for the heating medium although pipes were generally considered to give a more equal diffusion of the heat. The question of inlets and outlets for the air was an important one. He favoured the louvre type of ventilator, and recom-

mended them being turned upwards. Where it could be arranged, he thought a baffle plate should be fitted in front of the opening on two sides only, an inch from the wall, as this tended to direct the air over the heated medium, especially if the latter be represented by pipes. Where particularly large apartments were being heated from a fire or boiler, he thought it was advisable to have independent flow and return mains, if only to avoid throttling down which was usually necessary when there were many branches with varying levels connected to the same main. Throttling down very often impaired the efficiency of the whole system owing to the absence of that rapidity of circulation which was essential in obtaining an even temperature. Another matter which was often overlooked was the necessity for having all branches, &c., properly covered with a view to getting the maximum amount of heat where it was required. In this way a large amount of radiation where it was not required was prevented.

Mr. J. A. Dargue (Messrs. Dargue & Griffiths, Liverpool) said his firm was the first to instal the Pulsial system on a large scale. This system was a positive one, and had the advantage of being able to be regulated. It would also carry practically any distance. In one installation there were six circulation mains, each one mile long, and exhaust steam, supplemented by live steam, was used. The hot water left at about 200° and returned at about 173°. The temperature at the extreme end of the circulation was 62°.

Mr. A. E. Wheeler (Messrs. Z. Berry & Co., Westminster) was pleased to see that the author had struck a different note in his paper to previous papers on this subject. He treated more of ventilation than of heating. He maintained that their first object should be to supply the air, and then take means to heat it to a comfortable temperature in winter. The practice had arisen in the heating profession to lay-off the heating surface as having some proportion to the cube of the building, but it did nothing of the kind. If this practice were followed, it meant that in a place like a picture gallery there was an enormous amount of cubic space and very few people, whereas in a church there would be less heating surface than was required. He disagreed with the author in his advocacy of open fires. The paper spoke of them as being healthful, but overlooked the enormous amount of dirt which they created. Further, when Mr. D. K. Clarke was making experiments for the smoke prevention committee, he found that with an open stove 43 per cent. of the heat was wasted, whereas with a closed stove, which corresponded with a boiler, only 24 per cent. of the heat was wasted. It was said that radiator systems were stuffy. But why was this? It was because of the absurd practice of installing radiators in rooms which were made as air-tight as possible without any satisfactory arrangements for allowing the polluted air to get away. A chimney was an efficient ventilator, and with a radiator in front, it formed a Plenum system.

Mr. Coleman asked for the result of experiences with spraying water upon air. He drew attention to the difference between moist atmosphere and dry atmosphere, and to the need for regulation in admitting air according to the climatic conditions. Sixty degrees with moist air was more uncomfortable than 70° with dry air. He would also like to know whether any difficulty had been experienced in closing down certain radiators under pressure without shutting off the main valve and reducing the pressure in the whole system. Did the shutting off of radiators under pressure produce a hammering? He also asked what was the real difference between a turbo and a forced system.

Mr. Scott hoped that open fires in hospitals would not be done away with. as in his opinion the cheerfulness which they imparted to the patients was as beneficial to them as a large proportion of their medicine, &c. With regard to the limit of height at which to fix heating pipes, he said that in one instance he fixed them 8 feet above the floor level, and others on the floor level, and connected them every 10 feet by vertical pipes. It was in a workroom 30 feet by 40 feet, and in spite of the doors always being opened, there were no draughts.

Mr. H. C. Adams said the Board of Trade had recently issued a report concerning the explosion of the heating tubes at Barton's Home, Suffolk, last year. This was a Perkin system which had been in use for twenty-two years, and had been inspected three times every year in addition to being tested once a year to 1 ton pressure. The pipe burst and killed a child, but the Board of Trade could give no reason why it should have done so. They were small pipes, and as wrought iron was subject to corrosion, perhaps they had become blocked up. The Plenum system was installed some years ago in the Birmingham General Hospital, and this was one of the earliest installations on that system. Very elaborate means were introduced for adding moisture to the air, and he had not heard of any complaints that this had been unsatisfactory. He thought more attention should be given to the ventilation of domestic buildings, offices and small workshops. Natural ventilation was possible with such buildings in the country, but in the London atmosphere it was almost impossible.

Mr. A. E. Penn drew attention to the fact that electric heating and ventilating had not been mentioned in the paper. In the case of the Bath Club they did for 6*l.* what originally cost more by steam. When electric supply companies took the matter up more seriously he thought electricity would prove a strong competitor with steam.

Mr. Maclean thought the reason why the Plenum system sometimes failed was that it was not properly looked after. This system admittedly required considerable attention, and if they desired fresh air then it was worth the extra trouble. With regard to electricity, Professor Carpenter had calculated that it cost from twenty to twenty-eight times as much as steam.

Mr. F. Broadbent, as a consulting electrical engineer, somewhat ridiculed the last statement. Station costs were being rapidly reduced, and in many cases were now below one penny per unit, and he had not the slightest doubt that electricity would soon prove a serious competitor with steam and gas.

Mr. Waldron mentioned the use of a steam jet for forcing hot water through pipes. This required no moving machinery, the whole of the hot steam being held in the water. With regard to forced circulation by means of pumps, they should not forget that pumps worked slowly. If the pump was not fully large enough for the work, then above a certain speed knocking occurred which would be transmitted a tremendous distance through the water in the pipes. He had found centrifugal pumps more satisfactory. This, like the steam jet system which he had mentioned, was noiseless. He concluded by mentioning a Leeds hospital where the engineer in charge varied the quantity of air admitted according to the climatic conditions, with very satisfactory results.

The author having briefly replied, a hearty vote of thanks to him closed the meeting.

## THE TIMBER TRADE IN 1909.

Messrs. Foy, Morgan & Co. state in their annual wood report that from a statistical point of view the past year bears a close resemblance to its predecessor. The importation of sawn and planed wood goods into the United Kingdom has again been on a much reduced scale, although slightly larger than in 1908, while, on the other hand, the consumption, estimated by the usually accepted standards, has continued at the same low level to which it had been reduced in the previous year. Previous records show that recourse must be had to the year 1895 to find any parallel to either of the last two years in respect of the smallness of both import and consumption. In fact, the great development in the wood business which marked the years 1898 to 1903 has been slowly contracting since then, and the volume of trade has followed a descending scale which for the time being puts business back to the footing of 1895.

It will be seen that the import for the past year, although some 70,000 standards in excess of 1908, marks a decline of about 80,000 standards on the figures for 1907, and 300,000 standards on the figures for 1906. Yet despite the reduction in the demand from this country which these figures indicate, a steady advance in the average cost, due partly to the rising cost of production and partly to the increasing competition from the foreign markets, can be traced for some years past, although to some extent disguised by the growing tendency to introduce smaller sizes and inferior qualities in mitigation of rising prices. The opinion was for some time widely held that the import must fall considerably behind even that of the previous year, owing to the admittedly large deficiency in the early supplies from Sweden and Finland, and the subsequent cessation of production through the strike and lock-out in Sweden. The Board of Trade returns down to the end of July gave strong support to this belief by disclosing a considerable shortage in supplies to that point, but during August and September heavy shipments from Russia practically cleared the previous deficiency, and the growing anxiety of the importers to replenish stocks before the close of the navigation led to an increase of supplies during November, which more than accounts for the slight aggregate excess of the whole year. Russia's contribution continues to swell—in 1907 it was 37 per cent., in 1908, 42 per cent. and is now 46 per cent. of the total import, while the net increase of about 90,000 standards from Russia during the past year has proved more than sufficient to counterbalance the shortage from Sweden consequent upon the prolonged labour troubles. It will be found that during the past year the Russian supplies have exceeded the average of the previous five years by 19 per cent., whereas from all other sources a steady decline is shown, including Sweden with 30 per cent., Norway with 20 per cent., and Canada with 12 per cent. below a similar average in the past.

The fluctuations in the import returns at the various outports have been less pronounced than in the previous year, probably because the depression affecting special branches of trade had been fully discounted already. The Irish ports have all taken larger supplies, as might have been expected in order to compensate for the shortage recorded in 1908. On the other hand the Bristol Channel ports, which made little or no reduction in the previous year, now show a diminution of about 10 per cent. London has increased its import by about 5 per cent., while the remaining ports of the United Kingdom would appear to have been satisfied with the reduced scale of supply established in the previous year, there being fewer instances of variation in an upward than in a downward direction.

The result of the past year's trading must have been on the whole profitable to all sections of the trade, whether shippers, importers, or dealers, although the last have not perhaps benefited to the same degree as the former classes owing to the double drawback they have had to fight against—the abnormal slackness of demand in combination with no slight difficulty in procuring supplies, which were often insufficient and nearly always dearer when wanted. The business done in the past year, although confined within narrower limits than formerly, has been on a thoroughly sound basis, with a remarkable absence of bad debts, and is thus a welcome contrast to the series of years of unprofitable trading, culminating in the misfortunes of 1907-8, which had brought merchants in this country almost to the point of despair. The most hopeful feature at present is the check which has been brought about in the paralysing drop in the consumption of wood in this country. For five or six years previously the curve of demand has persistently declined as the great outlets for wood have been closed in succession, first in consequence of the great depression in the building trade, and later through the stagnation in the shipbuilding, engineering, cotton and export trades. Throughout this period the problem has always been to accommodate the importation to the altered conditions, and the explanation of the unprofitable nature of business in recent years must be sought mainly in the difficulties of this adjustment, even after making allowance for the increased competition which ensues when orders grow fewer or smaller. The volume of the import during the past year would seem to give no opening for criticism from this point of view. On the other hand, with regard to consumption, the trade has doubtless seen the worst, and may now expect to participate in the revival which is so confidently foreshadowed in many quarters, although the building trade is proverbially slow to follow the movements in general trade.

The wholesale market opened last January with prices already determined through the large transactions previously concluded with Continental buyers. Another important factor was the admitted shortage in F.C.W. stocks, estimated in Sweden at 100,000 standards and in Finland at 35,000 standards. So that, notwithstanding the depressed outlook, the importers found themselves forced to follow their foreign competitors in order to secure an adequate proportion of the early shipments which the depleted condition of stocks in this country rendered necessary. In adopting this policy at the outset the importers took the right course, and have found their ultimate reward in the continued upward movement of local prices to meet the higher cost of the new supplies as they came along. This has been quite a feature of the year's business. The effect of the sales made during January and February was to establish the market for a certainty. By this time the Swedes had cleared 40 per cent. of their new production, while the Russians, who entered the field later, were even more successful and disposed of more than half, a result attributable to the increasing popularity these stocks enjoy and the moderate prices at which they were marketed. Meanwhile the condition of trade here (and also in Germany, where, in fact, the rise in prices had been originally engineered) continued to be so bad that considerable uneasiness as to the future was from time to time manifested. During March the market became consequently very quiet. Whatever had been purchased for forward delivery had been acquired on the strength of the known diminution in the supplies, and there could be no inducement to extend operations while it was proving such a difficult matter in the depressed condition of trade to raise spot prices to the level of the new import cost, even though stocks had been meanwhile reduced to perhaps the lowest level known in recent times. Some slight stimulus to trade was derived from the demand for rebuilding at Messina. At the beginning of May the position was recognised as having greatly improved, stocks everywhere being depleted to a point previously unknown, while prices strengthened considerably in consequence of the report that "open water" would be three weeks later than usual. Consequently, by the time the new supplies reached this country local prices were already showing a margin of profit on import cost. The period between Easter and Whitsuntide thus served to consolidate prices and to entirely remove any misgivings as to a possible collapse in prices which the stagnation in March had encouraged. Early June witnessed the diffusion of a feeling of quiet optimism under which any balances or supplementary specifications, especially of White Sea stocks, were easily disposed of. Deal sizes in the lower qualities were much sought after, some important re-sales being effected. From Midsummer onwards the trend of prices was continually upwards as the reality of the shortage in supplies became more and more evident, the effect being moreover heightened through the delay in getting delivery owing to the late opening of the navigation. Those merchants who, influenced mainly by the conditions regulating production, bought freely in January, now found their reward in the profitable opening afforded by the market at this juncture; while those who refrained from buying, influenced solely by the shrinkage in retail trade which seemed for a time to find even fuller confirmation during the depression in March-April, experienced afterwards very great difficulty in procuring sufficient stock for their ordinary trade requirements. During July prices of deals and battens rose from 10*s.* to 15*s.* per standard.

The months of August and September will be memorable on account of the strike and lock-out in Sweden, which led to a practical cessation of production in that country for seven or eight weeks. The effects of the strike must dominate the market and inevitably involve an increased cost in wood supplies for a long time to come. Whatever immediate advantage may have accrued to stockholders here and abroad from the fillip thus given to prices in the present and near future, there must remain the detriment caused by an inflated cost at a time when trade, if it is to revive, needs fostering by supplies which are cheap and easily procurable. Scarcely any attempt was made by the importers to cover their requirements during August, the effect of the labour troubles being then only dimly realised, but during September a large business was done greatly to the advantage of Russian and Finnish shippers, who were enabled to clear their autumn stocks with a facility previously unexperienced. Since the strike Swedish shippers have had no great quantity to sell, being mainly occupied in the fulfilment of old contracts, and the ground was thus left free for the Russian shippers to dispose of any balances that remained.

---

THE thirty-eighth annual general meeting of the Edinburgh, Leith, and District Building Trades Association was held in the Building Trades' Exchange, 61 Lothian Road, on the 27th ult. Mr. David Wilson, J.P., vice-president, in moving the adoption of the report, referred to the continued dulness in the building trade, but thought that the general indications were that an improvement could be expected in the course of the present year. The Association was never in a better position, either numerically or financially, since its institution. The following office-bearers were elected for the ensuing year:—President, Mr. David Wilson, J.P.; vice-presidents, Messrs. J. Crowe, J. Dennis and S. Slater; secretary and treasurer, Mr. James Cameron, 61 Lothian Road.

THE Glasgow Town Council at their last meeting considered a letter from the Secretary of the Scottish Exhibition, 1911, enclosing a plan of the proposed Industrial Hall. It had been suggested that this building might be so constructed that it could be used as a permanent structure after the exhibition was closed, as there was a great want of hall accommodation for motor and other exhibitions in the city. The architect estimated that the building for the exhibition would cost about 14,000*l.*, but could be erected as a permanent structure for 25,000*l.* The executive are willing to erect the building and hand it over to the Corporation if the latter will pay the difference. The letter was submitted to the parks and finance committees.

Wales.—Feb. 16.—For completing the erection of the Siloh Methodist Chapel, Gwauncaegurwen. Mr. Arthur S. Williams, M.S.A., architect, Llandilo.

Wales.—Feb. 23.—For the construction of a swimming bath at the South Wales and Monmouthshire Truant School, Merthyr Tydfil. Mr. C. M. Davies, architect, High Street, Merthyr.

Wales.—Feb. 23.—The Glamorgan County Territorial Force Association invite tenders (*a*) for proposed gun sheds and stores in Dumfries Place, Cardiff, and (*b*) for extensive repairs at the Drill Hall Buildings. Deposit 1*l*. 1*s*. each. Mr. W. H. Dashwood Caple, F.R.I.B.A., 2 Church Street, Cardiff.

Wales.—Feb. 28.—For erection of twenty-two houses in three blocks, and six pairs of semi-detached villas, together with the construction of roads, sewers, and surface-water drains, on the Meyrick Estate, Gwaelodygarth Field, Merthyr Tydfil, for the Grove Building Club. Mr. T. Edmund Rees, architect and surveyor, Merthyr Tydfil.

Wednesfield.—Feb. 15.—For the erection and completion of a Council school for 412 infants, and a cookery room, at Lichfield Road, Wednesfield, Staffordshire. Deposit 1*l*. 1*s*. Apply by Feb. 15 to Mr. Graham Balfour, Director of Education, County Education Offices Stafford.

---

The Institution of Heating and Ventilating Engineers will hold their annual meeting on the 15th inst., at the Trocadero Restaurant, W., at 2.30. The presidential address will be delivered by Mr. C. Ingham Haden, and a paper will be read on "The Regulation of Heat by Control of Steam Pressure," by Mr. A. H. Barker, B.A., B.Sc.

Mr. Robert Walker, J.P., M.S.A., A.M.I.C.E., died recently at his residence, 17 South Mall, Cork, at the age of seventy-five. Mr. Walker joined the Society of Architects in 1886, two years after its foundation, and served as president for four years, receiving the gold medal in 1897. He was an enthusiastic advocate of registration.

From the Central Lending Library at Nottingham there have been issued from time to time special lists of technical books which may be there obtained. The fifth deals with the building, furnishing and decorative trades, and costs a halfpenny. Such classified lists are to be welcomed, and might be more generally issued from the principal public libraries of the provinces.

# TENDERS.

## BRISTOL.

For alterations and additions to Burfield House, at Westbury-on-Trym, Bristol, and the erection of the Red Maids school, for the Governors. Mr. Frank W. Wills, F.R.I.B.A., architect, Bristol.

## TRADE NOTES.

The prospectus has been issued of The Oil and Ozokerite Company, Ltd., with a share capital of 1,450,000*l.*, divided into 950,000 cumulative 7 per cent. participating preference shares, and 500,000 ordinary shares. The issue advertised is of the preference shares, and of 800,000*l.* 6 per cent. first debenture bonds, both being offered for subscription at par. The company has been formed to acquire and work two mines of ozokerite (a natural petroleum wax which is the best substitute for beeswax), as well as petroleum territories situated on the Tustanowice Oil Fields—the richest petroleum district in Galicia, Austria-Hungary. The subscription list will be closed for town to-night, and for the country and the continent on Saturday.

The trade and commerce committee of the Newcastle Corporation recommend the City Council to purchase a crane, to be erected on the Newcastle quay, at a cost of a little over 1,300*l.*

Mr. Walter Yates, President of the Institution of Heating and Ventilating Engineers, has issued an appeal for support to the heating and ventilating section of the approaching Japan-British Exhibition to be held at Shepherd's Bush. The Japanese Government and people are, he says, keenly interested in all matters connected with heating and ventilation, and are anxious to know where the most perfect appliances can be obtained.

The (U.K.) Winget Concrete Machine Co., Ltd., of 5 Star Chambers, Newcastle-on-Tyne, have just received from one of H.M. Government departments a further order for another "Winget" concrete machine, complete with ordinary outfit, pallets, &c. There could be no more convincing proof of the merit of these machines than the significant fact that Government departments are giving repeat orders for them.

Messrs. Bayliss, Jones & Bayliss, Ltd., were the unfortunate victims of a disastrous fire, which occurred on Saturday night last at their Victoria Works in Wolverhampton. The fire broke out in the large electrical power station, and the entire building was destroyed, together with the very valuable plant. Messrs. Bayliss, Jones & Bayliss have, they inform us, been fortunately able to arrange for a large and immediate supply of electric energy which will enable them to resume work at the end of the current week. It is eloquent of the firm's determination and skill to find that within seven days of a fire involving a loss of many thousands of pounds they are able to announce themselves in a position to take any and every order for their class of goods.

A piquant American calendar issued from the Stanley Works, New Britain, Conn., reaches us through Messrs. Wm. E. Peck & Co., 31 Bartholomew Close, E.C., their London agents. All the productions of the Stanley Works enjoy a high reputation in the United States, more especially their wrought, bronze, and steel butts, and their hinges with and without ball bearings. This fact, however, is scarcely emphasised in the hanging calendar, which is chiefly conspicuous for a charming reproduction in colours of "The Mischief Maker." The light-hearted picture should bring relief to many a jaded mind; it shows a vivacious maiden with a peacock's feather in her hand, snuggling down on a couch, and laughing at the mischief she has wrought. As a specimen of colour printing the calendar merits high praise. Messrs. Wm. E. Peck & Co. are favourably known to architects through the H. & C. wrought steel "Louvre" ventilators.

## CORRESPONDENCE.

### Reinforced Brickwork Tests.

Sir,—Mr. Brown's attention has been called to an article on page 16 of your issue of January 28, reviewing a reinforced brick pier test. I have been instructed to write and point out that this reinforcing mesh, manufactured by Messrs. Johnson, Clapham & Morris, is made under licence from Mr. W. H. Brown, patentee of mesh reinforcement for brickwork.

I shall be glad if you will notify this fact in your next issue.

You will see by enclosed leaflet that Messrs. Johnson, Clapham & Morris have given due prominence as being licensees under Brown's patents.—Yours faithfully,

Arthur Hey,
For W. H. Brown.

36-38 Victoria Street, Westminster:
February 3, 1910.

## THE FOUNTAIN COURT, HAMPTON COURT PALACE.

The view shows the north-west corner of the quadrangle of William III., designed by Wren and executed about 1689-1700. It is so named on account of the fountain, which was formerly erected by Queen Elizabeth in the Clock Court of Wolsey's Palace and subsequently removed to this court. The court is not a perfect rectangle, the north and south sides being 116 feet 10 inches, the east side 110 feet 1 inch, and the west 109 feet. The height of the cloisters is 12 feet and they are composed of open arcades of semicircular arches supported on rectangular piers of stone with roofs formed with brick groining supporting the floors of the state rooms over. The carved stonework was carried out by William Emmitt, under the supervision of Grinling Gibbons, who was directly responsible for the heads on the keystones. The carving to the circular windows on the second floor represents lion skins draped over garlands of bay leaves and supported at the top corners by anchors. The stonework is partly Portland and partly an Oxfordshire oolite, and the brickwork is composed of thin red rubbed bricks.

It is interesting to note that Wren's private office during the building was situated just behind the cloisters of the communicating gallery, shown on the left hand of the drawing.

This court was measured by Mr. Reginald Pywell in the early part of 1908. The figure in the foreground is a copy from the original by Mr. E. J. Sullivan.

The proposal to erect a new band stand in the Municipal Gardens, Lord Street, Southport, at a cost of 450*l.*, has just been approved.

Mr. Thomas Adams, of 3 Pall Mall East, London, has been appointed Town Planning Comptroller to the Local Government Board. Mr. Adams, who is a Scotsman, became the first secretary of the Garden City Association about ten years ago, and later became secretary and manager of First Garden City, Ltd.

Cheltenham Town Council have refused to accept a motion to enforce trade union rates of wages upon all contractors who do work for the Corporation.

Mr. Edward Shewbrooks, of the firm of Messrs. Shewbrooks & Hodges, architects, Newcastle-on-Tyne, died very suddenly on the 5th inst.

The Notts Football Club have finally decided to commence the preparation of a new ground in Meadow Lane, at a cost of 4,000*l.* The scheme includes the erection of a large new pavilion, and the re-erection of a stand now standing at their old ground. The plans have been prepared by Messrs. W. & R. & F. Booker, architects, Nottingham.

Mr. T. J. Bailey, who retired from the post of education architect to the London County Council on January 1, is to be retained at a fee of 300*l.* a year for two years in a consultative capacity. He will be available for consultation with his successor only, and not with any committee or member of the Council.

A local syndicate has acquired the remainder of the Lewis estate, of about forty acres, extending from Cliftonville Cliffs to West Northdown, for building purposes.

## CUBICAL EXTENT AND UNITING OF BUILDINGS.

ON October 15, 1907, the London County Council decided to seek the amendment of sections 75, 76 and 77 of the London Building Act, 1894, so as to enable the Council to allow horizontal separation of buildings and increased cubical extent in buildings of the warehouse class, and to give the Council discretionary power with regard to openings in party walls, the construction and materials of fire-resisting doors, and the uniting of buildings. The Building Act Committee at the time suggested that it would be desirable that a statement should be drawn up and adopted by the Council laying down the principles which would guide the Council when dealing with applications for permission to erect buildings exceeding 250,000 cubic feet in extent, &c.; but an amendment that this object should be secured by the inclusion of regulations in the amending Act was lost. The required amendments of the Act having been obtained by Part III. of the London County Council (General Powers) Act, 1908, the Building Act Committee have drafted, in consultation with the Fire Brigade Committee, the regulations, which are given below. They have arranged with the Fire Brigade Committee that all applications made under Part III. of the Act of 1908 shall be dealt with by themselves alone as far as possible in accordance with these regulations, if approved by the Council, but that in the event of their decision with regard to any application being contrary to the views of the chief officer of the London Fire Brigade, an opportunity shall be afforded to the Fire Brigade Committee of considering the matter before any recommendation with regard to such application is submitted to the Council.

### REGULATIONS WITH REGARD TO APPLICATIONS UNDER PART III. OF THE LONDON COUNTY COUNCIL (GENERAL POWERS) ACT, 1908.

*Additional cubical extent.*

1. No application for consent to the provision of additional cubical extent shall be entertained in respect of a building which is or is to be in more than one occupation.

2. All consents shall be subject to such fire-extinguishing appliances being provided as may in the opinion of the Council be necessary, and to direct telephonic communication being established with a London Fire Brigade station if required by the Council.

3. Particulars of the methods of heating, lighting and ventilation proposed to be adopted shall be submitted.

4. Arrangements for lessening the danger from fire in premises in respect of which consent is given shall be properly maintained. Premises will be liable to inspection by the chief officer of the London Fire Brigade to ensure such proper maintenance.

5. In dealing with applications in respect of buildings of the various classes set out hereunder, the following principles shall be considered in conjunction therewith. In any case they may be varied or other conditions imposed, as the Council think fit. These regulations are to be considered in conjunction with the provisions of the Act, and in no way as a modification of those provisions.

(A) As regards buildings not more than one storey in height in one occupation and used exclusively for the manufacture of boilers or machinery in metal, and for all kinds of metal work in connection with metal-framed structures, such cubical extent may be allowed as may in the opinion of the Council be reasonable, having regard to the circumstances of the case, provided that—

(i.) The building be more than two miles distant from St. Paul's Cathedral if the operations of smelting or melting be carried on therein.

(ii.) The building, including fittings and fixtures, but excluding doors, windows, skylights, lantern lights and their frames, be constructed throughout of incombustible materials.

(iii.) Any portion of the building used for the manufacture or storage of oils or varnishes, moulds, models, frames, patterns or other substances or articles of a combustible nature, be properly and efficiently separated from, and not included in, the portion of the building in respect of which additional cubical extent may be allowed and do not exceed the limits prescribed in the Act.

(B) As regards buildings of more than one storey in height in one occupation and used exclusively for the use, manufacture or storage of non-inflammable or fire-resisting or incombustible materials, such cubical extent may be allowed as may in the opinion of the Council be reasonable, having regard to the circumstances of the case, provided that—

(i.) The height of the building do not exceed 60 feet, measured from the pavement level to the upper surface of the floor of the topmost storey.

(ii.) The building be not less than 40 feet from any other building, except where it is entirely separated therefrom by an imperforate wall of the thickness required by the London Building Act, 1894, and of the full height of the higher building throughout.

(iii.) The building be constructed throughout of incombustible material, and the doors, windows, skylights, lantern lights and their frames be constructed of fire-resisting materials.

(iv.) All floors be imperforate except as hereinafter provided, and be furnished with scruppers to carry off water poured on during a fire.

(v.) All constructional ironwork below the level of the surface of the floor of the topmost storey be protected by not less than two inches of incombustible material.

(vi.) All openings in the external walls or roofs, excepting staircase windows and shop windows on the ground floor when the show spaces are separated from the main building by fire-resisting enclosures, be fitted with fire-resisting frames filled in with fire-resisting doors, shutters or glazing, a sufficient portion of the filling of the openings above the ground storey being made so as to be easily opened from the outside in order to facilitate the ingress of firemen.

(vii.) Vertical shafts for staircases, staircase enclosures, lifts, hoists, shafts or trunks for pipes or wires, and other leads and horizontal ducts, be properly and efficiently separated by walls and fire-resisting doors from the divisions in respect of which additional cubical extent is required, and from any other division communicating therewith, and be so arranged that the access to such shafts or ducts from any floor shall be provided with a secondary incombustible enclosure with self-closing fire-resisting doors.

(viii.) If any vertical shafts be roofed, the roofs be constructed of light frames, filled in with thin glass and protected on the outside by strong wire guards, and the shafts be carried up not less than three feet above any adjoining roofs. In the case of a shaft not carried up to and through the roof, it be sealed over at the top with solid incombustible material not less than six inches thick.

(ix.) All horizontal trunks, ducts, &c., be enclosed with solid incombustible material not less than three inches thick.

(x.) Any portion of the building used for packing or for the storage of packages be properly and efficiently separated from the portion of the building in respect of which additional cubic extent may be allowed.

(xi.) When the building is more than two storeys above the ground storey, and the total extent between party walls exceeds one million cubic feet, there be provided at least one unenclosed staircase constructed of brick and concrete, affording access to all floors and the roof through the outer air, without any internal communication with the building.

(xii.) If the building exceeds 250,000 cubic feet, $\frac{1}{8}$th at least of the total length of the boundaries of the site do abut upon a thoroughfare or thoroughfares not less than 40 feet wide. If the building exceed 1,000,000 cubic feet, $\frac{1}{4}$th at least of the total length of the boundaries of the site do abut upon a thoroughfare or thoroughfares not less than 40 feet wide. If the building exceed 2,000,000 cubic feet, $\frac{1}{2}$ at least of the total length of the boundaries of the site do abut upon a thoroughfare or thoroughfares not less than 40 feet wide. If the building exceed 3,000,000 cubic feet, $\frac{3}{4}$ths at least of the total length of the boundaries of the site do abut upon a thoroughfare or thoroughfares not less than 40 feet wide. If the building exceed 4,000,000 cubic feet, the site be an island site.

(C) As regards buildings of more than one storey in height in one occupation and used for the sale and storage or manufacture, but not for storage purposes only, of goods of a non-fire-resisting nature, or used for the purposes of a trade involving the use of materials of a non-fire-resisting nature, additional cubical extent may be allowed, subject to the provisos (i.) to (xii.) set out in paragraph (B), and provided also that—

(xiii.) The basements be entirely cut off from the ground floor and upper floors of the building and approached only by a separate means of access from the outside of the building.

(xiv.) Any lifts from the basements be adjacent to an external wall or do have no internal communication with the storeys above.

(xv.) No division or cell on any floor formed by the vertical and horizontal separations do exceed 250,000 cubic feet, and the floor area of such division or cell do not exceed 20,000 square feet.

(xvi.) Every floor be of the thickness required by the Council, such thickness not being less than 6 inches.

(d) As regards buildings of not more than three storeys in height in one occupation and used as motor garages or car-sheds, or for other similar purposes, such cubical extent may be allowed as may in the opinion of the Council be reasonable, having regard to the circumstances of the case, provided that—

(i.) The building be constructed throughout of incombustible materials, and be completely separated by imperforate walls from adjoining properties.

(ii.) Any store for petrol be completely separated from the main building.

(iii.) Any portion of the main building used for the manufacture or storage of varnishes or oils, or moulds, models, frames, patterns or other substances or articles of a combustible nature be properly and efficiently separated from and not included in the portion for which additional cubical extent may be allowed and do not exceed the limits prescribed in the Act.

*Openings in party walls.*

6. Applications for consent to openings larger than those allowed by the Act in party walls separating divisions of cubical extent will not be entertained unless the buildings affected be constructed throughout of incombustible materials, and unless—

(i.) The openings be fitted with double doors or shutters in accordance with the provisions of the Act at a distance apart of not less than one-fourth of the full width of the proposed opening.

(ii.) The width of all such openings taken together on each floor do not exceed one-half of the length of the party wall on each floor in which they occur.

*Uniting of buildings.*

7. Applications for consent to the uniting of buildings of the warehouse class with buildings of the same class or with any other buildings, either or both being in different occupations, will not be entertained when the combined cubical extent of the buildings to be united exceeds 250,000 cubic feet.

## VARIETIES.

A new Wesleyan chapel is to be built at Newport Road, Barnstaple, seating 250 and costing 1,269*l*.

A site has been cleared in the western end of the borough of Chelsea for the erection of new premises for the Stanley Ward Conservative Club.

The Royal Commission on the Preservation of Ancient and Historical Monuments have decided to schedule the Whitgift Hospital, Croydon, as among the monuments in Surrey most worthy of preservation.

The West Bromwich Town Council have decided that application be made to the Local Government Board for sanction to a loan of 17,900*l*. for the erection of new schools at Hill Top, to accommodate 1,280 scholars, together with workshop, dining, cookery, and laundry centres.

Dunoon parish church is to be reconstructed. When the alterations are carried out there will be accommodation for 922. The present seating accommodation is 700. The cost is estimated at 4,000*l*.

St. Mary's Church, Barton-on-Humber, is to undergo extensive restoration at the expense of an anonymous donor. The work will include the filling of the east window with new glass, the restoration of the south aisle, the substitution of a tiled floor in the sanctuary, and the provision of altar rails and a new oak altar.

Plans have been prepared by Mr. Hillersden Bulteel for the rebuilding of the Devon and Cornwall Ear and Throat Hospital, Plymouth. The work is to be carried out in sections, and will be commenced as soon as the first 1,000*l*. is collected.

The executive committee of the Scottish Exhibition of National History, Art, and Industry, Glasgow, 1911, invite competitive designs suitable for poster, and for illustrating other official publications in connection with the exhibition. The prizes offered are 40*l*., 20*l*. and 10*l*. The designs must be sent in by March 15.

A new road is to be made on Exmoor from Brendon to Couplehan Two Gates, a distance of about thirteen miles, which will traverse some of the finest scenery in West Somerset. The contract, amounting to 3,577*l*., has been let to Messrs. Pethick Brothers, Plymouth.

During the stripping of the walls of a room at the Barnhurst Old Hall, belonging to the Wolverhampton Corporation, the workmen discovered a fine old wainscot panelling of exquisite carving of the Jacobean period. It extends from the floor to the ceiling of the room, which is 18 feet square and 15 feet high and is in perfect condition.

Negotiations for the purchase of the ruins of Sampson's Factory, Castle Boulevard, Nottingham, which was destroyed by fire eight years ago, were completed last week by Mr. J. Holdsworth, flock manufacturer, of Beeston, who proposes to rebuild the factory on the existing walls and foundations, which are very massive, and to let the premises as a tenement lace factory. The necessary plans have been prepared and the contract will be let as soon as possible.

The general works committee of Coventry City Council, to whom the question was remitted some months ago, has decided to invite architects to send in alternative plans showing how the vacant land in Earl Street can be best utilised for the erection of municipal buildings, and for a scheme for such buildings and town hall, the latter absorbing adjoining property, including St. Michael's Baptist Chapel, Messrs. Browett's solicitors' offices, &c.

Worksop Priory Church is to be enlarged by the rebuilding of the choir and the restoration of the Early English Lady chapel, which is at present in a ruined condition. The Augustinian Priory at Worksop, of which the present parish church and ruined Lady chapel are the remains, was founded by Sir William de Lovetot about the year 1103. The minster was completed about 1170, and was one of the most important religious houses, next to Roche, in the district. The architect for the present scheme is Mr. Harold Brakspear.

Mr. H. T. Hare, F.R.I.B.A., submitted at the meeting last week of the Bangor University College Council designs for the Pritchard-Jones Great Hall, estimated to cost 17,000*l*., which, subject to the approval of the donor, were accepted. The hall will accommodate about 1,000 persons, and includes a large entrance hall, or crush room, with ample cloakroom accommodation. Four external statues are to be provided by another donor.

The oak screen in Salisbury Cathedral separating the north-east transept from the north choir aisle, probably erected in the eighteenth century, consisting of fourteenth and fifteenth century work, and made up of much inferior material, which was taken away some months ago, has now been re-erected. The inferior material has been removed, as well as the paint with which it had been covered. The work has been done by Messrs. Noyes & Green, of Crane Street, under Mr. C. E. Ponting, the cathedral architect.

A member of the Bangor City Council aroused much interest some time ago by his statement that an examination of a large number of the old oil-paintings till recently stored in the old Museum were found to bear such names as Rubens, Titian, Vandyke, and others equally well known. It was thought that some, if not all, might be valuable old masters, or at any rate copies of the same, and the Council engaged an expert to examine and value the pictures. The expert now reports, "None of them are original works, nor have any of them any value."

The Marquis of Tullibardine, M.P., Grand Master Mason of Scotland, presided at the quarterly meeting of the Grand Lodge, held in the Freemasons' Hall, George Street, Edinburgh, on the 3rd inst. Plans were submitted by the Past Grand Architect (Mr. A. Hunter Crawford, F.R.I.B.A.) of the proposed reconstruction of the Grand Lodge premises in George Street, at an estimated cost of about 30,000*l*. It was agreed to proceed at once with the scheme. The existing hall, which was erected over fifty years ago, and the front buildings are to be cleared away and the new offices will be erected on the site.

Mr. H. A. Reed, the Local Government Board inspector, held an inquiry last week into the application of the Liverpool Corporation for sanction to borrow 225,500*l*. for improvement schemes under Part I. of the Housing of the Working Classes Act, 1890, for the improvement of the Beau Street, Bevington Street, Holly Street, Frank Street, Grafton Street, and Saltney Street unhealthy areas, including the erection of dwellings for the working class on land within those areas. The Liverpool Corporation have spent about a million pounds sterling on the demolition of insanitary property and the erection of new houses, and it involves a 2*d*. rate. The present sum of 225,500*l*. is divided into 104,000*l*. for the purchase of the areas, and 121,000*l*. for new buildings to house 2,960 persons. Most of the land has been already acquired. It is proposed to provide each house with a bath, and each dwelling will be on a self-contained system. A recreation ground of half an acre is proposed in the area between Bevington Street and Bond Street, with a separate playground for boys and girls, and a bandstand is to be provided.

Wellington.—Feb. 25.—For erection of public baths, for the Wellington (Salop) Urban District Council. Contract No. 1, for erecting the baths; (2) heating and warming. Deposit 2*l.* 2*s.* Mr. J. W. Littlewood, clerk, Bank Chambers, Wellington, Salop.

---

Mr. G. H. Willoughby, F.R.I.B.A., of Manchester and St. Annes, has been appointed by the Oldham Town Council to act as adjudicator on the competitive designs submitted by local architects for the town hall extension, at an estimated cost of 25,000*l.*

The death occurred on the 6th inst., at Forest Hill, of Mr. William Robert Green, M.I.M.E., who was for about half a century associated with R. Waygood & Co., Ltd., the lift and crane manufacturers. Born at Poole in 1838, Mr. Green joined his uncle, the late Richard Waygood, who had founded the present business, in 1833, at Beaminster, Dorset, and who had removed it in 1840 to works in Newington Causeway. The work then consisted principally in the making of agricultural machinery, and in hot-water engineering; but, in the early sixties, the manufacture of small hand-lifts was commenced. Under Mr. Green, who became a partner, the construction of sugar, rice, oil and other machinery was added. The lift making part of the business rapidly increased, and among the first hydraulic lifts was a book lift made and fitted, soon after 1865, at the Court House at Ryde, Isle of Wight. When the business was formed into a private limited company, Mr. Green was a director, and since his recent retirement he acted as consulting engineer to the company, which now employs nearly a thousand hands as compared with the eighteen to twenty when Mr. Green joined in about 1860.

# TENDERS.

## CARSHALTON.

For the construction of four quiescent settlement tanks and roof over existing tanks, four percolating filters, &c., at the sewage farm, for the Urban District Council.

## TRADE NOTES.

The directors of John Oakey & Sons, Ltd., recommend the payment of a final dividend at 5 per cent. to the Ordinary shareholders, making a total of 10 per cent. for the year, and in addition a bonus of 5 per cent. free of income tax, leaving a balance of 6,202*l*. 15*s*. 3*d*. to be carried forward to next year.

Messrs. George Mills & Co., Ltd., engineers, Radcliffe (the proprietors of the "Titan" sprinkler), are frequently receiving letters from home and abroad showing the value of sprinklers in mills and works. One of the most recent is of a fire having broken out in the mixing room of the Textile Manufacturing Co., Bombay, India, which was quickly extinguished by the "Titan" sprinklers, which were installed some time ago.

Messrs. E. H. Shorland & Brother, of Failsworth, Manchester, have recently supplied their patent Manchester stoves, with descending smoke flues and ventilators to the Workhouse infirmary extensions, Sheffield. Amongst other recent contracts by the firm are the following:—The additions to the Commercial Travellers' Schools, Pinner, are being warmed and ventilated by means of Manchester stoves and Manchester grates; the Runcorn Conservative Club is being ventilated by Shorland's patent exhaust roof ventilators and special inlet panels; the extensions to the Isolation Hospital, Lowestoft, are being warmed and ventilated by means of Manchester stoves with descending smoke flues; the Infectious Diseases Hospital, Darwen, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves and patent exhaust roof ventilators.

The National Provident Institution will hold their seventy-fourth annual meeting at the Cannon Street Hotel, London, on the 25th inst. The report shows that in the past year 1,576 proposals for assurance were accepted by the Board amounting to 692,959*l*., and the new premiums annually payable on which amount to 29,697*l*. The amount of new business exceeds that transacted in any previous year of the Institution's existence. The accounts for the year show a balance of receipts over disbursements of 162,634*l*., which increases the accumulated funds of the Institution by that amount to 6,688,106*l*.

The Metal Jointing Co., Ltd., Adelphi House, W.C., are the makers of "Amalgaline"—a patent that is expected to revolutionise the ordinary clumsy methods of lead jointing. Amalgaline is a metallic ribbon 0.05 millimetre thick, treated with a composition to prevent the formation of oxides. On the application of heat the ribbon melts at a lower temperature than the metals to be acted upon, and causes their amalgamation at a considerably lower temperature than their normal melting point. The process is briefly as follows:—For jointing lead pipes a patent cutter is used to cut the ends of the pipe to a dead true fit in the form of a spigot and socket or coned joint. On placing a strip of amalgaline between the cleaned surfaces to be joined and applying heat sufficient to melt the strip, the surfaces of the lead fuse, and in fusing they amalgamate. Amalgaline is in no sense a solder. The invisible joints thus obtained are very strong and neat, and are expeditiously and simply made, no matter how inconveniently the pipe may be situated. The Metropolitan Water Board, after a severe test, have accepted this method of jointing. Amalgaline is applicable to the making of metal joints for very many purposes besides the ordinary ones in lead pipes.

The *Diario Official* of Brazil, says the *Board of Trade Journal*, publishes a decree authorising the opening of a special credit amounting to 24,000*l*. in favour of the Ministry of Justice and Home Affairs, for the completion of the building intended for the National Library.

## VARIETIES.

Mr. William Longden was elected President of the Sheffield Master Builders' Association at the annual meeting on the 10th inst., in place of Mr. W. W. Mears, retired.

Croydon borough council have declined to adopt a proposal to pay the trade union rate of wages to all their employés, and insert a clause in all contracts under their control compelling the contractor to do the same.

Messrs. W. Mortimer & Son, architects, Lincoln, have prepared sketch plans of a proposed receiving home at the Workhouse. The plans, which have been adopted, are estimated to cost 2,000*l.*

The Yardley Rural Council on Tuesday resolved that competitive plans for the erection of an isolation hospital to accommodate eighty beds be invited from architects within a radius of fifty miles, and that premiums of 50, 25, and 15 guineas respectively be offered for the best three sets.

The Belfast Corporation are about to undertake an extension of their gas works at a probable cost of nearly 150,000*l.*, inclusive of plant. The consulting engineers recommend the use of the Twin Island site, which is situated in Belfast Lough, on the city boundary, and is owned by the Harbour authorities.

The Great Western Railway Company contemplate the expenditure of a further 20,000*l.* for improvements at Newton Abbot passenger station. The scheme includes the construction of a new goods depôt near the Kingsteingnton Road, with which considerable progress has been made, so far as the filling is concerned, and for the carrying out of which a vote of 25,000*l.* was made in 1908.

Mr. Justice Parker last week gave judgment in an action in which the proprietors of a young ladies' school in Eaton Road, Hove, claimed a perpetual injunction to restrain the Hove-Brighton Skating Rink Company, Ltd., from carrying on a skating rink in such a manner as to cause a nuisance to the plaintiffs. His Lordship held that an actionable nuisance had been established, and granted an injunction, which was suspended for a fortnight to enable the defendants to see whether the nuisance could be stopped by structural alterations.

Kodak, Ltd., have offered the London County Council a rent of 1,700*l.* a year for a lease for ninety-nine years of a site in Kingsway between Wild Court and Keeley Street. The site has an area of about 11,635 square feet with frontages of 77 feet, 174 feet and 145 feet to Kingsway, Wild Court and Keeley Street respectively, and adjoins the L.C.C. Wild Street, Holborn, school, the use of which for educational purposes may be discontinued. The offer is subject to the company having an option to take a lease, at a rent at the rate of 2*s.* a square foot a year of a portion of the site of the school in the event of this site becoming available for commercial purposes. The Improvements Committee recommend its acceptance.

Arrangements have been made for the delivery at the London County Council School of Building, Ferndale Road, Brixton, S.W., of two important lectures dealing with cement and concrete. The first, on "The manufacture and uses of Portland cement," will be given by Mr. A. C. Davis, F.C.S., A.I.C.E., &c., manager of the Saxon Portland Cement Company, on Friday, February 25, and the second, dealing with "Reinforced concrete," will be delivered by Mr. E. P. Wells, C.E., J.P., &c., on the following Friday, March 4. The lectures, to which admission is free, will each commence at 7.30 o'clock prompt; Mr. J. S. Holliday, chairman of the advisory sub-committee of the school, will preside on the first occasion, and Mr. H. D. Searles-Wood, F.R.I.B.A., a member of the committee, will take the chair at the second lecture.

The Hamilton Burgh School Board, N.B., have decided to proceed with the erection of new Academy buildings in accordance with the modified plans. The cost is estimated at 33,000*l.* exclusive of the site.

A small estate of some 9½ acres of land on the East Riding side of Selby has, it is understood, been purchased for the erection of a starch manufactory for a German firm. The site is close to the river Ouse.

The Old Kilpatrick School Board have accepted the plans for a new higher-grade school submitted by Messrs. Stewart & Paterson, architects, 14 Blythswood Square, Glasgow, at a cost of 14,077*l.* This sum does not include the price of special furniture to be provided for the laboratories and other details.

The opening of the new nurses' home at Leicester Infirmary took place on the 15th inst. The building has been erected at a cost of 22,500*l.*, this being the completion of the improvement and extension scheme, costing about 100,000*l.*, inaugurated by Sir Edward Wood. The contractors for the building were Messrs. Henry Herbert & Sons, Leicester, and the work was carried out under the superintendence of the architects, Messrs. Everard, Son & Pick, Leicester.

The Bournemouth borough surveyor, Mr. F. W. Lacey, F.R.I.B.A., is preparing plans and provisional estimates for the continuation of the under-cliff drive to Boscombe. The scheme includes provision for terraces in the cliffs, with shelters, and for another bathing station, and a slipway near the Boscombe Pier. The plans are, in addition, to provide for the extension of the drive round the flag-staff at Boscombe in a curve through the pleasure gardens, to join the over-cliff drive. The existing over-cliff drive is also to be improved.

The firm of electrical engineers who have taken a five-acre site at Abbey Park, St. James's, Northampton, with the option of three acres more, will, it is expected, employ about 400 men. It is anticipated that building operations will be begun shortly. There is a growing demand for houses in the district. Mr. G. H. Stevenson, the architect, is preparing plans for the development of the whole Abbey Park estate and adapting it for building purposes.

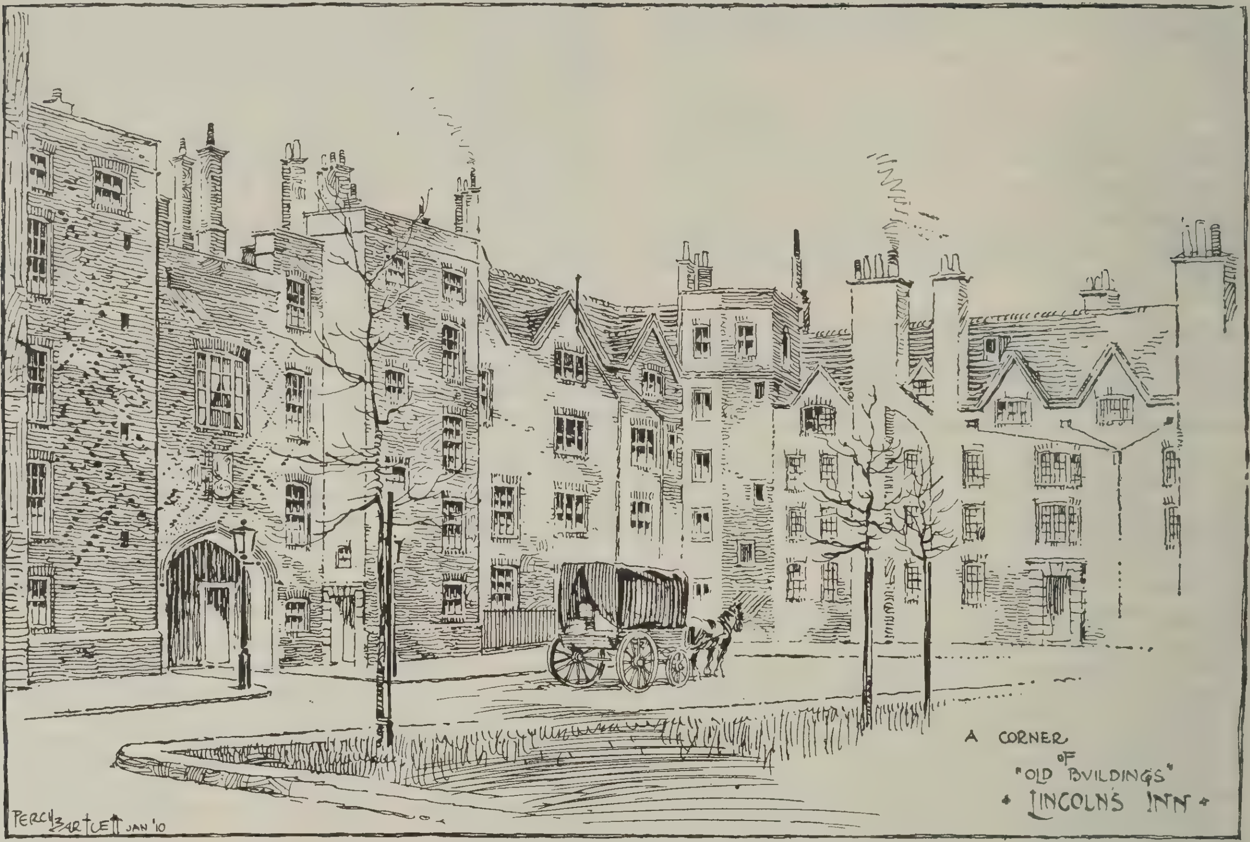
Mr. J. Simmons, C.E., Doncaster, has prepared a report for the Greasborough Urban Council on the sewerage of Mangham. This is in connection with the suggested making of new roads for opening out the school field at Parkgate for building purposes. The scheme will entail an expenditure of about 1,500*l.*, and this the Council unanimously agreed to undertake if an assurance was given by Earl Fitzwilliam's agent that a sufficient number of building plots would shortly be let.

The subscribers to the Perth Royal Infirmary on Monday approved the recommendation of the directors to erect a new infirmary at Tullylumb according to plans prepared by Mr. James Miller, A.R.S.A., architect, Glasgow. A site of over eleven acres has been feued from the Glover Incorporation at 15*l.* per acre. The sketch plans show a new infirmary consisting of four main ward blocks, each two storeys in height, with administrative department in the centre, dispensary, isolation block, &c. There is provision for 100 patients, and the estimated cost is 36,190*l.*, to meet which there is a fund of 31,783*l.* available. The meeting confirmed the appointment of Mr. Miller as architect of the new infirmary, approved generally of the plans, and authorised the directors to proceed with the erection of the building.

The contracts for the plant required in connection with the extension of the electricity station of the Brighton Town Council have been divided between Messrs. Richardsons, Westgarth & Co., Ltd., of Hartlepool; the British Westinghouse Company, Trafford Park, Manchester; and the General Electric Company, Ltd., of Birmingham. The main contracts will be executed by Richardsons, Westgarth & Co., Ltd., who are to provide a double-cylinder Parsons-Brown-Boveri turbine, coupled to a Siemens alternator, capable of giving a continuous output of 3,500 k.w., with a steam consumption of 14 lb. per k.w. hour at a normal load of 3,000 k.w.

The Town Clerk of Edinburgh has issued to the Lord Provost's Committee a report with regard to the development of the Fountainbridge district. He refers to the different attempts made to improve the district, and points out how circumstances are changed by the removal of the slaughter houses and the passing of the Housing and Town Planning Act. The slaughter house area must be dealt with at once, and it must be considered in relation to the neighbouring lands, which include the canal area. The report discusses the subject of the development of the slaughter house site with or without the development of the canal area. Reference is made to the advantage which the removal of the canal would be from a health point of view. Plans have been prepared by the Burgh Engineer showing tentatively the lines of a town planning scheme for the development of the district. The leading features are (*a*) the provision of a through road 60 feet in width connecting the Grange and Merchiston districts with the West End, Belford Bridge, and Queensferry Road; and (*b*) provision for intercepting from Earl Grey Street and Lothian Road traffic from the Merchiston and south-western districts bound for the Caledonian Railway, Princes Street, and eastwards.

## "THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.



In these days of a somewhat strained picturesqueness it is a relief and a lesson to turn to work which relies upon its proportion and simplicity for dignity and charm. Such is represented in the accompanying sketch, made upon the spot, of "Old Buildings," formerly known as "Gatehouse Court." The gateway from Chancery Lane, with its flanking towers, is a fine specimen of Tudor red brickwork, in which, though darkened by age, is to be seen a diaper of black bricks. It is one of the few, if not the only, example of its kind in London. Over the arch, which has a hood or drip mould, on both fronts are to be seen stone panels bearing the Royal coat of arms, those of the Earl of Lincoln (from which this Inn of Court takes name), and others. The windows have been modernised. The gateway itself was erected in Henry VII.'s reign, the adjoining buildings being of later date. Cromwell was probably a frequent visitor, as Thurloe, his secretary, had chambers here.

## THE BRIXTON L.C.C. SCHOOL OF BUILDING.

As a result of a visit to the L.C.C. School of Building at Ferndale Road, Brixton, by the Federation of London Building Industries, the following letter has been addressed to the chairman of the Education Committee of the London County Council:—

"The following account of the visit will, I trust, convey to you and the Educational Committee of the L.C.C., some of the impressions made upon us as the result of inspecting the many interesting sides that the school presents, in the development of technical education as applied to the building industries.

"The Federation have consistently opposed what might be termed 'indiscriminate education.' By that we mean the education of a number of persons in trades or professions who have no intention of following same. Happily, at the Brixton School of Building 'indiscriminate education' does not exist, and we were assured by Mr. A. R. Sage, who conducted the party, that without exception all the evening students are working at the trades in which they are receiving instruction. In the case of the day students the fathers of the boys are required to sign a declaration that their sons are to follow the craft taught. The Federation regards the above with every satisfaction, as it not only insures the proper expenditure of public funds, but also safeguards the interests of the several trades concerned.

"The whole work of the school bears the stamp of intelligent treatment, the kindred trades working hand in hand in the carrying out of schemes which cannot fail to be instructive. For example, in the bricklayer's shop the students are building a wall in English bond, with part end wall, door and windows openings, &c.

"The carpenter students have made the necessary door frames, &c., and have also fixed same, thus securing for the students a practical demonstration of every-day building practice. This system appears to be carried a good deal further, for we were shown a very fine example of brickwork which had been executed from plans prepared by student draughtsmen under the instruction of Professor B. Pite, F.R.I.B.A.

"The plumbing class is a particularly good one, and we were shown some very good examples of work. Carpentry, painting, masonry are fully catered for, and some of the work in the masonry and carving shops is excellent. A beginning has been made with instruction in ferro-concrete construction, but all agree that this important study must be carried further, as little is known about it in this country; but we must all admit that in the practice of building construction in the future, ferro-concrete must play a very important part owing to its almost unlimited possibilities.

"Mr. G. Dew, L.C.C., the chairman of the Federation, is very keen on the special training of students in this important branch of the building trade, and there is much to be urged in favour of this course, as to-day the men who are engaged upon works where ferro-concrete is being employed have had little experience in the process, while the German workman has an intimate knowledge of it.

"In conclusion, let me state that the Brixton School of Building is not by any means a playhouse; on the contrary, we found it a home of science and intelligent training for building trade workers, and we heartily wish its work to be extended."

The Riccall Rural District Council has adopted plans for the erection of fifty houses on the Barlby Road, near Selby, close to where two new factories are to be started.

The Renfrew Parish Council have agreed to erect offices on the north side of the Clyde, near to Yarrow's Yard, at a cost of 2,000*l*.

will be utilised in producing the desired diffusion of the fresh air is, I think, greatly diminished. The great problem of uniform distribution of fresh air, therefore, seems to me to be, in a general way, easier of solution in a two-fan system than in a one-fan system.

2. *Double Glazing.*—I have little doubt but that a substantial part of the success is due to the double glazing of the windows. It is well known that still air, while allowing heat and light to radiate freely through it, is almost a perfect non-conductor of heat. Between the two sheets of glass in the windows is a layer of still air, which practically prevents heat from being conducted out of the hall through the window panes. If there had been one sheet of glass only, a substantial amount of heat would pass through the glass, and the air in contact with the windows would be cooled and rendered thereby heavier. In this way a downward cold current of air would be produced, and would descend near the walls on the heads of the audience below, to their great discomfort. But worse than this, the cold current of air would be composed largely of vitiated air, which would thus be again supplied to the occupants of the room. There is, in addition, the great economy of heat which is effected by the double glazing. It would be perfectly easy to ascertain by experiment the actual saving in fuel produced by double glazing an area of 950 square feet of window glass, given an average outside temperature of 45°, and an average inside temperature of, say, 65° Fahrenheit.

3. *The Warming of the Walls, Ceiling, &c., of the Room by means of Radiators.*—Before the audience assembles care is taken to raise the temperature of the walls, furniture, &c., to about 60°. In this way the warmed air is not seriously cooled by contact with the walls and ceilings, and the consequent down-draught is not substantially perceptible.

4. *The Facility with which the Temperature of the Incoming Fresh Air can, within Certain Limits, be Raised or Lowered.*—This appears to be essential in the case of a hall in which the number of the audience is variable, as it seems that the temperature of the fresh air supplied should, to some extent, vary inversely as the number of the occupants of the hall.

The great advantage of a two-fan system was, I believe, first pointed out by our chairman, Dr. Shaw. In a course of lectures, delivered in Cambridge a few years ago, Dr. Shaw showed that the energy required to drive a definite quantity of air into a cubical chamber and out again was less when two fans are used (one compressing, and the other dilating the air) than when one fan only is used, whether compressing or dilating. This being so, we were satisfied that the cost of running two fans, even including the additional working friction, could not substantially exceed the cost of running one only for the same amount of air moved. Moreover, we were aware that both plenum and vacuum systems have serious disadvantages connected with doors and windows, disadvantages which seem to disappear when two fans are used. Again, a remark in Dr. Shaw's recent work on air currents, to the effect that the loss of heat through windows seems to have no compensating advantage, encouraged us to recommend the University to go to the additional expense of double glazing.

I do not suppose that any system of ventilation, however complicated, can ever be perfect; that is, I do not expect that we can ever arrange that each occupant of a room shall breathe fresh air and fresh air only of exactly the temperature which he prefers. It might be done, I suppose, by laying on cold and warm fresh air by two separate pipes to each occupant. But this is not a practicable suggestion. We must in fact be satisfied at present with a general success, and this I hope we have attained to a very high degree in our large Examination Hall.

Dr. **Louis C. Parkes**, in opening the discussion, said that there were one or two points arising out of the paper which he should like to raise. The first was in connection with the use of double glazing in the windows. In a building like that described by Mr. Lock, and which was required for examinations, lectures, and dinners, it would no doubt serve a very useful purpose. But for ordinary uses it was very necessary that people should be able to see out of the windows; and this would be impossible if the inner sheet of glass is ground. Moreover, even if it were not ground, the view would necessarily be obscured. It would, perhaps, be possible to have a system whereby warm air is introduced between the double glazing for the purpose of preventing evaporation. Some years ago the Royal Courts of Justice had a very bad reputation for their ventilation. But more recently the Office of Works introduced practically the same system as that described by Mr. Lock. It has been found to answer extremely well as long as it is given a fair chance. The attendants are constantly watching the thermometers placed throughout the building, and as soon as a rise of temperature above 65° is observed instructions are telephoned to the engineer in the basement to increase the supply of fresh air. The problem in some of the courts was exceptionally difficult. For instance, it was quite impossible to foresee the extraordinary fluctuations in the number of people present. In a case of special general interest one court becomes packed while another would be almost empty. Unfortunately, too, some of His Majesty's Judges are not enamoured with the system of ventilation installed, and they insist on opening all the windows, with the result that the system is a total failure. Other Judges do not believe in ventilation of any sort, and so they stop the inlets and render the court very close and stuffy. The system of ozonisation had been tried in one court as a consequence of the Judge being obsessed with a fear of infectious disease. The Judge believed that any such danger would be removed by the introduction of ozone. But it was found that ozonising the air had no influence whatever on the destruction of germs, owing to the fact that the amount of ozone that could be introduced without producing unpleasant effects on the throat was so very small as to be almost negligible. Another large building that was ventilated on something like the lines described in Mr. Lock's paper was the House of Commons. Here the air was drawn in from the Terrace and introduced into the chamber through gratings in the floor. But that way had proved unsatisfactory, as the air became fouled by the dirt deposited on the floor by the members' boots before it reached the members' lungs. This may account for the fact that the House of Commons very early shows the ravages of influenza.

Mr. H. D. **Searles-Wood**, F.R.I.B.A., said he would like to put two questions to Mr. Lock. The first was whether any means were provided for cleaning the tubes which supply the fresh air to the Examination Hall; for in most cases they get into a very foul state if left to look after themselves. The second was, whether there was any way of moistening and cleansing the air as it passes through the battery chamber?

Mr. A. E. **Wheeler** thought that the paper was exceptionally interesting as being an account of a successful use of the plenum system. It supported the contention that had been often advanced, that if the plenum system was given a fair chance it would prove a success. In the cases of the failures it was usually traceable to negligence on the part of the attendants.

Mr. **Skinner** (Principal of the Chelsea Polytechnic), remarked that as a Cambridge man he did not retain the pleasantest recollections of the old arrangements under which they used to sit for examinations in the Corn Exchange. In that place there was a very ample supply of air, but very little heat. He would like to learn the opinion of the present undergraduates as to the efficacy of the large Examination Hall. In reference to the subject of heating as a whole, he wanted to make a small protest against the indiscriminate employment of the word "radiators." The instrument described in the paper heat by convection, and not by radiation.

Mr. G. **Hubbard** said that he had had the advantage of going over the Examination Hall at Cambridge with Mr. Lock. He thought he would be safe in saying that the system introduced was Mr. Lock's own system. There seemed to be no doubt that each candidate sitting in the Examination Hall got his fair share of fresh air. The double glazing of the windows was one of Mr. Lock's ideas. The imprisoned air between the panes was an excellent non-conductor of heat.

Mr. E. **Thomas Swinson** expressed his disappointment that the subject of ventilation had not been treated on broader lines. The only system spoken of that evening was a mechanical one. His own opinion, based on experience of public buildings, was that the one and only system which will work is a combination of the plenum and the vacuum. A great objection to the plenum was that it was so easy to throw out of order. Dr. Parkes had mentioned that the air of the House of Commons was fouled before it reached the members; this accorded with his own experience of the many public buildings in London where the air was introduced through undesirable inlets and drawn from undesirable places. Practical engineers should try to obviate this real danger. The question of humidity was a very serious factor in ventilation schemes. Greater regard should also be paid to the heat thrown off by the human body. In many buildings there were great difficulties encountered owing to the wrongful planning and the inability of architects to pay a due regard to ventilation.

Mr. J. R. **Preston** said that Mr. Lock's paper would seem to support the view that upward ventilation was better than downward. Twelve months ago many engineers favoured downward because the introduction of air was easy. The position of the heating and ventilating engineer was quite different in this country to what it was in countries like America, Austria, or Germany, where 10 per cent. of the cost of the building is expended on its heating and ventilation. The regulation of temperature was a most important thing, and a great market was awaiting a simple and cheap heat regulator; it would both effect a saving in fuel and be a great comfort. The introduction of ozone plant was extensively practised in the United States. It was remarkable that no technical school in this country had made ventilation and heating a separate subject, although it was now such an important science. Research had still to be done on an extensive scale, and contractors lacked the means to conduct it for themselves.

Mr. Henry Adams said the subject was a very important one from the health and the commercial point of view. The working efficiency of people in badly ventilated workshops was decreased by from 10 to 15 per cent., so that it was really a very good investment for a manufacturer to spend money in the proper heating and ventilation of his workrooms.

Dr. W. N. Shaw, in concluding the discussion, said that a good deal of stress had been laid on the subject of humidity. In his opinion it only became of importance when the temperature was 70°, 80°, or 90°; when the temperature was in the region of 60° or 65° there was no satisfactory evidence to prove that it was a vital matter. It was a question that had been talked about for a considerable time, and in many establishments a tank of water was to be seen like an offering to the goddess Humidity. The great difficulty that beset a scheme like that just described by Mr. Lock was the lack of sustained interest in it. During the summer the information evaporated, and when with the next term a new man comes to take charge of it there was no one to show him what he does not understand, and so the system suffers. The large Examination Hall at Cambridge should afford splendid opportunities for practical experiments in physics.

The Rev. J. B. Lock briefly replied to the points raised. All the tubes and ducts could be got at for cleaning purposes. With regard to experiments by the students of physics, his experience was that physicists were so occupied with theory that they would not busy their minds with so coarse a thing as practice.

## THE SOCIETY OF ENGINEERS.

The first ordinary meeting of the new Society, formed by the amalgamation of the Society of Engineers and the Civil and Mechanical Engineers' Society, was held on Monday, February 7, at Caxton Hall, Westminster. At the commencement the meeting was presided over by Mr. E. J. Silcock, M.Inst.C.E., F.S.I., F.G.S., last President of the Society of Engineers, and Mr. W. Noble Twelvetrees, M.I.Mech.E., A.M.I.E.E., last President of the Civil and Mechanical Engineers' Society. The premiums awarded by the Council of the Society of Engineers for papers read during 1909 were presented by Mr. E. J. Silcock as follows:—The President's gold medal to Dr. David Sommerville, for his paper entitled "Some Observations on the Chemistry and Bacteriology of Sewage Purification"; the Nursey premium of books to Mr. E. R. Matthews for his paper on "The Corrosion of Steel Reinforcement in Concrete"; and a Society's premium of books to Mr. W. E. Haldwell for his paper on "The Sinlumkaba Ferro-concrete Bridge." Mr. W. Noble Twelvetrees presented the following premiums awarded by the Civil and Mechanical Engineers' Society for papers read during the last session:—A premium of books and instruments to Mr. R. O. Wynne-Roberts for his paper on "The Past, Present and Future of the Organisation of the Engineering Profession," and a premium of books and instruments to Mr. H. Laurence Butler for his paper on "Specifications for Engineering Works."

Mr. Diogo A. Symons, M.Inst.C.E., M.I.Mech.E., the first President of the new Society, having taken the chair, votes of thanks to the Presidents of the constituent Societies were proposed by the senior Past Presidents, and seconded by the senior Vice-Presidents of the Society of Engineers and of the Civil and Mechanical Engineers' Society.

These resolutions were carried by acclamation, and the President then delivered his inaugural address.

After rendering thanks for his election as first President of the new Society, Mr. Symons alluded to the internal affairs of the Society, pointing out that since the amalgamation there were over 700 members, and putting in a plea for large attendances at the meetings. Referring to the examination which was to be the qualification for Fellowship of the new society, he believed that its introduction would have the same beneficial effect as had been the case in the Institution of Civil Engineers.

Proceeding to more general subjects, he called attention to the value of workshop training to engineering students, whether they intended to take up the civil or the mechanical branch of the profession. He belonged to the civil branch, but had often looked back with gratitude to the time he had spent in the shops.

Touching some of the branches of engineering work with which he was associated, the President referred to the question of water supply in foreign cities.

Ferro-concrete, so largely used at the present, had in many instances proved economical and entirely satisfactory for constructional works. He, however, considered that a large factor of safety should be allowed and every care taken to ensure the use of the very best materials and workmanship.

The question of the disposal of sewage was one which called forth innumerable inventions and improvements, but there was still a tremendous field for the energies of the engineer and the chemist. Referring to engineering work abroad, in which British capital was invested, the fact should not be overlooked that works financed in England were invariably designed by British engineers and carried out by British contractors, so that a great deal of outgoing capital returned to its source. In connection with foreign investments, "Government guarantees" were not always so satisfactory as the phrase seemed to imply, and it was important, before investing money in such enterprises, to ascertain as fas as possible the earning capacity of the project under consideration.

With regard to the motor industry, Mr. Symons called attention to the great advance that had been made in this branch of engineering, and referred to the dust nuisance and the traffic problem in large cities. He also quoted statistics showing the enormous increase in recent years of mechanically propelled vehicles, and the corresponding decrease in horsed vehicles.

Alluding to the subject of aviation, it was gratifying to note that British manufacturers and aeroplanists were making good headway, and that several aviation meetings were to be held in England during the present year.

Speaking of the education of young engineers, he emphasised the importance of a thorough grounding in fundamental principles before any attempt at specialisation was attempted, and laid stress on the advantage of gaining engineering experience with a contractor on public works. The tendency of engineering students to accept salaried appointments after too brief a training was deprecated because such appointments usually involved loss of valuable instruction and experience.

In conclusion, a further reference was made to the details of the amalgamation which had just been effected. A vote of thanks was heartily accorded to the President for his address, and the proceedings then terminated.

---

The Acting British Trade Commissioner for South Africa (Mr. E. J. Cattell) reports that the contract for the erection of a new railway station at Pretoria has been signed. The cost of the work is to be 91,284*l*. The names of the contractors and of the architect for the station may be obtained by British firms interested on application to the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

The Bacup Corporation has decided to apply for power to borrow 10,000*l*. for the widening of Burnley Road, and the arching of the river in preparation for the building of a new post office. Another 3,000*l*. is to be borrowed for the electric lighting of the borough. Bacup with Rawtenstall is committed to the expenditure of 25,000*l*. on a new technical institute to be built at Waterfoot. An elementary school is being built at a cost of 6,000*l*.

The Glasgow Corporation have approved the following motion:—"That there be inserted in all schedules and specifications issued to foreign manufacturers or their agents for the supply of goods required by any of the departments of the Corporation a clause to the effect that foreign offerers or their agents will be bound to produce evidence to the effect that, as far as practicable, their works are carried on in conformity with the Standing Orders of the Corporation relative to standard rate of wages and other conditions of labour; and that it be remitted to the town clerk to prepare and submit to the Corporation for their approval the form of such a clause."

**Under no circumstances whatever can the Proprietors of this journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.**

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

## TENDERS, ETC.

⁂ *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2* p.m. *on Thursdays.*

## COMPETITIONS OPEN.

Blyth.—March 12.—The Governors of the Blyth Secondary school invite architects with offices in Northumberland, Durham, or Newcastle-upon-Tyne, to submit plans for a secondary school to accommodate 280 pupils, and caretaker's house. The assessor appointed is Mr. J. A. Gotch, F.R.I.B.A., F.S.A. Mr. Thomas R. Guthrie, Clerk to the Governors, Blyth.

King's Norton.—Feb. 26.—The Education Committee invite designs for a new elementary school to be erected at Woodgate, in the parish of Northfield. Apply by Feb. 26 to Mr. J. F. Moore, secretary, Education Offices, King's Norton.

Leeds.—March 1.—The Directors of the Leeds Co-operative Society, Ltd., invite designs for new business premises and offices. Premiums of 100*l.*, 50*l.*, and 25*l.* for designs placed first, second, and third by assessor. Conditions and lithographed plans on application to Secretary on receipt of stamped addressed foolscap envelope with deposit, 2*l.* 2*s.* Secretary, John W. Fawcett, 10 Albion Street, Leeds.

March 1.—A committee of glazed brick manufacturers invite designs for works to be executed in glazed brickwork, also essays as to the advantages to be derived from the use of this material. Premiums of 100 gns., 50 gns., and 25 gns. awarded to designs and essays jointly. Mr. Max Clarke, F.R.I.B.A., assessor. Apply to Mr. J. Johnston Green, 142 Liverpool Road South, Southport.

Scotland.—March 21.—The Renfrew Parish Council invite plans and estimates for offices to be erected at Blawarthill, Yorker Road, near Scotstoun West Station. Deposit 10*s.* No premium. The Clerk to the Council, 1 Manse Street, Renfrew.

Sheffield.—March 31.—The Endcliffe Park Church authorities desire plans for church for 650, institute for 150, primary department for 125, junior department for 95, and caretaker's apartments. Premium, not merged in commission, 35*l.* Assessor, Mr. Chas. Hadfield, F.R.I.B.A. Deposit 5*s.* Will be returned to those who send plans to Mr. J. W. Nicholls, secretary, 64 Everton Road, Brocco Bank, Sheffield.

Walsall.—Designs are invited for the erection of a public elementary school (mixed) to accommodate 500 children at Bloxwich. Conditions of competition and plan of site from Mr. W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.

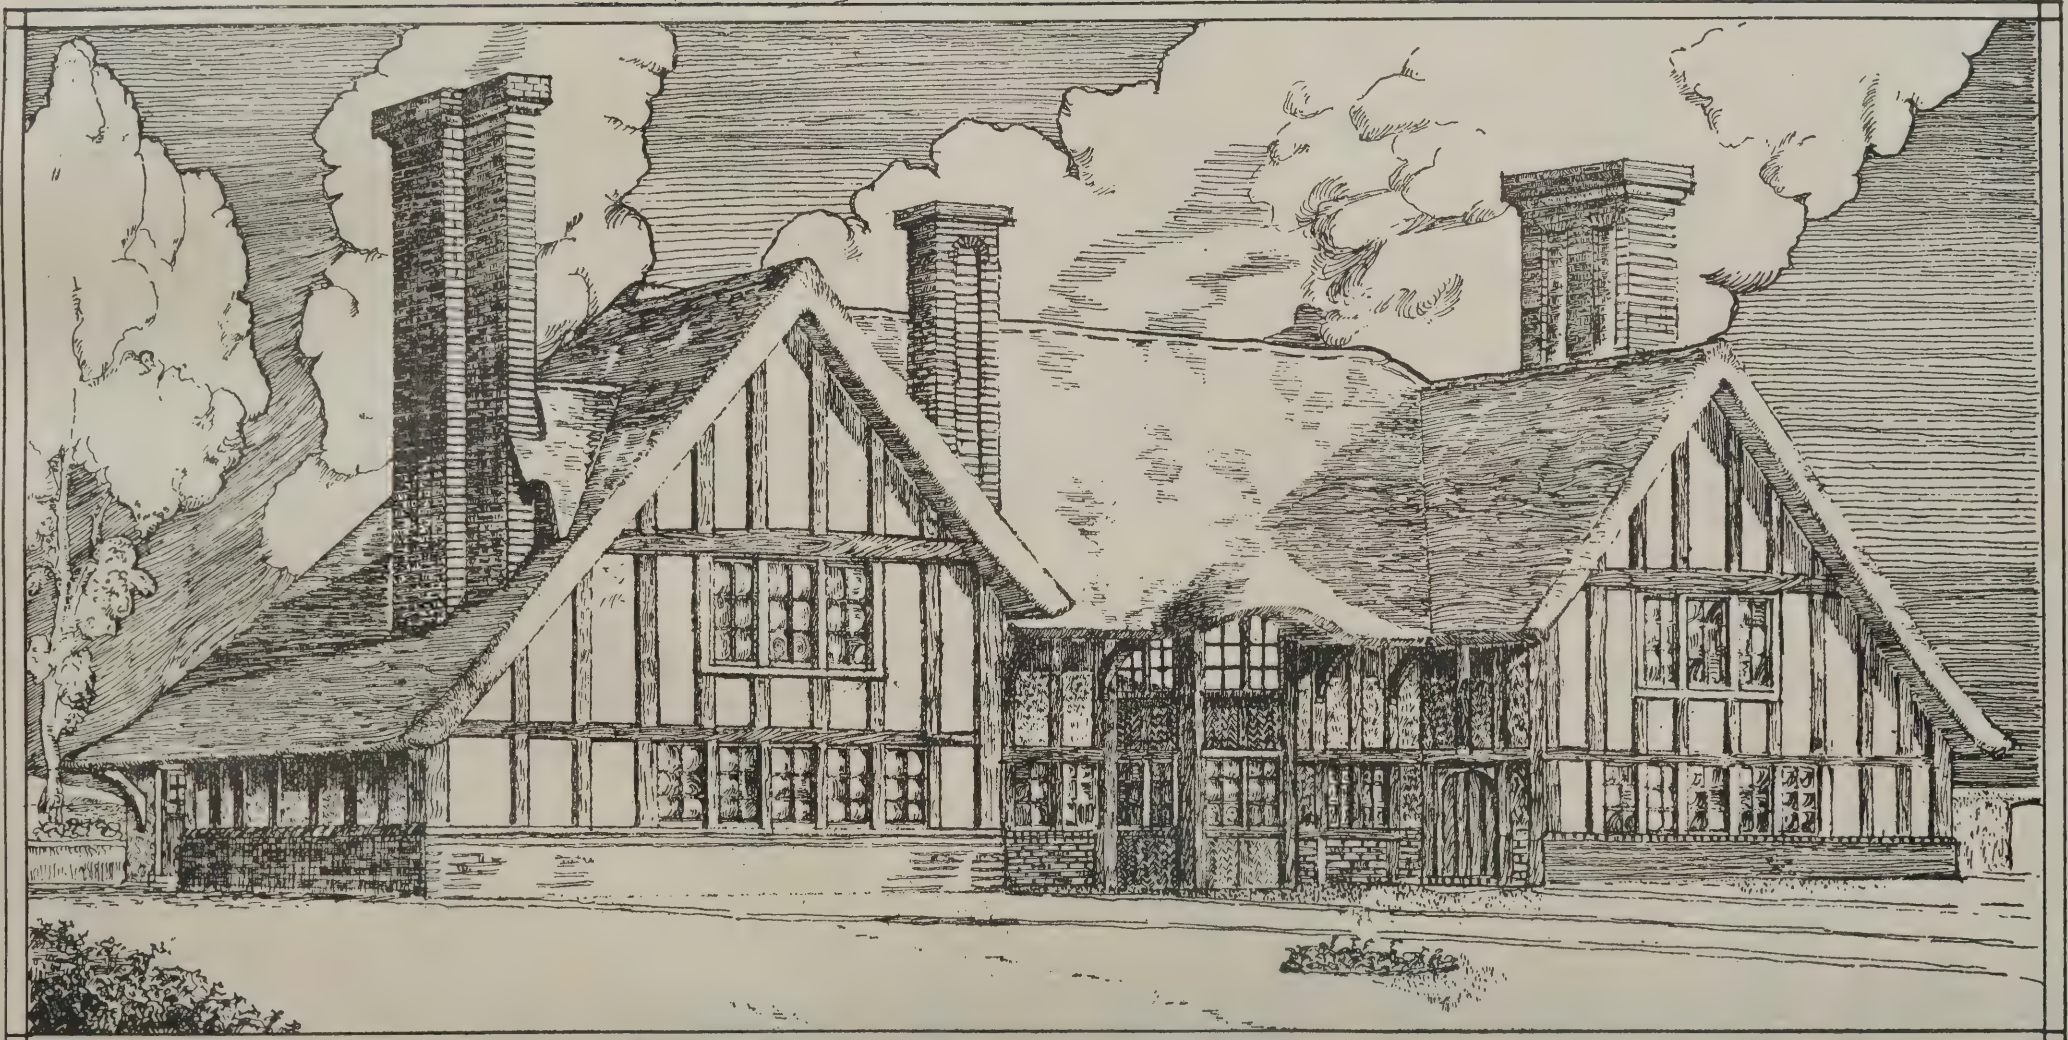
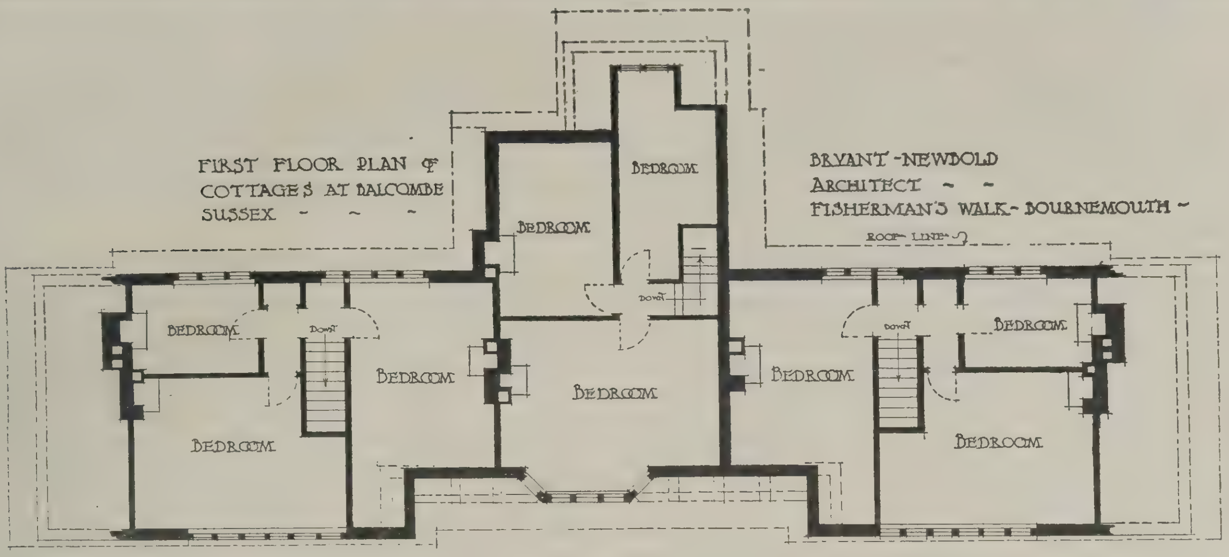
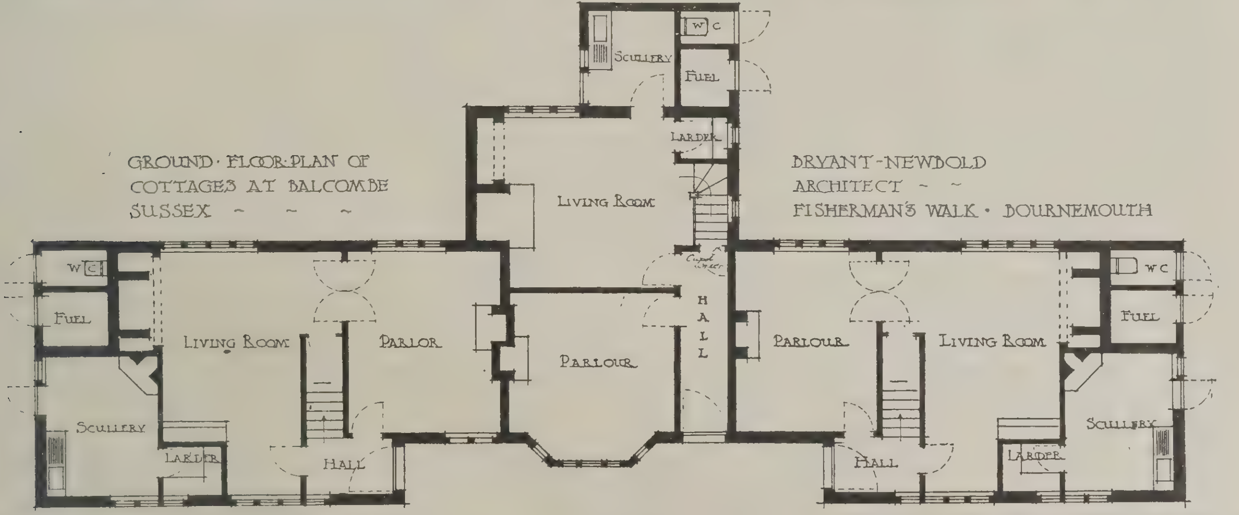
The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, held its usual monthly meeting on Thursday, February 17. Grants of money were made in aid of the following objects., viz. :—Building new churches at Dawdon, St. Hilda and St. Helen, County Durham, 150*l.* ; Loughborough, St. Peter, 100*l.* ; St. Albans, St. Paul, Herts, 200*l.* ; Woodford Bridge, St. Barnabas, Essex, 150*l.* ; Woolacombe, St. Sabinus, Devon, 100*l.*, and Friern Barnet, St. John, Middlesex, 70*l.* ; and towards enlarging or otherwise improving the accommodation in the churches at Barfreystone, St. Mary the Virgin, Kent, 10*l.* ; Birkenhead, St. Matthew, 60*l.* ; Pembrey, St. Illtyd, Carm., 80*l.* ; Scopwick, Holy Cross, near Lincoln, 25*l.* ; South Tottenham, St. Philip, Middlesex, 100*l.* ; and Lavenham, St. Peter and St. Paul, Suffolk, 50*l.* The following grants were also paid for works completed :—Dartford, Christ Church, Kent, 150*l.* ; Earby, All Saints, near Leeds, 50*l.* ; Gorton, St. Philip, Manchester, 90*l.* ; Abergavenny, Holy Trinity, Mon., 40*l.*, and Sutton-in-Ashfield, St. Michael and All Angels, Notts., 90*l.* In addition to this the sum of 250*l.* was paid towards the repairs of nineteen churches from trust funds held by the society.



PERSPECTIVE VIEW

COTTAGES AT BALCOMBE, SUSSEX.—Mr. Bryant Newbold, Architect.





## COTTAGES AT BALCOMBE, SUSSEX.

This group of cottages has been erected at Balcombe in one of the prettiest parts of Sussex. An effort has been made to bring the design into harmony with its rural setting, one of the means employed being the use of thatch as a roof covering. The architect was Mr. H. Bryant Newbold, of Bournemouth.

---

The first annual general meeting of the Concrete Institute was held at the Royal United Service Institution, Whitehall, on February 17, the Right Hon. the Earl of Plymouth, C.B. (late First Commissioner of Works), President, in the chair, supported by Sir Henry Tanner, I.S.O., Mr. E. P. Wells, J.P., Hon. Treasurer, Mr. Wm. Dunn, F.R.I.B.A., and other members of Council. The result of the ballot for six vacancies on the Council was as follows:—Messrs. C. H. Colson, M.Inst.C.E., William Dunn, F.R.I.B.A., Professor Henry Adams, M.Inst.C.E., Messrs. William G. Kirkaldy, Assoc.M.Inst.C.E., J. S. E. de Vesian, M.Inst.C.E., and E. Fiander Etchells, F.Phys.Soc. The Hon. Treasurer thereupon read the annual report and accounts, the adoption of which was moved by the Earl of Plymouth, who dwelt on the satisfactory progress which the Institute had made. This was seconded by Sir Henry Tanner, who referred to the work of Mr. Edwin O. Sachs in the foundation of the Institute. Mr. F. E. Wentworth Sheilds, M.Inst.C.E., and Mr. E. Fiander Etchells, F.Phys.Soc., dealt at some length with the work of the Science Standing Committee. After the discussion of various matters of detail, Mr. William Dunn proposed, and Sir Henry Tanner seconded, a vote of thanks to the President for occupying the chair.

A well got-up little guide to the Black Forest has just appeared in print and contains also a description of the Rhine and Neckar and famous towns like Heidelberg and Baden-Baden. This profusely illustrated pamphlet will be sent gratis and post-free on application to the Internationales Offentliches Verkehrsbureau, Berlin, Unter den Linden 14.

Messrs. Wm. Potts & Sons, Ltd., clock manufacturers, Leeds and Newcastle, are making a new hour-striking clock for Selaby, near Darlington; also a memorial striking clock with large external copper dial, painted and gilt, for Arthington parish church, Leeds.

## COMPETITIONS.

Coventry.—The Coventry City Council on Tuesday agreed to organise a competition in order to obtain designs for municipal buildings with or without a town hall on a site belonging to the Council in Earl Street. There will be a supplementary plan for a town hall to be erected on the site of St. Michael's Baptist Chapel and some adjoining offices. The premiums will amount to 450*l*.

Saltburn.—The North Riding Education Committee recently invited designs for a girls' high school to be erected at Saltburn. It is now announced that the successful architects are Messrs. S. B. Russell & T. E. Cooper, 11 Gray's Inn Square, W.C., and that the twenty guineas premium has been awarded to Messrs. F. J. Eedle & Meyers, Railway Approach, London Bridge, London; and the ten guineas premium to Messrs. Robert Evans & Son, Eldon Chambers, Nottingham.

Peterborough.—The R.I.B.A. Competitions Committee, who have been in communication with the promoters of a competition for a proposed secondary school in Peterborough, report that they are now satisfied with the conditions of the competition.

Scotland.—The Kyles of Bute Hydropathic Company having decided to rebuild their establishment at Port-Bannatyne, recently destroyed by fire, have selected the following three Glasgow architects to compete:—Mr. George Bell, F.R.I.B.A.; Mr. A. Balfour, F.R.I.B.A., I.A.; and Messrs. Thompson & Sandilands, FF.R.I.B.A.

Warrington.—The design of Mr. T. A. Buttery has been selected in competition for the proposed schools in Evelyn Street.

---

A joint report by the medical officer of health and the sanitary inspector for Leith has been issued, in which the almost universal employment of cisterns in the burgh is condemned as highly insanitary and unnecessary. They suggest therefore that the local authority should urge:—(1) That in all new buildings in Leith a supply from the main be provided in every house or other dwelling; (2) that a by-law be made and enforced by the Water Trust whereby a supply direct from the main will be made obligatory in all existing houses or other buildings; (3) that when supplies for drinking and culinary purposes are introduced from the main pipe, supplies from cisterns should not be insisted upon.

## MODERN INDO-EUROPEAN ARCHITECTURE.

AN interesting paper on "Art Administration in India" was read recently before the Indian section of the Society of Arts by Mr. E. B. Havell, who has acted as Principal of the Government School of Art at Madras and later of that at Calcutta, and is in a peculiarly advantageous position to discuss the subject. The attitude the author adopts is one of general hostility to the existing conditions as being extremely harmful to the native artistic instincts and traditions. Mr. Havell complains that a European standard of taste and manner has been introduced and established to the exclusion of indigenous art. One of the instances he gives is the architectural policy of the Public Works Department in India. On this subject he spoke as follows:—

I will turn to another official windmill against which I have been tilting with less success in the last twenty years—the architectural policy of the Public Works Department. It is hardly necessary to explain in detail its bearing upon the art administration of India. Mr. Cecil Burns, in the paper read before the Society of Arts last May, admitted that, as nearly all the decorative arts have originated from and are dependent upon the style of architecture they are intended to enrich, the decision to adopt European styles in Government and other buildings must exercise a powerful influence upon the practice of all the crafts allied to the building trade, and through them upon the teaching of the Schools of Art. Yet he was content to put this question, as well as the teaching of the fine arts, on one side, and to attribute the depressed condition of Indian handicraft chiefly to the opening of the Suez Canal. He considered that the arguments for and against the adoption of European styles in modern Indian buildings were sufficiently stated in a paper read before this Society, by Mr. T. Roger Smith, F.R.I.B.A., in 1873; and said that the question had been since fully considered in connection with the erection of the Queen Victoria Memorial building in Calcutta.

I will deal with Mr. Roger Smith's paper first. The gist of his arguments can be shown in a few short extracts. He says:—"Let us for consistency's sake be European in art; for art, if it be true, is an expression of national individuality more intense and more truthful than custom, fashion, or government. In the stubbornness with which we retain our nationality we resemble the Romans." This doctrine is more briefly expressed by Mr. Kipling's phrase, "East is East, and West is West, and never the twain shall meet." The stubbornness with which we have clung to this idea has been the main cause of our difficulties in India, but in art matters it is diametrically opposed to the principles which have been laid down by the Secretary of State, and nominally, at least, accepted by the Government of India.

Mr. Roger Smith goes on to state three reasons which might be brought forward for using an Indian style in Indian public buildings. "First, it is said that it is suited to the climate; secondly, that the natives can do it; and lastly, that it is, or can be, very beautiful. But," he added, "the sufficient answer, of course, is that it may be all these, but that it is not European, far less British. Of the three reasons alluded to, by far the most powerful is the one placed first, namely, that Indian architecture, whether Mohammedan or Hindu, is the offspring of the climate, and, as such, better fitted than anything we can import to the circumstances of the country. Very true, but so is Indian food, Indian dress, Indian living, Indian administration. They are all the offspring of the climate, yet we cling very naturally to the food, the dress, the manners, the principles of governing to which we are accustomed, though while we retain them in principle, we are not unwilling to make such variations in detail as will tend to diminish some of the inconveniences experienced in consequence of the peculiarity of the climate and *entourage*, leaving the question of encouraging the art of the country, in those cases where the building is devoted to the use of natives of the country, to stand on its own merits." You will observe that Mr. Roger Smith treats the matter of the preservation of Indian art as one of altogether inferior importance to that of nursing our own insular prejudices. But now he comes to the root of the matter. "The second reason for employing the styles of the country, namely, that the natives can design and build in them, is answered by the fact that the natives will not be employed. The buildings which are built for European use and with European funds in India have been invariably built under European supervision and from European designs, and always will be; and though the artificers employed may be natives, yet that does not make the buildings native works any more than the printing in Calcutta of an English book by Hindu compositors makes it a Hindu book."

The answer to what I must call this extraordinary argument simply is that there are no public buildings in India, built exclusively for European use and with European funds, and though *de facto* we have excluded Indian architects from the Public Works Department, it has never been laid down by official authority that they are always to be so excluded.

I do not think that any responsible British statesman of the present day would wish to argue that the design of public buildings in India must always remain in the hands of Europeans.

If we go back to the original reasons for the adoption of European styles in the Public Works Department it is easy to understand that very little, if any, consideration has ever been given to artistic principles; this policy was simply forced upon the department by the artistic and architectural ignorance of its officers. The designing of public buildings was for very many years placed in the hands of military officers or engineers, who had no training whatever in architecture as an art, and not even the archæological skill of the average European architectural draughtsman. The Macaulay doctrine established the departmental principle that bad European art was better than good Indian, so the Public Works officers, instead of using the architectural skill of the Hindu master-builders, as their Mogul predecessors did under similar circumstances, took their tee squares and set squares, and with the help of European archæological diagrams, made their paper designs for public buildings in the so-called "classic" style, their choice being mainly determined by the fact that this style presents fewer difficulties to the amateur architect than any other. Even to this day, this process of departmental routine is taught as architecture to Indian students, in all the engineering colleges of India by European professors of drawing and design, and these mechanical exercises enable the engineering graduate of the universities to oust the traditional master-builder from his hereditary and legitimate employment. The first results of these primitive archæological experiments by the Public Works officers were sometimes disastrous and dangerous to life and limb for the Indian workmen employed in executing them. Sometimes the buildings collapsed before they were completed, and accidents of a like nature are not altogether unknown even in the present day.

Occasionally, it must be admitted, the Public Works Department has set a better precedent, and among its officers there have been architects of skill, like Mr. Chisholm and Mr. Brassington in Madras, and Sir Swinton Jacob in Jaipur, who have successfully adapted Indian styles to departmental requirements. But they have hardly solved, as the Moguls did, the much more important problem of making full use of the traditional science and art of the Indian master-builder for the purposes of the State. And in this question of style every Viceroy, Governor, Head of Department, and every official architect has been a law to himself. No definite principle has been laid down, and the paramount importance of architectural style in relation to the preservation of Indian art and handicraft has never received the slightest official consideration, though, as one of the artistic advisers of Government, I have endeavoured on every possible occasion in the last twenty years to draw official attention to it.

Mr. Cecil Burns is entirely incorrect in his statement that the matter was fully considered in connection with the scheme for the Victoria Memorial at Calcutta. The facts are that at the first inception of the scheme for the memorial Lord Curzon invited public discussion and suggestions. The suggestion I submitted to Lord Curzon was that as a preliminary measure a competent architect should make a survey of buildings in Northern India constructed by living Indian master-builders who still carry on the traditions of Indian architecture, and that after this was done the design for the memorial should be made in a living Indian style in consultation with the best native master-builders that were found. This was very much the procedure which Shah Jahan adopted in connection with the building of the Taj. Lord Curzon engaged a competent architect, but did not carry out my main suggestion, to investigate thoroughly the living traditions of Indian architecture, for the reason that Calcutta was a European city, and that an Indian style of building would be unsuitable there.

I cannot myself conceive how it is possible to defend the Public Works policy on practical, æsthetic, or ethical grounds. The reasons given for it always seem to me to be pedantic, when they are not frankly philistine and indifferent to the interests of art. Let us suppose for a moment that there existed in England at the present day a large number of master-builders, masons, and other craftsmen who had at their fingers' ends all the architectural and craft traditions of the Middle Ages. Would architects and artists say that it was impossible, or undesirable, to employ these men in Government work because they did not know Latin and Greek, had no certificates from the Board of Education, and could not draw their designs on paper to an exact scale for the approval of the Local Government Board? And what would His Majesty's Opposition in the House of Commons say if, in the discussion on the Estimates, it was found that Government departments were sometimes employing architects, sculptors, and decorators from Calcutta for public buildings in London, and paying them ten, or twenty, or fifty times the rate of wages these English master-builders and craftsmen demanded, because the provincial English styles were not considered departmentally correct? In England such a situation is unthinkable, but it is actually the situation which has been considered right and proper for India during the last fifty years, and this is the situation which the art experts sent out by the Secretary of State to revive Indian art are asked to face. Is it surprising that they sometimes think discretion is the better part of valour?

Mr. Cecil Burns has, however, plenty of courage. He proposes that the School of Art lamb should die down with the Public Works lion, or, in other words, that the Principals of Schools of Art should accept things as they are, and cooperate with the Public Works Department in the decoration of public buildings. I myself have always strongly advocated such co-operation, provided that the security and free action of the lamb could be guaranteed, but I think the lamb is rash to thrust its head into the untamed lion's mouth. The system of co-operation was, in fact, as Mr. Chisholm stated in the discussion on Mr. Burns's paper, introduced by him when he was doing the double duties of Superintendent of the School of Arts and Consulting Architect in Madras. But directly I took charge of the School of Arts the Public Works Department withdrew its orders from the school and started workshops of their own. This is an illustration of the difficulties in which Principals of Schools of Art are placed. There is no fixed policy in art matters, and they have practically no voice in the settlement of artistic questions. Until it is the settled policy of the Government of India that living Indian styles shall be adopted as far as possible in all public buildings, there can be no co-operation between Art Schools and the Public Works Department for the advantage of Indian Art. The Principal of the School of Art is a subordinate official of the Education Department with a much inferior official status to that of the Consulting Architect, and if the latter chooses to have imitation Renaissance, or Gothic, or to invent a style of his own, for the design of public buildings, he is quite at liberty to do so.

Moreover, the Schools of Art are quite out of touch with the best Indian builders and decorators, and must always remain so if bound hand and foot by departmental authority.

## THE ART OF THE LEADWORKER.

THE Carpenters' Company are giving a valuable course of "Craft" lectures on Wednesday evenings at Carpenters' Hall, London Wall, E.C., and reports of them have appeared in our columns. The lecturer last week was Mr. Lawrence Weaver, who took as his subject "The Art of the Leadworker." A large number of fine specimens of English work were shown on the screen.

After commenting on the dignity of the calling, he said that the art of the leadworker was as living as it was individual. Its chief applications begin in architecture by being severely practical, as in roofing and water supply pipes. The next use was in objects which combined the useful and the decorative, such as fonts and pipe-heads. Finally, they reached the purely decorative in garden ornaments.

In the design of lead fonts the general character of the arcaded bowls with large figures admittedly resembles that of contemporary stone fonts. There is, however, a delicacy of modelling in the floral decoration and in the detail of the robes, combined with a general softness of effect, which would be impossible in stone. The fineness of detail might be obtained in marble, but it would be joined with a certain harshness, unavoidable in delicately wrought stone. There remains the alternative of bronze, but bronze calls for treatment more defined and less homely than suits the character of lead. Lead has a lower place, but it can take on a gentle dignity and simplicity incapable of transference to another material. Dealing with fonts, Mr. Weaver showed first the magnificent example at Walton-on-the-Hill, Surrey, which is one of eleven existing fonts having as chief feature a large arcade with prominent figures, presumably of the Apostles, generally twelve in number. The Ashover font has twenty figures in bold relief, simply draped and without mitre or nimbus. The example at Brookland, Romney Marsh, belongs to another class, for in addition to an arcade it has other important decoration. In this case there are two arcades, the upper one showing the signs of the zodiac, and the lower, figures illustrative of the labours of the months. The Pyecombe bowl dates about 1300, and marks the dawn of Gothic in the trefoil heads of the upper band of arcading. The Brundall bowl is the only one left in Norfolk, and is the only one that bears an image of the Crucifixion.

Rain-water heads are comparatively modern things. There is no historical evidence to anything of the kind earlier than 1241. The conservativeness of plumbers is often strikingly illustrated in the forms employed. Leadwork is frequently fifty years or more behind the stone-carving and plasterwork, so far as its design is concerned. The craftsmen were contented to follow the lines that their fathers had followed before them. Some of the wonderful interesting work at Haddon Hall is strongly mediæval, although the earliest there goes no further back than about 1580. This house epitomises the development of rain-water heads for over a century. The forty-seven at Knole Park, Sevenoaks, on the other hand, all date between 1604 and 1607. The twenty-nine different types not only touch the highest point of dcorative charm, but reach the limit of dexterous treatment. At Hatfield House there is a fine series of heads ranging from 1610. Several are very large, and two of the largest fit round the angles of the building and rest on the stone cornice, which is pierced so as to take the down-pipe. At the Abbot's Hospital, Guildford, there is a series of fourteen pipe-heads and pipes dating from 1627 to 1629. At St. John's College, Oxford, are four magnificent heads dating from 1630, which are conspicuous for their elaborate painting and gilding. They were recently restored by Mr. F. W. Troup from the traces left of the old colour.

The decorative problem of a rain-water cistern was not materially different from that of a font, but was quite unlike that of a pipe-head. At St. Fagan's Castle, Cardiff, is the earliest dated cistern. It stands 44 inches high, and is 20 feet in circumference. On the exterior there is a double row of arcaded panels, thirty out of the thirty-two being cast from the same pattern. It probably dates from 1620. The cisterns made in Devonshire and Somerset, in the late seventeenth and early eighteenth centuries, show a vigour which is absent from the London work of the same period. They were probably the work of the same plumber; they were certainly cast from the same or duplicate patterns. A typical London example is at the Record Office in Chancery Lane, near the doorway of the Rolls Chapel. London plumbers dotted the faces of their cisterns with shells and stars and stiff little goddesses. One of the most elaborate in England is at Lincoln's Inn. At Charlton House, Kent, there is an octagonal cistern placed on a lawn and effectively used as the base of a fountain.

Lead, said the lecturer, seemed the material *par excellence* for garden ornaments. But it was obvious that lead was not suitable for figures which required to be stayed with iron rods in consequence of not standing well over their bases. This disability was seen in equestrian figures and many others. For portrait statues it had the great recommendation of cheapness. The most satisfactory example extant of this class of work was that of Sir John Cass, made by Roubilliac in 1751; it now stands in the new Cass Foundation Institute, in Jewry Street, E.C. The oldest portrait bust in England is that of the great Lord Fairfax: it is now in the Council Chamber of the York Philosophic Society.

In nothing, declared Mr. Weaver, does lead take such a high place as in connection with spires—those symbols of Christian aspiration. The finest remaining spire, and the only one that has come to us without being restored, is at Long Sutton. Like many others, it was rendered conspicuously beautiful by the delightful texture of its surface, which has acquired with age a kind of white patina, such as could never be seen on stonework.

For the twenty-eight towers crowned with either spire or lantern by Wren, leaded timber was employed for nineteen and stone for only nine. His design for the top of the tower of St. Swithin's, in Cannon Street, is especially curious for the scooped-out splays at the junction of the tower and the octagonal spire. Other interesting examples of his great work in this direction are St. Martin's, Ludgate Hill; St. Augustine's, Watling Street; St. Margaret's, Lothbury; St. Edmund's, Lombard Street, and the lantern of St. Benet's, Paul's Wharf.

In the old days timber was used in the construction of towers because there was nothing else to use. Since then scientific progress has been made, and everywhere steel construction has been introduced. But there seems to be an almost universal feeling of shame in its use, and a desire for its concealment as far as possible. If the mediæval architect had had that material there is little doubt that we should have now leaded steel spires—*i.e.*, spires made up of steel ribs and lead filling. The last slide shown by Mr. Weaver was a leaded steel tower, designed by Sir Charles Nicholson, to illustrate the effect of such a combination.

## VARIETIES.

A second service reservoir is to be constructed by the Aberystwyth Town Council at a probable cost of 8,000*l*.

The work of completing St. Augustine's Church, Derby, by the building of a chancel, a vestry, and crypts, is to be proceeded with at once, at a cost of 3,700*l*.

The Princess Alice Hospital at Eastbourne is to be enlarged. It is estimated that about 3,500*l*. will be required for this purpose.

It has been decided after considerable delay to proceed with the Free Library and Art Gallery at Blackpool, which will cost about 18,000*l*.

Mr. Kitchen, architect to the Local Government Board, has prepared an official report emphatically condemning the workhouse infirmary at Bangor. He advises that a new infirmary should be erected on another site.

The Penrith Rural District Council have adopted a scheme prepared by Mr. J. Graham, Carlisle, for the water supply of their western district. It comprises two small reservoirs in Greystoke Park, and the cost is estimated at 20,000*l*.

Messrs. Siemens Bros., Ltd., have under consideration the desirability of making an important addition to their dynamo works in Stafford, which will provide employment for several hundred more workpeople. Plans have been prepared for a new section, which will comprise workshops and foundries.

Edinburgh School Board have instructed their architect to prepare plans for a new school on ground purchased from the city at M'Leod Street, off Gorgie Road, for 5,700*l*. The school, in which accommodation will be provided for about 1,200 pupils of twelve years of age or over, will cost, it is estimated, from 15,000*l*. to 20,000*l*.

Mr. B. T. Batsford will publish early in March a volume entitled "The Manor Houses of England," by the Rev. P. H. Ditchfield, M.A., F.S.A., and illustrated by Mr. Sydney R. Jones. It is intended to form a companion to the "Charm of the English Village," by the same authors, published two years ago. The book illustrates and describes in a popular manner the best typical examples of manor houses, many little known, and all the exterior and interior details which combine to give them lasting interest and attraction.

Mr. Fred. W. Albury, architect, Reading, has admitted into partnership Mr. H. Whiteman Rising, F.R.I.B.A., of Norfolk Street, W.C., and also Mr. E. P. Morgan, who has been in his office for the past twenty-five years. In future all communications should be addressed to Albury, Rising & Morgan, 154 Friar Street, Reading, or to the London Office, Oswaldestre House, Norfolk Street, Strand, W.C

Improved Service to the South of Germany and Trieste.—On and from May 1 the service *viâ* Harwich and the Hook of Holland will be greatly accelerated. Passengers, for instance, for Wiesbaden, Heidelberg, Stuttgart and Munich will arrive much earlier than hitherto, and through carriages will be run to these towns amongst others. Passengers for Trieste will be due to arrive at Munich 10.21 p.m., which will enable them to leave the same evening for Trieste, arriving there the following morning. In the direction to England the services from the towns above-mentioned will also be improved.

At last week's meeting of the Coventry Education Committee progress was made with the scheme for erection of a Council school in Centaur Road, Earlsdon. The buildings are to accommodate 1,200 children, and the cost is not to exceed 17,000*l*. Provision was also made for the enlargement of Stoke Council School, so as to afford accommodation for 1,200 children. Instructions were given to invite tenders for erection of a new school in Mile Lane, and the tender of Mr. A. J. Lord, of Wolston, to carry out the enlargement of Radford School at a cost of 3,930*l*. was accepted.

A faculty for carrying out a scheme for the extension of the Dudley parish church, at an estimated cost of 8,397*l*., has been issued. The chief works proposed are as follows:—To take down the eastern end, and extend the church eastward by the erection of a chancel, with north and east aisles and vestries, with an organ chamber over the latter; build a memorial chapel to seat seventy on the north side; construct a crypt to accommodate 200 underneath the chancel. The plans have been prepared by Messrs. Chatwin & Sons, architects, Birmingham.

The Tyne Improvement Commissioners are about to appoint a chief engineer over their various pier, river, and dock works, in succession to the late Mr. James Walker, M.I.C.E. Applications from candidates will be received up to March 3. The engineer will be responsible for the designing and execution of all the engineering works of the Commissioners. He will devote himself exclusively to the service of the Commissioners, and reside in the district. The salary is 1,500*l*. per annum. No application will be considered from any candidate over fifty years of age. Each candidate must state whether or not he is a practical diver.

The Building Acts committee of the London County Council desire that, to secure prompt action with regard to applications under section 22 (34) of the London County Council (General Powers) Act, 1909, the Council should delegate to them its authority under that sub-section, by which the Council is empowered to waive or modify certain of the requirements contained in the section as to the erection of buildings of iron or steel skeleton construction, the object of the sub-section being to facilitate the erection of such buildings. It is recommended "That paragraph 3 of the reference to the Building Acts committee be amended by the insertion after the words 'London Building Acts Amendment Act, 1905,' of the words 'and section 22 (34) of the London County Council (General Powers) Act, 1909.'"

A quarterly general meeting of the Glasgow Institute of Architects was held last week in the secretary's chambers, 115 St. Vincent Street, Mr. George Bell, F.R.I.B.A., president, in the chair. Reference was made to the death of Mr. Alexander Petrie, who had been a member of the Institute since 1874, had held the office of treasurer from 1890 till 1898, and had been vice-president from 1898 till 1902. The recommendation that the Council should take steps towards the better regulation of competitions promoted within its province, which was remitted to the Council by an extraordinary meeting of the Institute, had been held over meantime in view of the action of the Royal Institute in regard to the matter. A suggestion by the Glasgow Master Brickmakers' Association that there should be a uniform thickness of brick in the trade had been considered, and the suggested standard thickness of three inches had been approved of. The Council had under consideration the conditions of the competitions promoted by the Kyles of Bute Hydropathic Company and the Dumbarton School Board, and representations were made regarding amendment of the conditions in both cases. It had been arranged to hold an exhibition of designs submitted by Glasgow architects in the competition for the National Museum of Wales.

The East and West Molesey Urban District Council met for the purpose of again considering the acceptance of a tender for the erection of an isolation hospital. At a previous meeting in committee it was felt that the tender of Mr. E. Potterton, a local builder, should be accepted, but as this was not the lowest it was decided to approach the Local Government Board on the subject. The report of the Isolation Hospital Committee recommended the acceptance of the tender of Messrs. J. Appleby & Sons, of Southwark Park, S.E., whose figure was 3,336*l*. The Clerk reported that, as instructed, he had seen one of the assistant secretaries of the Local Government Board and explained why the Council wished to give the contract to Mr. Potterton. The assistant secretary, however, advised that they should accept the lowest tender, as acting in the way suggested was open to jobbery and malpractices. He also pointed out that, if the Council did not accept the lowest tender, people outside would not tender in the future, and the Council would be left in the hands of the local builder. He promised to give a written answer if Mr. Cann, the Clerk, stated the case in a letter. Mr. Cann read the letter he sent, from which it appeared that, after the committee had decided to recommend the acceptance of Messrs. Appleby's tender, Mr. Potterton obtained particulars of the tenders, and undertook, if his tender could be accepted, to reduce his price by 200*l*. He also promised to put the local unemployed on the work. Mr. Cann pointed out that there was a great deal of unemployment in the district. In the reply of the Local Government Board occurred the following sentence:—"I am to state that if, on the grounds mentioned in your letter alone, the District Council were to accept a tender other than the lowest, the Board would not be prepared to sanction a loan in excess of the lowest tender." The report of the committee was eventually adopted, and it was decided to apply for a loan of 3,248*l*. 4*s*. 10*d*.

## NOTICE TO ADVERTISERS.

**Under no circumstances whatever can the Proprietors of this journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.**

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

## TENDERS, ETC.

⁂ *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

## COMPETITIONS OPEN.

BLYTH.—March 12.—The Governors of the Blyth Secondary school invite architects with offices in Northumberland, Durham, or Newcastle-upon-Tyne, to submit plans for a secondary school to accommodate 280 pupils, and caretaker's house. The assessor appointed is Mr. J. A. Gotch, F.R.I.B.A., F.S.A. Mr. Thomas R. Guthrie, Clerk to the Governors, Blyth.

SCOTLAND.—March 21.—The Renfrew Parish Council invite plans and estimates for offices to be erected at Blawarthill, Yorker Road, near Scotstoun West Station. Deposit 10*s*. No premium. The Clerk to the Council, 1 Manse Street, Renfrew.

SHEFFIELD.—March 31.—The Endcliffe Park Church authorities desire plans for church for 650, institute for 150, primary department for 125, junior department for 95, and caretaker's apartments. Premium, not merged in commission, 35*l*. Assessor, Mr. Chas. Hadfield, F.R.I.B.A. Deposit 5*s*. Will be returned to those who send plans to Mr. J. W. Nicholls, secretary, 64 Everton Road, Brocco Bank, Sheffield.

WALSALL.—Designs are invited for the erection of a public elementary school (mixed) to accommodate 500 children at Bloxwich. Conditions of competition and plan of site from Mr. W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.

THE Town Council of Stirling have declined the offer of a colliery firm to work a trial lease of the coal underneath the town's lands at Winchelhaugh and the Raploch village, to the west of the town. One of the reasons for the refusal is that the famous view from Stirling Castle would be destroyed by the presence of a coal pit in the immediate foreground.

## LONDON.

For the execution of the roadwork and platelaying, exclusive of the supply of rails and special trackwork, in connection with the construction, on the underground conduit system of electric traction, of the authorised tramways from (1) Streatham *viâ* Mitcham Lane and Southcroft Road, to Tooting Junction; and (2) Garratt Lane, *viâ* Wimbledon Road, to the county boundary. The tenders also contain provision for paving works outside the tramway tracks in connection with widenings of Mitcham Lane and Southcroft Road.

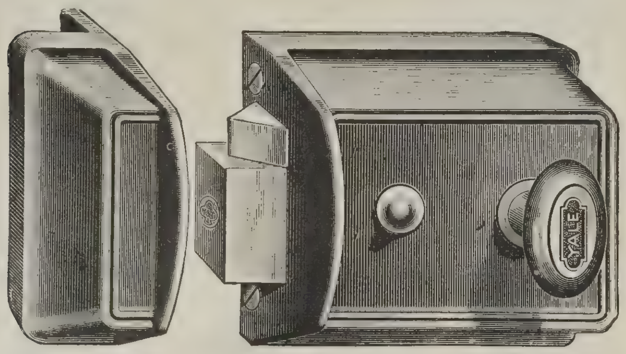
| J. & T. Biscomb & Sons (*accepted*) | 977 | 10 | 0 |

## TRADE NOTE.

The Yale and Towne Company, 6 City Road, Finsbury Square, E.C., are placing on the market an important addition to their rim locks in the "Yale Ninety" Automatic Night Dead Lock, here illustrated. It is a well built rim construction with a heavy solid dead bolt that springs locked when desired, and can be unlocked from the outside by its key, and from inside by a knob. When the bolt is unlocked, either by the key or knob, the dead bolt and trigger are both withdrawn and held back. When the stop is pushed down the trigger is released and thrown out, the main bolt still being held retracted. When the door is closed the trigger impinges against the strike, releasing the main bolt and deadlocking it. If the holder of the key wants to go away, the person left on the premises only has to push the little button down. When the door closes the bolt springs firmly forward, solidly deadlocking the door. The iron case is 3½ by 3 by 1¼ inches. Three keys go with each lock. The lock is adapted for use on doors ⅞-inch to 2½ inches thick, and is reversible for doors of either hand, opening in or out. It can be furnished master-keyed if desired. In the Ninety-one Lock the button on the inside of the case is used merely to hold back the trigger bolt, as in a regular night latch.



Messrs. William Henman & Thomas Cooper, architects and surveyors, Birmingham, have dissolved partnership by mutual consent. The business will be continued by Mr. W. Henman under his own name.

Mr. C. S. Errington, A.R.I.B.A., architect, Newcastle-on-Tyne, is preparing the quantities for a hospital to be erected in the grounds of the Northern Counties Institution for the Deaf and Dumb, on the Moor Edge, Newcastle. The new hospital will be two storeys in height and contain four wards, with accommodation for sixteen beds.

The Secretary for Scotland has been in communication with the Treasury in regard to the addition of certain officers to the staff of the Local Government Board for Scotland, with the view more especially of securing an efficient administration of the Housing and Town Planning Act passed by Parliament at the end of last year. It is proposed to appoint an engineering inspector, who will specially concern himself with the town planning work, and will have as assistant another inspector with special architectural qualifications.

## VARIETIES.

The plant at the municipal gasworks in Doncaster is to be extended at once. A power stoking and generating plant will be installed at a cost of 2,500*l*.

The Rural District Council of Malmesbury have instructed Mr. T. J. Moss-Flower, C.E., of 28 Victoria Street, Westminster, S.W., and Carlton Chambers, Bristol, to prepare a scheme of water supply for the district of Hullavington.

The Belgian Consul at Alexandria reports that the municipal authorities of that town have decided to erect a large theatre. It appears that financial negotiations regarding the scheme are now proceeding. The cost of construction is estimated at not less than 60,000*l*.

Negotiations are proceeding for the purchase of a large site in one of the main streets of Maidstone for a new building, which will combine a theatre and picture palace, an ice skating rink, a roof garden and tea rooms, and which will be furnished with a hydraulic lift for passengers.

The Earl of Ellesmere has given permission to the Eccles Corporation to remove the portion of an old stone cross built into the wall of an outbuilding behind Moat Grange Farm, Peel Green, Barton. It is proposed to place it on the vacant land adjoining the Carnegie Library in Church Street, Eccles.

The Society for the Protection of Ancient Buildings have addressed a letter to the Archbishop on the subject of St. Helen's Church, York, hoping that it may not be allowed to become a ruin or be pulled down, and pointing out that it would be less of a desecration to find some secular use for the building than to destroy it.

The opening ceremony of the Spurgeon Memorial Church, Thornton Heath, took place on February 22. The building is of Late Gothic design, with red brick facings and Bath stone dressings. The contractors are Messrs. Battley, Sons & Holness, 21 Old Kent Road, S.E., and the amount of contract 3,215*l*. The architects are Messrs. George Baines & Son, 5 Clement's Inn, Strand, London.

The Durham County education committee recently wrote to the Stanley District education committee stating that in twenty-one departments in the area the number of children on the books was equal to, or exceeded, the accommodation. The Council recommended that the following works be carried out, at an estimated cost of 37,335*l*.:—New school for 400 boys at Collierley, 5,725*l*.; remodelling of present schools at Collierley for 400 girls and 400 infants, and provision of cookery room, 2,000*l*.; new school for 900 scholars at Catchgate, 11,750*l*.; new school for 600 scholars at Annfield Plain, 8,540*l*.; new infants' school for 220 at Oxhill, 1,500*l*.; new school for 400 girls at West Stanley (exclusive of site), 5,000*l*. The district committee has decided that the suggestions in regard to Collierley schools be carried out; that new schools be erected at New Kyo; and that sites for new schools should be purchased at Catchgate and Shield Row. The other proposals were left over.

The Troon Dean of Guild Court on Monday approved plans for a Roman Catholic church to be erected in St. Meddans Street, Troon, N.B. The church, which is in the Scotch Gothic style—grey stone being used—of the fifteenth century, is designed to seat about 500, and consists of a nave 26 feet wide, with aisles. The slate roof is of open timber work. At the north end is a tower 35 feet square on plan and rising to a height of about 52 feet. On the south is the chancel flanked by two transepts and terminating in a five-sided apse. The total length of the church is about 120 feet, and the width 45 feet. A presbytery and sacristies are also to be built on the site.

The Devon and Exeter Architectural Society held their annual meeting recently. The following members constitute the officers and council for the ensuing year, viz., Mr. W. H. May, M.S.A., president (Plymouth); Mr. Charles Cole, M.S.A., vice-president (Exeter); Messrs. M. A. Bazeley (Plymouth), J. Crocker, F.R.I.B.A., John M. Pinn, T. A. Andrews, J. A. Lucas, A.R.I.B.A., O. Ralling (Exeter), C. Cheverton, M.S.A. (Devonport), J. S. Southcombe (Barnstaple), Mr. S. Dobell, hon. treasurer (Exeter), and Mr. Allan Pinn, A.R.I.B.A., hon. secretary (Exeter).

The timber industry of Queensland is advancing, though the export trade is at present only small. Last year there were 175 saw mills working, in connection with which there was invested capital to the amount of 360,181*l*., and 2,960 hands were employed. Soft woods were cut to the quantity of 64,696,990 feet, cedar 1,125,866 feet, and hardwood 34,936,160 feet, the total value reaching 665,750*l*. These figures, in comparison with those of the previous year, showed an increase of twenty saw mills, of wood cuts 9,006,900 feet, and the value 87,513*l*. The revenue from royalties and licenses also proportionately increased. At various exhibitions the variety, beauty and usefulness of the Queensland woods have been acknowledged, and now that more attention is being given to the industry by the Lands Department a big export trade is only a question of time.

A well-attended meeting of members of the Bristol Society of Architects was held at the Fine Arts Academy last week. The chair was occupied by Mr. Mowbray A. Green, F.R.I.B.A., President of the Society. A paper was read by Mr. John Markham, A.R.I.B.A., on "The Architectural Treatment of Reinforced Concrete." The lecture was mostly devoted to the question of the main structural lines and forms which this comparatively new building material may be likely to assume. Among other points dealt with were the nature and properties of the materials used, viz. concrete and metal; the result and value of a scientific combination of these components; question of corrosion of the reinforcements; methods of securing adhesion between the metal and the concrete; fire resisting qualities; "internal" design of beams, columns and walls; absolute lack of precedent in design; decorative treatment and finish and future scope for this method of building. A large number of diagrams and lantern views in illustration of the subject was shown.

A number of local men have purchased the ancient buildings in Hexham known as the Moot hall and the Abbey Gate, and their sites. The buildings were conveyed to the trustees in the following terms:—"Upon trust at all times hereafter to maintain and preserve as historical monuments and protect from decay or injury the ancient buildings hereby conveyed without any alteration of the original architectural features or character thereof, and permit the said building known as the Moot Hall to be used only as a museum or library or other public institution, or for some other purpose consistent with and conducive to the maintenance and preservation thereof as an historical monument, and for protection thereof from decay or injury." They have also purchased the property in the Market Place, which has been built against and in front of the Moot Hall with a view to its removal at some future date, so that the Moot Hall may be seen in its true proportions. An appeal is to be made for financial aid

The President of the Board of Education has appointed a Departmental Committee to inquire and report whether the cost of buildings for public elementary schools can properly, and with due regard to their suitability and durability be reduced by the use of materials or methods of construction, different from those ordinarily employed at present, and if so, what steps should be taken to facilitate the adoption of such materials or methods, and whether any alteration in law is required for the purpose. Mr. Runciman has been greatly impressed with the great cost of erecting school buildings in accordance with modern standards of suitability and convenience. He desires to offer every encouragement to local education authorities and other bodies and persons to submit proposals calculated to reduce the inevitable expenditure on these objects. Plans of modern schools are determined by educational and hygienic conditions and do not admit of modifications which would greatly reduce the cost, nor can much be done by eliminating unnecessary and extravagant features. It appears to the President possible that by the adoption of new methods of construction and new materials substantial reduction might be effected, at all events, in some localities. The committee is composed of Mr. L. A. Selby Bigge, Principal Secretary Elementary Branch Board of Education, chairman; Mr. N. T. Kershaw, Assistant Secretary Local Government Board; Mr. F. Clay, Architect of the Board of Education, with Mr. J. G. Milne, senior examiner of the Board, secretary. The committee will sit and receive evidence immediately, with a view to reporting as soon as possible.

The Board of Education have been in communication with the Hull Education Committee on the subject of altering the plans by Messrs. Crouch, Butler & Savage, of Birmingham, for the proposed Training College, which were recently selected in a competition under the assessorship of Mr. J. W. Simpson, F.R.I.B.A. In a letter the Board state that the most important departure from established usage consists in providing a common refectory, kitchen, and quarters for servants of both hostels in a separate block of buildings. This arrangement, though *primâ facie* economical, appears to them to be exposed to some grave objections. The use of a single dining-room for all meals by students of both sexes will, certainly, necessitate an undesirable strictness of supervision; the organisation of the domestic staff presents difficulties, the only possible expedient appearing to the Board to be the appointment of a lady superintendent to supervise the whole of the domestic staff, who would require good pay and accommodation; and, thirdly, the distance of the kitchen and servants' quarters from the hostel will be found productive of constant inconvenience. Although the plans might be amended, the Board feel grave doubt as to sanctioning a plan and organisation which are, to say the least, quite untried. Messrs. Crouch, Butler & Savage, of Birmingham, were communicated with, and in their letter they state that should the committee decide to adopt the Board's suggestion they would advise a rearrangement. They point out, however, that the "collegiate" atmosphere desired by the Board, added to the alterations definitely suggested, is likely to entail additional expenditure. But the Board find 75 per cent. of the cost, and it is for the committee to consider whether it is advisable to adopt the Board's suggestions. The Education Committee recommended that the architects be instructed to proceed at once to get out rough sketch plans to conform to the requirements of the Board of Education, and submit them to the sub-committee at as early a date as possible.

A demonstration of the Kearney High-speed Railway took place at the Crystal Palace on Wednesday, the 2nd inst., when Mr. E. W. Chalmers Kearney explained to a party of visitors the advantages of his single-tube system, which it is suggested should be adopted on the proposed Strand and Crystal Palace Railway, and elsewhere. A model railway 200 feet in length has been constructed in the south-western gallery at the Crystal Palace, and this was shown in operation with model cars on a scale of ¾ inch to the foot, with automatic switches and signals complete. The method of working trains in both directions through one tube was shown, together with the arrangement for combining the convenience of a station where lifts are not required, with the advantages of an underground method of transit, which is attracting considerable attention.

Shakespearean discoveries of exceptional importance are made public in the March number of *Harper's Magazine.* The new facts are derived from over a score of hitherto unknown documents which have been found after long and systematic research in this country by Professor Charles William Wallace.

## COMPETITION.

Belfast.—The Senate of the Queen's University at Belfast decided on Saturday to organise a competition open to architects in the United Kingdom for the following new buildings:—(*a*) A new science block for the accommodation of the departments of physics, botany, zoology, and geology, 22,500*l.*; (*b*) an extension of the existing medical buildings, 8,500*l.*; (*c*) an extension of Students' Union buildings, 3,000*l.* Sir Aston Webb, R.A., F.R.I.B.A., will act as assessor. The author of the design placed first will be appointed architect, and premiums of 150*l.* and 100*l.* will be awarded to the second and third designs.

## NEW CATALOGUES.

Expanded metal, as manufactured by the Expanded Metal Co., Ltd., York Street, S.W., has been in general use since about 1890; consequently it is not surprising to find that the company have brought out six editions of their pamphlet No. 1. This is entitled "Expanded Metal Lathings for Plaster Work," and it deals with the widely differing applications of the material in an instructive fashion. The range is extensive, both geographically and structurally. The first illustration is a photograph taken after the San Francisco fire and earthquake of 1906, showing the "Kohl" building standing, apparently uninjured, amidst a sea of ruins, while the last page gives detail drawings of light-framed office bungalows at Port Talbot Docks. The behaviour of expanded metal in the San Francisco disaster led Capt. J. S. Sewell, in a report to the U.S.A. Government, to recommend its use as a protective covering for metal. Amongst the numerous large buildings in which it has been employed in this country are the new Public Offices, Westminster; College of Science, South Kensington; Royal Naval College, Dartmouth; Hearts of Oak Buildings, London; Armstrong College, Newcastle-on-Tyne; North British Hotel, Edinburgh. This pamphlet, however, is much more than a series of views of buildings where the material has been introduced for plaster work; it goes into the many uses of expanded metal and gives full and lucid explanations aided by detail drawings.

## NEW TOWN HALL, PERTH, WEST AUSTRALIA.

THIS design received first prize in the competition. The authors are Messrs. Grainger & Little, of 150 Queen Street, Melbourne, Australia, who were also the successful competitors for the works, now nearing completion, in connection with the administrative block of the Melbourne town hall.

The new town hall at Perth comprises a main hall, 140 feet by 75 feet by 50 feet high, with balconies, galleries, chorus and organ accommodation, and in connection therewith is a supper room, 80 feet by 80 feet, and cloak rooms.

The main entrances are from Barrack Street and Hay Street. The Council administrative offices, Council chamber and suites for the mayor and councillors are also provided. The official departments are all on the main ground floor.

The elevations are treated in Italian Renaissance, and will be carried out generally either in Donnybrook freestone or cement. The cost will be 45,000*l*.

MESSRS. JOHN DICKINSON & CO. (BOLTON), LTD., have prepared a short pamphlet under the title of "Notes and Comments concerning Natural Rock Asphalte." The firm have for many years made a speciality of contracts in Limmer, Seyssel and other leading brands, and are in a position to speak with authority. The subject is treated in a more or less general manner, and is illustrated by about half a dozen photographs of buildings where the concrete and rock asphalte work has been executed by the firm. Messrs. J. Dickinson are willing to send copies of the booklet on application.

THE revised catalogue of Messrs. G. Woolliscroft & Son, Ltd., contains thirty sheets showing in colour a large number of new designs for tiling, mosaic, and other work. A paragraph in the introduction emphasises the desirability of having the fixing carried out by Messrs. Woolliscroft's own experienced men, as "nothing but disaster results from engaging incompetent workmen." The advice is excellent, for it is a common experience to find tiling badly fixed. The designs selected are for many different tastes and purposes, and whereas some show a delightful restraint, others have florid patterns. It is always open to an architect to order his own designs. Accompanying the catalogue is a price list pamphlet for 1910.

MESSRS. RICHARD JOHNSON, CLAPHAM & MORRIS, LTD., have issued a new catalogue of their reinforced or monolithic brickwork (Brown's Patents, 1906). In our issue of January 28 we gave an account of some tests carried out on a plain and a reinforced brick pier at the Municipal Technical School in Manchester, which afforded a striking testimony to the additional strength obtained by using their patent steel wire mesh as a reinforcement. The catalogue includes this and other tests, which all afforded most satisfactory results, as well as examples of net cost, suggestions as to the use of the mesh, photographs and diagrams.

THE catalogue for 1910 issued by Messrs. Winsor & Newton, Ltd., carries with it an impression of dignity and permanence that well becomes a firm who for the past seventy years have been building up a reputation that is second to none. When in 1832 Messrs. Winsor & Newton first sought appreciation and patronage as artists' colourmen (or rather as actual manufacturers of their own colours), the colours at the disposal of a painter were fewer and much poorer than they are to-day. A revolution was gradually brought about by their application of chemistry, where before rule-of-thumb sufficed; and in 1844 the firm established their still existing North London Colour Works in Kentish Town. The first public honour came in 1851, when they received the only medal awarded for artists' colours at the Great Exhibition. Since then many other distinctions have come to them; but none are of equal value to the continuous approval their products have won from a succession of users. To their business of royal artists' colourmen has been added that of drawing paper stationers, artists' brushmakers and fine art publishers. The catalogue gives illustrations and prices of mathematical instruments, easels, inks, mounting and other boards, together with many other etceteras that make up the necessities and luxuries of an artist's life. This latest list runs to over 350 pages, and is both well bound and well printed.

## TESTING OF PORTLAND CEMENT.*

IN regard to the testing of Portland cement I think I am right in saying that of all the materials of construction subject to a system of testing, Portland cement is probably the most dependent on the judgment and skill of the tester, and with all the well-equipped laboratories and apparatus it is still impossible to remove the most important factor of personal equation. In order to obtain the knowledge usually sought for as to the qualities of cements to be used, it is first necessary that the samples which are taken for investigation should represent the whole quantity of the bulk. Therefore as soon as the cement has been bulked, either at the manufacturers' works or on the works in connection with which the material is to be used, samples are generally taken from each parcel of cement, and are so distributed as to give as far as possible a fair average sample of the whole parcel. When all these samples are mixed together the sample for testing can be taken therefrom, and the material is generally tested in accordance with the terms of the British Standard Specification. Now the requirements of this specification arrange that the cement shall be tested:—(1) For fineness of grinding; (2) for specific gravity; (3) for chemical composition; (4) for neat tensile tests; (5) for sand tests; (6) for setting time; and (7) for soundness.

Personally I would revise the order in which these tests stand in examining a parcel of cement, and I think that it would be preferable to take each test as it would naturally occur in practice, namely:—

The first inquiry the cement user makes as to the quality of the material under notice takes the form of a test for fineness; thus in passing through the manufacturer's stores, or when the first bag is opened on the contractor's works, the cement is mechanically and half-unconsciously passed through the fingers in order to ascertain the fineness. The coarse particles in a cement can thus be readily perceived, and the practised tester is in this way able to gauge approximately the residue present in the sample.

For the past three or four years there has been a growing desire on the part of engineers for a much finer cement, and it may be said that the principle of fine grinding is now in the ascendency—an improvement in the manufacture greatly in favour of the consumer both as regards economy in use and reliability in result. Too much attention cannot be paid to fineness of grinding, for the finer the cement the more intimately can it be incorporated with the aggregate used for the concrete, and therefore the stronger will be the work.

The test for fineness, therefore, derives importance from the fact that, other qualities being equal, fine cement has a much greater sand or aggregate carrying capacity than coarse cement has; that is, it will show an increased strength with the same charge of sand, or equal strength with a greater charge.

Now, Portland cement as delivered by the manufacturer consists of a mixture of coarse and fine particles, respectively known as "residue" and "flour." The residue is the coarsely-ground clinker left on the fine sieves which are used for testing, and the value of the flour in a cement is that the very fine particles are believed to contain principally, if not wholly, the cementitious property of the material. Residue is practically inert, or even possibly so much adulteration, and it is found to be a cement that is generally the hardest and the best burned materials that have not been reduced in the process of grinding, and therefore only sufficiently fine for the water added in use to attack the surface of the particles, the interior of which remains inactive. If this residue were reduced to flour, it would be found to be a good quality cement showing high tensile strength. Therefore a sample of cement as delivered to the consumer, if divided into residue and flour, will show that on a sieve having 180 by 180 meshes per square inch, the residue will be about 18 per cent. and the fine grit and flour about 82 per cent.

In extracting the flour from the material which passes through the sieve by means of light air-pressure, we see that the average cement contains from 50 to 60 per cent. of flour, the balance being a very fine grit that has passed through the meshes of the sieve.

Portland cement, therefore, when delivered on to the work is first tested for fineness of grinding, and only a few years ago the usual fineness called for in cement was about 10 per cent. residue on a 50 by 50 mesh sieve—*i.e.*, a sieve having 2,500 holes to the square inch; but to-day the fineness is more likely to be as follows:—

| | | |
|---|---|---|
| No residue ... ... | 50 by 50 | mesh sieve. |
| Trace sieve ... ... | 76 by 76 | ,, ,, |
| 5 per cent. sieve ... | 100 by 100 | ,, ,, |
| 14 per cent. sieve ... | 180 by 180 | ,, ,, |

In carrying out the test it is generally arranged that 100 grams of cement, approximately about 4 ozs., shall be continually sifted for a period of fifteen minutes, and the results should be as I now here describe.

A cement that passes this test can be considered a thoroughly first-class quality product in every respect, provided, of course, the further tests of the cement are satisfactory. The next test that would be carried out in gauging the quality of cement is probably that of the setting times. When Portland cement is mixed with water a plastic paste is formed which ultimately hardens into a stonelike substance, and according to the activity shown in this transition from a paste to a thoroughly hard mass, so is the material found to be of a quick or slow-setting nature.

It is of importance that the cement user should be aware of the setting properties of the cement to be employed in constructional work, for unexpected results are apt to ensue from the omission of this test. It often happens that when a quick-setting material is inadvertently delivered on to the contractor's works, and is brought into use, the setting has commenced even before the wet mixing of the aggregate and cement is completed, with the result that this setting action, being unnoticed, is interfered with, and the material will not again set for some days, or at least until the moisture has thoroughly dried out of the mixture, and even then its cohesive value is often so greatly reduced as to render the cement practically valueless. This is a common occurrence in the use of cement, and may easily be avoided by a systematic testing of activity. Care, then, should first be taken to ascertain the setting time of the cement, and, next, that no greater bulk of mortar is mixed than can be used before the setting commences.

---

* Part of a paper by Mr. A. C. Davis, F.C.S., A.Inst.C.E. (Managing Director of the Saxon Portland Cement Company, Cambridge), entitled the "Manufacture, Testing, and Uses of Portland Cement," read last week before the L.C.C. School of Building, at Brixton.

Under no circumstances must a cement which has once been allowed to set be re-tempered or re-mixed for use, since from what has been said it will be seen that the material is thereby rendered worthless.

Cement manufacturers have it in their power to make either a quick or slow-setting cement, and, unless otherwise instructed, supply the latter, which takes thirty minutes and upwards to harden the surface of the test pat. A quick-setting cement commences to harden in a few minutes, and although perhaps equally strong in its tensile resistance and constructional value, yet a cement of this nature must be used with care. It is employed under water, in plaster work, and when working in cold weather. In all other cases it is most advantageous to use a slow-setting cement.

This is indeed indispensable when dealing with careless workmen not under supervision, who always prepare their mortar many hours ahead, and even sometimes drown it with excessive quantities of water.

Now the two setting-time tests at present in use are one for the commencement of the setting, called the initial set, and the other for the end, or final set, the time when a weighed needle makes no impression on the test pat.

The initial set of a cement is generally gauged from a small pat made with a minimum amount of water. The commencement of set is seen to occur when crystallisation of the cement starts by the drying of the pat and its assuming a certain amount of solidity.

The pat can be prepared by taking 100 grams of cement and in well mixing the same on a non-porous slab with 25 per cent. of water of a temperature of 58° to 64° F. The time employed in mixing this cement should not exceed forty seconds, and then the plastic mixture should be placed upon a glass or iron plate and shaken down to a thickness of ½ inch in the centre and a diameter of 4 inches.

The pat is then placed aside to allow the cement to set, and the initial setting time is plainly shown by a certain drying and a slight resistance to the point of a pencil.

The final set similarly has taken place when the cement will not take an impression by the weight of the standard needle. The final setting time of the cement, according to the British Standard Specification, shall not be less than two hours nor more than seven hours for slow-setting cement.

Then probably the next test carried out in the examination of cement will be the test for soundness, which includes testing for contraction and expansion.

The soundness tests are those which connect themselves definitely with some serious defect to which cements are subject, and this is of paramount importance. This test can be made with the most simple apparatus—if, indeed, any apparatus is required—is easy of manipulation, and its results are obtained immediately.

Numberless methods are in vogue for ascertaining the soundness of cements, and the inquiries more generally classified under this heading are those which have reference to constancy of volume, and to this end the accelerated or boiling tests are employed in order to ascertain the exemption of cement from undue expansion or contraction.

The accelerated tests most generally used are those of putting the pat or block of cement in steam and in hot and boiling water and examining the results after some hours. If the cement is sound the boiled pats will be quite perfect in shape, but if unsound the cement will crack and sometimes boil away to mud.

As to these tests for expansion it cannot be stated with any degree of certainty that results which may be obtained by the hot test are identical with those which may be experienced in actual construction work, but there is no doubt that if the cement is in the slightest degree unsound the hot test will at once detect and emphasise the weakness.

The expansion of cements under the accelerated test is generally caused by what is known as "free" or uncombined lime, and this is introduced into the product either by careless or unscientific mixing, or burning of the raw materials used in the manufacture, or by the incorporation of under-burnt clinker from the kilns.

If a cement is poorly manufactured, the aeration or atmospheric slaking, which is generally carried out upon construction works to-day, will eliminate to some extent what free lime may be present; but a properly manufactured cement will withstand the hot or boiling tests as soon as the material is taken from the grinding mills.

In the early days of cement manufacture most of the trouble of cement users was due to the expansion of the material through over-liming and other faults in the manufacture. This caused a swelling and ultimate disintegration after the work was in place.

To-day, however, cements which stand the accelerated tests by steam or boiling water should be used in preference to others, and moreover such tests should be constantly applied on the work of concrete construction, for although the hot tests sometimes reject suitable material, they will always reject material unsound by reason of the existence of active expansive elements.

To carry out a rough-and-ready soundness test, therefore, it is only necessary to take the pat of cement which has been used for the setting-time test and immerse the same in a saucepan of cold water. The water should then be brought slowly to a point of boiling, and the pat of cement kept under water for five or six hours. Under this test no warping or cracking at the edges should take place, and if the pat is perfectly sound after being under observation for the period mentioned it may be taken that the cement may be used in concrete work with every advantage.

This accelerated test is more efficient than another old-time device for the test of over-liming or expansive cements. This other arrangement was to mix a sample of the material with water to about the consistency of treacle, the whole being then poured into an ordinary bottle or small glass test-tube, which is shaken until full to overflowing and then placed aside in a cool place. If the cement is over-limed, or even if the proper grinding and amalgamation of the raw materials have not been properly carried out by the manufacturer, the cement will expand and split the glass sooner or later, according to the degree of the imperfection. If, on the other hand, the cement is under-limed (or over-clayed), it will contract and become loose in the receptacle.

In these bottle tests, however, care should be taken to keep the bottles or tubes in a cool place, or in an even temperature, for if placed in a warm atmosphere or near a fire, cracking will result through the different rates of expansion with glass and cement, even if the cement be perfectly sound. This cracking will occur on account of the normal expansive and contractive tendencies of cement caused by heat and cold.

I could enumerate many other tests for showing the soundness of cements, but since my time is short I will now only refer to the test of expansion in Portland cements as outlined by the British Standard Specification.

This is called the "Le Chatelier" test, and it consists of filling a small split cylinder of spring brass with cement, thus forming a mould 30 mm. internal diameter and 30 mm. high. On either side of the split in the metal mould are attached two indicators with pointed ends, and the distance from these ends to the centre of the cylinder is 165 mm.

In conducting this test for showing the soundness of cement, the mould is first put upon a small piece of glass and filled with cement gauged in the usual way, care being taken to keep the edges of the mould gently together while this operation is being performed. The mould is then covered with another glass plate, a small weight is to be immediately placed on this, and the mould is then to be placed in water at a temperature of 58° to 64° Fahr. and left there for twenty-four hours.

The distance separating the indicator points is then to be measured, and the mould placed in cold water, which is to be brought to boiling point in about thirty minutes, and kept boiling for six hours. After cooling, the distance between the points is again to be measured ; the difference between the two measurements representing the expansion of the cement, which must not exceed the limits laid down by the British Standard Specification.

These limits in the specification are that the cement when tested by the Le Chatelier method shall not in any case have a greater expansion than 10 mm. after twenty-four hours' aeration, and 5 mm. after 7 days' aeration.

Since, therefore, the manufacturer must keep in stock a considerable quantity of cement so as to supply his customers with a perfectly cool product fit for use, when received on the works, the cement should test not more than 5 mm. expansion.

Now included in the soundness test there is also a test for contraction. Contraction cracks in the test pat are often met with, but are rarely a sign of bad quality. They are perhaps more generally found to be due to faulty testing rather than to a deterrent quality in the nature of the cement. However, there is a test in existence which clearly shows the contraction of cements, and although this is not a test adopted by the British Standard Specification, it is a useful test to carry out.

The apparatus used in this method of testing the contraction of cements is a tapered mould of 3⅝ inches diameter, inside measurement, and 1½ inches high. This mould is filled with neat cement of a plastic consistency, and is left to dry off and set hard. If there is any contraction the cement block will be loose and will leave the mould, and if not the block will remain tight in the mould.

This description completes our tests for the soundness of the cement under investigation.

*Tensile Strength.*—Then the next test of importance is that of ascertaining the neat tensile strength of the cement and the sand tensile strength of the same period.

Strictly speaking it is not necessary to have both neat and sand tests in testing the strength of Portland cements, and preferably, the sand test alone should be used.

In the future only mortar mixtures in the proportions of one cement to three sand will be tolerated, and, moreover, I consider that these tests will not be reckoned entirely decisive, but compression tests on at least 3-inch cubes in the case of sand materials, and 6-inch cubes in the case of concrete, will be demanded for all purposes for which clear insight is desirable in the working of the material in actual construction. With the now increased demand for a finely ground cement, therefore, it is to be expected and, in fact, should be urged, that in place of neat tests an admixture of sand should be employed in estimating the value of the cement. In the neat tensile test the full value of the cement as a concreting material or as a cementing power never comes into play, and, granted that a finer cement is a more valuable product, a coarse sample will, in a neat test, give results as to tensile strength equal to those obtained by a fine cement. But, on the other hand, the difference between the constructive values of a coarse and a fine cement will be most noticeable in a test for tensile strength, carried out with a mixture of sand and cement in the proportion of three to one.

The value of sand in the place of neat tensile tests is more appreciated day by day, and this hardly requires an explanation since cement is rarely, if ever, used in a neat state, except by customers who have a wrong impression of its qualities. In a sand test we obtain information of a more practical value, and, therefore, on the former count the test of neat briquettes is deprecated.

Now in the British Standard Specification both sand tests and neat tests are called for. Testing briquettes are prepared by gauging the cement with a proper quantity of water into a smooth easy working paste. Then the cement gauged in this way is filled into moulds or frames as shown here. When this cement has set sufficiently to enable the mould to be moved without injury to the briquette, and which generally occurs after some twenty-four hours, the briquette is taken from the mould and put into a tank of water for a period of seven and twenty-eight days, &c. Generally a number of briquettes are made up in this way because it will be found that the test results of the briquettes are extremely variable, according to the method of preparation, and therefore the average of say six briquettes is taken to show the mean strength of the cement under test.

The briquettes are now tested in a tensile testing machine such as we have here. For breaking the briquette it is held in strong metal jaws in the machine, and the load is steadily and uniformly applied, starting from zero and increasing at the rate of 100 lbs. in twelve seconds in the case of neat cement briquettes. The cement which passes the British Standard Specification must show an average strength in seven days of 400 lbs. per square inch; in twenty-eight days of 500 lbs. per square inch; and in the case of sand tests the cement and sand briquettes shall bear tensile stresses of 150 lbs. after seven days from gauging, and 250 lbs. after twenty-eight days from gauging.

In making up a sand briquette, it is prepared from one part of cement to three parts by weight of dried standard sand, which is obtained from Leighton Buzzard. This sand must be thoroughly washed, dried, and passed through a sieve of 20 by 20 meshes to the square inch, and must be retained on a sieve of 30 by 30 meshes per square inch.

In all tests of neat and sand briquettes it should be borne in mind that the briquettes must be immersed in water until ready for test. This arrangement is made because it is considered that the test has more severity with the cement being in water than is the case if the briquettes were left to dry in the air.

Much care must always be exercised in preparing briquettes for the tensile strength tests, for it is quite an easy matter to show very poor results with a good cement if the tester is a novice in the preparing of briquettes. However, plenty of experience is gained by practice in this work, and I will not dwell upon this test any further.

The remaining tests outlined in the British Standard Specification are those for specific gravity and chemical composition. These two tests are generally referred to consulting chemists when required by the consumer, but they are rarely carried out.

The specific gravity test some years ago replaced the old-time test of weight per bushel, which has been rendered useless and made obsolete by the present fine grinding of cement. So long as all cements were coarsely ground and about the same degree of fineness, the requirement that the cement should weigh a specified number of pounds per striked bushel was found fairly satisfactory when made workable by uniform methods in carrying out the test. When a heavy cement was required by the consumer, a heavy weight was stipulated with the weight per bushel test, but as the demand for a finely ground cement increases, the weight of 112 to 120 lbs. per bushel, once easily attained, cannot now be reached, and the weight of a well-burned ordinary cement ground finely enough to pass through a 76 by 76 mesh sieve will be about 105 to 110 lbs.

The quality shown in checking the weight of cement is nowadays generally ascertained by calculating its specific gravity or the weight of cement as compared with the weight of an equal volume of water or other standard substance at the same pressure and temperature. This test is carried out with facility by one or other of the simple appliances which have been devised, and the results are immediately known.

It is not, however, a test of importance, nor a test easily applied, and since it is not a general test I will not now refer to its description in detail.

Portland cement possesses a very high specific gravity on which its value as a mortar is based. All other cements have a smaller specific weight, and therefore cannot form a mortar of equal density and resisting power. The specific gravity of Portland cement varies between 2.90 and 3.20.

Similarly, in regard to the chemical composition of cements, it may be said that this test will render valuable services in the detection of adulteration, and it is of use also in determining whether certain constituents believed to be harmful in cements, such as magnesia and sulphuric anhydride, are present in admissible proportions.

The chemical analysis of cements, therefore, if taken in conjunction with the mechanical and physical tests, affords much desirable information in the selection of a good quality material; indeed, it is almost necessary that both the chemical and mechanical examination of a cement should be made before the positive pronouncement of quality can be given, and when both have been ascertained the suitability and efficiency of a cement for any given purpose can be at once accurately determined.

Since, however, this work of the chemical analyses must be carried out by qualified chemists, and which is rarely called for, I will, therefore, also only give a passing reference to this test.

It might here also be mentioned, in conclusion, that in addition to testing cements by the chemical and physical tests according to well-known standards and theories, the average consumer generally tests the qualities of cement by practical results, preferring to watch the action of cement in work rather than rely upon the qualities as shown by the laboratory records. However, this "practical" test, be it said, is far more likely to give erratic results as to the qualities of cements, and with far more serious consequences, than any of the recognised theoretical tests above mentioned, for there are innumerable ways in which a perfectly satisfactory quality cement by faulty manipulation may be made to appear otherwise, and there are again many aggregates which destroy the otherwise sound qualities of many products of proved first-class quality.

This practical test is often the parting of the ways between manufacturer and consumer, and in addition to being extremely unscientific, the test is fair to neither the one nor the other; and in the event of unsatisfactory concrete work ensuing, two distinct and definite courses are adopted by the cement maker and the purchaser, the one stating that he is only responsible for the quality of his cement, and the other that he is not responsible for any faulty work carried out with the cement he purchases.

## COMPETITIONS OPEN.

Blyth.—March 12.—The Governors of the Blyth Secondary school invite architects with offices in Northumberland, Durham, or Newcastle-upon-Tyne, to submit plans for a secondary school to accommodate 280 pupils, and caretaker's house. The assessor appointed is Mr. J. A. Gotch, F.R.I.B.A., F.S.A. Mr. Thomas R. Guthrie, Clerk to the Governors, Blyth.

Liverpool.—The Corporation invite designs from architects practising in Liverpool for a branch library estimated to cost not more than 7,000*l*. Mr. W. E. Willink, F.R.I.B.A., will act as assessor. Apply to Mr. E. R. Pickmere, town clerk, Reference Library, William Brown Street, Liverpool.

Scotland.—March 21.—The Renfrew Parish Council invite plans and estimates for offices to be erected at Blawarthill, Yorker Road, near Scotstoun West Station. Deposit 10*s*. No premium. The Clerk to the Council, 1 Manse Street, Renfrew.

Sheffield.—March 31.—The Endcliffe Park Church authorities desire plans for church for 650, institute for 150, primary department for 125, junior department for 95, and caretaker's apartments. Premium, not merged in commission, 35*l*. Assessor, Mr. Chas. Hadfield, F.R.I.B.A. Deposit 5*s*. Will be returned to those who send plans to Mr. J. W. Nicholls, secretary, 64 Everton Road, Brocco Bank, Sheffield.

Walsall.—Designs are invited for the erection of a public elementary school (mixed) to accommodate 500 children at Bloxwich. Conditions of competition and plan of site from Mr. W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.

## COMPETITIONS.

DUMBARTON.—The School Board have received six sets of plans for the proposed academy and higher grade school at Braehead, N.B. Mr. S. Preston, master of works to the Govan Parish School Board, has been appointed assessor.

PORT BANNATYNE.—Mr. A. Balfour, F.R.I.B.A., I.A., has been successful in the competition organised by the Kyles of Bute Hydropathic Company for rebuilding their premises at Port Bannatyne which were recently destroyed by fire. The competition was limited to three Glasgow architects.

OLDHAM.—Messrs. Taylor & Simister have been awarded the first premium of 50*l*. offered by the Town Council to architects practising or residing within the borough for an extension of the town hall. The assessor was Mr. G. H. Willoughby, F.R.I.B.A., of Manchester. The designs will be on view at the town hall on March 12, 14, and 15.

WATERLOO.—The designs submitted in competition with twelve others by Messrs. George Baines & Son, 5 Clement's Inn, Strand, W.C., for the Liverpool Waterloo Baptist church and schools have been adopted, and the scheme is to be at once proceeded with. The estimated cost, exclusive of tower, is about 4,500*l*.

## CORRESPONDENCE.

### Re Arbitration where Party Walls are Interfered With.

SIR,—Will you kindly inform me through your columns, where building owner has an award agreed upon with the adjoining freeholder's surveyor, as to whether, if his building is let out as offices on lease or three years' agreement, say on all floors, each of his tenants can claim a separate award protecting himself as against adjoining owner, who is either pulling down said wall, or say building new chimney breasts against it, and raising or building new chimney shafts on roof, or whether each tenant must look to his landlord, i.e., the freeholder, for protection against damage done to his offices? In the text books I cannot find it clearly stated as to the law in the matter, as it seems to me this may mean immense expense and trouble to the building owner in the event of probably a dozen or more awards being necessary.—I am, yours truly,

STUDENT.

REPLY.—In the case you mention each tenant must look to his landlord for protection against damage done to the property tenanted. It is the landlord's duty to secure quiet enjoyment to his tenant.

THE Manchester City Council have formally given notice of their intention to erect a public elementary school for about 1,200 children at Gorton.

THE Builders' Clerks' Benevolent Institution held their forty-third annual meeting at 21 New Bridge Street, E.C., last week, Mr. Leonard Horner, the President, occupying the chair. It was reported that the sum of 703*l*. had been paid in pensions, and 23*l*. 6*s*. 6*d*. disbursed in affording temporary relief. There are now twenty-eight widows and two aged clerks receiving pensions. The Hon. Treasurer (Mr. E. Brooks) presented the balance sheet, which showed that the institution had invested funds to the amount of 7,842*l*. Mr. William Downs was elected President for the ensuing year.

THE London Master Builders' Association held their annual meeting on February 28. Mr. Leonard Horner was elected president, and Mr. G. Bird Godson and Mr. Jas. S. Holliday vice-presidents for the coming year. The Council has acquired new premises in a building now being erected in Kingsway, to which the business of the Association will be transferred in due course. Members are reminded that the offices are available for private business appointments, and it is hoped the increased accommodation in the new premises will be of service.

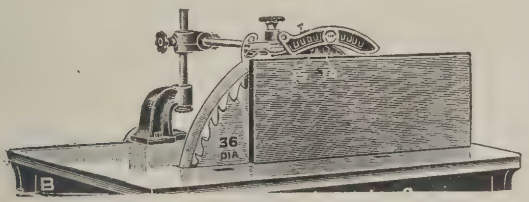
THE *Board of Trade Journal* states that the *Gaceta de Madrid* publishes a notice inviting tenders for enlarging and altering the building of the Faculty of Medicine at the University of Santiago de Compostela. The upset price is put at about 97,000*l*., and a deposit of about 2,900*l*. will be required, to be increased by the successful tenderer to 10 per cent. of the accepted contract price. Tenders should be sent before April 6. Tenders are also invited for the construction of a building for a Royal Academy of Medicine at Madrid. The upset price is placed at about 22,600*l*., and a deposit of about 680*l*. will be required, to be increased by the successful tenderer to 10 per cent. of the accepted contract price. Tenders for both works should be addressed to the "Ministerio de Instrucción Pública y Bellas Artes," Madrid, where they will be opened at 1 P.M. on March 31. Local representation is necessary in both cases.

## THE MANCHESTER BUILDING TRADES EXHIBITION.

The opening ceremony of the Manchester Building Trades Exhibition was performed on Tuesday, the 8th inst., at the City Exhibition Hall, by Sir William H. Bailey (head of W. H. Bailey & Son), the chair being occupied by the Mayor of Salford. In an able speech Sir William Bailey pointed out the benefits to be derived from all exhibitions which brought the buyer into closer contact with the manufacturer and the merchant. An exhibition like the present one was calculated to raise the standard of decoration introduced into the homes of the people, while at the same time it demonstrated the improved facilities now available for heating and ventilating as well as the general improvement in sanitary conditions. Sir William dealt at some length with the opportunities offered to local authorities for dealing with overcrowding in cities by the new Town Planning Act, and he made an earnest appeal for its application to Manchester and Salford where densely populated areas were to be found.

The City Exhibition Hall is situated in Liverpool Road, off Deansgate. It is claimed to be the finest hall of the kind in the provinces. The building is undoubtedly compact, accessible and well-lighted. The exhibition itself must be regarded as a distinct success and as reflecting great credit on Mr. W. Cawood, the promoter, who for the first time has produced something fully entitled to be called a Building Trades Exhibition. The hall is filled with exhibits, which are all directly connected with the building industries and of interest to architects as well as the trade and the general public. Perhaps the only disappointing feature is the want of enterprise shown by sanitary potters and engineers. The display of this class of goods is a comparatively poor one and very unrepresentative of the great firms of the country. Their absence is all the more surprising as, owing to the ever-increasing amount of attention being paid to sanitary science, it would appear to be well worth the while of enterprising firms to take every opportunity of bringing themselves prominently before the public notice. A genuine, if vague, desire for improved sanitary conditions is general; it now remains for the sanitary specialists to crystallise and guide that tendency. The quickest way to accomplish this is by seeking all the publicity possible.

*M. Glover & Co.*, Engineers, Holbeck Lane, Leeds, show their wood-working machinery at Stand No. 14, including working models of ingenious firewood splitting and bundling machines. Prominent is the "Ideal" saw guard here illustrated which can be easily and accurately adjusted to fit different diameters of saws. It has a very improved form of riving knife and permits sawing to the full depth without it being necessary to elevate the guard or riving knife. The "Ideal" guard consequently affords absolute protection. Another interesting speciality in operation is the patent Circular Safety Cutter Block for wood-planing and moulding machines. The new cutter makes it quite impossible for the workman to receive more than slight flesh wounds at the tips of his fingers, and at the same time it makes the planing more perfect. The knives are both lighter and cheaper. They are firmly held close to the cutting point and work with much less vibration than the hitherto heavy unsupported knives. Glover's saw-sharpening machine is strong, occupies small space, and is very rigid while working at full speed. Thousands of these machines are giving the greatest satisfaction. Messrs. Glover are also showing an improved saw bench and a new improved "Universal" vice. In the vice generally used there is not enough room between the jaws and the screw case to allow of long objects being held vertically. This is provided for in the "Universal," the screw and bottom part being arranged out of the way of the work extending downwards. It is equipped with a swivel jaw moving on a ball and socket joint to receive taper work. Also on exhibition is a compact appliance for making window frames which the firm are just introducing, and which they say will revolutionise this class of work.



GLOVER'S "IDEAL" SAW GUARD.

*Messrs. W. Hilton & Sons*, Moss Side Steam Marble Works, Manchester, show at Stand No. 15 specimens and photographs of work they have carried out in Lancashire. One of their exhibits is a staircase with one baluster in English coloured alabaster and the other in Caen stone; the two different designs and materials suggest in use different purposes. The stand also includes panelling in various marbles, as well as examples of turning stone executed for the Manchester Infirmary, and photographs of various contracts.

*Messrs. Tutin & Co.*, Manchester, have erected on Stand 18 a building of two rooms with walls constructed of their "Salamander" brick partitions. These are obtainable in four sizes—the 10 inches by 4 inches blocks are made in thicknesses of 1½ inches, 2¼ inches, and 3 inches, while the fourth size is 4 inches by 10 inches by 6 inches. For the outside walls of this stand 4-inch and 3-inch bricks are used, for the inside partitions 3-inch blocks. The "Salamander" partitions are hollow fireproof blocks made by a special process. They will take nails and can be easily sawn. The blocks are moulded so as to interlock, and the surface is keyed for tiles or plaster. Architects are already familiar with hollow blocks for exterior and interior use in floors, walls, roofs, and partitions. The "Salamander" bricks are a valuable addition to the existing varieties. It might be mentioned that a partition has just been erected of them in Manchester by Messrs. Tutin & Co. 90 feet long by 20 feet high.

*Messrs. C. Jennings & Co., Bristol*, have a varied collection of their woodwork at Stand 26. It includes doors, gates, elaborate fretwork grilles, a shop front, balusters, and general woodwork. Not an inch of space has been wasted in the effort to convey an idea of the diversity of output from the joinery works in Pennywell Road, Bristol, where they cater for the requirements of mansion and cottage with equal readiness, and where they wage war against the invasion of foreign goods.

The *Saxon Portland Cement Co., Ltd.*, have done their best to compensate those visitors who cannot journey to their Norman and Saxon Works at Cambridge by displaying at Stand 29 a sort of synopsis of the evolution of Portland cement. Samples are given of the chalk marl in its original state, and then of the material as it passes through various scientific processes before it becomes finished Saxon cement. The stand must be a pleasant relief to many visitors, who are apt to feel satiated with a collection of exhibits where everything in the way of production has to be taken for granted. Here it is possible to get some idea of the thoroughness and intricacy of manufacture involved in the production of a cement which has to come up to the standard of the Saxon Portland Cement Co.

The *Municipal School of Technology*, Manchester, supply in Stands 31 and 32 one of the features of the exhibition. The School has been at its present splendid premises in Sackville Street since 1902, but for twenty years previous the Corporation had controlled the Technical School. There are no less than 5,000 students at present attending the day and evening classes. The Municipal and Sanitary Engineering Department, whose work is here shown, numbers with the classes in architecture and building construction 718 pupils. The extremely interesting exhibit is under the direction of Professor J. Radcliffe, M.Sc., and includes examples of old and defective plumbers' work contrasting with that executed by their own students, and high-class work used for demonstration purposes. There are also various instruments and models employed for teaching, together with drawings executed by students. The two stands are intended to suggest the resources of the School for technical training by displaying what is done in a sub-section of one of the departments. The result is an unqualified success, and will undoubtedly serve to arouse still further enthusiasm for the work of the Municipal School of Technology.

The *Carron Company* occupy three Stands, Nos. 34, 35 and 36, for their products, most of which are familiar, though minor improvements are introduced when possible. Their latest cooking range, "The Carron," is shown in action, as also is the "Tyne" combination cooking and sitting-room grate. This latter has two hot-air flues which warm the two independent ovens over the fireplace. In appearance it is the same as an ordinary living-room grate, except that the mantelpiece is replaced by the oven doors.

The *Empire Stone Co., Ltd.*, 231 Strand, W.C., at Stands 37 and 38 show specimens of their much used footway paving. For architects the samples of artificial stone as supplied to many important buildings, and of mosaic, terrazzo and in situ paving will be of special interest. Empire stone can, of course, be made to match red and yellow Mansfield, Portland and other natural stones; it is unaffected by climatic conditions, and its durability is guaranteed. It lends itself in an especial manner to carving and general high finish. A floor with a span of 10 feet on the Siegwart system has been laid down. The Siegwart fireproof floor consists of hollow beams made of granite concrete reinforced with steel rods. The beams have a uniform width of 10 inches and are of varying depth and span. The beams are sent out from the works ready for immediate use on the job, where they are laid side by side without centering and grouted with cement. The floor surface may then be finished off at once.

On the same Stand as the above are specimens from the various quarries owned by the *Enderby and Stoney Stanton Granite Co., Ltd.* They include worked granite, setts, broken granite for roads, kerbs and channel stones, &c.

*W. & R. Leggott, Ltd.*, have at Stand 39 an interesting display of architectural and builders' ironmongery. Conspicuous among them are the panels showing the arms of the Corporations of Manchester and Bradford. Special attention should, however, be paid to the "Wathol" mortise panic bolt, which has been approved by the L.C.C. and several provincial authorities. The bolts are mortised into the edge of the door and are covered by a metal strip, the only visible parts being the cross rails. They are applicable to single, swing and rebated doors; while the bolts can be operated from the outside by a key only, they are self-locking when the door is closed.

*Messrs. G. Brady & Co.* make a special feature at Stand 48 of a new type of electric service lift in which steel tapes are used for suspending the cage. The tapes wind on a flanged pulley. The gear is found to work very efficiently and to be cheap in first cost; it will raise a load up to 56 lb. Messrs. G. Brady & Co. calculate that the cost of current for a "T" type of lift would be 13*s.* and the cost of maintenance 5*l.* per annum; and they compare this with the 75*l.* a year paid for the labour required to work a busy hand lift all day. The greatly increased first cost of an electric lift over a hand lift is counterbalanced by the amount of work it can do in the same time. The "T" type of lift has been put on the market as fitted for pockets which have hitherto been unable to afford an electric lift. Messrs. Brady show other kinds of lifts, an electric cathead hoist for warehouses, &c., and their revolving shutters.

The *Duroline Wire Wove Roofing Co., Ltd.*, show their unbreakable glazing at Stand 58. "Duroline" is composed of a thick translucent varnish reinforced with a fine wire netting. Its durability led to its adoption at the old Aquarium, Westminster, in place of glass for the roof, which had proved a constant source of expense. Colonel Majendie, Chief Inspector of Explosives, said of the material, "In some respects I consider 'Duroline' preferable to and safer than glass." For ornamental purposes the flexible sheets can be supplied in various colours. The uses to which it may be put are almost without number; they include all those of glass. As a fireproof glazing it would seem to have especial advantages in skylights, for even if intense heat melts the varnish, the wire mesh remains intact.

The *Ruberoid Co., Ltd.*, at Stands 61 and 62 show the wide applicability of the material to roofs of all kinds and for such work as valley gutters, cheeks of dormers, domes, &c. It has now enjoyed a successful career of nineteen years, and during that time has been employed in all parts of the world. Its merits must be familiar to our readers both from actual use and from occasional mention in these columns. Ruberoid roofing gets its greatest praise from those who have employed it.

*Messrs. Machin & Koenig* have erected a half-timbered building at Stand 71 with Eternit slabs for the exterior and interior walls and Eternit tiles covering in the roof. The structure is on similar lines to the new Courts of Criminal Appeal in the London Law Courts, which were likewise built up of a half-timbered frame and Eternit walls and roof. Being composed of asbestos cement the slabs possess great heat and fire-resisting qualities as well as strength and durability. A large number of iron buildings are lined with "E T" slabs as a fire protection, as well as isolation hospitals, schools, doss-houses, shelters and other buildings. There are special "Eternit" asbestos tiles for roofing of an average weight of 21 lb. per square yard, as against about 140 lb. for red tiles, while their tensile strength and crushing strength is 5,781 lb. and 8,281 lb. per square inch respectively.

The *Clee Hill Granite Co., Ltd.*, Ludlow, exhibit at Stands 75 and 76 the different materials supplied to a very large number of county and local authorities from their quarries, comprising setts, macadam, and rough stone for breaking and chippings for footpaths, binding, concrete drives, &c. No better testimonial could be wished for than the following from Mr. R. Phillips, A.M.I.C.E., consulting county surveyor, of Gloucestershire:—"I have tried your stone against six of the hardest and best known road stones, and in every case Clee Hill stone has proved the best."

*W. B. Haigh & Co., Ltd.*, Oldham, at Stand 7, show four of their wood-working machines for different purposes, viz., bandsawing, four-side planing and moulding, tenoning, mortising and boring. The firm hope that interested visitors will journey to their Oldham works, which are only seven miles distant, and inspect the two hundred odd types of machines for sawing and woodworking.

*F. W. Bromley*, Urmston, exhibits at Stand 27 contractors' plant of various kinds, including a number of builders' hoists, hand and motor driven, belting, and a single-cylinder friction steam winch.

*Messrs. J. Dugdill & Co.*, Failsworth, make a good display at Stand 41 of their patent movable fittings and accessories for gas and electric light. In the various extensible switch pendants no counterweights or wall switches are required, so that the effect is extremely neat.

The *Diamond Tread Company, Ltd.*, show at Stand 46 their non-slip stair treads and tiles, which are familiar from general use all over the country.

The *Fawcett Construction Company, Ltd.*, have laid at Stands 87 and 88 their Mon' Lithcrete fire-resisting floor, which carries a load of 18 tons, and shows a deflection of only 1¼ inch. The floor consists of pierced steel girders (from which the web metal has been sheared and the top flanges reduced in width) spaced at from 1 foot to 5 feet apart, and set in broken brick or other suitable concrete. Mr. Mark Fawcett, the inventor, guarantees that the strength of the Mon' Lithcrete steel girders in combination with concrete is double that of joists of equal weight. A tension bond between the girders is obtained by passing twisted hoop steel through the web openings. The system has proved extremely successful and the Fawcett Construction Company have now patented it in the principal countries of the world. The stand also includes the "Edwardian down-draught preventing chimney pot," which is to be seen on Windsor Castle as well as on many a small cottage.

The *Aerograph Co., Ltd.*, must now rely with confidence on being able to attract a crowd of visitors to their stand—which at Manchester is No. 70. The Aerograph spray-painting apparatus is made in sizes to suit all classes of work, from the villa to the largest gasometer or bridge; it is also adapted for all kinds of stencil and shading work on any surface or material. The outfit consists of the handpiece, i.e., the Aerograph, an air compressor, a paint pot and tubes; there are also motor outfits for petrol and electric power. The company have adapted the same principle to a white-washing machine.

The *Check Fire Door Co.*, at Stand 66, show fireproof doors and cupboards constructed on their system, which have come through the tests of the British Fire Prevention Committee with conspicuously successful results, and are now accepted by all insurance companies. The door consists of a thin sheet-iron cover plate on one side, and a perforated iron plate on the inside, between which is a filling of asbestos composition and slate. There are angle irons and a cover strip. Their resistance to fire was a record for single doors, although the total thickness was only one inch.

The *Christie Patent Stone Co.* display at Stand 84 a four-light bow window rebated to take square glass. The company manufacture high-class architectural stonework, and show a few examples on the stand, as well as a collection of photographs of the carved work at St. Thomas's Church, St. Helens, where they executed all the interior arches to nave, aisles and chancel, as well as the door heads and sills.

The *Patent Rapid Scaffold Tie Co., Ltd.*, have at Stand 42 the "scaffixer" tie, which has come to put an end to the scaffold ropes and cords. This valuable patent consists of an iron "scaffixer" block, which is driven into the horizontal pole; two chains are then attached to the hook plate and carried one under and the other over the horizontal and round the vertical pole, and finally linked to the hook plate. The block is then screwed with a spanner as tightly as possible into the horizontal pole. The block can be fixed in one minute and with the greatest ease by any labourer; no wedges are needed to render the tie of the utmost rigidity. Contractors who have hitherto had to do the best they could with cords should welcome the "scaffixer" tie, which is equally applicable to any tie that can be made with the customary cords.

The *Fernden Fencing Co.* have samples of a Fernden cleft chestnut pale fence and gate fence, as well as tree-guards, &c.

The *Yorkshire and Lincolnshire Tar Distillation Co., Ltd.*, have met with the utmost success in the sale of their wood preservative "Kreenol," which is being increasingly specified by architects for both interior and exterior timber work. As well as acting as an effectual preservative against dry-rot, decay and vermin, it stains the wood right through in a pleasant brown shade. One gallon of Kreenol covers about 400 square feet of well seasoned hard wood. It is sold in drums from 1-gallon size to barrels containing 40 gallons or over.

*Messrs. Cookson & Co., Ltd.*, Newcastle-on-Tyne, one of the largest firms of white lead manufacturers in the world, arranged to hold at Stand 49 a series of tests on their Crescent brand of white lead. They claim that it will go much further than any other white lead, and possesses a more consistent density. The stand indicates the wide ground covered by Messrs. Cookson & Co., for it includes several varieties of lead, pipes, &c.

The *Metal Jointing Co., Ltd.*, demonstrate at Stand 50 their entirely new system of jointing between lead and lead, or brass and lead. In a recent issue we described their process, and so there is no need to go into the details again. The company have made a special effort to display the advantages of "Amalgaline."

Cambell's patent combined bath and sink "The Cottager," of which the sole makers are *Messrs. Baxendale & Co.*, Manchester, is to be seen at Stand 68. The bath is of cast iron, and has a glazed ware sink resting across the foot. When the bath is required for use the sink is turned round so as to allow the hot and cold water to enter the bath. The sink has an independent waste pipe.

*Messrs. Kirchner & Co.* contribute several of their joinery machines, which are fitted with the latest labour-saving devices.

Amongst the other exhibitors are C. E. MacCarthy & Co.; Wilson's, Ltd.; the Van Kannel Revolving Door Co., Ltd.; the Reason Manufacturing Co., Ltd.; the Manchester Tenants, Ltd. (half-size model of two cottages as erected in Garden City, Levenshulme); J. Sagar & Co., Ltd.; F. McNeill & Co.; the "Plastoment" Asbestos Flooring Co., Ltd.; Shannon, Ltd.; Edward Leigh (safety ladder brackets); Frazzi Fireproof Construction, Ltd.; H. C. Cleaver, Ltd.; Sanitaries, Ltd.

## THE ART OF THE PLASTERER.

A lecture under the above title was given by Mr. George P. Bankart on the 23rd ult. at Carpenters' Hall, and it was remarkable for its practical nature. At the outset Mr. Bankart explained that his special purpose was to interest and instruct the young plasterers of to-day; and in order to do this he showed how very much the design and technical qualities of plaster work had been and is being influenced by the nature of the materials. "Stucco-duro" was used as far back as 3500 B.C.; under the ancient Romans it became a most valuable adjunct to decoration, and was revived once more at the Renaissance. It was then introduced into England by itinerant Italians; but the difficulty of obtaining the constituents caused the native craftsmen to adapt the new methods to their own "parge" plaster, composed of very old lime, sharp sand, powdered tiles, road scrapings, cowdung, and oxhair. Whereas "stucco-duro" could be modelled to any degree of fineness, spareness or depth of undercutting, "pargetting" was never undercut, but was softly defined and bevelled-edged. The former process was re-introduced by Inigo Jones and Wren, and enjoyed a short career of gradually declining merit until, under the guidance of the Brothers Adam, it burst into a last flame before flickering out. Then came a black interval, when the pseudo-Classic horrors of so-called stucco, not "stucco-duro," were erected in our cities and towns.

When he had thus briefly traced the history of the art, Mr. Bankart dealt at some length with the present-day position of plaster work in the following interesting manner:—

First consider our present-day plaster materials. We have plaster of Paris, Keene's cement, Parian cement, Portland cement, and others. The three former are excellent for interior decoration, and the latter for exterior decoration, if properly understood and naturally used. There is also the ordinary grit plaster with which we generally coat walls and ceilings, and which, I regret to say, is seldom what it should be. This is mainly due to the newness and insufficient slaking of the lime, a bad habit born of the hurry and impatience of the age. Architects should insist in their specifications on the lengthy storage and slaking of lime for plastering; the remedy is quite in their hands.

With reference to these modern materials, the principles and methods of doing the old decorative work apply equally much to them. "Stucco-duro" we have not available now. This is a great misfortune, particularly as the kind of modelling for which this material alone, of all plasters, is so admirably fitted is still increasingly in demand, and is, unfortunately, attempted in plaster of Paris (a soft plaster), absolutely incapable to any degree of producing the technically and artistically fine qualities readily produceable in "stucco-duro." Not only is plaster of Paris unsuitable and incapable, by reason of its softness for this kind of work, but the process of production by gelly casting is also inadequate. The difference between the nature and the quality of the two materials and of the two processes is great, and must be obvious to anyone with eyes and any sense of judgment. If spirited high relief modelling of the old quality, with thin leaves, detached flowers, and isolated stem work, fine crisp detail, and deep shadows, &c., &c., is to be done again, builders and plasterers will have to be persuaded and encouraged (*i.e.*, compelled) to "put down" well burnt lime and to keep it slaked and stored for years, instead of days and weeks as now. In Northern Italy this is done at the present day, thousands of tenements having their lime-pit storage of fifteen, twenty, and thirty years maturity. Architects and public alike want and ask for this class of work, but it can never be done properly or become a great and worthy art again until the proper material of "stucco-duro" is forthcoming. You cannot possibly, by any process, get out of any material technical qualities that it does not possess. This point of the misuse of material is conveniently and wilfully misunderstood and evaded by many architects, who are content to deceive themselves and their clients that they are getting a certain style for convenience called "Georgian." Let me make myself quite clear. "Plaster of Paris" (sulphate of lime) is a very soft and somewhat dull plaster; it is easily damaged; it will not take a thin sharp edge. To show its qualities to advantage it therefore requires a "low relief" (or moderately "low relief") kind of modelling, with no sharp, knife-like edges which will not reproduce, cast, or "draw" from a mould of plaster, or gelly, with quite ordinary care. It is capable of most excellent and beautiful decorative results, treated with moderate flatness of relief, but it must have a mellow and soft definition. On the other hand, "stucco-duro," or carbonate of lime—*i.e.*, well burnt and very old slaked lime, fine sand, and sharp fine grit, or marble dust—was a very smooth "butter-like" plaster when moist, but it set as hard as flint, would take a clean, sharp edge, and could be worked as thin as a rose petal without fear of being easily damaged. It was pure and legitimate modelling. I have heard it called "carving." It was not carving. The "imitation" of it means carving. The substitution of the soft plaster to do the work of a hard one is but a poor makeshift. Something will have to be done to remedy this shortcoming by a little understanding and arrangement between the architect and builder, or their respective societies. It could and would, with time, be easily remedied and supplied "on demand." Until then the best substitution for this kind of undercut work (so far as I know) is in the modelling and casting in plaster of Paris or Keene's cement of the flowers, fruit, &c., individually and separately; and in the fitting of them together afterwards, bedding them into a hollow ground work prepared to receive them. This, of course, requires the judgment of an artist as well as the skill of a "mechanic." Plasterers must sooner or later cultivate the artistic judgment which is inseparable from the craft of the plasterer. Many persons think good modern plaster work is a forlorn hope, or do not give it a thought at all. They are under a delusion with regard to plaster work, for good interesting modern decorative plaster work is being done by modern journeymen plasterers, with conveniently obtainable modern plasters and on thoroughly sound, "artistic," and technical principles. One of the first methods that naturally suggests itself is in the "running" of simple flat members, or rounded "bead-like" mouldings on walls, beams or ceilings in ordinary lime and sand plaster, without "gauging," between which short repeating lengths of simple flat modelling, solid cast, are inserted and stuck in, the joints being neatly filled in and softened off. This is plaster work pure and simple, assuming that the design and modelling are all right.

Then there is the process of modelling and casting individual flowers, leaves, fruit, &c., in low relief, in "plaster of Paris." Draw in the design on the ceiling or on the wall itself, and, after cutting away the "skimming" coat, stick the castings up and model the stem work in between on the ceiling. Stem work having any body of stuff should be built up first with ordinary lime-and-sand plaster with "tow," and the surface afterwards modelled with "lime putty" and "plaster of Paris," or with Keene's cement.

Another nice, clean, and "crisp" process is that of drawing out one's design on a finishing coat of Keene's or similar cement, modelling the stems, flowers, and leafage direct. Work on just so much space only at a time as can be kept damp and in working condition for the day, or some of the modelling may drop off. In doing this it is helpful and expeditious to make a few plaster or cement dies of various sizes. Much time and superfluous labour can then be saved by putting-on, where required, four or five roughly-shaped dabs or pats of moist cement, striking them with the plaster die, which can be held up in place with sticks from the scaffolding until the cement is sufficiently set to remove the die, then clean off and "make good" the surface, &c. There is the similar method of working Portland cement for exterior decorative work, either by part-casting in pure Portland cement or in pressing Portland cement and sand into a clean "plaster of Paris" mould, bedding the casts into the wall where required, and modelling the stem work in cement, in situ, with a small steel tool or trowel.

If one is modelling a vine or rose treatment, it is always helpful to have a length of the old vine or bramble stem on the scaffolding by way of guidance and inspiration. This is also a genuine plaster process.

Then there is the modern process of working in "fibrous plaster"—viz., "plaster of Paris," wood, and coarse canvas —cast in strips or slabs from plaster or gelly moulds, and fixing it up with brass screws or nails, copper wire, or canvas "wadding" to the timber, iron, or "expanded metal" construction of the building. This process is due to the development of the iron, steel, and concrete construction. It has come to stay, whether we consider it genuine plaster work or not. Its extensive employment is purely a matter of convenience, and even of necessity, but the process is capable of excellent decorative treatment (properly developed) and of expeditious manufacture and affixation in the hands of the skilled mechanic.

Success in all these processes lies very largely in knowing and developing to the full (without abuse) the natural decorative capabilities of the material one has to work in, whether it be "stucco-duro," lime and sand plaster, "plaster of Paris," Keene's, Parian, Portland, or any other cement.

Something else is needed.

Now, I want a few words with the younger generation of plasterers, to whom one must look for the future resuscitation of the plasterer's "art," which I fully believe will thrive again sooner or later. I want to appeal in particular, if I can, to the inner nature and intelligence of the apprentice, of the improver, and of the "journeyman" plasterer, who has some interest in his work beyond the day's drudgery and the week end. As a mechanic he is excellent; as a plasterer he is too excellent; that is too mechanical. He carries his work, mechanically, too far to be an artist. He often unconsciously wipes out of his work, whilst doing it, artistic qualities by mere force of habit; beautiful qualities of surface, which he has been trained to regard as indifferent workmanship, because it is not perfectly smooth and polished. If the plasterers of Queen Elizabeth's time had had the mechanical instinct of the present day, some of their work might have been perhaps still more interesting than it is. There is any amount of intelligent interest and artistic ability lying dormant in the plasterer's trade at the present day, if it can only be roused and cultivated and encouraged. In my opinion there is nothing to stop a healthy revival of the plasterer's art if the juniors and younger adult members of the trade will only rise to the occasion, try to cultivate the decorative element conjointly with the mechanical side, and once realise the great difference and increased interest it would give to their daily work in the way of relief from continuous mechanical drudgery.

Some of you may say to yourselves, as I did, "How am I to begin?" "Where am I to begin?" Begin by looking at the old work, by examining it, by analysing it, by trying to do something like it, until "ideas" come to you from doing so. Then try to work them out. Notice in the old decorative plaster work that, with the exception of one type, it was mostly the flat treatment of flat surfaces. Notice the simple flat saucer-like leaves, with bevelled edges, and the bossy flowers. Notice the simple stem work, waved or bent into varying forms of "rhythm," enclosing simply arranged sprays that grow quaintly from it. Notice the softness of the low relief "plaster of Paris" modelling, and the crispness, brilliancy and vigour of the higher relief "stucco-duro" modelling. The modern plaster modeller, as a rule, has much to unlearn, because he models without plastering; he will not trouble to look at and learn from the old work, and he forgets his material and he will not be "simple." He likes restlessness and undulation of surface, and a "plenty-for-your-money" sort of look about his work; "sparkle" I think they call it. The fault is not altogether his own. He is often the slave of the public. Notice the softness, the roundness, or the flatness and the simple grouping of the old plaster mouldings, as well as the scale of them. They did not resemble wood, stone, or marble mouldings, with sharp edges. Notice how some of the old plaster decoration took inspiration from the tapestry and needlework of the period in which it was done. Notice how the flowers and leaves were set mostly flat, or in profile, on not too level or smooth a background with little or no foreshortening, and that perspective (in this flat plaster decoration) is conspicuous by its absence. A lot of modern decoration is putrid because it attempts to combine naturalistic representation and perspective in a decorative setting. It is absurd. The old plasterers went to nature for their inspiration, and absorbed just so much of her as was helpful to their purpose and expressible in their material in a simple way and limited degree; but they stopped short at imitation and mimicry. Bunches of grapes were sometimes round in shape, sometimes oval, or pointed at one end and round at the other, made up of rings of flat berries. The same kind of interpretation or "convention" applies to the vine leaf, with its pentagon outline, irregular edges, central loopings, and radiating veinings; and to the rose, its leaf, and all other forms. They were not copies of, or like, grapes, vine leaves, roses, &c., but all the same they were unmistakably grapes, vine leaves, roses, &c.; you could not call them anything else—that is to say, they were decoratively shaped and arranged harmoniously, poetically, musically—call it what you will.

You will find plenty of restraint and reserve, generally, throughout the old work. Seldom does it look strained, overcrowded, affected, or pettifogging in scale. It became natural and easy to them, because the work was done straightforwardly, and at the building. They moved about from job to job taking their moulds and models with them, and earned 6*d*. and 10*d*. a day then against 1*s*. an hour now! Pick out and learn all you can in this way from the good old work, and try to do good work of your own. Learn from the simplest and purest of what was done in the past (when your trade was a great art), watch what living men have done and are doing still with your own material, as a means of real "decorative" expression. Find out for yourselves the beautiful qualities that are possible to your material, and try to get into your own work some of the spirit of the old stuff, until you can do better! It must come as a pleasure, to do it well, and also as a hobby as well as a trade. Train yourselves to feel and to realise something of "scale," contrast of light and shade, line, and form, and even then you may not be able to do it for some time! The rest, the instinct, depends on Nature's endowment, and the will-power, the concentration, and the intelligence you personally bring to bear in developing your art and yourself at the same time, for art is human, and depends on the degree of your humanity. It must be acquired, and then cultivated and developed. Try to do simple things well, first, and you will generally stick to them, for simple things are more difficult to do well than elaborate rubbish. The rest will come of itself, gradually.

## TRADE NOTE.

Messrs. Joseph Kaye & Sons, Ltd., Leeds, proprietors of Kaye's patent seamless serrated oil cans, with Kaye's patent seamless spouts, have just received further orders from the British Navy for 3,918 oil cans and 6,963 seamless spouts for His Majesty's *Dreadnoughts*.

A training college for teachers is to be erected in Dundee by the Board of Education. The local education authority are negotiating for a site. It is expected the outlay will be about 40,000*l*.

The Winter Gardens, New Brighton, are to be altered at a cost of about 4,000*l*. The theatre will be enlarged so as to accommodate 1,350 people instead of 900, as at present. The plans have been approved by the various local authorities.

The Ballachulish Slate Quarries, N.B., will shortly be worked by electricity. The preliminary foundations for the haulage and pumping machinery have been commenced. It is believed to be the first instance in Scotland of introducing electric power into a slate quarry.

Scotland.—March 21.—For mason, carpenter, slater, painter and glazier work of proposed Baptist Church, Buckie. Mr. George Macpherson, architect, Buckie.

Scotland.—March 23.—For brick, joiner, plumber, plaster and tile works of proposed golf pavilion, Cowdenbeath. Mr. D. B. Campbell, architect, Cowdenbeath.

Scotland.—March 23.—For brick, joiner, plaster, slater and plumber work in alterations and additions to the Cowdenbeath Library Society's premises in High Street. Mr. William Stewart, 58 Stenhouse Street, Cowdenbeath.

Shrewsbury.—March 21.—For erection of stables and depôt at Roushill, for the Corporation. Deposit 2*l*. 2*s*. Forward names to Mr. Arthur E. Williams, architect and surveyor, County Chambers, 12 High Street, Shrewsbury.

St. Helens.—March 21.—For erection of a school in North Road. Deposit 1*l*. 1*s*. Mr. Frank S. Biram, architect, George Street, St. Helens, Lancs.

St. Helens (Lancs.).—March 22.—For erection of a laundry, &c., at the borough sanatorium. Deposit 1*l*. 1*s*. Mr. Geo. J. C. Broom, M.I.C.E., borough engineer, Town Hall, St. Helens.

Sturminster Marshall.—March 24.—For building an elementary school at Sturminster Marshall, Dorset. The County Surveyor, Wimborne.

Sunderland.—March 22.—For erection of a nave and aisle of the new church of St. Aidan, Grangetown. St. Aidan's Mission Room, Grangetown.

Tinsley.—March 25.—For the following works for the Parish Council:—(1) Constructing a fence wall, and (2) wrought iron railings and gates for enclosing the recreation ground. Mr. J. L. Winkley, clerk, 15 Harrowden Road, Tinsley, Sheffield.

Wales.—For taking down and rebuilding 94-95 Queen Victoria Street, Tredegar, Mon. Mr. H. Waters, M.S.A., Market Chambers, Ebbw Vale.

Wales.—For pulling down and rebuilding the Britannia Inn, at Llanbadoc, near Usk, Mon. Messrs. Swalwell & Havard, architects and surveyors, 202 Dock Street, Newport, Mon.

Wales.—March 22.—For carrying out the following works, for the Barry local education authority:—(1) Alterations and additions to Holton Road infants' school, Barry. Deposit 2*l*. 2*s*. (2) Plumbing work in connection with such alterations and additions. Deposit 1*l*. 1*s*. Mr. G. A. Birkenhead, architect, 102 St. Mary Street, Cardiff, and St. Nicholas Road, Barry.

Wales.—March 23.—For taking down existing cottages and erecting two houses at Penygarn. Mr. D. C. Udell, architect, Commercial Street, Pontypool.

Wales.—March 23.—For erection of two houses at Porthcawl. Deposit 2*l*. 2*s*. Messrs. Geo. F. Lambert & Son, architects and surveyors, Bridgend.

Wales.—March 25.—For renovations to the Vine Tree Inn, Llanvetherine; also to the Three Salmons Inn, Llantilio Crossenny, near Abergavenny. Mr. B. J. Francis, architect, Abergavenny.

Wales.—March 25.—For taking down existing and erecting two stables, coach-house, boundary walls, &c., at White House, Little Mill, near Pontypool. Mr. D. C. Udell, architect, Commercial Street, Pontypool.

Wales.—March 29.—For erection of 76 or more houses, proposed to be built at Tredegar, Mon. Mr. Wm. Harris, architect and surveyor, Bank Chambers, Bargoed.

Wales.—March 31.—For alterations and additions to Maesydderwen to convert into county schools, for the Governors of the Ystradgynlais County School. Mr. J. Cook Rees, architect, Neath. Sealed tenders to be sent to Mr. B. L. Thomas, clerk to the Governors, Tir Roger, Ystradgynlais, by March 31, endorsed "Tender for schools."

Wales.—April 1.—For erection of cookery-kitchen and class-room at Brynmawr Council school, Breconshire. Mr. Charles W. Best, M.I.C.E., surveyor to the Education Committee, County Hall, Brecon.

Wales.—April 5.—For the erection of an infants' school, with offices, &c., at Clarence Street, Mountain Ash. Deposit 2*l*. 2*s*. Mr. W. H. Williams, architect, Town Hall, Mountain Ash.

Wales.—April 7.—For the extension of the Victoria warehouse, Victoria Wharf, North Dock Basin, Swansea, for a distance of 57 feet, with four floors, and erecting two additional floors on the old building. Mr. A. O. Schenk, M.Inst.C.E., Harbour Offices, Swansea.

Wales.—April 21.—For new mixed and infants' school (346 places) and cookery kitchen at Builth Wells, Breconshire. Mr. Charles W. Best, M.I.C.E., surveyor to the Breconshire Education Committee, County Hall, Brecon.

Waltham.—April 5.—For the execution of alterations and repairs at the Waltham Council school, Kent. Mr. C. J. Wanley Croft, correspondent, Bridge, Canterbury.

Walton-on-Naze.—March 31.—For erection of a public Elementary school. Deposit 3*l*. 3*s*. Send names by March 31 to the architects, Messrs. Tomkins, Homer & Ley, Frinton-on-Sea.

Watford.—March 23.—For supply and erection of a steel and corrugated iron building, size 29 feet by 30 feet by 24 feet high. Mr. D. Waterhouse, engineer to the Council, High Street, Watford.

Watford.—March 23.—For building a pump chamber and engine foundations in brickwork and concrete. Mr. D. Waterhouse, engineer to the Council, High Street, Watford.

Wednesbury.—March 31.—For the erection of public sanitary conveniences (exclusive of sanitary fittings) near the Market Place. Mr. E. Martin Scott, borough engineer and surveyor, Town Hall, Wednesbury.

## TENDERS.

### CHOLSEY.

For the enlargement of the Council school at Cholsey, Berks.

| | | | |
|---|---|---|---|
| Stephens, Bastow & Co. | £1,652 | 0 | 0 |
| Bloxham | 1,531 | 0 | 0 |

| Treasure Bros. | 3,850 | 0 | 0 |
| Blay | 3,829 | 0 | 0 |
| Somerford & Son (*accepted*) | 3,757 | 0 | 0 |

## SCOTLAND.

For improvements at the Forfar Infirmary.

*Accepted tenders.*

| | | | |
|---|---|---|---|
| Findlay & Co., mason work | £328 | 10 | 0 |
| M'Laren & Sons, plumber work | 282 | 14 | 0 |
| Dall, joiner work | 175 | 7 | 6 |
| Mackenzie & Moncur, copper, piping, &c. | 120 | 0 | 0 |
| Kerr, slater work | 24 | 10 | 0 |
| Troup Bros., plasterer work | 18 | 8 | 3 |

## SOUTH SHIELDS.

For the formation of the forecourt of the Municipal Buildings. Mr. E. E. Fetch, A.R.I.B.A., 20 John Street, Adelphi, W.C.

| | | | |
|---|---|---|---|
| Young (*accepted*) | £3,755 | 0 | 0 |

## WALES.

For the extension of the Queen Street Infants' School, Abertillery. Mr. W. H. Hiley, architect, Abertillery.

| | | | |
|---|---|---|---|
| Jones | £2,282 | 0 | 0 |
| Davies & Sons | 2,156 | 0 | 0 |
| Tudor, Abertillery (*accepted*) | 2,090 | 0 | 0 |
| Colborne | 1,899 | 10 | 0 |

---

The Stone Carvers' Trade Association recently presented a memorial to the various Associations and Institutes of Architects in Great Britain. The memorialists deplored the low standard of work generally prevailing, and pointed out that it was the result of the men being compelled to leave work in an unfinished condition. The evil of scamping, they averred, was often caused by the work being sub-contracted, or being let to the lowest tenderer irrespective of its quality. It was held that the remedy was entirely in the architect's power, for he had only to refuse to pass scamped work, and it would cease. Whilst not venturing to criticise design, the Association pointed out that most old work was admittedly superior, because it was properly executed—the outline being good, the shadows sharp, and a proper play of light and shade. The Association has received favourable replies from most of the institutes and associations to whom the memorial was sent, expressing sympathy with its aim.

## PORTMADOC SLATES.

In a previous article (*Architect*, September 24, 1909) it was shown that the only slates entitled to the name "Portmadoc," and the guarantee of quality this name carries with it, were those produced in the Festiniog district of North Wales, and also that all the quarries of importance producing such slates were included among the members of the Festiniog District Quarry Proprietors' Association. A list of the names of these quarries was given, and the various slate veins of the district which are worked by them were briefly described.

It is the intention of the present article to deal, as then promised, with the characteristics of these various slate veins, and more particularly with those of the slates produced from each of them.

*Old Vein.*—In discussing Portmadoc slates from this point of view it is but natural to deal with the Old Vein first. Not only is this the vein that produces the finest quality of slates in the district, but it is also the most extensively worked. "Old Vein" and "Portmadoc" are terms whose conjunctivity is more than familiar in the slate trade, not only in this country, but wherever slates are used the world over, and while the slates from other veins in the district are without exception of excellent quality, "Old Vein" slates remain the Portmadoc slate par excellence. The best slates from this vein, which are so well known as "Best Old Vein," can challenge comparison with any produced elsewhere, and it is not going too far to say that it is to the "Old Vein" product that Portmadoc owes the larger portion of its fame as a slate-producing district.

In describing a slate it is somewhat difficult to name features which markedly distinguish it from others which in general appearance may bear a resemblance to it. This is perhaps particularly the case with Portmadoc slates, since their colour is one that does not differ greatly from that of slates produced in several other places, both at home and abroad.

Great strength and durability are features that are common to the "Old Vein" and all other Portmadoc slates. Their durability means not only ability to withstand the ordinary atmospheric influences under constant exposure on a roof, but also to last practically indefinitely under the severe conditions imposed by the acid-charged atmosphere of our great towns. The thousands of roofs throughout this country and abroad that have been roofed with Portmadoc slates for periods of fifty years and upwards are conclusive evidence on this point. It is these inherent, rather than apparent, qualities of strength and durability that most distinguish genuine Portmadoc slates from many others.

To return to the "Old Vein," however, the colour, as is generally known, is a blue grey, and this colour, as a general description, is again common to all Portmadoc slates. Though the colour of the slates from all the veins shows but little difference, "Old Vein" slates are more blue and less grey than any others. They probably show a truer blue than any other slate on the market. Let it here be said that no Portmadoc slates are in the least black in hue. This is worth remembering, as there are certain inferior qualities of slates, which quickly perish, that are sometimes offered as "Portmadocs" and which have a decided blackish appearance. The surface of an "Old Vein" slate is dull, never shiny, but very close-grained and fine looking.

The quarries at the present time working in the Old Vein are the Oakeley, Messrs. J. W. Greaves & Sons, the Maen Offeren, the Votty and Bowydd, New Rhosydd, Diphwys Casson, Park and Croesor, and Glanrafon.

QUARRYING "OLD VEIN" SLATE IN OPEN, FESTINIOG.

Among other important buildings, the new Palace of Peace at The Hague is at the present time being roofed with best Old Vein slates from the Oakeley quarries.

*The New Vein.*—The New Vein is perhaps the next in importance to the Old Vein, or at any rate has been so in the past, though the Back Vein, which is now being worked by three of the principal quarries, bids fair to rival it in the matter of output. The slates from the New Vein are of a somewhat rougher texture than those of the Old Vein. The surface is coarser and more gritty, and the colour perhaps rather more grey and less blue. Some of the better beds worked in this vein, however, produce a very high-class of slate. Messrs. J. W. Greaves & Sons at the present time work some of the finest beds ever encountered in this vein, for which they have adopted the trade name of Deep Vein by way of distinguishing them from the general ruck of New Vein slates, which are of scarcely equal quality.

The Oakeley Company turn out from the New Vein some heavy slates $\frac{1}{3}$ inch to $\frac{1}{2}$ inch thick in random sizes. These make a very striking and picturesque roof when laid in diminishing courses. Such a roof was exhibited by this company at the Building Trades Exhibition held at Olympia last spring, and attracted much attention from architects.

The quarries working New Vein are the Oakeley, Messrs. J. W. Greaves & Sons, and Diphwys Casson.

*The Back Vein.*—The peculiar feature of the Back Vein is that the cleavage surface generally presents a slightly stripy or, as it is locally called, "barred" appearance, and also in places shows a faint mottling, which, though highly characteristic, is only discernible on close observation. The banding is more a matter of a difference in texture than in colour, and is not distinctly observable except at close quarters. It is altogether a different thing, as far as appearance and effect go, to the dark bands known as "ribbons" which cut across certain Pennsylvania slates, or the light green bands found in some of the Bangor purple slates. The bands are caused by the cleavage cutting across the original bedding of the rock, and as there is often misconception on this point it should perhaps be added that there is no tendency for the slate to break in the direction of the band. In the geological process of formation into slate the beds have been consolidated and cemented together into one mass. So thoroughly has this process been carried out in the case of the Back Vein slates that if broken under pressure they yield more readily in a direction at right angles to the original bedding than in the direction of the bands or "bars."

It is a question if the lack of uniformity in appearance in the Back Vein is any real disadvantage to the slates when placed on a roof, but in the trade at least a slate of plain and unstreaked surface like the Old Vein is generally preferred. Back Vein slates, as well as New Vein, are accordingly placed at a somewhat lower price than Old Vein, and with this in their favour find a very large sale in the home market.

The Votty and Bowydd and Maen Offeren quarries produce the largest quantity of Back Vein slates. The vein reaches its largest development in these two quarries, and nowhere else is it extensively worked, though Messrs. Greaves's quarry produces a certain quantity of slates from it.

*The North Vein.*—This vein is not worked to any great extent at the present time, but has been worked in recent years by the Oakeley Company, and some time ago by the Maen Offeren Company. Most of the slates obtained from it are of much coarser texture than those from the other veins. The cleavage is not very good, and hence it is difficult to make any but heavy slates from it. Where a thick, rough-surfaced slate is required the North Vein slates make a very strong and substantial roof. The colour is somewhat darker and less blue than Old Vein.

*Craig Ddu and Bwlch Slater Vein.**—The Craig Ddu and Bwlch Slater quarries work a slate vein which cannot be identified with any of those previously described. The slates from it, however, somewhat resemble Back Vein. They are barred in a similar manner to the Back Vein slates, have a very fine-grained surface, and are noted for their strength, straightness, and entire freedom from iron pyrites. The cleavage in the best beds of this vein is excellent and permits of the slates being split to any thickness.

*Wrysgan Veins.*—The Wrysgan quarry works two veins which are known as the Upper and Lower Veins. These again cannot be identified with those worked in any of the other quarries. Of the two the Upper Vein produces the superior quality of slates. The cleavage in this vein is good, and the slates made from it are straight and have a smooth surface.

The cleavage of the Lower Vein is not so well developed as that of most of the Festiniog veins. The slates made from it are therefore rather thick. They are also barred, but are a good strong slate of a heavier type than the average product of the Festiniog quarries.

The illustrations accompanying this article show typical quarry scenes.

SPLITTING PORTMADOC "OLD VEIN" SLATES.

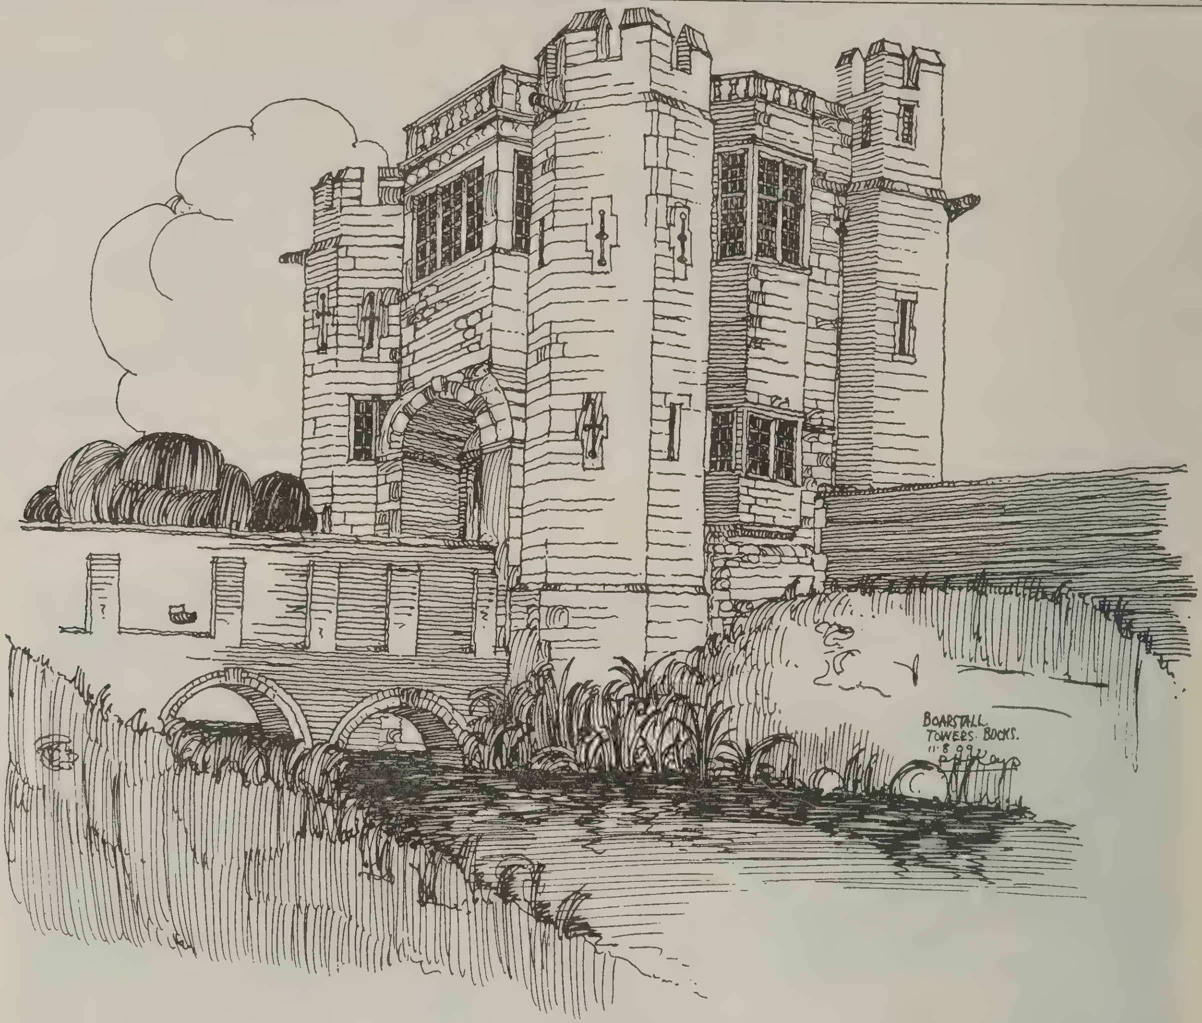
The first shows men quarrying the slate rock in the open workings, where the cleanness of the natural joints is seen to the best advantage, a special feature of the Festiniog quarries. The second is a view in one of the slate mills of a slatemaker splitting slates. In this the wonderful cleavage and great strength of the rock is well demonstrated by the long split in the large-sized slate the man is making with his chisel.

The photographs from which the blocks were obtained were taken by Mr. J. C. Burrow, of Camborne, Cornwall.

THE Kent Education Committee have approved plans for the enlargement or the erection of the following schools:—Cliffe Council, infants, accommodation 80; Guston (voluntary), mixed and infants, present accommodation 84, increased accommodation 106, new class room; New Romney (voluntary), mixed and infants, present accommodation 227, increased accommodation 264, new class room.

---

* It was stated in the previous article that this vein and the Wrysgan vein might be the same. The writer has since been advised that there is no foundation for this.



BOARSTALL.
TOWERS. BUCKS.
11.8.99.
P.H. Keys

BOARSTALL TOWERS, BUCKS.—From a Sketch by Mr. P. Hubert Keys.

This old keep, on the borders of Oxfordshire, is all that remains of a fine old Tudor mansion destroyed during the Civil wars.

## COMPETITIONS.

Acton.—The R.I.B.A. Competitions Committee are considering the conditions of the competition for a new school at Acton, London, W., with a view to their amendment.

Ireland.—The Royal Institute of the Architects of Ireland report that the conditions attached to the competition for new Council offices for the Meath County Council are unsatisfactory.

Scotland.—The conditions of the Renfrew Parish Council competition, which were criticised in our issue of March 4, have been considered by the Glasgow Institute of Architects. Members have been informed that they should refrain from competing.

Walsall.—The Secretary of the Royal Institute of British Architects desires us to announce that the Competitions Committee are considering the conditions of the Walsall (Bloxwich) school competition with a view to their amendment.

## CORRESPONDENCE.

Messrs. Hofler, Ltd., Soho Square, W., ask us to publish the following letter:—

Central Criminal Court,
City of London, E.C.:
March 15, 1910.

Messrs. Carl Kleinhans, Alexander George Lee
and Ernst Haensel, separately.

Dear Sirs,—Having libelled you in certain letters written by me to you and to other persons, including Mr. Shand Kydd, and having been committed to take my trial in respect of such libels, I desire to retract and withdraw the whole of such libellous statements and to admit that there is no foundation for the charges I have made against you.

I further undertake to pay the costs of the proceedings as between solicitor and client forthwith.

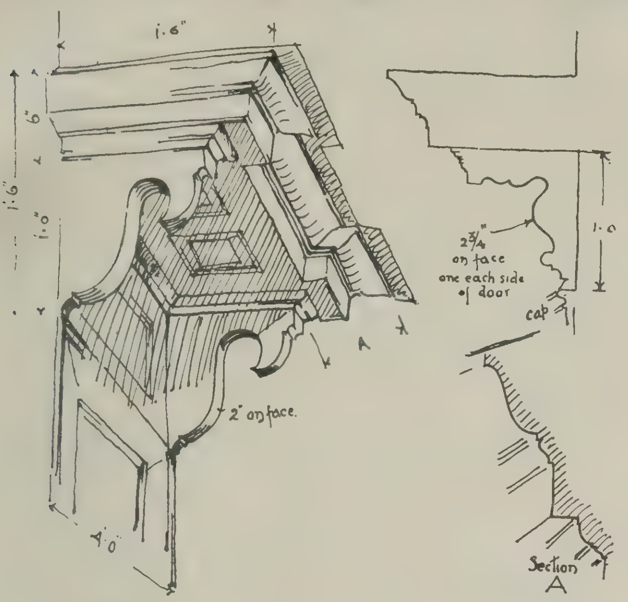
My explanation is that the letters complained of were written by me whilst I was in a state of mental collapse resulting from overwork, excitement and grave disappointments, which caused me to labour under misapprehensions which during severe strain became exaggerated out of all proportion, and prompted me to make statements which, after due reflection in a state of composure, I deeply regret and unreservedly withdraw. I desire sincerely to apologise to you and all others concerned, and solemnly promise not to repeat such conduct, but, on the contrary, to make good, as far as is in my power, any harm that may have accrued therefrom.

You are at liberty to use this apology in any manner you may think fit.

(Signed) Wilhelm Hofler.

The Egyptian Customs Authorities invite tenders for the rebuilding of the burned tobacco stores of the Customs House at Cairo. Tenders must be made out on stamped paper (obtainable from Mr. A. L. Webb, C.M.G., Queen Anne's Chambers, Broadway, S.W.), and sent to the Director-General of Egyptian Customs, Alexandria, before March 31. A deposit of E4,000*l*. will be required with each tender. It is to be noted that legal domicile in Egypt is necessary. Copies of the plans, specifications, &c., may be seen by British contractors at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

The Edinburgh and District Water Trustees have decided to print the following notice on the assessment notices:—"The Trustees beg to draw the attention of occupiers of houses to the importance of seeing that their cisterns are cleaned out once every six months, or oftener if required by the authorities. This should be done by brushing only, and there should be no scrubbing with freestone, sand, or chemicals. Particular care must be taken that the cisterns are all kept securely covered by a close-fitting lid, in order that dust and other matter may be prevented getting into them and contaminating the water."



A DOORHEAD. From a Sketch by Mr. Banister F. Fletcher, F.R.I.B.A.

## TRADE NOTES.

Messrs. Chas. Knowles & Co., Ltd., have removed their West End show room to 495 Oxford Street, just near the Marble Arch. These are larger and more convenient premises, and afford special opportunity for a good display of their art wall papers.

The Northern Asphalte Co. send out from the Standard Works, Leeds, an enormous quantity of pure bitumen damp-proof courses. Their "Dreadnought" quality, in rolls of 8 yards long, has been approved under the Manchester and Salford new building by-laws. It is a good thing to stock, as it does not stick together when rolled.

Messrs. Wm. Moore & Co., Lauderdale Buildings, Aldersgate Street, E.C., have just issued a new leaflet price list of their dust-sheets for decorators, &c., their cleaning requisites, tarpaulins, and other specialities. The strong special calico dust sheets are stocked in four sizes from 10 feet by 6 feet to 12 feet square, but any other size will be quoted for. Messrs. Moore are willing to send all their articles for inspection.

The Wellington Tube Works, Ltd., Great Bridge, Tipton, have prepared and copyrighted an approximate net price list which should be of great value to plumbers, gas-fitters, and other users of tubes. At present buyers are hampered by an intricate system of discounts. This will now be obviated by the tabular list of the Wellington Tube Works, which gives in the top line the internal diameter of gas, steam and water tubes from ⅛ inch to 6 inches, while below it, arranged in columns, is the corresponding gross price per foot, and then the net cost at discounts from 35 per cent. to 90 per cent. The various discount prices can thus be seen at a glance. The idea is an excellent one, and should be heartily welcomed by harassed purchasers. A copy of the card will be sent on application.

A description recently appeared in the *Daily Telegraph* of the lift installation introduced into the Royal Liver Building, Liverpool—the first British skyscraper. The contract (which is the largest ever placed with a British firm for the equipment of one building) was let to Messrs. R. Waygood & Co., Ltd. The American idea of arranging the lifts in batteries is carried out. Right in the centre of the building there will be a battery of ten lifts. Of these six will be called "express" lifts. They will move at a speed of 400 feet per minute, and will only stop at certain floors. There is also a battery of four similar lifts at the pierhead entrance, with another lift at a private entrance. The signalling arrangements for the lifts are right up to date. The device is ingenious. A passenger on entering the building can tell at a glance which lift will be available to take him to the floor which he desires to reach. The various lift attendants can communicate with each other when a signal is received. Telephones and automatic lights are used.

On the occasion of the opening of the Hospital for Invalid Gentlewomen, Lisson Grove, by the Prince and Princess of Wales last week, the automatic electric passenger lift installed by Smith, Major & Stevens, Ltd., was used by their Royal Highnesses. This machine is up to date in every respect. No attendant is required. On each floor served is a button push, momentary pressure of which will call the lift if not already in use. When it arrives at the landing the door may be unlocked and the cage entered. After entering the cage the landing door must be again closed and locked by the simple movement of a lever, otherwise the control circuit is interrupted and the cage cannot be moved. In the cage are placed button pushes corresponding to the floors. The pressure of any button will send the cage to the corresponding floor. A stop button will stop the cage if a wrong button has been pressed. When the lift is in use all the controlling buttons are dead, so interference when the passenger is using the lift is impossible. No door can be unlocked or opened when the cage is not standing opposite that particular door. The action of locking a door simultaneously restores the electric circuit. We understand Messrs. Smith, Major & Stevens, Ltd., have recently erected eight lifts worked on this principle at the new offices of the *Morning Post* newspaper, Strand.

## EASTER HOLIDAY ARRANGEMENTS.

The special programme of excursions issued by the Great Central Railway contains an almost unlimited choice of resorts suitable for all tastes and requirements. The arrangements for Thursday, March 24, embrace nearly 600 seaside and inland resorts, extending through the Midland Counties, Yorkshire, Lancashire, North-East and North-West Coasts, and North of England generally. Arrangements have been carefully made to shorten the journey of the long-distance traveller by bringing his destination as near to London as possible in point of time. Special corridor trains leave Marylebone on Thursday, March 24, at 8.45, 10.0 a.m., 12.5 p.m., 3.15, 3.20, 4.30, 6.20, 10.0 p.m., and 12.30 midnight; and special trains will also be run on Good Friday, Saturday, Sunday, and Monday (Bank Holiday).

Other noticeable features of the programme are the issue of Saturday to Monday week-end tickets, frequent day and half-day facilities to the picturesque and historical villages in Middlesex, Herts, and Beechy Bucks. Special low fares are announced for walkers and cyclists available from Marylebone by any train on any day, and from Saturday to Monday. Copies of this comprehensive publication may be obtained free of charge at Marylebone Station, Great Central Company's Town Offices and Agencies, or by post from Publicity Department, 216 Marylebone Road, N.W.

Excursion tickets will be issued by the South Eastern and Chatham Railway to Paris by a special service, *viâ* Folkestone and Calais, leaving Charing Cross at 2.50 p.m. on March 24, reaching Paris at 10.50 p.m., also *viâ* Folkestone and Boulogne, by the services leaving Charing Cross at 10.0 a.m. and 2.20 p.m., on March 23, 25 and 26, and at 10 a.m. on Thursday, March 24, and by the Night Mail Service leaving Charing Cross and Cannon Street at 9.0 p.m. each evening from March 23 to 26 inclusive, *viâ* Dover and Calais. Returning from Paris at 8.20 a.m. or 2.30 p.m., *viâ* Boulogne, or 9.15 p.m. *viâ* Calais any day within fourteen days. A special service to the French Riviera, *viâ* Folkestone and Calais, by which cheap tickets to Cannes, Nice, Monte Carlo, Mentone, &c., will be issued, leaving Charing Cross at 2.50 p.m. on March 24. A cheap excursion to Boulogne will leave Charing Cross at 2.20 p.m. on Saturday, March 26, and Sunday, March 27; returning at 12.0 noon, or 7.10 p.m. on Easter Monday. The Casino at Boulogne will be open from March 24 to 29 inclusive. Similar tickets will also be issued to Calais. On Good Friday, Easter Sunday and Easter Monday, special day excursions will be run to Boulogne and Calais. Special cheap eight-day return tickets to Amsterdam, The Hague, and other Dutch towns, *viâ* Queenboro' and Flushing, will be issued from March 23 to 28 inclusive, leaving Victoria and Holborn at 9.42 a.m. Cheap eight-day return tickets to Ostend will be issued from March 23 to 28, inclusive. During the holidays the Continental services will run as usual. A special Restaurant Car Express Service to Switzerland, *viâ* Dover, Calais, Laon and Bale will leave Victoria at 8.50 p.m., Herne Hill 8.55 p.m., Charing Cross 9.0 p.m., and Cannon Street 9.5 p.m. on March 24.

Return tickets to Tunbridge Wells, St. Leonards, Hastings, Bexhill, Canterbury, Whitstable, Herne Bay, Birchington, Westgate, Margate, Broadstairs, Ramsgate, Sandwich, Deal, Walmer, Dover, Folkestone, Shorncliffe, Hythe, Sandgate and New Romney (Littlestone-on-Sea), will be issued from London and certain suburban stations by any train (mail and boat expresses excepted) on March 24, 25, 26 and 27, available for return on or before March 29, but not on day of issue. Cheap day excursions on Good Friday and Easter Monday will be run from the principal London stations to Ashford, Canterbury, Deal, Tunbridge Wells, Hastings, Bexhill, Whitstable, Herne Bay, Ramsgate, Broadstairs, Margate, Sandgate, Folkestone, Dover, &c. On Easter Monday cheap day tickets will be issued to many places of interest, and from London to the Crystal Palace (High Level), including admission. Full particulars of the Continental and home excursions, extension of time for certain return tickets, alterations in train services, &c., are given in the special holiday programme and bills.

---

For visiting Holland and Germany during the Easter holidays the Great Eastern Railway Company's Hook of Holland route offers exceptional facilities. Passengers leaving London in the evening, and the northern and midland counties in the afternoon, arrive at the chief Dutch cities next morning. A corridor restaurant train is run between London and Harwich. From the Hook of Holland through carriages and restaurant cars run in the north and south German express trains, reaching Cologne at noon, Bale and Berlin in the evening. Reduced fares have been arranged by the Harwich-Antwerp route for passengers wishing to visit Brussels. Tickets dated in advance can be obtained at the Liverpool Street Station Continental inquiry or booking offices. The Danish Royal mail steamers of the Forenede line of Copenhagen will leave Harwich for Esbjerg (on the west coast of Denmark) on Thursday, March 24, Saturday, March 26, returning March 29 and March 30. The General Steam Navigation Company's steamers will leave Harwich for Hamburg on March 23 and 26, returning March 26 and 30.

---

## VARIETIES.

The Tiverton Town Council, having decided to erect a new boys' school in Westexe, recommend the education committee to throw it open to competition, but without any premium.

The Maxwelltown Town Council have passed plans for a factory to be erected in King Street, Maxwelltown, for Mr. J. Steel for the manufacture of gloves and neckties. The plans provide accommodation for forty workers in the first instance, and there is room for future extensions.

A students' conversazione in connection with the Polytechnic Schools of Engineering and Architecture was held on the 11th inst. in the Regent Street premises. Mr. A. Dykes Spicer distributed the medals, prizes and certificates gained during the year.

A company is in process of formation for the erection of a Queen's Hall in Northumberland Street, Newcastle-on-Tyne. The building is estimated to cost 32,000*l*. The plans, which have been passed by the Corporation, were prepared by Messrs. Graham & Hill, architects, of Newcastle.

The Sheffield and Ecclesall Co-operative Society have adopted a scheme for the erection of a new central store in Sheffield. The premises and offices will have a frontage of 80 feet to Ecclesall Road and 100 feet to Cemetery Road. The plans have been prepared by Mr. H. L. Paterson, A.R.I.B.A., Sheffield.

A cargo of about 350 tons of grey granite blocks has been sent over from the United States to Aberdeen by the Douglas Granite Company. If the experiment is successful a further 1,000 tons will be immediately shipped. A similar attempt at importation failed about fifteen years ago owing to the cost of the imported material.

The Co-partnership Tenants have, it is said, acquired the Childwall Estate, near Liverpool, amounting to 170 acres, from the Marquis of Salisbury. The Childwall scheme provides sites for some 1,200 houses with gardens, after leaving ample space for avenues, tennis lawns, recreation grounds, and sites for halls and other social institutions.

The Woking Urban District Council have approved the architect's plans of the technical institute and secondary school, which had been prepared for submission to the Board of Education, and a copy of the quantity surveyor's estimate, from which it appeared that the estimated cost, irrespective of the purchase of the site, would be 23,397*l*.

A company has been formed to erect "silos" (storehouses) at Rotterdam for cleaning, drying and storing grain. Application is to be made to the Town Council for a site alongside the Maas Harbour, and a contract is to be entered into with the port authority for the supply of electric power. The estimated cost of the buildings and the electric installation is stated to be 58,000*l*.

The Faversham Town Council have resolved to apply to the Local Government Board for sanction to a loan of 37,483*l*. for the sewage disposal scheme. The total is divided into four separate amounts, viz., 3,700*l*. for land (repayable in sixty years), 25,624*l*. for works, buildings, &c., (repayable in thirty years), 4,342*l*. for machinery (repayable in fifteen years), and 4,177*l*. for other purposes (repayable in thirty years).

An influential British committee is being formed in connection with the International Hygiene Exhibition at Dresden in 1911. All the countries of Europe, the United States, Mexico, Argentine, and Japan, are to take part in the exhibition. The scientific department will have twelve principal group classifications, of which the two first are:—(1) Air, light, soil, water; (2) settlements and dwellings, including houses and habitations, light, heating, water supply, &c.

The *Diario Oficial*, of Uruguay, publishes a notice inviting tenders for the construction of two warehouses and six storing depôts for the Montevideo docks. The buildings are to be of reinforced cement. Tenders, which will be opened on June 1, should be addressed to the "Consejo de Administración del Puerto de Montevideo (Oficina de Trafico y Conservación), Calle Cerrito 185," Montevideo. Plans and specifications relative to the above may be seen at the same address.

According to the *Rangoon Gazette* of February 14, the administration report of the Public Works Department of Burma for 1908-9 states that works are projected at a total approximate cost of 58 lakhs. Amongst these are the following:—Contagious diseases hospital at Kandawgalay, 2 lakhs; smallpox hospital at Kambe, 3¾ lakhs; additional accommodation for Rangoon town police, 5 lakhs; central lunatic asylum, 10 lakhs; extensions to Rangoon College, 4 lakhs; Rangoon Museum, 3 lakhs. (Lakh = 100,000 rupees = 6,667*l*.)

The Council of the Royal Institute of the Architects of Ireland held a meeting last week, when a letter was read from the city treasurer with reference to the proposed extension of the municipal buildings, Dublin, and it was decided to ask the Corporation to receive a deputation from the Council on the subject of instituting a competition for the buildings, limited to architects practising in Ireland. The question of a competition for the new University buildings was also under consideration.

The Liverpool Workhouse Committee will shortly carry out improvements at the Brownlowhill Workhouse in consequence of representations by the Local Government Board. It is proposed, amongst other things (1) that two additional sanitary towers be erected in connection with the men's hospital, one adjoining the acute wards and the other in connection with the infirm wards; (2) that the central sanitary tower on the female side of the hospital be enlarged; (3) that the whole of the kitchen, scullery and bath accommodation of the lying-in wards be reconstructed; (4) that a lift be provided in connection with both men's and women's hospitals. The cost is estimated roughly at 8,000*l*.

The Glasgow master joiners and their men having failed at their conciliation board to settle their present difference as to hours and wages, the matters in dispute will go before a conciliator nominated by the Board of Trade. The men asked for an eight-hours' day for the first five days of the week, and four hours on Saturday, making forty-four hours per week, as compared with fifty at present, and also for an advance of wages from 9*d*. to 10*d*. per hour. The employers, on the other hand, wish the working hours to be fifty-one per week, and they decline to grant any advance of wages. They wish the joiners to work one hour more on Saturdays than at present, so that they may stop at the same time as their other men.

The Agent-General for Queensland has received a letter from a working carpenter who arrived in the State early last year from England, which indicates how great is the demand for labour in Northern Queensland. He says:—"I arrived early in January 1909; I soon got employment near Cairns, North Queensland. During the year I have been in the State—I arrived with only 3*l*. 11*s*. in my possession—I have paid all my living expenses, and now have to the credit of my banking account, saved out of earnings, the sum of 80*l*., to which I expect to add considerably during the present year. I am still doing well."

Proposals are under consideration for remodelling and extending the Royal Exchange buildings in Glasgow, with the view of providing better facilities for the members. The plans comprise an extension of the general meeting room, and the addition of more convenient writing, reading, smoking, and cloak rooms, &c.; and they also provide for modernising the present letting offices, and increasing their number by the addition of one or more storeys. The extra storey or storeys will be confined to the western portion of the building, so as to avoid any interference with the fine front in Ingram Street. The plans have been prepared by Mr. Alexander N. Paterson, architect, Glasgow.

An inquiry was held last week in the Council Chambers, Govan, into an application by the Town Council to the Secretary for Scotland for a Provisional Order to authorise them to increase their borrowing powers in connection with the sewage scheme from 20,000*l.* to 73,000*l.* The former sum was authorised under the Act of 1898, but in the interval the scheme has been greatly extended. When the original estimates were framed, 10*l.* per yard was generally accepted as an outside figure to allow for construction of sewers such as were required for Govan, but experience both of contractors and Glasgow Corporation showed that the cost was as much as 25*l.* per yard. Another reason is that the boundaries have been extended, and there is a considerably longer sewer to be constructed. Mr. F. G. Holmes, burgh engineer, Govan, and Mr. William Cecil Easton, C.E., Glasgow, explained the scheme.

Mr. William M. Mitchell, R.H.A., died on Saturday at his residence, Abbeylands, Killiney, at the age of sixty-seven. He had been in delicate health for the past few months. Mr. Mitchell was a well-known architect and a past President of the Royal Institute of the Architects of Ireland. He designed several important public buildings, amongst which were the City of Dublin Technical Schools, the Masonic Female Orphan School, the Métropole Hotel, Dublin, Messrs. Todd, Burns & Co.'s new premises in Mary Street, the Spa Hotel, Lucan, the Methodist Church, Clontarf, &c. For some years past his two sons have been associated with him as partners, and they will carry on the practice.

## THE CANAL COMMISSION REPORT.

In 1906 the Royal Commission appointed to inquire into and report on the Canals and Inland Navigations of the United Kingdom began their sittings. The order of the inquiry was drawn up as follows:—(1) Their present condition and financial position; (2) the causes which have operated to prevent the carrying out of improvements by private enterprise, and whether such causes are removable by legislation; (3) facilities, improvements and extensions desirable in order to complete a system of through communication by water between centres of commercial, industrial, or agricultural importance, and between such centres and the sea; (4) the prospect of benefit to the trade of the country compatible with a reasonable return on the probable cost; and (5) the expediency of canals being made or acquired by public bodies or trusts, and the methods by which funds for the purpose could be obtained and secured; and what should be the system of control and management of such bodies or trusts.

After examining 266 witnesses and having 106 sittings, the Commissioners drew up the following recapitulation of the more important steps to be taken to give effect to the policy of unifying inland waterways. Except in regard to the first of these steps, viz., the formation of a Waterway Board, which they describe as "the most urgent part of our recommendations," they say:—"We do not wish to attach importance to the exact order in which each successive measure should be adopted. We desire rather again to indicate that the work of carrying our entire scheme into effect must be gradual—although we trust that it may be continuous—each stage of the execution of the scheme being necessarily preceded by a careful estimate of the probable cost of improvement, and of the prospects of traffic and of an adequate return, direct and indirect, on this expenditure."

The summary of recommendations is as follows:—

"The financial assistance which we recommend that the State should give first, for the acquisition, and secondly, towards the improvement of waterways is already indicated. We have made suggestions on the subject of local assistance, either in contributions, or local works, or guarantees, or otherwise. It would be necessary to ascertain, as regards each successive measure of improvement which the Waterway Board take up, to what extent assistance would be rendered by some at least of the localities and interests that would receive benefit.

"We further recommend:—

"1. That the first measure should be the appointment of a central Waterway Board for Great Britain.

"2. That, either by the Act constituting that board, or in an early scheme proposed by them and submitted to Parliament, the waterways comprised in the four main routes which we have described should be vested in the board, to whom the administration of all waterways vested in them should be entrusted.

"3. That if, for financial or other reasons, the larger works of improvement, which we should desire to see commenced at once, have to suffer some postponement, the unification of these waterways and the transfer of their administration to the Waterway Board should nevertheless be effected without delay. We consider that this will be a most important step forward, especially if accompanied (*a*) by such minor improvements as the Waterway Board may consider desirable, and (*b*) by some reduction of tolls consequent on unification.

"4. That, on appointment, the Waterway Board should review the whole situation on the lines of practical business indicated, with special regard to finance and the benefit to trade and public interests, to the extent of local assistance, to prospects of traffic, and to competition with railways. If satisfied that the improvement of the four main routes, or of one or more of them at a time, would be desirable, on these lines, the Waterway Board should propose a scheme or schemes for submission, if approved by your Majesty's Government, to Parliament. If the alternative course set forth be adopted, such scheme or schemes will be submitted in the first instance to the Development Commissioners.

"5. That, when satisfied of the expediency of acquiring and unifying any further waterways, either as branches or feeders of the main routes, or subsequently in other parts of England and Wales, or at any time in Scotland, the Waterway Board should propose further schemes from time to time. These schemes would set forth the nature and extent of the improvements proposed to be carried out by the Waterway Board on each waterway.

"6. That the acquisition of any British waterways of importance now in the hands of railway companies should be included in one or more of the earlier schemes.

"7. That the Caledonian and Crinan Canals, and the projects for their improvement, should be among the interests confided to the care of the Waterway Board.

"8. That it is worthy of careful consideration whether the collection of information as to the flows of rivers and streams, and as to water-supplies in the districts of Great Britain where there are navigable waterways, should not also be entrusted to the Waterway Board.

"9. It should also be considered in the future whether this board should not be assisted by local advisory committees, representing local interests at the more important centres of origin or delivery of traffic.

"10. That the alterations in the existing laws or principles of procedure indicated in our report as desirable should be considered."

## TRADE MARKS OF CONSTRUCTIVE MANUFACTURERS.

We have received from L'Agence de Brevets et Marques de Fabrique, Jacques Gevers et Co., 70 Rue Saint-Jean, Antwerp, the following list of trade marks published in December 1909 and January 1910:—

ENGLAND.

*Cement.*

| | |
|---|---|
| "Feusol" | Kerner-Greenwood & Co., St. Ann's Offices, St. Ann's Street, King's Lynn, Norfolk. |
| "Vianex" | The Barnstone Blue Lias Lime Co., Ltd., Barnstone, Nottinghamshire. |

*Constructive Materials.*

| | |
|---|---|
| "Copenacre Ground" | The Bath Stone Firms, Ltd., 6-7 Kingston Buildings, Abbey Yard, Bath, Somersetshire. |
| "Nipsol" | William Bennett Snell, Treville Street, Plymouth. |
| "Dainty White" | G. & T. Earle, Ltd., Dalton Street, Wilmington. |
| "Erlite" | G. & T. Earle, Ltd., Dalton Street, Wilmington. |
| "Knowlit" | William Humphrey Knowles, Queen's Road, Battersea, London, S.W. |
| "Carbojen" | C. Jennings & Co., 146 Pennywell Road, Bristol, timber merchants. |
| "Neumonite" | F. Chiesman & Co., 14-20 St. Mary Axe, London, E.C. |

| | |
|---|---|
| “Stocal” | The Permanent Decorative Glass Co., Ltd., Queen's Mill, Queen Street, Lancaster. |
| “Permatilhic” | George M. Callender & Co., Ltd., 25 Victoria Street, London, S.W. |
| “Purexide” | Purex, Ltd., Greenford Colour Works, Greenford Green, Harrow. |
| “Teakoid” | John Broadfoot & Sons, Ltd., Inchholm Works, 6 James Street, Whiteinch, Lanarkshire, N.B. |
| “Permanent” | William Miller, 29 Mowbray Street, Nottingham. |
| “Marbeletic” | Marchetti Brothers, 73, 75 and 77 Copnor Road, Portsmouth. |
| “Muribloc” | Muribloc, Ltd., Prince's Wharf, Jew's Row, Wandsworth, London, S.W. |
| “Tarafirma” | Tarafirma, Ltd., 17 Victoria Street, Westminster, London, S.W. |
| “Sampittic” | John Hutchinson, 141 Ebury Street, London, S.W. |

### DENMARK.

*Cement.*

| | |
|---|---|
| “Kongsdal” | Cementfabriken Kongsdal, Aktieselskab, Kobenhagen. |

*Constructive Materials.*

| | |
|---|---|
| “Kongsdal” | Cementfabriken Kongsdal, Aktieselskab, Kopenhagen. |

### GERMANY.

*Cement.*

| | |
|---|---|
| “Zullichol” | Carl Züllich, Leipzig, Lindenau. |
| “V.S.” | Valentin Schultheiss, Kulmbach, Bahnhofspl. |
| “Rennes” | Fränkische Portland-Cement- und Kalkwerk-Akt.-Ges., Hersbruck. |

*Constructive Materials.*

| | |
|---|---|
| “Anker” | Hermann Paul, Breslau. |
| “Rat” | Arnold Otto Meyr, Hamburg. |
| “Engelswerk” | Engelswerk, C. W. Engels, Foche b. Solingen. |
| “Kamel” | Frank Reddaway, Wien. |
| “S.S.” | Engelswerk, C. W. Engels, Foche b. Solingen. |
| “Schwa-wu” | Henry Zitzer, Hamburg. |
| “Silesia” | Carl Henckell, Hamburg, Hopfenfack. |
| “Triumph” | Carl Henckell, Hamburg, Hopfenfack. |
| “V.” | Carl G. Voigt, Hamburg. |
| “Singa” | Barmer Export-Gesellschaft mit beschränkter Haftung, Unter-Barmen. |
| “A B C” | J. D. Schmidt & Lohmann, Remscheid-Bieringhausen. |
| “Hœstatia” | Carl Henckell, Hamburg, Hopfenfack. |
| “Sirius” | Carl Henckell, Hamburg, Hopfenfack. |
| “Plastrumit” | Senfarth, Hamburg, Neueberg. |
| “Gluckskugel” | J. E. Evers, Wansbek. |
| “Acta” | Anhaltische Tonwerke A. Wilkendorf, Coswig, Anhalt. |
| “Schilpp's Ideal-Estrich” | Schilpp & Wolff, Frankfurt a. M. |
| “Petrefakt” | Ludwig Kerkow, Gross-Buchholz b/Hannover. |
| “Höllenstein” | Deutsche Glascementwerke, G.m.b.H., Kiel-Gaarden. |
| “Durolith” | Durolith-Werke, G.m.b.H., Hamburg. |
| “Fiat” | Westfalia Fabrik dekorativer Wandbekleidungen, G.m.b.H., Hilchenbach. |
| “Radium” | Albert Carl, Nirdorf, Berlin. |
| “Zullichol” | Carl Züllich, Leipzig, Lindenau. |
| “V. S.” | Valentin Schultheiss, Kulmbach. |
| “Ultra-Capital” | Seebohm & Dieckstahl, G.m.b.H., Mannheim. |
| “Jungfer” | Wilhelm Michael Dubois, Frankfurt a. M. |
| “Huralumin” | Dürener Metallwerke, Aktien-Gesellschaft, Düren. |
| “J. E. P.” | Eugen Post, Cöln, Lindenthal. |

### BELGIUM.

*Cement, &c.*

| | |
|---|---|
| “Le Plomb” | Société Anonyme des Carrières de Baulx et de Gaurain-Ramecroix (anciens établissements Alex. Dapsens), Baulx p. Tournai. |

| “T. V.” | Neuchâtel Asphalt Co., Ltd., London. |

The Edinburgh Town Council have approved of a revised plan for the second portion of the buildings completing the Municipal College of Art. The estimate of the approximate cost is 70,000*l*. An appeal will be made for the 12,000*l*. required to reach that sum.

The Hampstead Borough Council has decided to purchase a strip of land adjoining the town hall for the purpose of erecting additional offices thereon. The strip is a quarter of an acre in extent, and the purchase price is 3,500*l*.

A slight improvement in the Welsh slate trade has been noticed for some weeks past, and it is believed that greater steadiness in the political situation would mean an immediate change for the better.

The new Post Office, Worksop, is being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet ventilators. The Cottage Hospital, Marlston, is being warmed and ventilated by means of Shorland's patent Manchester grates and ventilators. The Solihull and Meriden Joint Isolation Hospital is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues, supplied by Messrs. E. H. Shorland & Brother, of Failsworth, Manchester.

The Reigate Mines, Ltd., have opened up the ancient building stone mine at Clears, Reigate. It was the property of Edward III., and was then only used for work in connection with the State. This stone is a very beautiful colour, being a milky cream. Almost all the churches of Surrey have been built with it, Reigate Church being amongst them. Henry VII.'s Chapel in Westminster Abbey is also built with the material. There are some houses in Reigate over 100 years old, in which the stone looks clean and fresh and has not lost its colour. The stone is most suitable for inside work, and it carves excellently. The price is low, being 1*s.* per foot put on rail.

A large church clock has just been erected at Great Weldon, Northamptonshire, which shows time on one dial and strikes the hours. It has been made generally to the designs of the late Lord Grimthorpe by Messrs. John Smith & Sons.

## VARIETIES.

Messrs. Lister & Co., Ltd., plush manufacturers, Attleborough Mills, Nuneaton, propose to erect a large new weaving shed which will accommodate about 500 extra hands.

Mr. J. K. Hunter, architect, Ayr, has been invited by the Ayr Town Council to prepare plans for a pavilion costing about 6,000*l.*, to be erected on the Low Green.

Messrs. Robey E. Carpenter & Co., quantity and measuring surveyors, Leicester, have entirely moved their offices from 7 Humberstone Gate to 112 St. Peter's Road, Leicester. Their 'phone number 4,487 remains the same.

The burgh engineer of Edinburgh has been instructed to prepare a skeleton plan of improvements in certain parts of that city by way of experiment on the lines of the town planning scheme.

The proposal to expend 185,000*l.* in providing additional pier accommodation and otherwise improving the harbour at Douglas, was last week approved by the Manx Legislature, the right to carry out the work in sections being reserved.

The Reading Board of Guardians have adopted the plans prepared by Mr. W. Roland Howell, architect, for the enlargement of the workhouse. The scheme will cost 12,000*l.* By eight votes to seven it was decided that the tenders should be invited from Reading builders only.

Plans have been prepared for a new hotel in New York of twenty storeys high, and containing about 1,000 rooms. It will stand on the opposite end of the block on which stands the Waldorf-Astoria Hotel. The cost is calculated at 2,400,000*l.*

The Manchester education committee recommend the City Council to apply for a loan of 26,000*l.* for the erection of a school of domestic economy on a site at the corner of High Street and Upper Brook Street, which has already been purchased.

The Glasgow Corporation on the 17th inst. adopted a scheme prepared by Mr. A. B. M'Donald, the city engineer, for the demolition of the old property on the Bell Street and High Street area, and the erection thereon of buildings with shops on the ground floor, and fireproof warehouses on the upper floor. The cost is estimated at 28,000*l.*

The Governors of the Glasgow and West of Scotland Technical College have been officially informed that the Scottish Education Department have agreed to give a further grant of 37,305*l.* towards the cost of the completion of the building scheme with the necessary equipment, conditional upon the whole of the works being completed and equipment provided within three years. The total estimated expenditure towards which the grant could be made was 74,611*l.*

A Parliamentary White-paper has been issued showing the 1909 accounts for public offices and buildings. The principal items in the accounts are:—Public offices (Whitehall site), 1,228,827*l.*; Westminster site, 1,710,926*l.*; Science and Art Buildings, South Kensington, 827,360*l.*; completion of Admiralty, including extension, 303,734*l.*; Post Office buildings (Queen Victoria Street and West Kensington), 334,253*l.*; Patent Office extension, 86,433*l.*; British Museum extension, 47,150*l.* Each account includes expenses incurred before 1909.

A dispute between the Aberdeen operative painters and their employers regarding working hours has been settled by the Aberdeen Conciliation Board, to whom a reference was submitted by the parties. The operatives demanded a nine hours' days from April 1 to September 30, an eight hours' day during March and October, and a seven hours' day from November 1 to February 28. The Masters' Guild did not wish to be tied down to any stated times, and desired to leave matters as before. The Conciliation Board has decided that the operatives' demands are reasonable, and express satisfaction at the assurance of the representatives of the parties that in the application of this rule both parties would have reasonable regard to the exceptional circumstances in particular cases.

An attempt to revive interest in Elizabethan architecture is to be made at Olympia next month at the exhibition devoted to the Ideal Home, where the large annexe is to be transformed into a Tudor village with rustic shops ranged in picturesque fashion round the green. There will be the village stocks, the forge, the barber's shop, and the old inn; while close by the brook will fall in a cascade over rocks into the trout pool. To add to the verisimilitude all the occupants of the shops will be firms not less than 100 years old. The Tudor buildings will be historically accurate in every detail.

Some time ago a request was made to the Birmingham Corporation on behalf of the workmen employed in the building trades in the city that the working rules which by agreement between the masters and men govern those trades should be observed by the Corporation in relation to building trade operatives in municipal employment. A joint committee of representatives of the labour-employing committees of the City Council was appointed to consider the matter, and subsequently the various departments were requested to report as to how they would be affected by the adoption of the rules. The reports show that the whole of the departments were unable to agree to the adoption of the proposals in their entirety, and arrangements were therefore made for the partial application of the rules by the Corporation committees.

## INCORPORATED SOCIETY FOR PROMOTING THE ENLARGEMENT, BUILDING AND REPAIRING OF CHURCHES AND CHAPELS.

This Society held its usual monthly meeting on Thursday, the 17th inst., at the Society's house, 7 Dean's Yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. There were also present the Revs. Canon J. Erskine Clarke, H. B. Coward, W. B. L. Hopkins, A. G. Ingram, G. Miller, C. F. Nolloth, G. Pole-Carew, Canon Edgar Sheppard, C.V.O., D.D., Canon H. E. Trotter, and the Master of Magdalene College, Cambridge, Sir William E. M. Tomlinson, Bart., Lieut.-Col. the Hon. G. H. W. Windsor Clive, the Hon. E. P. Thesiger, C.B., Colonel W. F. Tipping, Messrs. George Cowell, W. S. de Winton, E. Lee-Warner, H. W. Mozley, C. K. Norman, J. E. Ollivant, J. C. Powell, L. C. Wakefield and Lewis Wigram.

Grants of money were made in aid of the following objects, namely, building new churches at Birmingham, St. Basil, 130*l.*; Birmingham, St. Benedict, 235*l.*; Beltinge, St. Bartholomew, Kent, 130*l.*; Longton, St. Chad, Staffs., 225*l.*; and Southend-on-Sea, St. Erkenwald, 200*l.*; rebuilding the church of St. Paul, King Cross, Halifax, 250*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Aldrington, St. Philip, Sussex, 100*l.*; Dymchurch, St. Peter and St. Paul, Kent, 25*l.*; Hackney Wick, St. Mary-of-Eton, Middlesex, 75*l.*; Stocklinch, St. Mary Ottersay, Somerset, 15*l.*; and Walpole, St. Peter, Norfolk, 20*l.* Grants were also made from the Special Mission Buildings Fund towards building mission churches at Caergeiliog, near Holyhead, 5*l.*, making in all 20*l.*; Dockenfield, Frensham, Surrey, 35*l.*; Holloway, St. Padarn's Welsh church, Middlesex, 40*l.*; and Litherland, St. Andrew, near Liverpool, 40*l.* The following grants were also paid for works completed:—Southolt, St. Margaret, Suffolk, 15*l.*; Haslington, St. Matthew, Cheshire, 50*l.*; South Perrott, St. Mary, Dorset, 40*l.*; Little Fransham, St. Mary, Norfolk, 15*l.*; Cann, St. Rumbold, Dorset, 15*l.*; Smithfield, Wrexham, Denbigh, 30*l.*; and Fazakerley, St. Nathaniel, Liverpool, 25*l.* In addition to this the sum of 300*l.* was paid towards the repairs of twenty-five churches from trust funds held by the Society.

At this meeting the Rev. T. T. Norgate, F.R.G.S., F.R.Hist.S., secretary of the Clergy Friendly Society, was appointed secretary of this Society to fill the vacancy caused by the recent death of Mr. Joseph Monday.

## COAL v. GAS FIRES.

The Corporation of Glasgow have within the past few months been entering very energetically upon an air purification and anti-smoke crusade. In this connection a valuable report has been prepared on the effect on the atmosphere of the use of gas stoves in dwelling houses by the Corporation chemist (Mr. F. W. Harris), the sanitary inspector (Mr. Peter Fyfe), and the engineer of the Gas Department (Mr. A. Wilson). The tenancy was secured during six months of two dwelling-houses of equal dimensions in all respects and identical as to situation. They were ordinary houses of two rooms and kitchen, on the same flat.

The experiment was conducted on the following lines:—A gas fire was ignited and a coal fire kindled simultaneously in two different rooms, both identical in regard to situation and structural details. Galvanometer readings were taken every ten minutes throughout a period of six hours from 10 A.M. to 4 P.M. The thermopile was placed at the point of maximum intensity on the semi-circle, which point was found to be the centre, at a height of 1 foot both for gas and coal fires. The coal combustion was regulated according to the usual domestic practice—the fire gradually developing into a bright, clear combustion, then allowed to burn itself somewhat low before replenishing with a fresh supply of coal. Experiments were made on two days with different gas fires. Gas fire No. 4 consumed 29.7 cubic feet per hour at a pressure of 16 tenths, whilst the consumpt of gas fire No. 6 was higher, namely, 33 cubic feet per hour at a pressure of 16 tenths.

The radiation efficiency of the gas fires tested, as indicated by the galvanometer readings taken at a height of 1 foot (the position of maximum intensity), and calculated to a standard of 100 cubic feet consumption of gas of a calorific power of 600 B.T.U., was expressed as follows:—No. 1 gas fire, 86; No. 2. 81; No. 3. 70; No. 4. 91; No. 5. 90; No. 6A, 135; No. 6B, 82; No. 7A, 120; No. 7B, 91. Nos. 6A and 6B represented the results of observations of the same fire burning different consumpts of gas. In the case of 7B four of the centre burners were turned off.

The great advantage of a coal fire from the point of view of comfort was that the heat imparted to a room was diffused in the form of radiant heat. The question naturally followed, how did the above figures, expressing the comparative radiation efficiency of various gas fires, compare with the figures obtained under similar conditions for coal fires? A reliable comparison of the radiation efficiency of gas fires was only rendered possible from the fact that the intensity of radiation became practically constant after a certain time. Experiments on similar lines to ascertain the radiation efficiency of coal fires speedily demonstrated that with coal fires the case was quite the reverse. The galvanometer readings fluctuated so rapidly and so widely that any attempt to record a series of readings with the object of calculating the same to a standard of definite coal consumpt and calorific value was rendered futile; in fact, such a record would be not only worthless, but actually misleading. A decision on the comparative heating efficiency of gas and coal depended so much on the comparative radiation efficiency of these fuels when burned under ordinary conditions that, for the purpose of this report, such a comparison becomes essential. If gas fire No. 6 was debarred from the comparison on account of its comparatively high radiation efficiency and gas consumpt and the consideration was limited to the results obtained with gas fire No. 4, whose comparative radiation efficiency was 91, it would be noticed—firstly, that the intensity of radiant heat emitted from a gas fire was very regular, whilst that from a coal fire was subject to extreme and rapid fluctuations; and, secondly, that the radiating powers of a gas fire were much more speedily developed than those of a coal fire. It was obvious that, given a modern, well-constructed gas fire, fitted with gas and air regulators, intelligently fixed and used, the radiation efficiency became a definite asset; whereas the corresponding efficiency of a coal fire, being dependent upon innumerable conditions, could not be designated otherwise than as an indefinite quantity. Another advantage that a gas fire possessed over a coal fire was that its radiation efficiency was to a certain extent under control, which was certainly not the case with a coal fire. The main point for consideration was the percentage of total heat generated by the combustion of gas in the different gas fires which was transmitted to the room in the form of convected heat. The following percentages were obtained:—

| | Percentage of total heat given off as convected heat. |
|---|---|
| Fire No. 1 | 7 |
| ,, ,, 2 | 19 |
| ,, ,, 3 | 13 |
| ,, ,, 4 | 23 |
| ,, ,, 5 | 10 |
| ,, ,, 6 | 16 |
| ,, ,, 7 | 29 |

The tabulated results for the convected heat from a coal fire showed that 2.3 per cent. of the total heat generated from the combustion of coal in an ordinary domestic fire was imparted to the room in the form of convected heat. The percentage of total heat generated and given off in the form of convected heat was therefore greater for gas fires than coal fires. Sufficient evidence was obtained to enable the assertion to be made that at least 75 per cent. of the total heat generated by the combustion of coal in an ordinary domestic fire was lost in the form of flue heat.

In regard to the hygienic efficiency of gas fires compared with coal fires, the report stated that it was an accepted fact that if the carbon-dioxide resulted entirely from respiration, then the proportion of this gas became a direct index of the polluted condition of the air, solely because the quantity of it found was in such cases in direct proportion to other products of respiration organic in nature and toxic in properties. The perfect combustion of coal gas yielded no toxic compounds, and therefore considerably more latitude was permissible in regard to the proportion of carbon-dioxide when a portion of that gas had been derived from combustion. This principle had been adopted by the departmental committee on the ventilation of factories and workshops in deciding upon a legal limit for carbon-dioxide. Another point of considerable importance was that the tests for carbon-dioxide were made after the fires had been burning six hours, so that the reporters could not be accused of putting forward results too favourable to gas fires; on the contrary, the reverse was the case. There could, however, be no doubt that this proportion of carbon-dioxide, due to gas combustion found in the air of a room, was incapable of producing any injurious physiological effect. Coal fire experiments on similar lines were made, and it was found that under normal conditions of chimney draught no waste products, either of complete or incomplete combustion, were bye-passed into the room, whilst the carbon-dioxide content of the air in the room was not materially increased. These results would occasion no surprise when it was stated that the average flow of chimney gases was in the case of coal fires not less than 17,500 cubic feet per hour, which was equivalent to changing the air of a room ten times every hour. Gas fires were equally efficient as ventilating mediums as coal fires, for although only in one case was the volume of waste gases passing up the flue per hour found to approach that of coal fires, yet such an outgoing volume as 17,500 cubic feet was altogether unnecessary. The common objection to gas fires—namely, that they caused undue dryness of the air—was not based upon fact; on the contrary, experiments unmistakably demonstrated that gas fires exerted no more drying effect on the air of rooms than ordinary coal fires.

The total expenditures for the six hours' trial were:—For gas, 4.2912*d.*; and for coal, 2.9062*d.*, or 1.385*d.* in favour of coal. If the price of gas were 16*d.* per 1,000 cubic feet instead of 24*d.*, the cost of these two fires would have been identical, with a manifest advantage from the gas fire in rapid, evenly, and progressive heating power to the maximum and an instantaneous extinction when no longer required. But even with an extra $1\frac{1}{3}$*d.* gas could claim a convenience and simplicity of regulation impossible with coal; a rapidity of effect which coal fires could not attain to; and an absence of dirt and dust and ashes which might easily compensate every cleanly housewife for the fractional saving she could make in money by burning coal. The reporters were therefore of opinion that, even when fires were required for continuous daily use, if gas was burned in properly constructed grates or stoves, and the cost of service for attending coal fires, and the extra work entailed in dusting, sweeping, and washing because of them, were added to the price of the fuel, the cost of heating by gas compared very favourably with the cost of heating by coal. Where domestic cooking alone was the consideration, or when rooms required to be rapidly heated and kept at an even temperature for short periods, gas fires were not only more convenient, but would cost less than coal fires even with gas at its present price.

In regard to the effects a more general adoption of gas firing in dwelling-houses and other occupied premises would have on the atmosphere of the city, the report stated that the perfect combustion of either gas or coal yielded products chemically identical, differing only in the proportion in which they were produced. The perfect combustion of a fuel necessitated that the temperature of the fuel and its products must be maintained at or above their ignition point, whilst at the same time each particle of fuel must be brought into contact with an adequate supply of air. By the employment of a gaseous fuel, such as coal gas, these conditions were easily secured, and required only the intelligent use of a modern gas fire or stove. On the other hand, the perfect combustion of coal in an ordinary domestic grate was an impossibility as the two essential conditions for perfect combustion could only be imperfectly fulfilled. The reporters were therefore confronted with the fact that the atmosphere was constantly being vitiated with the discharge from domestic chimneys of the visible and invisible products of the incomplete combustion of coal. The general conception of smoke and its composition was that it consisted almost entirely of finely divided particles of unconsumed carbon, and that the obnoxious qualities of smoke were proportional to its density and colour. That was incorrect. Smoke was a body of great complexity, its composition depending not only on the nature of the substance burned, but on the temperature prevailing during the formation of the smoke. The chimney gases from a coal fire contained averagely 13.58 lb. of solid matter per million cubic feet, whilst the chimney gases from a gas fire were entirely devoid of any trace of solid matter. In order to impart to the lay mind a practical conception of what the 13.58 lb. per million cubic feet meant, it was explained that this quantity was equivalent to fully 5 per cent. of the coal consumed.

The reporters conclude by stating that they feel assured that after a careful study of their facts and figures the citizens will readily acknowledge that the smoke-producing, wasteful domestic coal fire must be replaced by the more cleanly, evenly, and healthy gas fire before we can hope to obtain a purer atmosphere or even begin in earnest with the work of air purification.

EIGHTEEN Belgians landed at Leith last week from Antwerp en route for Skye, where they are to be engaged in marble cutting by the Skye Marble Company. They are stated to be more highly skilled than the home workers in the cutting of the fine white marble to be found on that island.

## EASTER HOLIDAY ARRANGEMENTS.

EXCEPTIONAL facilities for spending Easter in the country or by the sea are announced by the London and South Western Railway Company.

The novel experiment of running express trains from London to Bournemouth every half-hour on the Thursday before Easter proved such a success last year that the arrangements will be repeated for the coming holiday, and between 1.20 and 8.20 P.M. on Thursday, March 24, all trains for Bournemouth will start from the new South station at Waterloo, which will be reserved for Bournemouth passengers only during the time the "half-hourly" service is running. Ordinary and "week-end" tickets will be issued by these trains; also by special express from Waterloo to Bournemouth and the New Forest on Good Friday morning at 10.15.

There will also be special trains and cheap tickets to other resorts in the Sunny South and South-West, including the Isle of Wight, Southsea, Lee-on-the-Solent, Southampton, Swanage, Weymouth, Lyme Regis, &c.

Many will doubtless be travelling "in the path of the sun" to the West, and for such additional corridor trains will be run from Waterloo, including a special dining-car express at 7 P.M. on Thursday, March 24, to Ilfracombe, Bideford, Barnstaple, Exeter, Exmouth, Okehampton (for Dartmoor), Tavistock, Bude, Launceston, Padstow and other places in Devon and Cornwall. Cheap excursion tickets will be issued to these parts, by special trains leaving Waterloo on Thursday morning and midnight.

Week-end tickets will have extended availability from Thursday to Tuesday, and be issued by all trains.

Beautiful Brittany, the "Land of Pardons," with its interesting festivals, is most attractive at this time of the year, and the 24*s.* 6*d.* trips from Waterloo, via Southampton, to St. Malo on the Thursday and Saturday before Easter allow of a long or short stay, as desired, being available for return any day of sailing within fourteen days.

Similar bookings are announced to Normandy (Cherbourg 23*s.* 6*d.*, and Havre 24*s.* 6*d.*); also to Paris 26*s.*, Guernsey and Jersey 22*s.*

On Easter Monday a corridor express half-day excursion will leave Waterloo 11.30 a.m. for Weymouth, Swanage, &c., at return fare of 4*s.* 3*d.* A refreshment-car will run in the train. Other trips will be run to the seaside and riverside places.

Programmes giving full particulars, obtainable at the Company's London offices, stations, &c., or from Mr. Henry Holmes, superintendent of the line, Waterloo Station, S.E.

## THE BUILDING TRADE IN QUEENSLAND.

THE facts gleaned in regard to the subject go to show (according to a correspondent) that the past year has been one of the most prosperous yet recorded in the building trade, not only in Brisbane, the capital of Queensland, but in many of the other leading centres. The number of new buildings erected and in course of erection has never been greater. Every one of the leading architects at Brisbane who has been spoken to on the subject has said unhesitatingly that the year has been absolutely the best experienced. It was not alone dwelling-houses which were being built, but warehouses, stores, villas, butter factories, shops, and every other kind of premises were going up with a rush. In the country as well as the town the same thing was observable, and as a matter of fact the consensus of opinion appeared to be that in country towns and country districts more building was being done than had ever taken place before. It would be impossible to give a record of all the work and all the buildings which have been erected in the city during the past year, but as an instance it may be mentioned that one architect said that he had in one week in October last received commissions exceeding 60,000*l.* One matter which struck this gentleman very forcibly was that he could not get the same amount of competition for work offering. It was impossible, he said, to get the same number of tenders as had formerly been obtained. He had repeatedly offered private tenders for 1,500*l.* or 2,000*l.* to men and had them refused; the men were all too busy to take them on. Two or three years ago the same men would have tumbled over each other to get them. So much can be said for the state of the building trade generally at the present time, and with regard to the future no diminution in the demand for new premises is expected. According to a Brisbane contemporary the building trade is "flourishing like a green bay tree, and what is more, it will keep on flourishing for some time to come."

## ILLUMINATING ENGINEERING SOCIETY.

A meeting of this Society was held on Tuesday evening, the 15th inst., at the house of the Royal Society of Arts, Professor Silvanus P. Thompson (President) in the chair, when a discussion took place on "Recent Developments in the Measurement of Light and Illumination."

The **President** said he had been asked to open the discussion by certain very brief remarks and the exhibition of some simple and rough pieces of apparatus. He would therefore begin with the methods rather than the results of photometry; the latter were to be considered at their next meeting. The whole art, so far as it was an art, rests on the shifting of something or other—varying the distances of two sources of light from a screen until there was equality of illumination on the two halves. The developments after that became a science and not an art. They had need too for standards in photometry. The candle which was the standard in Germany was a particularly little lamp. The English candle was too unreliable and there were various others which failed. The best was the Harcourt Pentane lamp. One of the oldest ways for getting illumination for the purpose of photometry was Ritchie's, another Rumford's, and then there was Trotter's. An extremely excellent photometer could be made with two blocks of paraffin wax placed face to face with a leaf of tinfoil interposed between the two. That was Joly's photometer, and it was one of the simplest and one of the best. One of the worst was the Bunsen grease-spot. Then there was the Lummer-Brodhun prism photometer, and lastly the principle introduced by Rhode for judging the illumination of lights of different heights by the flicker of reflected light upon a divided screen; when both halves were equally bright a standard could be formulated.

Professor A. G. **Vernon Harcourt**, M.A., F.R.S., &c., said the comparison of lights of different colours had been estimated in various ways. There was Sir William Abney's plan, which gave good results by the rapid movement of red and blue lights at short intervals. Professor Harcourt went on to describe some official experiments he had made at the South Foreland some years ago on the amount of light given by different illuminants for use in lighthouses.

Professor **Fleming** referred to primary and secondary standards of light, and said that although an immense amount of labour had been spent in trying to obtain them, the light varied in a most marked degree in all standards. He advocated a universal standard and urged that some of the resources and funds of our great national institutions should contribute towards experiments for solving the problems.

Mr. A. P. **Trotter** dealt with the question of experimental facilities at technical colleges and scientific institutions for the study of photometry. When he was preparing to write, he said, a series of articles some two years ago on the subject, he had not been engaged in photometry for about eighteen years, and so he visited establishments of three kinds to see what was being done in photometry. Engineering rooms, lamp manufacturers' works, and the laboratories of technical colleges amazed him by their antiquated and limited material. The teaching of photometry he knew made two classes, the science and the art, and in the technical colleges it fell between physics and engineering, and it was likely to lose its place if more care was not taken in photometrical instruction. In the laboratories which he had seen there was either apparatus twenty, thirty, or forty years out of date, or else they had the most expensive and highly accurate kind, and nothing between it and the old-fashioned. Physics as a branch of photometry was lamentably treated. He did not know of a single textbook in the English language in which the Bunsen photometer was described accurately. From the educational point of view photometry could be divided into two sections, the elementary and the practical laboratory work, which was a fascinating art.

Mr. **Pattison**, of the National Physical Laboratory, said though the Pentane lamp had been criticised rather severely, for the present it served well as a temporary standard and would take a very great deal of beating. They could reduce it to an accuracy of 0.1 per cent., and he thought therefore it compared very favourably with other standards. The suggestion had been made that Professor Violle's should be followed up. It had been, he said, their intention at the National Laboratory to do so, but he felt the colour of the light would be a great difficulty to overcome. For a reliable electric standard they must get it in terms with other lights. In experimenting on the colour it seemed to him that they were face to face with some physiological problem. For as one man will see a red light better than a blue, and another man a blue light better than a red, it was necessary that the colour should be based fundamentally on some form of average value. It was possible to attack the problem though a number of divisions might be the result, for in that way they could obtain a calibration.

Professor **Sampner** dealt with No. 3 of the queries prepared for discussion at the meeting which was as follows:—"What are the best modern methods of obtaining the polar curves of light distribution and of measuring the mean spherical candle-power of different sources, and what possibilities are there of simplifying and improving such processes in the future? What are the best methods of deriving the mean spherical or mean hemispherical candle-power from such curves in the case of all illuminants?" The question, he said, seemed to divide itself into two parts. With reference to arc and glow lamps the general law of distribution had been worked out, but practically it was a very difficult matter to get a mean spherical candle-power. As regarded arc lamps it was altogether different. In such cases they had to deal with a distribution which varied in a very complicated way, and they were also working with an illuminant which was not constant itself. Although elaborate methods had been devised for measuring the candle-power of arc lamps in different directions, the speaker ventured to think that many people had not worked out the problems because the experiments were of an extensive kind, and they found they were testing something which was not constant.

Mr. **Liberty** said they had heard descriptions of, and seen many and sundry photometers, but they still felt doubtful of their accuracy. He, for one, he said, was looking forward to the time when they could have some national standard of photometry, even as they were hopeful of obtaining an international standard of light. All standards seemed confusing, and it was the same with the photometer. To his mind the best kind of photometer they could have was the flicker.

Professor **Morris** said various photometers had been spoken about during the evening, and he wished to say that from his own experience, working with the grease spot photometer was as satisfactory as with many others. The grease spot must be well made, perhaps they would need to make thirty or forty attempts at it to have a good one. Then he believed it was best to work with an exceedingly small spot, and after removing the coating of grease to slightly heat the paper. He would have been glad if the absorption of globes had been dealt with for it was not easy to gauge the amount of light a globe would absorb.

Mr. J. S. **Dow** said the light which gave the brightest illumination was not necessarily the best as a standard.

The **President**, in concluding the proceedings, said one point had come out as a result of the meeting, and it was that the subject was very much too vast for one evening's discussion or even for two. They had begun work on an enormous field, he would not say it was unexplored, but it had not been worked out by any other society, and for that reason alone they found there was justification for such a society as their own. Perhaps it was well that in their first year they should be dealing wholesale with such big problems, for in the next session they could get down to details, and perhaps after that to papers and lectures.

---

The French Government is proceeding with the gradual abolition of the use of white lead. According to the *Revue Syndicaliste*, its use as a basis for paints—and practically all housepainting is done in lead-paints—is prohibited by a measure which has recently been passing between the Chamber of Deputies and the Senate. The last difficulty to be overcome was the question of compensation to the makers of white lead. The Chamber refused any indemnity to the manufacturers of "murderous products," but the Senate on the contrary defended the manufacturers and maintained the principle of compensation. Two Commissions were appointed representing the Chamber and the Senate. They met and have come to an agreement. The majority of the Commission of the Senate abandoned the principle of compensation, and were satisfied with a postponement of the date after which the prohibition was to come into force. To this delay the Chamber agreed. The essence of the agreement is that in five years after the promulgation of the law the use of white lead shall be prohibited in the painting of buildings, both of the exterior and the interior. Inspectors are charged with seeing that the law is observed. The penalties for infraction are to be those in the Workshops Health Act of 1893.

## THE LE CHATELIER BOILING TEST OF CEMENT.

THE Concrete Institute held their eighth ordinary general meeting at the Royal United Service Institution, Whitehall, S.W., on March 17, when Mr. D. B. Butler, A.M.Inst.C.E., F.C.S., read a paper entitled "Notes on the Le Chatelier Boiling Test of Portland Cement."

The soundness of Portland cement—*i.e.*, its freedom from expansion ("invariabilité de volume" or "volumenbeständigkeit," to give its French and German equivalents respectively)—the author thought, was its most essential property, and should be always the first thing to be determined in estimating the constructive value of a sample. It was obvious that, notwithstanding other highly desirable qualities which a cement might possess, such as great strength or large sand-carrying capacity, if it was unsound, and contained certain elements which subsequently caused expansion, with, in extreme cases, disintegration and crumbling, it was not only of no use as a constructive material, but was at once converted into a destructive material. Although with the improved methods of manufacture obtaining of recent years these extreme cases of disintegration had become more and more rare, expansion of a more or less dangerous nature was not infrequently met with.

The original test for soundness, the author explained, was based more or less on working conditions—*i.e.*, pats or cakes of neat cement, plunged into cold water when set, or after twenty-four hours in air, and examined at intervals; if at the end of a month they showed no signs of cracking or distortion, and adhered firmly to the glass plate on which they were made, the cement was considered satisfactory as regards soundness. This test laboured under the obvious disadvantage that twenty-eight days had to elapse before a definite opinion could be pronounced, and the cement finally accepted for use, a delay that was frequently impossible in practice, although it might be argued that the generally specified twenty-eight days' tensile tests laboured under the same disadvantage.

To obviate this long delay several accelerated tests for soundness have been evolved from time to time. About thirty years ago the late Henry Faija introduced a test for soundness, consisting in subjecting cement pats to seven hours in moist air of 110° Fahr. followed by seventeen hours in warm water of 120° Fahr., which enabled an opinion to be formed in twenty-four hours instead of having to wait twenty-eight days as formerly.

The next accelerated test was that of M. Deval, brought out about ten years later; after twenty-four hours in air or under a damp cloth at ordinary testing-room temperature, and two days in water of 176° Fahr., the strength developed was supposed to be comparable with that of one day air +6 days in ordinary cold water; while after a further four days in hot water, *i.e.*, one day in air and six days in hot water, the strength developed was supposed to be comparable with one day air +27 days' cold water.

### *The Boiling Test.*

From the 176° Fahr. of the Deval test it was but a step to the boiling test now in vogue, and having regard to the difficulty of always maintaining an equable temperature of 176° Fahr., the boiling test is certainly considerably simpler; the ordinary qualitative boiling test consisted of allowing a pat to set twenty-four hours in a damp box of 60° Fahr., and then placing it in cold water, which was gradually raised to boiling and maintained at that temperature for six hours, after which treatment the pat should show no signs of warping or cracking; it was sometimes further specified that the edges of the pat should also break off with a sharp crisp ring, which was a very sure indication that it was free from cracks or flaws of any kind.

The foregoing tests were all of a qualitative order, and depended more or less on the personal experience of the operator, as to whether the results obtained were seriously defective or not.

### *Bauschinger Apparatus.*

The most accurate quantitative method of measuring expansion or contraction, whether in air, cold water, or by the various accelerated tests, was the Bauschinger micrometer calliper apparatus, in which the test pieces consisted of prisms or square bars 100 mm. long and 22 mm. by 22 mm. cross-section; the delicacy of the instrument was such that variations in the length of the bar to within $\frac{1}{200}$ mm., or 0.005 per cent. could be determined with certainty. It, however, required very careful expert handling, and was somewhat expensive, the equipment including moulds, costing about 12*l*.

### *The Le Chatelier Test.*

The only other quantitative method of note for determining expansion was that devised by M. Le Chatelier, which was adopted by the British Standards Committee in 1904 as the standard method of determining the soundness of cement. The description and method of working, taken from the revised British Standard Specification of 1907, was as follows:—

"The cement shall be tested by the Le Chatelier method, and shall in no case show a greater expansion than ten millimetres after twenty-four hours' aeration and five millimetres after seven days' aeration.

"The apparatus for conducting the Le Chatelier test consists of a small split cylinder of spring brass or other suitable metal of 0.5 millimetre (0.0197 inch) in thickness, forming a mould thirty millimetres ($1\frac{3}{16}$ inches) internal diameter and thirty millimetres high. On either side of the split are attached two indicators with pointed ends, the distance from these ends to the centre of the cylinder being 165 millimetres ($6\frac{1}{2}$ inches).

"In conducting the test, the mould is to be placed upon a small piece of glass and filled with cement gauged in the usual way, care being taken to keep the edges of the mould gently together while this operation is being performed. The mould is then to be covered with another glass plate, a small weight is to be placed on this, and the mould is then to be immediately placed in water at a temperature of 58° to 64° Fahr., and left there for twenty-four hours.

"The distance separating the indicator points is then to be measured, and the mould placed in cold water, which is to be brought to boiling-point in fifteen to thirty minutes, and kept boiling for six hours. After cooling, the distance between the points is again to be measured; the difference between the two measurements represents the expansion of the cement, which must not exceed the limits laid down in this specification."

It certainly had this advantage over the Bauschinger apparatus, that it was cheap and simple, and involved no costly apparatus, but whether it was equally accurate was quite open to discussion. In the course of ordinary professional testing work, the author stated he had had to carry out many thousands of tests for soundness by the Le Chatelier method, and the conflicting results he had sometimes obtained had led him to the conclusion that where the condemnation of a cement for unsoundness was concerned, the results given by the Le Chatelier test should not be too rigidly interpreted.

The author then quoted series of experiments to show the variable results which might be obtained by different operators, and even by the same operator working under exactly the same conditions.

In order to ascertain if differences in the elasticity of the moulds were in any way responsible for the variable results obtained, the author devised a special apparatus. The variation given by different moulds was considerable. However, the results did not definitely point to differences in the elasticity of the mould as being responsible for the variable results obtained, since No. 10, which was an extremely weak mould, gave the least expansion in two cases out of three.

It was thought possible that the position of the test pieces in the boiling bath, whether in the centre or round the outside, might have had something to do with the variations found, and tests were therefore made to ascertain if this were so, but the results suggested that this was not the case. Nor did variations in time of cooling after boiling appear to affect the result in any way.

### *Differences due to Aeration.*

Another curious feature about the Le Chatelier test was that instances were very frequently met with in which the expansion was considerably greater after six days' aeration of the sample than when first received, or after only twenty-four hours' aeration. From the point of view of a test for soundness this was an obvious absurdity, since it was a well known and thoroughly acknowledged fact that cement improved with aeration as regards soundness; it therefore very strongly suggested that the increased expansion of such samples upon boiling was due to causes altogether outside the question of soundness as it was generally understood, i.e., the presence of disruptive agencies within the cement itself, which would eventually cause expansion under ordinary working conditions.

### *Less Expansion on Boiling than in Cold Water.*

In a paper read before the Concrete Institute in May last on the setting properties, &c., of Portland cement, Mr. H. K. G. Bamber referred at considerable length to the Le Chatelier boiling test and raised one or two interesting points.

He first of all drew attention to the fact that the expansion of the specimen during the preliminary twenty-four hours' immersion in cold water was altogether ignored, only the subsequent expansion during boiling being taken into account, and pointed out that instances frequently occurred in which the expansion in cold water was considerable, whereas that resulting on boiling was negligible. The author of the present paper said he could fully bear out that statement, for it was the custom in his testing-room to record in every case the expansion caused by previous immersion in cold water, as well as after boiling, and in many cases, more especially with slow-setting cement, the expansion in cold water was very much more serious than that due to boiling.

Surely it was more important to record the expansion under actual working conditions in cold water than that produced by boiling, for whatever the value of boiling as an accelerated test for soundness, cement was rarely, if ever, subjected to boiling water in practice.

Mr. Bamber also referred to the somewhat arbitrary condition of only allowing the cement twenty-four hours to harden under water, before being subjected to the boiling water, and suggested that failure was frequently due to the cement, more especially the slowly hardening varieties, not having had time to sufficiently harden in that brief period to withstand boiling water.

Referring once more to Mr. Bamber's paper, he gave as one reason of cement sometimes failing to pass the Le Chatelier test, the inability of the coarse particles, or unpulverised clinker, to withstand boiling water without expansion, and expressed the opinion that "it has yet to be proved" that because such unpulverised material caused expansion when submitted to boiling water, that it would also cause expansion under ordinary working conditions in cold water. With this the author agreed, and quoted experiments which showed that there was something in the contention.

The experiments embodied in the paper, taken as a whole, appeared, the author suggested, to justify his remark at the commencement, that where the condemnation of a cement for unsoundness was concerned, the results given by the Le Chatelier boiling test should not be too rigidly interpreted. Apart from the mass of anomalies and conflicting results continually met with, it was quite an open question whether a cement should be condemned as unsound because it would not withstand boiling water twenty-four hours after gauging, whether that twenty-four hours' preliminary hardening was in cold water or in air.

Whatever excellent reasons there might be for or against accelerated tests, the author could vouch from personal experience for the fact that considerably less than twenty years ago not 10 per cent. of the Portland cement manufactured in England or elsewhere would withstand boiling water under the foregoing conditions; the obvious inference, therefore, was that if such was a true test for soundness, 90 per cent. of the cement used twenty years ago was unsound. This, in view of the hundreds of thousands of tons then used for important engineering work throughout the world, was rather a startling proposition; and having regard to the excellent condition of such work at the present time, was one that could scarcely be seriously maintained.

Mr. Bertram Blount in opening the discussion from the chair, remarked that the paper was admirable for its contents, for the labour involved, and for its perfect lucidity and impartiality. But at the same time he thought the author had supposed that because certain nations had failed to prepare the same admirable qualities of cement as were to be obtained in this country therefore we should all set back the hands of the clock and revert to discarded methods of testing. With this he thoroughly disagreed.

Mr. H. K. G. Bamber believed that Mr. Butler had rendered a conspicuous service not only to the engineering profession, but also to the cement trade in raising any question which would tend to elucidate this difficult subject. Mr. Butler had dealt with his subject from a comparative point of view in as much as he described various tests for the soundness of cement. The Faija test had fallen somewhat out of use by reason of the fact that the manufacturers knew that if any slab failed to pass that test it must be very bad indeed. Mr. Bamber stated that he himself looked upon the Deval test as one of the most important, and if any cement for which he was responsible could pass that test he knew he had no cause for sleepless nights. This test was the most satisfactory from the manufacturers' point of view. The Le Chatelier test had been correctly described as a cheap and simple one. It was also true that the results obtained by it should not be too rigidly interpreted; in practice experts did not draw a very hard and fast line in the matter. M. Le Chatelier had since suggested that the test should be modified so as to cover the expansion of the specimen during the preliminary twenty-four hours' immersion in cold water, instead of only the subsequent expansion during boiling being taken into account. Mr. Bamber believed the point should be dealt with as he was firmly of opinion that a cement which expands considerably in cold water is much more dangerous than one which only expands in hot water. As to the severity of the test there could be no doubt that the engineering profession would at any rate come to the conclusion that it was preferable to have a test that was unnecessarily severe than one which was not strict enough. It would be most regrettable if they fell back on tests common twenty years ago.

Mr. Cooper thought that the paper was built up on a false foundation. The Le Chatelier test was by no means invariably to be relied on, and if a sample of cement failed to comply with it there was no reason for concluding in consequence that it was unsound. One objection to it was that no matter whether the cement was slow or quick setting it was boiled for an arbitrary period. It was largely admitted that cement which is spread out and aerated is improved thereby in soundness. But experience showed at the same time that cement not infrequently gets worse after aeration—at least it does if judged by the test in question.

Mr. Gordon Nicol, engineer to the Aberdeen Harbour Board, said that the paper dealt with a subject of the utmost importance to the engineering profession, because if there was one quality in cement that was essential to an engineer it was that of soundness. Aberdeen, where he came from, enjoyed perhaps a rather unhappy reputation for failures in cement; but these perhaps were due to other characteristics than to any unsoundness in the material employed. To the engineer some form of test for soundness was a sine quâ non; he has to anchor his faith to it once he has received an assurance that it has been passed after testing. Mr. Nicol said that for the past sixteen years he had carried out the boiling test very rigidly, indeed rather more severely than most people, and his impression was that in a comparatively short period a faulty cement may escape detection, whereas in a longer period it would be detected. It might be argued that the test was a too severe one; but none the less manufacturers are able to undergo it. Until engineers had discovered a more reliable one, they would like to be assured by the method now adopted that the cement was sound. He had used the Le Chatelier test for some time so as to comply with the requirements of the British Standard Specification of 1907, but it was on the longer period that he determined whether the cement was suitable or otherwise. A severe test for soundness was that of breaking the briquettes after boiling and comparing them with samples that had not been boiled. The accelerated test is one that should be used not only to show the acceleration of defects but also the acceleration of strength. Mr. Nicol concluded by saying that until they got a test that would satisfy the user of cement as to its soundness they would have to adhere to the boiling test.

Mr. C. H. Watson said his own recent experience combined with some of the figures which Mr. Butler had given in his paper would almost tend to shake one's confidence in the test; but such vagaries and eccentricities were quite capable of explanation. After having conducted these tests day after day, and seen so many results, he had come to the conclusion that they were not all to be taken dogmatically. The Le Chatelier test was not so emphatic that one could pass or reject cement on the showing of that alone. The results varied from many assignable causes. The Le Chatelier test, moreover, required to be carefully handled; in the hands of experts it was good enough, but when conducted by amateurs it produced extraordinary results. It was not one upon which cement should be accepted or rejected unless taken in conjunction with the British Standard Specification.

Mr. Lawrence Gadd and Mr, Plaister having also spoken,

Mr. D. B. Butler replied. He said that he was by no means averse to progress; what he wanted was a test for soundness which would detect unsoundness. A test which condemned both sound and unsoundness indiscriminately could not be a good test. The Faija test was such that if the cement did not show expansion under it, it would not show expansion under any test. One of the speakers had urged that the boiling should continue for forty-eight hours; his own experience was that if the cement does not show expansion in six hours it would not show any at all.

Preliminary preparations for the erection of tinplate works of eight mills by Messrs. Richard Thomas & Co., Ltd., at Llanelly, are now well in hand.

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

## TENDERS, ETC.

⁂ *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 p.m. *on Thursdays.*

## COMPETITIONS OPEN.

Birkenhead.—The Guardians invite architects residing within the limits of the Birkenhead Union to submit designs for a Children's Receiving Home. Premiums will be awarded for the three first designs. Mr. J. Carter, clerk, Poor Law Offices, Birkenhead.

Ireland.—April 23.—The Meath County Council invite architects in Ireland to submit plans and specifications for the building of new County Offices at Navan. Apply to Mr. H. J. Cullen, Meath County Council Offices, Navan.

Liverpool.—The Corporation invite designs from architects practising in Liverpool for a branch library estimated to cost not more than 7,000*l.* Mr. W. E. Willink, F.R.I.B.A., will act as assessor. Apply to Mr. E. R. Pickmere, town clerk, Reference Library, William Brown Street, Liverpool.

London.—June 15.—The Acton Urban District Council invite plans for schools at Rothschild Road for 850 pupils. Premiums of 100*l.*, 50*l.*, and 25*l.* are offered, but any premium awarded to the successful architect shall be merged in his commission of 3½ per cent. Deposit 10*s.* 6*d.* Apply after April 5 to Mr. F. A. Everitt, secretary, Education Department, Council Offices, Acton, W.

Walsall.—Designs are invited for the erection of a public elementary school (mixed) to accommodate 500 children at Bloxwich. Conditions of competition and plan of site from Mr. W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.

The consumption of electricity in Copenhagen is increasing at a very rapid rate, and a large alternating-current central station is to be built, as well as extensions to already existing stations. It is proposed that the new station shall have a capacity of 180,000 horse-power. At first, however, the plan only comprises the installation of three turbo-dynamos of 7,500 horse-power capacity each. The cost is calculated at about 340,000*l.*

## CONTRACTS OPEN.

Ashcott.—April 11.—For erection of a Council school at Ashcott, near Bridgwater. Messrs. Cottam & Samson, architects, Bridgwater.

Birmingham.—April 5.—For alterations to Birmingham head post-office. H.M. Office of Works, Birmingham.

Birmingham.—April 20.—For the erection of a fire station in Moseley Road, Highgate. Send 2*l.* 2*s.* deposit to the City Treasurer, Council House, Birmingham. Apply by April 8 to Messrs. Mansell & Mansell, 47 Temple Row, Birmingham.

Bootle (Lancs).—April 15.—For erection and completion of a public elementary Council school, in the south-east district of Bootle. Deposit 2*l.* 2*s.* Mr. J. Henry Farmer, town clerk, Bootle.

Bradford.—For the whole or part of the works required in the alterations and additions to premises, Market Street and Booth Street, for the Bradford District Bank, Ltd. (second contract). Forward names, together with a deposit of 1*l.* 1*s.* to Messrs. Carby Hall & Dalby, architects, Prudential Buildings, Park Row, Leeds.

Bradford.—April 5.—For the mason, joiner, slater, plasterer, plumber, and ironfounder trades required in alterations and additions to Paddock dyeworks, Pasture Lane, Clayton. Mr. Sam Spencer, architect, Old Bank Chambers, Great Horton, Bradford.

Bristol.—April 5.—For erection of extensions to a cold storage warehouse in Jervis Street, Barton Hill. Mr. F. Bligh Bond, F.R.I.B.A., Star Life Buildings, St. Augustine's Parade, Bristol.

Bugle.—April 3.—For erection of concrete chapel at Bugle, Cornwall. Rev. J. T. Morris, Sunny Bank, Mount Charles, St. Austell.

Chester.—April 7.—For the erection of the grand stand on the Pageant Ground at Eaton, Chester. Messrs. John H. Davies & Sons, honorary architects, 14 Newgate Street, Chester.

Cockermouth.—April 6.—For the various works required in erection of a house in Victoria Road. Messrs. W. G. Scott & Co., architects and surveyors, 2 Park Lane, Workington.

Codnor.—April 11.—For erection of Council school, Codnor, Derbyshire, to accommodate 120 infants. Deposit 1*l.* 1*s.* Mr. George H. Widdows, A.R.I.B.A, architect to the committee, St. Mary's Gate, Derby.

Cove.—April 25.—For erection of a Council school for 140 children at Cove, near Farnborough. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

Coventry.—April 8.—For erection of proposed building, Hill Top, Coventry, for the Triumph Cycle Co., Ltd. Mr. Herbert W. Chattaway, architect, Trinity Churchyard, Coventry.

Durham.—April 12.—For new Council schools at Middleton St. George, Hartburn, and Whitton. Mr. W. Rushworth, Shire Hall, Durham. For alterations and improvements at Usworth Colliery, Littletown, and Consett cookery centre. Mr. F. E. Coats, Shire Hall, Durham.

Erith.—April 18.—For erection of two additional wards and other extensions to the Erith Sanatorium, Little Heath, Belvedere. Deposit 2*l.* 2*s.* Mr. Harold Hind, surveyor, Council Offices, Erith, Kent.

Farnborough.—April 9.—For the completion of the superstructure of the extension to workshops at the Army balloon factory, South Farnborough, in the Aldershot Command. Plans, specification, and conditions of contract may be inspected at the office of the Director of Barrack Construction, 80 Pall Mall, London, S.W., on April 6, 7, and 8. Deposit 10*s.* Apply by April 9 to the Director of Barrack Construction.

Featherstone (Yorks).—April 5.—For the several works in connection with alterations, folding screens and extending urinal at the Featherstone Provided school (boys), viz., builder, joiner, and plumber. Mr. Charles Harris, Education Offices, Knottingley.

Halifax.—April 4.—For additions to Ashfield, Burnley Road. Messrs. Clement Williams & Sons, architects, Post Office Buildings, Commercial Street, Halifax.

Hazel Grove.—April 19.—For erection of a public elementary Council school in Chapel Street, Hazel Grove, near Stockport, to accommodate 800 children, with housewifery, laundry, and cookery centres and caretaker's quarters. Deposit 2*l.* 2*s.* Mr. C. T. Adshead, architect, Leinster Chambers, 4 St. Ann's Square, Manchester.

Herne Bay.—April 13.—For the construction of a pier pavilion on the new pier extension. Mr. Percy J. Waldram, F.S.I., and Messrs. Moscrop-Young & Glanfield, architects, 12 Buckingham Street, Charing Cross, W.C. Send 1*l.* 1*s.* deposit by April 2 to Mr. Joseph Jubb, clerk, Town Hall, Herne Bay.

Hertford.—April 2.—For laying a new wood floor in the dining hall at the workhouse. The Master at the Workhouse, Hertford.

Heywood.—April 16.—For erection of an addition to the Heywood Technical School for a picture gallery and museum. Deposit 2*l.* Borough engineer, Mr. J. Ainsworth Settle, A.M.I.C.E., Municipal Buildings, Heywood, Lancs.

Heywood.—April 16.—For erection of an extension to the Heywood Technical School for day secondary school and other requirements. Deposit 3*l.* Mr. Henry Littler, county architect, 16 Ribblesdale Place, Preston.

Hull.—For erection of a detached villa residence in Newland Park. Deposit 2*l.* 2*s.* Send names to Messrs. Wellsted, Dosser & Wellsted, Waterloo Chambers, Hull.

Ireland.—April 16.—For the erection of a school at Philipstown, King's County. Rev. J. Bergin, P.P., the manager, Philipstown.

Isleworth.—April 9.—For erection of new schools and caretaker's cottage in Twickenham Road, Isleworth. Deposit 2*l.* 2*s.* Mr. J. G. Carey, architect and surveyor, Council House, Hounslow.

Leytonstone.—April 29.—For erection of a county high school for 300 girls, to be erected at Forest Road, Leytonstone, Essex. Deposit 5*l.* Send names by April 11. Mr. W. Jacques, A.R.I.B.A., architect, 2 Fen Court, Fenchurch Street, London, E.C.

| Holmes, Birmingham (*accepted*) | 2,021 | 16 | 4 |

## RHYL PIER.

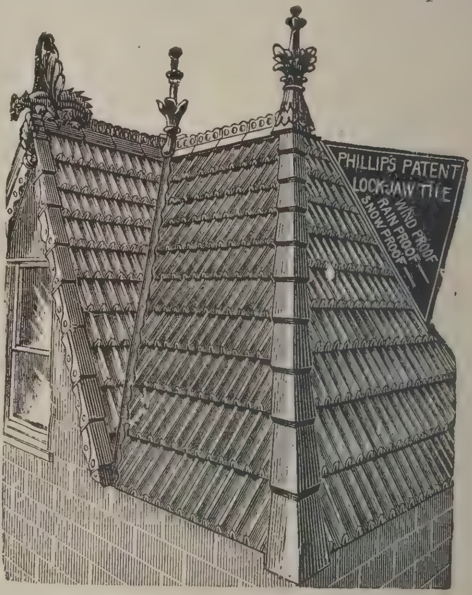
The difficulties connected with the application for a new Provisional Order to enable Rhyl Pier to be extended to deep water, so that steamers can call at all tides, have been overcome, as the Order is expected to be issued within two or three weeks. The promoters have instructed Messrs. Maxwell & Tuke, architects and engineers, 25 Brazennose Street, Manchester, to obtain estimates for the whole of the works. The contracts will be let immediately upon the receipt of the Provisional Order, so that work may proceed early in the spring. The scheme is a large one involving a capital of some 65,000*l.*, and includes encasing the present iron pier in ferro-concrete, widening it and extending it some 600 yards seawards by means of a ferro-concrete jetty. The landing place at the head of the jetty will be constructed in Tasmanian blue gum, and will have a depth of water at low spring tides of 12 feet. The present pier-head is to be considerably enlarged, and on it an open-air enclosure with bank kiosk will be erected capable of seating 1,000 people. Along the five embayments of the pier there will be ornamental kiosks and shelters, each 45 feet long and 12 feet wide, whilst nearer the land end will be erected a large and handsome dining-room to accommodate 400 persons at separate tables.

Between the pier proper and the promenade, on an area of some 6,800 yards, it is intended to erect an amphitheatre with gallery, capable of accommodating 1,400 persons, to be used for variety and minstrel entertainments, together with an assembly room or theatre (accommodating 2,500 persons), with full theatrical stage and galleries. There will also be a visitors' club, with reading, billiard and smoke rooms, twenty-four shops, and two tea-rooms. All these buildings will be erected on terra firma, and are designed with Old English Cheshire framing, and form a most picturesque group.

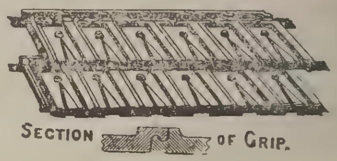
Mr. William Cowie, architect, Ayr, has been instructed to prepare plans for a Board School to be erected in Green Lane, Ayr, for 700 scholars.

## PHILLIPS'S PATENT LOCK-JAW ROOFING TILES.

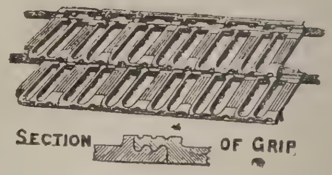
A tile that was highly spoken of some twenty-five years ago and which has ever since enjoyed a wide popularity must obviously possess considerable merit. It must be about a quarter of a century since the lock-jaw tiles were first put on the market. In the interval there has been a succession of patent tiles of different materials, different shapes, and different sizes which have each enjoyed a short or a comparatively long life and then, in many cases, dropped into obscurity. But the lock-jaw still remains in architects' specifications, and will doubtless continue to do so for many years to come. The tile is of clay subjected to a very great pressure, which renders it non-porous and strong, besides giving it a smooth surface. But the distinguishing feature of the patent is the inter-locking arrangement. Each of the four sides of the tile is moulded with a system of grooves and corresponding tenons, so that every tile locks into others on each side, top and bottom, the lower end of the top tile butting against or locking into the corresponding one underneath. Two patterns—the single grip and the double grip—are made; the former weigh only 35 cwt. per 1,000, and 150 go to the square, which works out at 600 lbs. per square; the latter weigh 40 cwt. per 1,000, and 170 go to the square. They are also made in two colours, red and dun. Half tiles of both patterns are made for every alternate course. The tiles have proved themselves particularly serviceable for use in exposed positions, as they lock so well together that they can defy the heaviest rain and snow, especially if the additional precaution of nailing is taken. Their broken surfaces are also of value as introducing a certain amount of architectural effect to a part that is rather neglected in most designs. Mr. Charles D. Phillips, the maker, has his works at Bridgwater and his head office in Newport, Mon.



SINGLE GRIP.



DOUBLE GRIP



A company is being formed for the erection of a large public hall in Dawlish at an estimated cost of 1,500*l.*

The plans committee of Aberdeen Town Council have passed the plans of a new Roman Catholic church to be built in the Torry district of the city. The estimated cost is 4,000*l.*, and the architect is Mr. Charles G. Menart, Glasgow.

It has been decided to proceed immediately with the enlargement of the Balby church, at a cost of fully 2,000*l.* The project includes the erection of a new east end, and the present seating accommodation will be doubled.

## MURAL PAINTING.*

MURAL painting is one of the oldest forms of expression, and has had a very chequered career. We need not go very far back (or we can go right back to very early times) to find the great use it has always been put to in recording the history of nations—history that perhaps without this mode of expression we should be in ignorance of. Take, for instance, the large egg tempera paintings in the tombs of Egypt, though perhaps the sculptors would claim these incised works as their own. How much more difficult it would be for us to-day to decipher without their aid the life of this great nation, their costume and the minute details of all their crafts, their woodwork, metal work, and ship-building. These paintings were transcripts from nature, glorified a little perhaps by the desire of the chief mourner to have the life of the dear departed handed down in as good a manner as possible; but that was only artistic licence. With this peg to hang their artistic abilities upon the Egyptians teach us colour and design. The colour was used in a crude and conventional manner perhaps, but it has so strangely influenced everything since down to the very wall-papers we are accustomed to. And so we have it from Egypt, Assyria, Persia and the Far East, gradually coming westward, passing through a certain Byzantine decoration, and so on to Italy. Italy contains everything that we know of interest in mural work: these ordinary workmen unconsciously laid down a foundation of decorative design which has had an enormous amount of influence on subsequent work. It was done by men with no R.A. school education, no Prix de Rome Concours as a hall-mark of their ability. At the same time we must remember that every stroke these men did was not only paint, but literature, because it tells us the story of their time far more beautifully than mere prose.

Far away from the seat of the laying down of this great tradition of coloured historical descriptions, and many centuries after, came Giotto and the other great Italian decorators, who though continuing the tradition of being in a sense historians, were rather more imitative artists. This was inevitable. The culture of the masses demanded something more, and they had learnt to see stereoscopically, that is to say they had learnt to see a thing more in the round than people like the Egyptians and the Byzantines. The figure instead of retaining that flat simplicity became more rounded; and the art of seeing cast shadow—which in reality meant the commencement of the realisation of tone—crept in. This was the awakening of a new era; and, as all revolutions, swept away much that was to be regretted; but still it was an advancement. These men were painting their time, using the people around them as their models, mixing them up with characters out of religion and allegory so that the lessons they were teaching would be more comprehensible to the people. All these men, Giotto, Botticelli, and so on, maintained the tradition of decorative mural work.

But something else came from the East, and this time it was a man who brought for sale sweet gums, incense and myrrh. He found, let us suppose, some struggling painter who had not done so well as his neighbour in the matter of altar-pieces, and this Hebrew dealer came to him and said:—"Thy work is not so brilliant as thy brother's; buy a small piece of this gum, take it and dissolve it in some oil, when dissolved spread it lightly over thy work, and it will make it passing beautiful, and you will sell much of it." The artist did this. What was the result? It was to revolutionise and perhaps ruin that great tradition of decorative art; it was the commencement of cabinet pictures. The larger and broader sense of wall decoration was almost obliterated, and was ultimately killed. It created a type of work which in mediæval times showed itself in things like the illuminated missals. But we to-day are trying hard to bring back some of the great work and big tradition of that past.

It is important to know the reason why such work was done, the difficulties which beset these men, and how they overcame them. As to-day, so then, the man who pays the piper chooses the tune. Take, for instance, Giotto, who was employed by the Franciscans. When one comes to think of his education in art, reared as he was in the prevailing type of Byzantine convention; when one realises that he had to deal with a subject like the life of that great patron saint of theirs, and Giotto lived hardly a century after St. Francis, and time went slower then than it does to-day, one marvels more at the work of Giotto in the church at Assisi the more one thinks of it. The Franciscans who demanded such works as the Assisi frescoes were teaching a love of their patron saint concurrently with the love of Christ. They had brought the Bible so much to the understanding of the people, so humanised the gospels that it was quite possible for Giotto to treat the subject with the people to be seen every day around him. Other painters manifest the same desire to recreate the past in the costumes of the present both for religious and secular paintings.

A more modern wall picture which bears a relation to our own day similar to the relation of Giotto's work to the time of St. Francis is in the House of Lords. It is by Daniel Maclise and shows the meeting of Wellington and Blucher. Though it may possess a lot of faults, a lot of things we would rather it had not, still it is an attempt by the artist to render a subject that appealed to him, and that he knew something about; and although we rather laugh at it and jeer at its Early Victorian characteristics, we cannot help admiring it. Lord Leighton's work at South Kensington is of a very different type, and although it would be unseemly to say anything against a man who did as much as Lord Leighton did for decorators, yet one cannot help thinking that in a very short time it will come to be regarded as much a piece of late Victorian work as Maclise's fresco is of early Victorian. The frescoes of Puvis de Chavannes in the Sorbonne possess characteristics which will always remain sound and keep them from getting out of date. This artist was one of the greatest of modern times because he brought back all the tradition of the Italians and placed it on a footing, and carried it out in a technical way that could be understood by all. Professor Moira then came to work by contemporary artists, dwelling at particular length on the frescoes at the Old Bailey. In the mural decorations that he and Sir William B. Richmond carried out at the Central Criminal Court they did everything they could, in conjunction with the late Mr. W. E. Mountford, the architect, to secure a perfectly dry and therefore more or less permanent wall whereon to place their work. This was arranged in the following manner:—First came the outer wall of stone and brick, then an air space, then a wall of one brick thick tied here and there, the inside of these walls receiving a coat of paint, then came another air space, and then another wall of reinforced stick and rag which is French plaster cast with layers of canvas and battens of wood, with a thin structure of woven steel galvanised embedded at the back. This last wall was slightly more forward at the top than at the bottom in order to prevent a certain amount of dust settlement. This was painted at the back. Sir W. Richmond then had a thin coat of marble dust and lime spread over the surface, on which he painted in situ in tempera. Professor Moira said that he himself painted on canvas very open, on which was laid a thin coat of marble chips and white lead, doing most of the more laborious work for the lunettes in the studio, and all the finishing in situ. These canvases were fixed to the walls, which were prepared with two or three coats of white lead with very thick white lead and strong varnish, thus embedding the canvas in two layers of thick paint, and in this way entirely shutting it off from any access to the outer air. Professor Moira painted in oil paint with a medium of hard white wax dissolved in turps.

Sir William Richmond prepared his wall with two coats of slaked lime and marble dust, one thick and the other thin. He tried three surfaces—one rough, the next less rough, and the third quite smooth; the latter proved by far the better method for the ground. When the two coats were nearly dry a thin layer of lime was painted over the whole surface then rubbed down; great care must be taken that the brush is a new one, for if it has been used for white lead great trouble will result. The design was then drawn in charcoal, corrected, and then redrawn in raw sienna and white.

Professor Moira dwelt in conclusion on a point which he had brought out in the course of his lecture, viz., the advisability of dealing with contemporary men and manners in wall painting. A precedent was established by the Early Italian masters, and it has been intermittently continued ever since. When one comes to look at the work of our time, one feels that the work of Brangwyn is going to live. For instance, in designing the decorative frieze for the office of the Grand Trunk Railway in Cockspur Street, there is a certain depth of allegory mixed up with contemporary life. A man represented in modern costume need not look ridiculous.

SECOND PREMIATED DESIGN FOR THE NATIONAL MUSEUM OF WALES.—By Mr. T. L. Vesper.

## CORRESPONDENCE.

### An Open Letter to Sir Aston Webb, C.B., R.A., F.S.A.

Sir,—Surely the experience you have recently gone through in assessing the designs for the Welsh National Museum must have had a saddening effect, the work thereon by competitors representing an appalling waste of architectural skill, a waste only inadequately represented by thousands of pounds in value, and years—not less than one hundred !—in time.

You, sir, have now an opportunity to stop this ruinous waste, and are to be congratulated in that you can inaugurate a new era in competitions and thus go down to all time as a pioneer. The two competitions (Scottish and Irish) in which you are appointed assessor give you this unique opportunity.

May I venture to suggest to you that small sketch plans of each floor—and plans alone—are necessary for an experienced man, such as you, to form an initial opinion upon? The plan being the vital part of any architectural scheme, the design may safely be left for after consideration when the competitor was in the short leet and paid his "out-of-pocket" expenses.—I am, &c.,

L.

### Treatment of Chimneys.

Sir,—I have always thought that a plain house, if on good lines, can always be redeemed from the commonplace by well-designed and plotted chimneys, and that three essentials are necessary to every good house:—(1) A good front doorway, (2) a good hall and stair, and (3) good chimney treatment. One can hardly get too much of a good thing, but these three points go a long way towards that good thing. Pardon me for saying that poor chimney treatment mars the country house at Neubabelsberg, illustrated in *The Architect* of March 25, when so much else of it is, to my thinking, very good.—Your obedient servant,

E. Swinfen Harris, F.R.I.B.A.

March 29, 1910.

## THE FOUNDATIONS OF STAINED-GLASS WORK.*

In dealing briefly with the material aspect of all branches of painting there are three principal factors to be considered: first, the ground on which the painting is to be executed; secondly, the materials used for elaborating the design; and lastly, the means by which these materials are so attached to the ground as to render the work permanent and lasting.

Stained-glass work differs from almost every other method of decorative painting in that the sheets of glass which provide the ground provide at the same time both the broad masses of colour and the outlines of the design, and the function of the paint is limited in consequence to producing the details of the design and stopping out the light in places, instead of producing it entirely, as in the case of canvas or mural painting. It is, in fact, analogous, only the reverse way, to producing a picture by tinting a photograph or etching. The success of the work depends therefore to a large extent on the choice and quality of the glass to be painted. In the work of the seventeenth and eighteenth centuries the elementary fact that stained glass is painting by means of glass rather than on glass was lost sight of, a colourless and featureless glass being employed merely as a ground on which to produce pictures in coloured enamels.

In discussing our glass two things have to be considered—its function as a ground and its function as a material. Each of these functions for its adequate discharge requires the glass to possess certain distinct properties, which are at first sight antagonistic. As a ground on which to paint the glass must have all the qualities of good glass, and more particularly be highly resistant to atmospheric action, because it will have to be exposed to the atmosphere for centuries under extremely trying conditions. Or, rather, it has to be of such a quality that the action of the weather enhances the beauty of the glass rather than destroys it. Glass should acquire beauty and dignity with age, and not

SECOND PREMIATED DESIGN FOR THE NATIONAL MUSEUM OF WALES.—By Mr. T. L. Vesper.

by rotting away necessitate the attentions of the inevitable restorer and their uncertain result.

The attainment of this quality depends largely on the composition of the glass, although local conditions have a certain influence. The Romans, who introduced the making of window glass, knew how to make glass, and their traditions were handed down to later times; but as time went on, from one cause or another, these traditions were lost. By all means honour the mediæval craftsmen and their work, but let us look facts in the face and admit that their knowledge of glass-making from this point of view was very deficient, and as time went on it got worse and worse until their glass, as regards composition, became about as bad as it could be.

Analysis of Roman window glass shows that it contained properties practically identical with those arrived at by modern scientific investigation as being the best possible composition. There was a great falling off in later mediæval glass. Both alkali and earth became excessive, and in consequence the glass was destroyed in several ways. As a matter of fact, it becomes on exposure quite changed in constitution, so that instead of being firmly combined it is possible to decompose it entirely with acid. It is clear then that however we may wish to follow mediæval tradition in other directions, we should not do so as regards the composition of their glass.

Careful analysis between Roman, mediæval and modern window glass suggests that the sheet glass used at the present day is as to its lasting power about as good as is ever likely to be got. And so long as it continues to be made of this composition the glass of to-day will be merely mellowed, not decayed, in the thirtieth century. There is every probability that it will continue because commercial considerations (which have an immense influence on such matters) are favourable. Instead of, as in so many cases, conflicting with the needs of the artist, economy dictates the same composition as the one arrived at from considerations of durability. Of the three principal materials used in glass-making—namely, sand, lime and soda—the last, which is the element of weakness, is by far the most expensive, so that from motives of economy the glass-maker uses as little as he can without raising the fusion point beyond the limits of his furnace.

The only objection to the modern glass is the fact that in general its solubility for silver is not very great—that is to say, it does not stain very nicely; it is true that it can be stained, of course, but you cannot obtain the rich, deep stain so characteristic of, say, the glass of Peckitt's time. And secondly, if fired at the temperature necessary for the fusion of the enamel, it "metals." Staining power depends on slight differences in the composition of the glass, though not sufficient to have any effect on its stability, and it lies in the power of manufacturers to effect an improvement.

The methods of making glass into sheets may be thus summarised:—(1) Cast or rolled (cathedral, &c.); (2) blown into cylinder (Muff glass); (3) blown and spun (crown glass); (4) blown into mould ("Early English" slabs). With the exception of the last, which is a modern introduction, all of these have been employed from very early times, but the second and third were exclusively used in mediæval times in the production of stained glass.

Whichever of these two methods was employed, however, the resulting sheets were never like window glass of the present day. Owing to the primitive nature of the furnaces and appliances the glass was very imperfect or very perfect, according as you look at it from the purely utilitarian or the æsthetic standpoint. That is to say, it would be absolutely useless for picture frames or such purposes owing to the irregular thickness and the "reaminess" caused by slight variations of composition in different parts of the sheet. But these very defects caused the light passing through it to become irregularly refracted and partially dispersed, and gave Gothic glass its peculiar character.

As time went on, however, and window glass began to come into use for domestic and utilitarian purposes, instead of being practically confined to the production of stained-glass windows, people began to demand glass which, instead of being looked at, should be looked through, and manufacturers set themselves to make it more regular and more transparent until it became the wonderful material it is to-day. This, of course, was perfectly legitimate; however much we admire the mediæval glass, we should none of us care to be without the mechanically perfect window glass of to-day. It is dull, featureless and absolutely uninteresting in itself, but it is most exceedingly useful.

The trouble was, however, that when the manufacture of sheet glass was being brought to this state of perfection there was very little sympathy and understanding between the scientific worker and the art worker, and the manufacturers regarded the old "imperfect" glass as a thing of the past, thinking that because their material was of superior utilitarian value it must be superior from every point of view, even from that of the glass painter, ignorant of the fact that the very qualities which they were painstakingly eliminating from their glass were the source of its beauty. The result was that the poor glass painters of the last century had nothing to use except this improved, featureless glass. Nothing else was made, and the glass-makers could not understand how anyone in their senses could possibly want anything else.

With sheets of featureless glass, with colours hard and crude, because uniform throughout, they tried to produce works of art which had to be looked at, and not regarded as a medium through which to view a landscape. Things at last got so bad in this way that a remedy had to be sought. And at first, of course, the remedy was worse than the disease. The glass-makers tried to produce the effect of the mediæval glass by manipulating their glass mechanically so as to give it an irregular appearance. The result may be judged by the following quotation from an article by James Fowler on "The Composition and Texture of Glass of Different Periods":—"The so-called Gothic revival has induced innumerable attempts to imitate the effects of Gothic glass, giving us . . . for the undulating surface of the old, softly mellowing and dispersing the light, a surface furrowed and ridged in vulgar regularity like that of corduroy cloth; for microscopic striæ and a few bubbles here and there, coarse protruding waves made on purpose, the greatest number of bubbles the glass can be made to hold when stirred with a patent stirrer, or ashes or cinders riddled over the surface to make it rough and unsightly. . . . Such wildness of exaggeration of accidental features . . . can have no interest but as indicative of awakening sensibility to the beauty of the ancient."

But this state of affairs was only the result of ignorance on both sides, and once glass workers and glass painters began to come into contact things began to mend. For the last forty years or more glass painters have had at their disposal glass which enables them successfully to carry out the best traditions of the old craft. This glass at the same time possesses the superior qualities of modern glass as regards composition; it combines, in fact, the artistic possibilities of the old with the scientific precision of the modern. There is, however, the constant tendency for history to repeat itself, and for the glass to lose its artistic qualities by becoming too mechanical and perfect, and the remedy for this is that mutual sympathy and understanding between the two sets of workers. Unless the glass painter keeps in touch with the craftsman and realises what he wants, he is sure to go wrong; the making of glass is a science, or ought to be; its manipulation is an art.

The great danger at the present time, however, seems to be the over-elaboration of variety in colour and texture, the striving by the glassmaker to continually produce new effects to tickle the fancy of the artist. The great fault of the modern stained-glass window is the temptation to lack of simplicity and harmony. In the thirteenth century you rarely find more than five colours of glass used in a window (this was about all the range they were capable of producing), but the effects obtained by balancing these few colours one against the other seem to be some of the most beautiful that the world has ever seen. Some modern windows have scarcely two pieces of glass of the same nature. The result may be extremely pictorial, but it misses some of the finest qualities of stained glass.

As the function of the materials for painting the glass is limited to producing the details of design in monochrome, only a very limited range of colour is necessary, and these colours are not bright and transparent, but opaque and confined practically to brown and black. In general nature the material used is a vitreous enamel—*i.e.* a fusible coloured glass, which can, after the painting is executed, be permanently fixed to and incorporated with the glass by the process of firing. This enamel, although of such a comparatively simple and restricted nature, plays a very important part in the production of a window, converting as it does a mere mosaic of colour into a definite subject design, and it has to fulfil certain stringent conditions which may be summarised thus:—

1. Fusibility.—Property of softening at such a temperature that it can be fused on to glass without destroying the texture of the latter.

2. Durability.—Property of resisting the corrosive influence of the atmosphere indefinitely.

3. Opacity.—Property of producing decided opacity in the finest lines, and of retaining this quality through the firing.

4. Working Qualities.—Capability of working easily in a brush when made into a paint.

5. Colour.—Property of retaining the same tone in all variations of light.

These requirements are met by mixing an intensely coloured pigment with a glass of special composition which is called "flux," and grinding the two together to an impalpable powder which can be employed as a paint. The glass painted in this manner being then raised to a red heat, the flux melts and acts really as a vehicle to bind the pigment on to the glass, in precisely the same manner as the oxidised oil in an oil painting or the carbonate of lime in a fresco holds the particles of pigment. As regards the actual composition of this enamel, the pigments used in its preparation must be such as have a very strong colour, are opaque, and are capable of being raised to a red heat without decomposition and without entering into combination with the flux; this puts out of court practically every pigment except the oxides of the metals, and in practice oxides of iron, copper, cobalt and manganese are almost invariably employed, either singly, mixed together, or combined together. By this last are meant such pigments as contain two or more metallic oxides not merely mixed, but in a state of chemical combination; pigments are obtained in this way having qualities which cannot be produced by mere mixing, and the use of such compounds is of great importance in the production of an enamel for glass painting. This pigment, however, only influences the third and fifth requirements enumerated, and its composition is of minor importance to that of the flux, on which depend the most vital properties of the enamel, the fusibility and durability.

The function of the flux is to bind the pigment on to the glass, and however permanent this latter may be it is not much use unless it stays where it is put, so that in effect the permanency of the painting depends solely and absolutely on the flux. The actual composition of the flux is a compromise between the two conflicting requirements of fusibility and durability; in general one may say that the more fusible it is the less durable it is, and *vice versâ*, so that the practice is to make it as durable as one can consistently with the necessity of making it sufficiently fusible to fire properly. The general aim is to make the flux as near as possible in composition to that of the glass, because the durability of the painting depends not only on the actual resistance of the flux to decomposition, but on the glass and flux acting in harmony as regards expansion and contraction, and so forth. In mediæval work the durability of the colour was in many cases superior to the durability of the glass itself owing to the composition of the flux. In the eighteenth and early nineteenth centuries matters were just the reverse—the glass was better, but the enamel was of such indifferent stability that it perished in a very short time, as will be evident to anyone who has closely examined the many windows of the period. This state of affairs was largely due to the fact that the principles governing the craft were but little understood and the flux was made too fusible. This is always a temptation, because not only is a more fusible colour easier and considerably cheaper, but it is much more facile in working, in addition to firing to a nice gloss more readily. The flux of that period, instead of closely approximating to the glass in composition, was widely divergent.

When once attention was drawn to the disastrous state of affairs it was not long before the matter was thrashed out and more satisfactory enamels introduced. The enamel of to-day approximates to the composition of the glass itself, with the exception that the use of lead is retained in most cases. It may be of interest to give some particulars as to the actual process employed in preparing these enamels. The first operation is the making of the flux; this is performed by mixing the ingredients thoroughly together and heating them to a temperature of about 1,500° C. for several hours until the chemical action is complete, and then pouring the molten mass of glass so formed in a thin stream into cold water; the object of this is to render it brittle and break it up into small fragments so as to facilitate the operation of grinding.

The next part of the process is the incorporation of the pigment with the flux and the grinding of the two together into an impalpable powder. This operation involves prolonged grinding in a powerful mill, as the particles of flux have to be uniformly reduced to an extremely small size in order that the enamel may work smoothly and satisfactorily in the brush. A mill having a considerable deadweight crushing power, such as the flat stone mills of the Potteries, is the most satisfactory for the purpose, and the enamel must be ground in water. After it has been ground in this way the enamel, or "colour" as it is called, must be thoroughly tested. A general test is first made by painting a slip of glass with it and noting its behaviour under the brush and its colour as compared with a standard. This gives an indication as to its working qualities, which is further investigated by determining whether the grinding has been properly performed.

The fusibility of the colour is determined by painting it on a slip of glass side by side with a standard and firing in a furnace under observation until the standard is correctly fired; it may also be determined absolutely by means of a pyrometer. A form of fusion pyrometer such as the Seger cone or thermoscope is most useful, the colour being made up into a similar cone and fired side by side with the standards.

Then there is the most important test of durability. One satisfactory method is to boil a slip of glass painted with the colour and fired in normal hydrochloric acid, and then determine the loss of weight in a given time.

If the colour passes these tests satisfactorily it is then finished off by drying. On drying, however, it sets into more or less hard cakes owing to a slight solvent action of the water, and has to be further treated in order to bring it into a state of impalpable powder so that it can be readily rubbed up into a paint with the palette knife. For this purpose it is re-ground dry, or in some cases it is necessary to grind it wet in a medium such as trichlorethylene, which has no action on it and which is very volatile, so that it can be driven off by gently heating, leaving the colour in a soft powder quite free from lumps. For use, the powder so prepared has to be mixed with a medium in order to hold it to the glass temporarily to preserve it against handling before it is fired. This medium should, however, be used to the smallest possible extent, and should be of such a nature that it is either completely volatile or completely decomposed below a red heat, otherwise it will interfere with the firing.

Lastly there is the matter of firing: the means to be employed for heating the painted glass to such a temperature that the flux in the "colour" or enamel will melt and combine with the glass so as to fix the painting permanently. This is purely a process; no materials are involved; all that has to be done is to heat the work red hot. It is a perfectly mechanical operation, and yet an integral part of the craft because a great deal depends on whether it is properly carried out, and because a good many things can go wrong.

The principal troubles that arise in the process of firing may be summarised thus:—

1. Cracking of the glass, due to (*a*) too rapid heating or cooling; (*b*) use of glass under strain or containing "stones."

2. "Sulphuring," due to the action of reducing gases on the lead in the "colour."

3. "Frying" of the colour, due to (*a*) rapid firing; (*b*) excess of medium; (*c*) "stale colour"; (*d*) defective colour; (*e*) hydration of the glass.

4. Blowing of the glass, due to development of gas from the bedding powder.

5. Uneven and incorrect firing, due to bad design or regulation of the kiln.

In the construction of the apparatus to be employed for conducting the firing the modern artist has a distinct advantage over his predecessors. The kilns of the mediæval glass-painters were of very primitive construction, and their firing was largely a matter of luck. According to the records of Theophilus they had no means of controlling the firing; the glass was heated up in a temporary kiln, allowed to cool, and then examined. "And having withdrawn the glass, try whether you can scrape off the colour with your nail; if you cannot, it is sufficient; but if you can, put the glass into the furnace again." That is to say, that as long as the enamel was sufficiently fired to be "tacked on," as we should call it, they would pass it, although no doubt they were aware that for the enamel to be thoroughly durable it should be properly fused on to the glass and show a surface like varnish.

If the work is half fired so as only to be just stuck to the glass, it will not last, however durable the enamel may be, and the inability of the mediæval craftsmen to control their firing accurately so as to ensure perfect fusion in every case must be obvious to anyone who has carefully examined an old window and noticed how, whilst in general the painting may have remained perfectly sound, here and there are found portions which have completely perished. Of course, matters improved somewhat as time went on, but even down to the seventeenth century the glass kiln remained a very crude and uncertain apparatus.

Coming down to our own time, the kiln of yesterday consisted of a cast-iron muffle heated by a coke fire. The kiln of the present is the gas kiln. This was introduced some forty years ago, and has now practically superseded the close kiln, although there are a few who still remain unconvinced as to its advantages. At first it was far from perfect, and despite its many advantages it gave rise to a great deal of trouble, so that a strong prejudice against it was created in many quarters. The mistrust was largely due to causes that have now been remedied, such as a misunderstanding of the principles of firing. The great thing is to be able to control the heat exactly; if the kiln is too hot, as usually happened at first, the glass finishes off rapidly, however slow it may have been in the initial stages, and instead of remaining at the firing point passes beyond it. This is extremely difficult to ensure in a close kiln, and very easy in a properly designed gas kiln, where the temperature is always under absolute control, though at the same time it is easy to go wrong with a gas kiln if this principle is not appreciated. There are several types of kiln available to-day which are capable of firing the glass uniformly and accurately provided they are used by a man who understands them. However, at the present time, in fact, there is no reason why the painter should shrink from firing his work himself and getting exactly what he wants from it; kilns are available which, whilst capable of turning out a considerable quantity of good work, can be placed in a studio and used with such ease and convenience as to enable the artist to do his own firing if he wishes.

Stained glass, and indeed every artistic craft, is not only an art, but also a science. It is, of course, absolutely essential that the glass-painter whose work is to live after him shall be an artist to the backbone, and the technical matters as discussed above are of but secondary importance. I am not going to suggest even that the glass-painter should also be a scientist, although the great works of the past in this and other branches of decorative art were done by master minds familiar with every detail of the technology of their work. But the artist who works in such crafts should be so far conversant with the principles governing his materials—the foundations of his craft—as to know their possibilities, and more particularly their limitations. Division of labour is essential in such a craft as stained glass; the artist cannot be expected to prepare all his materials, as some would have him do, nor perhaps would he be much better off if he did. Let us frankly realise that whatever may have been the case in the past, such a thing is impossible under modern conditions. There must be two sets of workers, the artists and those who work for them; but these two must work together to the same end if the best results are to be achieved; there must, in fact, be co-operation between science and art. The real function of technical education as far as concerns such crafts is to bring about this understanding, to teach the practical craftsman the fundamental principles on which his work is based, which he only learns by long and painful experience in his studio.

## DRY ROT IN TIMBER.

The attention of the Council of the Royal Institute has been drawn to the issue in October 1909 of a leaflet by the Board of Agriculture and Fisheries referring to the increasing prevalence of the disease known as "dry rot" in timber used in the erection of buildings, and, having taken the matter into consideration, the Council deem it to be in the interest of the public generally to issue some observations thereon.

From the official leaflet the following extracts are taken:—

"Infection with the dry-rot fungus sometimes takes place in the forest when felled timber remains stored there for some time. The first evidence of such infection is indicated by the presence of red stripes in the sawn wood. If such wood is thoroughly seasoned the mycelium present in the red stripes is killed. If the seasoning be neglected or imperfectly done, the mycelium, which possesses the power of remaining in a latent condition for some time, commences active growth when the wood is used in any part of a building where it is exposed to dampness, and this in some cases is unavoidable, as when the ends of joists are built into a wall.

"Under such circumstances dry rot eventually appears.

"On the other hand, the fungus is by no means rare on old beams and boards stored in wood yards, &c., and it is mainly from such sources that spores or portions of the spreading mycelium are introduced into buildings by new wood which has become infected.

"The fruit of the dry-rot fungus presents the appearance of irregularly shaped, flattened, or undulating patches of variable size, adhering by their entire under-surface to the substance on which they are growing. When mature the central portion of the patch is covered with an irregular network formed by slightly raised anastomosing ribs, and is of a rich brown colour due to the enormous quantity of spores which are deposited on surrounding objects under the form of snuff-coloured powder. These spores are diffused by currents of air, or by rats, mice and insects.

"The margin of the fruiting patch is surrounded by a snow-white fringe of mycelium which spreads in every direction over surrounding objects, creeping up walls and passing through crevices, the advancing mycelium being supplied with food and moisture from the parent plant growing on wood.

"This food is conducted through cord-like strands which form behind the thin advancing margin of mycelium.

"Owing to this supply of food from a central source the mycelium can extend over stones and other substances not containing food, and thus spread from the basement to the top of a house. Each time the migrating mycelium comes in contact with wood the latter is attacked and a new centre of food supply is established, from which strands spread in search of other sources of food. The mycelium often forms felt-like sheets of large size that can readily be removed intact. These sheets are white at first, but soon change to a pale grey colour—a character by which dry rot can be readily distinguished from another wood-destroying fungus *Polyporus fomentarius*, even in the absence of fruit, the felted mycelium of the latter remaining permanently white.

"The specific name of *lacrymans*, or 'weeping,' alludes to the power of the fungus to attract moisture from the atmosphere. Under certain conditions moisture is absorbed to such an extent that it hangs in drops, or even drips from the surface of the fungus. This moisture assists very materially in rotting the timber, which afterwards becomes quite dry and friable. Hence the popular name 'dry rot,' which alludes to the last and most frequently observed stage of decay."

The depletion of the more matured forest trees resulting in the importation of immature wood is said to be one of the contributory causes of the spread of the disease.

Spores may exist in the earth arising from the roots of trees or other source.

The rapid completion of a house before the materials of which its carcase is constructed have had time to dry thoroughly conduces to the germination of dry rot.

A warm, damp atmosphere surrounding the wood, such as exists under a floor immediately over the ground and in unventilated cellars, is another condition conducing to the spread of the disease.

Although, as above remarked, immature or imperfectly seasoned timber is said to be a cause of the spread of the disease, yet thoroughly matured and sound timber in a warm, moist atmosphere will readily fall a prey if attacked by the mycelium of dry rot, once a spore has been introduced.

It has been proved that the spores of the disease can be carried from house to house on the clothes or tools of workmen, and that wood can be infected from a spore on a carpenter's saw.

From the foregoing it will be seen that the disease may have been introduced (*a*) in the timber; (*b*) from the adjacent earth; and (*c*) accidentally by the importation of a spore. These are conditions over which architects have obviously no control.

## TRADE NOTES.

Messrs. E. H. Shorland & Brother, warming and ventilating engineers, the inventors and makers of the well-known Manchester stoves, have for family reasons converted their business into a private limited company. This has enabled some of the older employés of the firm to obtain a more direct interest in the business. The name of the firm will not be altered with the exception of the addition of the word limited, and the management will be in the same hands as formerly.

Messrs. Clarke, Chapman & Co., Ltd., have opened an office at 29 Queen Anne's Chambers, Broadway, Westminster, S.W., specially for the sale of their Clarke-Chapman water tube boilers (Woodeson's patent).

It is three years since London had a Laundry Exhibition. This will again be held at the Agricultural Hall, London, opening on Saturday. There will be the most comprehensive display of laundry machinery ever brought together in the United Kingdom, and competitions by laundry proprietors and exhibits of work by London County Council scholars will add to the popular interest in the event.

The committee of the Lochgelly Equitable Co-operative Society have given instructions to an architect to prepare plans for the reconstruction of the premises recently destroyed by fire. It is expected that the new structure will cost from 15,000*l*. to 18,000*l*.

## NOTICE TO ADVERTISERS.

**Under no circumstances whatever can the Proprietors of this journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.**

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

## TENDERS, ETC.

*** *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2* P.M. *on Thursdays.*

## COMPETITIONS OPEN.

BIRKENHEAD.—The Guardians invite architects residing within the limits of the Birkenhead Union to submit designs for a Children's Receiving Home. Premiums will be awarded for the three first designs. Mr. J. Carter, clerk, Poor Law Offices, Birkenhead.

IRELAND.—April 23.—The Meath County Council invite architects in Ireland to submit plans and specifications for the building of new County Offices at Navan. Apply to Mr. H. J. Cullen, Meath County Council Offices, Navan.

LIVERPOOL.—The Corporation invite designs from architects practising in Liverpool for a branch library estimated to cost not more than 7,000*l*. Mr. W. E. Willink, F.R.I.B.A., will act as assessor. Apply to Mr. E. R. Pickmere, town clerk, Reference Library, William Brown Street, Liverpool.

LONDON.—June 15.—The Acton Urban District Council invite plans for schools at Rothschild Road for 850 pupils. Premiums of 100*l*., 50*l*., and 25*l*. are offered, but any premium awarded to the successful architect shall be merged in his commission of 3½ per cent. Deposit 10*s*. 6*d*. Apply after April 5 to Mr. F. A. Everitt, secretary, Education Department, Council Offices, Acton, W.

WALSALL.—Designs are invited for the erection of a public elementary school (mixed) to accommodate 500 children at Bloxwich. Conditions of competition and plan of site from Mr. W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.

THE Institute of Metals have decided to initiate what is hoped will be an annual series of May lectures. The first of these will take place in London on Tuesday, May 24, when Professor Gowland, F.R.S., vice-president, will deliver a lecture on "The Art of Working Metals in Japan," which will be illustrated by diagrams and lantern slides. Previous to this lecture there will be a ballot for the election of new members.

| Westwood & Wrights | 512 | 0 | 0 |

## TRADE NOTES.

Messrs. Kershaw, Brassington & Co., of Lancaster and Settle, have just completed the ventilation of the new Central Post Office, London.

The contracts for the electric lifts for the South Manchurian Railway, and also for the Shanghai Municipal Council buildings, have been obtained by Messrs. A. W. Penrose & Co., Ltd., of 109 Farringdon Road, E.C., in competition with German and American makers.

At Dumbarton Dean of Guild Court last week, lining was granted to Messrs. Denny & Co. for the erection of a large machine shop, a small machine shop, and a valve shop. The contract for the extension is in the hands of Sir William Arrol & Co., Glasgow, and the cost will be about 50,000*l*.

The "Boletin Oficial" of the Argentine Republic contains decrees approving the plans and estimate of about 187,000*l*. for the construction of the Central National College of Buenos Aires; and the plans and estimate of about 61,000*l*. for the building of a station at Santa Fe on the Central Northern Railway. The requisite call for tenders is authorised in both cases.

## WATERPROOF PORTLAND CEMENT.

An important and at the same time highly economical method of making cement and concrete absolutely waterproof is being introduced into this country by the British Ceresit Waterproofing Company, Ltd., of Caxton House, Westminster. This most desirable end is effected by the use of Ceresit, a preparation which originated in Germany, and has been used with great success in that country and in other parts of the Continent, as well as in Egypt, Siam and America.

Ceresit is described as a cream white paste of about the consistency of butter. When added to water in the proportion of one to twelve, it dissolves immediately, turning the water to a milky white fluid. This used, as is ordinary water in the mixing of cement or concrete, makes the latter completely proof against the penetration of moisture or water, even under a pressure as high as 70 lb. per square inch. It is also claimed for it that it is sufficiently elastic to contract and expand under varying extremes of temperature, thus avoiding all likelihood of damage through intense extreme heat or frost. All this is effected without any increase in cost of labour. The water in which the Ceresit is placed mixes just as easily with cement as other water. There is no smell, and the only difference in the colour of the finished cement is that it is a very little lighter than when made in the ordinary way.

BATHS AT LIEGE.

CHATEAU AT STERREBECK.

Among many hundreds of structures in the building of which Ceresit has been used are the Kaiser's Castle at Posen, Germany; the City hospitals, Düsseldorf; several Government dams in Germany, water tower and swimming bath at Brussels, public schools at Vienna, electricity works at Bangkok, Siam; Protestant church at Alexandria, reinforced concrete cistern for the U.S. Government in Florida, and power plant in Chicago. Ceresit is also being used in large quantities by the State Government railways of Germany, France, Russia, and Austria, for tunnels, embankments, reservoirs, locomotive turntable foundations, water tanks, &c. We illustrate two buildings in the construction of which Ceresit has been used with complete success—one a château at Sterrebeck, which is surrounded by water; the other the public baths at Liège.

---

The absence of building by-laws in Perthshire is commented upon by Mr. R. M'Nicoll, the sanitary inspector for the county, in his annual report. At present, he says, no power is given to the public health department to interfere with any dwelling house or other premises during construction with a view to proper provision being made for the prevention of dampness, ventilation, testing of drainage, and other details.

## GLASGOW MAIN DRAINAGE.

The new pumping station which has been constructed in connection with the South Side section of the Glasgow Main Drainage Scheme was formally opened on Monday, the 4th inst.

For many reasons great difficulty was experienced in finding a site for Kinning Park Pumping Station with, among other requirements, good substrata. In August 1907 it became clear that the completion of the scheme would be seriously prejudiced unless an immediate start were made with the construction of this station on the site then authorised, its grave drawbacks notwithstanding. The Sewage Committee then approved of the design submitted by the consulting mechanical engineer (Mr. D. Home Morton), the general manager (Mr. Thomas Melvin), and Mr. W. C. Easton, engineer on construction and formerly resident engineer.

Shortly after they instructed Mr. Easton to proceed forthwith with its construction by their main drainage staff, holding him responsible for the construction of the whole station, notwithstanding its obvious difficulties, and the necessary barricade was erected on November 1, 1907. The site was of a cramped nature, being restricted on one side by a five-storey building over 70 feet high, on another by a transformer station delivering power to a large section of the tramways, and on the remaining two sides by streets carrying tramways.

The strata consisted of 19 feet of fine dry sand, followed by 44 feet of fine running silt, underlain at 63 feet from the surface by boulder clay. The level of the incoming sewer necessitated the excavations being carried down to a depth of from 45 to 51½ feet. The area to be excavated was over 100 feet long, varying from 50 to 100 feet in breadth. The troublesome stages were:—

1. Underpinning of the two adjacent buildings to 20 feet from the surface—*i.e.* just into the silt. The streets were also supported by walls, and the area thus enclosed excavated down to the running silt.
2. The forming of a silt-tight curtain extending into the boulder clay, enclosing the area to be excavated in the silt. This was effected by driving close-fitting sheet piling of timbers, 45 feet to 50 feet long, from the top of the silt.
3. The subdividing of the area thus protected into 34 pockets by internal sheet piling driven into the boulder clay.
4. The excavating to and plugging with concrete at 45 to 51½ feet from the surface of the bottom in each of the 34 pockets. This left from 18 to 12 feet of silt under the concrete and above the clay. This last was the critical stage. It occupied six weeks, and was completed on February 3, 1909.
5. The forming of a reinforced concrete raft on the internal piles, cut at the necessary level, over the whole area, followed by the building thereon of the walls—the external walls in concrete specially reinforced—up to the top of the silt.

The remainder of the work was by comparison easy, and the pump-house, roofed at a height of 110 feet from the foundation, was handed over to the consulting mechanical engineer on July 1, 1909. Although Mr. W. C. Easton and the contractors, Messrs. Glenfield & Kennedy, hydraulic engineers, Kilmarnock, had been previously advised by the resident engineer to keep back their work, they responded so promptly to a request to proceed that the station was put into work before the end of March 1910, or within two years and five months from the commencement of operations. The total cost of the station will be about 95,000*l*.

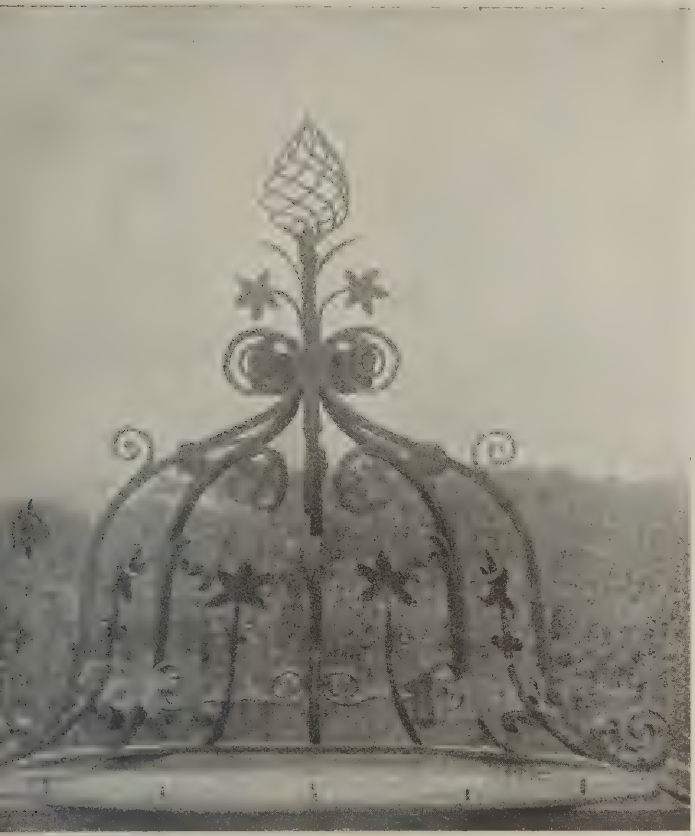
The pumping machinery raises the sewage from the intercepting sewer in St. James Street and delivers it through two rising mains into the main outfall in St. Andrew's Drive. There are three pumping engines, and provision is made to receive a fourth without interrupting the work of the pumps now erected. Two of the pumps are intended to deal with the present wet weather flow of sewage, the third being generally at rest as a standby. With the opening, probably in May, of the pumping station and purification works at Shieldhall the Glasgow Main Drainage Scheme will be completed, whereby the sewage of the city will be diverted from the Clyde into the new sewers and scientifically treated at the three outfall works at Dalmarnock, Dalmuir, or Shieldhall. The cost of the whole undertaking will probably total nearly two and a half millions sterling.

---

The British Consul at Alexandria reports with reference to a notice relative to the proposed erection of a theatre at Alexandria that the Municipality are prepared to receive tenders up to April 30. The auditorium must be capable of seating from 1,200 to 1,500 people; the cost of construction should be about 61,560*l*.

## WROUGHT-IRON WELL COVER.

This wrought-iron well cover was made without models or drawings by George Male, village blacksmith and farrier at Selsey Bill, Sussex, in his spare time, from rough sketches and suggestions by the owner, Mr. Edward Heron-Allen, of Large Acres, Selsey Bill. The whole weighs one and a half tons. There is also an elaborately wrought flange wheel and spout to the pump, which have not been photographed. The three front bars and intermediates were removed previous to taking the photograph in order to show the outlines better.



WROUGHT-IRON WELL COVER.

## THE CHINESE BUILDING MARKET.

The United States Chargé d'Affaires at Peking has furnished to his Government the following information concerning the letting of contracts and the supplying of materials to contractors for the Chinese Government, which, he says, applies fully to building construction in North China and, in great degree, throughout the Chinese Empire:—

The Chinese Government have no rules, printed or otherwise, for letting contracts, or for buying materials. The man on the spot with the lowest price and quickest delivery gets the work. Ninety per cent. of all the building done in China is done by Chinese contractors. When foreign material is specified, such as heating plants, plumbing, electric light plants, light fixtures, constructional steel, &c., tenders for these materials, either delivered on the ground or put in place, are invited from the many foreign firms in Tientsin or Shanghai. These firms hold agencies for the materials required, and all arrangements are made with them. Neither the foreign engineer nor the native contractor deals directly with the home houses, as it saves much trouble to deal with large houses well established in China. The prices of the latter include freights, duties, &c., and, where necessary, quotations are given including landing the goods where wanted and putting them in position.

Unless connections are made with a well-established firm, or a permanent agency for a special line of goods created, there is little chance of introducing foreign building material into China. As the large firms have their own expert engineers, a contractor can get fair prices quoted for everything at short notice. These firms make it their business to be closely in touch with all proposed work, both Government and private. The terms of payment usually offered by the Government are one-third on arrival of shipping documents, one-third on delivery, and one-third on acceptance. These Government terms were varied considerably during the last year, however; in order to help the foreign firms, as money was tight and exchange bad, the Government paid on several occasions one-half on signature of contract and one-half on completion of work.

## EXTENSION OF PUMP ROOM BUILDINGS, BATH.

At the Bath City Council meeting held on the 5th inst. a letter was read from the President of the Royal Institute of British Architects asking for particulars as to how any contemplated scheme would affect the Roman Baths, remarking that his reason for doing so was owing to the great interest taken in these ancient works by all architects, antiquarians, and students of English art and history.

Letters were also received from the Bath Abbey Council, and also from the Old Bath Preservation Society.

Mr. T. Sturge Cotterell, the chairman of the attractions committee, in moving the adoption of the minutes, stated that the committee had not yet formulated any scheme, but were dealing only with the accommodation the site of the old *Chronicle* office would afford if it was decided to erect a building thereon adjoining the Roman Baths. The letters received would be considered with the great respect which they deserved, but he should like to assure all those interested that the safety of the Abbey and the preservation of the Roman antiquities, and any further antiquities that might be found during the excavation, would be treated by the committee as of paramount importance, and every consideration would be paid to the views expressed in the letters received and by the President of the Royal Institute of British Architects.

## VARIETIES.

A new girls' school at a cost of 3,000*l.* is being erected at Rusthall, near Tunbridge Wells.

It has been decided to build a public hall at Brookfield, a suburb of Johnstone, N.B.

Mr. William Cowie, architect, Ayr, has prepared for the Prestwich Town Council plans for a kiosk and stand to cost 900*l.*

Mr. Edward Shewbrooks, of Newcastle, architect, left estate of the gross value of 22,186*l.* 14*s.* 3*d.*, of which the net personalty has been sworn at 609*l.* 6*s.* 1*d.*

Leith Town Council have resolved to obtain from their surveyor a plan of a hall and library which it is proposed to erect at the entrance to the tramway depôt, Leith Walk.

Mr. B. Ball, the borough surveyor of Nelson, has resigned his position, having accepted an appointment at Singapore. It has been decided to advertise for a successor at 300*l.* per annum.

The Stoke-on-Trent Guardians have adopted plans for the proposed new offices and board-room to be erected adjoining the present Union buildings at a cost of 7,500*l.*

A scheme of addition and reconstruction at Westgreen Asylum, Dundee, involving an expenditure of 3,000*l.*, is under consideration, providing accommodation for eighty patients, and improved house room for the nursing staff.

The Brazilian Minister of Communications is expected to shortly issue a call for tenders for the construction of a building in Porto Alegre for the housing of the postal and telegraph service of that town. The estimated cost of the work is said to amount to about 45,250*l.*

Mr. William Owen, a well-known Warrington architect, died on Monday last suddenly. Mr. Owen designed many of Warrington's public buildings, and he was also responsible, in collaboration with Mr. Segar Owen, for the designing and carrying out of many of the buildings at Port Sunlight for Messrs. Lever Bros., of which firm he was a director.

The Privy Council have approved the new by-laws of the Royal Institute of British Architects, as revised by the general meetings of February 7 and 15, 1910, with the exception of the new by-law 24. They have substituted for this the old by-law 22, with the addition of the Licentiates, and they have asked the Council to submit an amended form of words with reference to the action to be taken towards members who take part in competitions against the wish of the Council. This amendment will be taken into consideration by the Council without loss of time, and their recommendations will be submitted to the general body.

The next ordinary meeting of the Paint and Varnish Society will be held at St. Bride's Institute on April 14, when Mr. Gaston Depierres (the President) will read a paper on "Zinc Oxide." The latest information concerning zinc oxide, its manufacture and properties, will be dealt with. All those interested in the subject will be welcomed.

The Stockport Corporation isolation hospital at Dialstone Lane is to be extended at an estimated cost of 16,000*l.* The Finance Committee have decided to apply to the Local Government Board for sanction to borrow the money required.

The re-erection of Crosby Hall, formerly in the City of London, on the site of More's garden in Chelsea, is expected to be completed by the end of June. The opening ceremony is to be followed in the first week in July by a pageant representing the outstanding episodes of its history.

The details of the plans of the Alhambra Music Hall, to be erected on the site of the Waterloo Rooms, Glasgow, have now been practically arranged, and it is expected that building operations will be commenced in the course of the next few weeks. When completed the music hall will provide seating accommodation on the ground floor and two galleries for about 2,400 people.

A memorial window to the late Mr. G. F. Deacon, engineer, who largely contributed to the inauguration of Liverpool's water supply from Lake Vyrnwy, has been placed in Llanwddyn Church, which the Corporation erected as a recompense for the old edifice now lying beneath the waters of Lake Vyrnwy. The main feature of it is a representation of "Moses striking the Rock."

Wednesday, June 15, has been provisionally fixed as the date of the reopening of Ayr Auld Brig, and it is understood that the Town Council have decided to invite the Earl of Rosebery, whose oration in the town hall in September 1906 was mainly instrumental in the raising of the 10,000*l.* required for the carrying out of the preservative work, to take a leading part in the ceremony.

The annual general meeting of the Glasgow Institute of Architects (Associate Section) was held in the rooms on March 27. A very satisfactory report was read and approved, and the following committee was elected:—Messrs. A. M. Gardner, A. Wright, J. Wright, H. Higgans, E. G. Wyllie, T. Lunan, J. A. Wilson, Alex. Davie, William Vickers, junr., and A. Newton. Mr. Alex. Wright was appointed chairman, and Mr. J. A. Wilson, 92 Bath Street, was again elected hon. secretary.

Dundee Corporation's outlays in connection with the Mackison case litigation will come to about 4,000*l.* Treasurer Soutar at a recent meeting remarked that the importance of the action to the town did not merely consist in the fact that the Council got rid of an action for 15,000*l.*, but that, in gaining the decision, it had also disposed of a dozen other claims of a similar kind that were lurking behind it. The whole cost of the litigation to the town would not be more than the sum of 4,000*l.*, which was tendered at a certain stage in the litigation.

A Durer exhibition, under the auspices of the Liverpool City Council, will be opened on the 16th inst. The exhibition will be one of quite exceptional interest, containing a practically complete collection, in chronological order, of reproductions of the life work of the great German mediæval painter and engraver, Albrecht Dürer. This collection, numbering about 1,000 items, has been formed by Sir Martin Conway, who has lent it for the purposes of the exhibition.

Sir Aston Webb, the assessor in connection with the adjudication of the plans for the Usher Hall, held a meeting with Lord Provost Brown, Dean of Guild Carter, several town councillors, and the town clerk, last week, in the City Chambers, at which there were discussed and approved the conditions bearing on the designs competition for the hall. Sir Aston also inspected the site which has been selected for the hall. The conditions of the competition for designs will be issued in a very few days.

*Indian Engineering* (Calcutta) states that the trustees of the Victoria Memorial to be built at Calcutta have accepted the tender of a firm at that city for the execution of the work. The building, which will take some eight years to complete, is estimated to cost 50,00,000 rupees (about 333,000*l.*). The structure is to be of brick, faced with white marble slabs from Jodhpur. The name and address of the firm who have been given the contract may be obtained on application to the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

The Royal Institute of the Architects of Ireland held an ordinary meeting of the Council at 31 South Frederick Street, Dublin, on Monday, Mr. R. Caulfeild Orpen, B.A., occupying the chair in the absence of the President. A communication from the Stone Carvers' Trade Association with regard to the encouragement of the trade was considered, and the Council expressed themselves generally in favour of the Association's proposals. The amalgamation of the Architectural Association and the Institute was further discussed, and a proposal to erect a memorial to the late Sir Thomas Drew was under consideration.

At the last meeting of the heritors of the parish of Dunfermline, attention was called to the condition of the masonry of the more modern part of the abbey. It was stated that Sir R. Rowand Anderson had expressed the opinion that the position of matters was becoming serious. It was agreed that a credit balance of 50*l.* on last year's account should be applied to some scheme of restoration. It was pointed out by the Dean of the Guildry that not only was the quality of many of the stones inferior, but several of them had been laid the wrong way, and he remarked that a much bigger job might be involved than some of them anticipated.

The Admiralty have written to Greenock Corporation asking them to proceed with a building scheme to meet the requirements of the workers coming from Woolwich to the Clyde Torpedo Factory. While prepared to give their moral support to the scheme, the Admiralty states that the men cannot offer any guarantee as to the length of time they would continue in the houses. At a subsequent meeting of the law and finance committee it was unanimously agreed that should the Admiralty proceed with any such scheme the Corporation would give it their moral support, but that as there was no money in hand for providing houses they could not embark on an undertaking of this kind.

The Conway Suspension Bridge became free of tolls upon foot passengers at midnight, March 31, and in all probability will for the future always remain so. The Act of Parliament authorising the bridge to be built was passed in the reign of George IV. in 1821, and it was opened five years later. It passed into the control of the Conway Town Council in 1878. The Council undertook to maintain the bridge, and to set aside the profits from the tolls in a reserve fund. When that fund amounted to 10,000*l.*, they bound themselves to abolish the tolls, and to maintain the structure out of the income from the reserve fund. The reserve now stands at 8,000*l.* Reduced tolls will therefore be charged on vehicles, animals, &c.

The London Master Builders' Association held a council meeting recently, when it was decided to protest against the charges proposed to be made by the Port of London on building materials entering the Port. The Board of Trade will be asked to receive a deputation on the subject. It was also decided that members who may be engaged in litigation arising out of the conduct of their business could not rely upon the Council rendering financial assistance from the funds of the Association, unless the particulars relating to the dispute were submitted to the Council for their consideration, so that the question of whether or not financial assistance could be afforded should be decided by the Council beforehand.

The *Gaceta de Madrid* of March 23 announces a competition of plans, specifications, and estimates for the construction of a central market at Valencia, the cost of which must not exceed 2,000,000 pesetas (about 74,000*l.*). The plans and estimates must be submitted, within 150 days from the date of the *Gaceta*, to "El Señor Alcalde Presidente, Alcaldía Constitucional," Valencia. The successful competitor will enjoy certain preferential rights in the subsequent call for tenders for the execution of the works, and if such rights are relinquished he will be entitled to a premium of 25,000 pesetas (about 930*l.*). One of the conditions is that plans must be previously approved by a Spanish architect. The *Gaceta*, containing further particulars, may be seen by British firms at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

In connection with the Lancashire, Cheshire, and North Wales Building Trades Employers' Federation and the Lancashire and Cheshire Federation of Slate Merchants and Slaters a meeting, representing the whole of the slate trade in Lancashire and Cheshire, is to be held in Manchester on Thursday, April 14, "to protest against wholesale agents of the two great Welsh slate quarries continuing to compete for anything and everything in the way of slating and roof tiling, and to ask the quarry owners to consider the interests of the smaller men by actively discouraging these unfair operations on the part of their wholesale agents." The following resolution will be submitted:—"That this joint meeting of all the slate merchants and slaters, associated and otherwise, in the two counties of Lancashire and Cheshire, again express to the slate quarry owners the desirability of the old Lancashire custom being respected by their agents, and that the wholesale slate merchants shall confine their business strictly to the sale only of slates, and that neither directly nor indirectly will they compete for slating, but refer all inquiries for slating fixed complete to the local master slaters in the districts where the slating is required."

## NOTICE TO ADVERTISERS.

**Under no circumstances whatever can the Proprietors of this journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.**

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

## TENDERS, ETC.

⁂ *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 p.m. *on Thursdays.*

## COMPETITIONS OPEN.

Birkenhead.—The Guardians invite architects residing within the limits of the Birkenhead Union to submit designs for a Children's Receiving Home. Premiums will be awarded for the three first designs. Mr. J. Carter, clerk, Poor Law Offices, Birkenhead.

Edinburgh.—The Corporation invite competition designs for the erection of a new hall in Lothian Road, Edinburgh. They have appointed Sir Aston Webb, C.B., R.A., as assessor, Mr. J. A. Williamson, A.R.I.B.A., City Chambers, being associated with him. Three premiums are offered. Particulars and plans of the site will be supplied to competitors on payment of two guineas, which will be returned on receipt of a design in accordance with the conditions. Should architects, on receipt of the particulars, not desire to compete, the deposit will be returned, provided the papers are returned within four weeks. Mr. Thomas Hunter, town clerk, City Chambers, Edinburgh.

Ireland.—April 23.—The Meath County Council invite architects in Ireland to submit plans and specifications for the building of new County Offices at Navan. Apply to Mr. H. J. Cullen, Meath County Council Offices, Navan.

London.—June 15.—The Acton Urban District Council invite plans for schools at Rothschild Road for 850 pupils. Premiums of 100*l.*, 50*l.*, and 25*l.* are offered, but any premium awarded to the successful architect shall be merged in his commission of 3½ per cent. Deposit 10*s.* 6*d.* Apply after April 5 to Mr. F. A. Everitt, secretary, Education Department, Council Offices, Acton, W.

Walsall.—Designs are invited for the erection of a public elementary school (mixed) to accommodate 500 children at Bloxwich. Conditions of competition and plan of site from Mr. W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.

| Maggs | 3,849 | 10 | 0 |
| Turner & Son | 3,785 | 0 | 0 |
| Jones | 3,598 | 0 | 0 |
| Morgan | 3,594 | 0 | 0 |
| Bowers & Co. | 3,565 | 0 | 0 |
| Knox & Wells, Cardiff (*accepted*) | 3,525 | 0 | 0 |
| D. W. Davies & Howell | 3,456 | 0 | 0 |

## COMPETITIONS.

Blyth.—The Governors of the Blyth Secondary School recently instituted a competition among local architects for designs for a new Secondary school for 280 pupils with a caretaker's cottage at a cost of 7,000*l.*, to be erected in Plessy Road. Mr. J. A. Gotch, F.R.I.B.A., F.S.A., was appointed adjudicator, and has made the following awards:—1st prize, Mr. Edward Cratney, Wallsend; 2nd, Messrs. W. & F. R. Milburn, Sunderland; 3rd, Messrs. Shewbrooks & Hodges, Newcastle.

Bromley.—Mr. C. H. B. Quennell, F.R.I.B.A., has been awarded the first place in the limited competition for church schools at Masons' Hill, Bromley, Kent, for his design marked "D," and he has been appointed architect for the erection of the schools. An honorarium of 20 guineas has been awarded to Messrs. Russell & Cooper, FF.R.I.B.A., for design "A"; and an honorarium of 10 guineas will be paid to the other competitors. The designs are hung in the Art School, Bromley. Mr. H. P. Burke Downing, F.R.I.B.A., acted as assessor.

The Local Government Board have sanctioned the proposed drainage scheme at Emsworth prepared by Messrs. W. B. G. Bennett & Son, M.Inst.C.E., of Southampton. The scheme, which is estimated to cost over 20,000*l.*, was selected out of thirty others submitted in competition. Messrs. Bennett were awarded the first premium of 100*l.*, and have now been appointed engineers by the Council to carry out the works.

## THE IDEAL HOME EXHIBITION.

The exhibition at Olympia, which was opened last Friday, suggests that there must be several kinds or degrees of an ideal home, or perhaps the visitor is intended to make a selection of what he is shown, and out of that to create his ideal. The promoters fortunately recognised that a most important part in affording its inmates the greatest happiness is played by the dwelling itself and its appointments. Thus the heart of the exhibition is "The Central House." This is placed in the centre of the arena, and from it radiate something after the manner of a Union Jack the splendidly broad approaches. This 600*l.* house was, of course, erected in situ in a few days by Messrs. Holloway Bros., from the designs of Mr. W. Rupert Davison, architect, and it has proved one of the greatest attractions. It seems a pity that advantage cannot be taken to while away the tedium of the people waiting for admission in a queue outside the garden enclosure by a series of ten minute lectures on the appreciation of domestic architecture or kindred subjects. The house was given the most prominent position, and it has the additional attraction of having been put up in a few days—though not, as one visitor declared, in two. The interior shows the ideal house ideally furnished for 350*l.* The next most popular exhibit, though whether it would be an ideal feature in the Central House we would not like to say, is up in the gallery. It consists of babies. The toddlers certainly seem very charming in Stalls 60, 61, 62. If the ideal of the visitor is not yet satisfied he may find better luck in the food and cookery section, or the sections for music and recreation, hygiene and furnishing. Should he still feel that he has not even yet seen enough to answer his most exacting demands, he should turn to the Tudor Village, or to the two sections adjoining each other, devoted to heating and lighting, construction and decoration.

If the order of the catalogue is followed, one of the first stalls in this division is No. 32, where *Messrs. Sissons Bros. & Co.* show how pleasant and yet simple the walls of a room can be made to look with Hall's Distemper. The woodwork has been treated with their "Orientolac" and "Sisco." The colours are so soft, even and flat, that the small gilt oval mirror appears to be somewhat undesirable as breaking into the perfect harmony. Not far off is the good-sized pavilion erected by the *Silicate Paint Co.* (J. B. Orr & Co., Ltd.), to show the effects obtainable with their washable water paint "Duresco," and with Charlton Imperial zinc white for the interior woodwork. The qualities especially claimed for "Duresco" are its beautiful surface, and that it is durable, damp-resisting, non-poisonous and antiseptic, besides, of course, being washable. The makers emphasise that "Duresco" must not be made thin, 1 cwt. requiring to be broken up and thoroughly mixed and diluted with 1½ gallons of petrifying liquid. They also say that the touching up of the first coat is of the utmost importance. Another exhibit of an allied nature is the stand of *Messrs. Arthur Sanderson & Co.*, who in addition to some fine wall papers show "Paripan" enamel and "Wal-Pa-Mur"—the latter being offered as a cheaper alternative to "Paripan."

*Messrs. Wm. Duncan, Tucker & Sons, Ltd.*, are showing some of their aids to horticulture, such as an ingeniously fitted span-roof greenhouse, a "Caloricult" structure for intensive fruit culture, a span-roof garden frame plant preserver, and a garden tea house. Messrs. Duncan, Tucker & Sons enjoy a high reputation for this class of work, as well as for joinery in general.

The *British Cork Asphalte, Ltd.*, so to speak, bring forward the domestic side of their business more prominently than in the ordinary building exhibition, where the public works' side is rightly given prominence. Samples of products like Corketa, Corkite, and Corkadamant, are shown under ornamental guises, where their full utilitarian advantages are enjoyed with the addition of a pleasing appearance. The effects obtainable in Corkadamant call for attention.

*Messrs. Hammond & Champness, Ltd.*, are showing for the first time an electric service lift, in which the entire mechanism is attached to the lower part of the cage, i.e., it ascends and descends with it. The lift is controlled by push buttons, and in ascending through the floor it raises a trap door, which on the return journey is replaced exactly. This saves the necessity for any enclosure in the dining room. The service lift is of course very compact with its absence of all the usual gear. They also show their safety invalid lift, in which the invalid is enabled to haul himself up by a hand-rope with an astonishingly infinitesimal amount of exertion; as well as a hand power service lift, and some plant.

*Messrs. Oetzmann & Co., Ltd.*, have completely furnished a two-storey cottage. Their endeavour was to secure that everything should be in scale with the size of the cottage and in good taste. While each room has its distinctive colour scheme they all combine well together. The amount that can be done for a small sum when judiciously laid out will come as a surprise to most visitors. Considerably over a third of the cost of completely fitting and furnishing the whole seven rooms is expended on the best bedroom.

A most essential constituent of an ideal home is undoubtedly the fire. It would, we believe, be impossible for most Englishmen to conjure up an ideal home without including a cosy, comforting fireplace. Owing to national conservatism the form of it might possibly be in some cases an old-fashioned one that was far from the best. However, the majority who have experienced the vast improvements effected of late in the domestic hearth would no doubt picture one of the modern grates. There are a number of patent fires at Olympia including the "Devon," the "Tilt," the "Heaped" and the "Burkone."

The *Standard Range and Foundry Co., Ltd.*, in addition to exhibiting the "Burkone," have brought together a display of electrical, gas fittings, and general metal work, chimney pieces and ranges. Their latest self-setting range may be seen at work cooking. The feature of it is that the flame passes direct over the top of the boiler so that hot water is obtained in the shortest possible time, and in addition the flues are so constructed that the cook can have either direct heat to the bottom, or top and side heat for roasting. Another detail is the air regulator at the chimney base. On the stand is a new type of independent boiler for domestic hot water. The difficulty of obtaining a satisfactory supply all the year round is known to all; the new boiler, which is about to be put on the market, has come to solve the problem. It is fitted with a magazine which accommodates the 30 lb. of fuel necessary for twelve hours' burning without attention; during that time it will provide 20 gallons of boiling water per hour at a cost of 2*d*. per 12 hours. This boiler can be fitted to any water-supply system. The company recently took over extensive works for the production of wrought iron and copper work. The goods here exhibited are conspicuous for their design, execution, and ingenuity. For the latter we need only mention the combined electric table lamp and wall bracket. For specimens of design and execution the visitor should examine the wrought iron grille or the grotesques. Pride of place on the stand is given to the firm's "Burkone" fire. The patent consists of a solid fire-brick back, the bottom portion of which is modelled in the shape of a basin; in the centre of this is an iron cone through which the air enters into the heart of the coal, ensuring a brilliant slow combustion fire and perfect radiation. Owners of small property and others should see the "Municipal combined heating and cooking stove," which has been still further improved. The Standard Range and Foundry Co., Ltd., have their London show rooms at 106 Bond Street, W.

*Messrs. Candy & Co., Ltd.*, display specimens of the "Devon" fire in glazed briquette work, tiles, faïence and marble, as well as wood chimney pieces. In the 1908 Ideal Home Exhibition the "Devon" fire was selected in a competition as being the ideal fireplace for five rooms out of a possible seven.

The "Heaped" fire is shown in action at Stall 77, by *Messrs. Bratt, Colbran & Co.*, where it throws out a most convincing heat. It may be mentioned that "Heaped" fires have been introduced in the living room and parlour of the Central House, as being simple in construction, with no working parts to get out of order, and as throwing out the largest possible amount of heat. The architect says "it would be difficult to find a more satisfactory form of fire." The coal, it will be remembered, rests on a loose raised tray; the draught is controlled by the economiser. There are no bars in front to absorb the heat.

The *Coalbrookdale Co., Ltd.*, contribute the "Tilt" fire, in which the fire basket can be turned on a pivot when a strong draught is required, as at the time of lighting or when the fire has accidentally burnt nearly out.

On Stall 13 (*H. C. Cleaver, Ltd.*) is the new kind of anthracite stove manufactured by the Well Fire and Foundry Co., Ltd., 21 Berners Street, W., which is a distinct advance on the old patterns. It is easily lighted, continuous burning, and under perfect control.

The *Carron Company* have given up the greater part of the space to their latest range, which is of extra heavy make. The transparent inner door to the oven should receive a great welcome from cooks, who can inspect everything inside without danger of spoiling them. The range is a handsome one and contains many facilities for satisfactory working. On the stand there is also a small selection of their beautiful fire-grates.

*Messrs. Higgs & Hill* show their hospital furniture, joinery, &c. A special feature is the oak panelling which is made from well-seasoned wood. It is made hand or machine-finished as ordered. Included on the stand are goods by W. P. Corby & Co., who make a speciality of baths, sinks, urinals, and underground conveniences. A small fitting which will repay is the Patent Hygienic Lavatory Towel.

*Messrs. Newton, Chambers & Co.* exhibit "Izal," a disinfectant which is made up as a fluid, powder, soap, and various toilet preparations. It is a non-poisonous germicide which may be beneficially used for a very large number of purposes.

*Messrs. T. & R. Boote, Ltd.*, have a well arranged exhibit of tiles and pottery, which suggests the way in which tiling as now manufactured lends itself to decorative effect. The firm commenced making them over half a century ago, and have ever since been in the vanguard of the trade.

*Messrs. Waring & Gillow, Ltd.*, arranged their large space as a series of furnished rooms, without any fronts. The harmony of each compartment is quite refreshing to a visitor who has toured the exhibition. The furniture displayed makes no pretence at being cheap or of a makeshift character. It is of a kind that would be suitable to any sized house, for it derives its effect from design and colour rather than by size.

To exhibit in the Tudor Village it was necessary that the firm represented should have been in continuous existence for at least a century. This condition is fulfilled by *Messrs. Thos. Parsons & Sons*, who are to be found at "The Old Varnish House." Their business as varnish manufacturers was established in 1802; for a number of years carriage builders were their chief or only customers. But for at least twenty years past the firm have been devoting attention to the house decorator's requirements, and now produce an array of specialities like Endelline gloss white enamel, Endellflat enamel, and Lacquerite. The interior of "The Old Varnish House" shows the effects produced by working on Elite plaster.

A feature of the village is the quaint fire-station of the *Phœnix Assurance Co., Ltd.* In it are two of Merryweather's engines, one from Windsor Castle and the other from St. James's Palace. Since the Phœnix was established in the Langbourn Ward Coffee House, London, by a number of sugar bakers or refiners in 1781, they have paid away in claims no less a sum than seventy million pounds.

## BOLTON PRIORY, YORKS.

Bolton Priory, or Bolton Abbey as it is better known locally, was a priory of the Austin Canons, being founded at Embsay in 1120, and afterwards transferred to Bolton.

Here in this stately old pile may be found work of all periods from Transitional Norman to Perpendicular, it being commenced in 1151.

The only parts remaining of the Transitional Norman work are the lower parts of the choir and parts of the south transept and nave, the chief portion of the nave having been rebuilt in the Early English style, and the east end of the choir in the Decorated style.

The church was originally aisleless, but one was added later on the north side, the cloisters probably being the reason why one was not also added on the south side, and to partly balance this the nave, on the cloister side, was pulled down as far as the roof of the cloisters and six fine windows added as far as the length of the arcade.

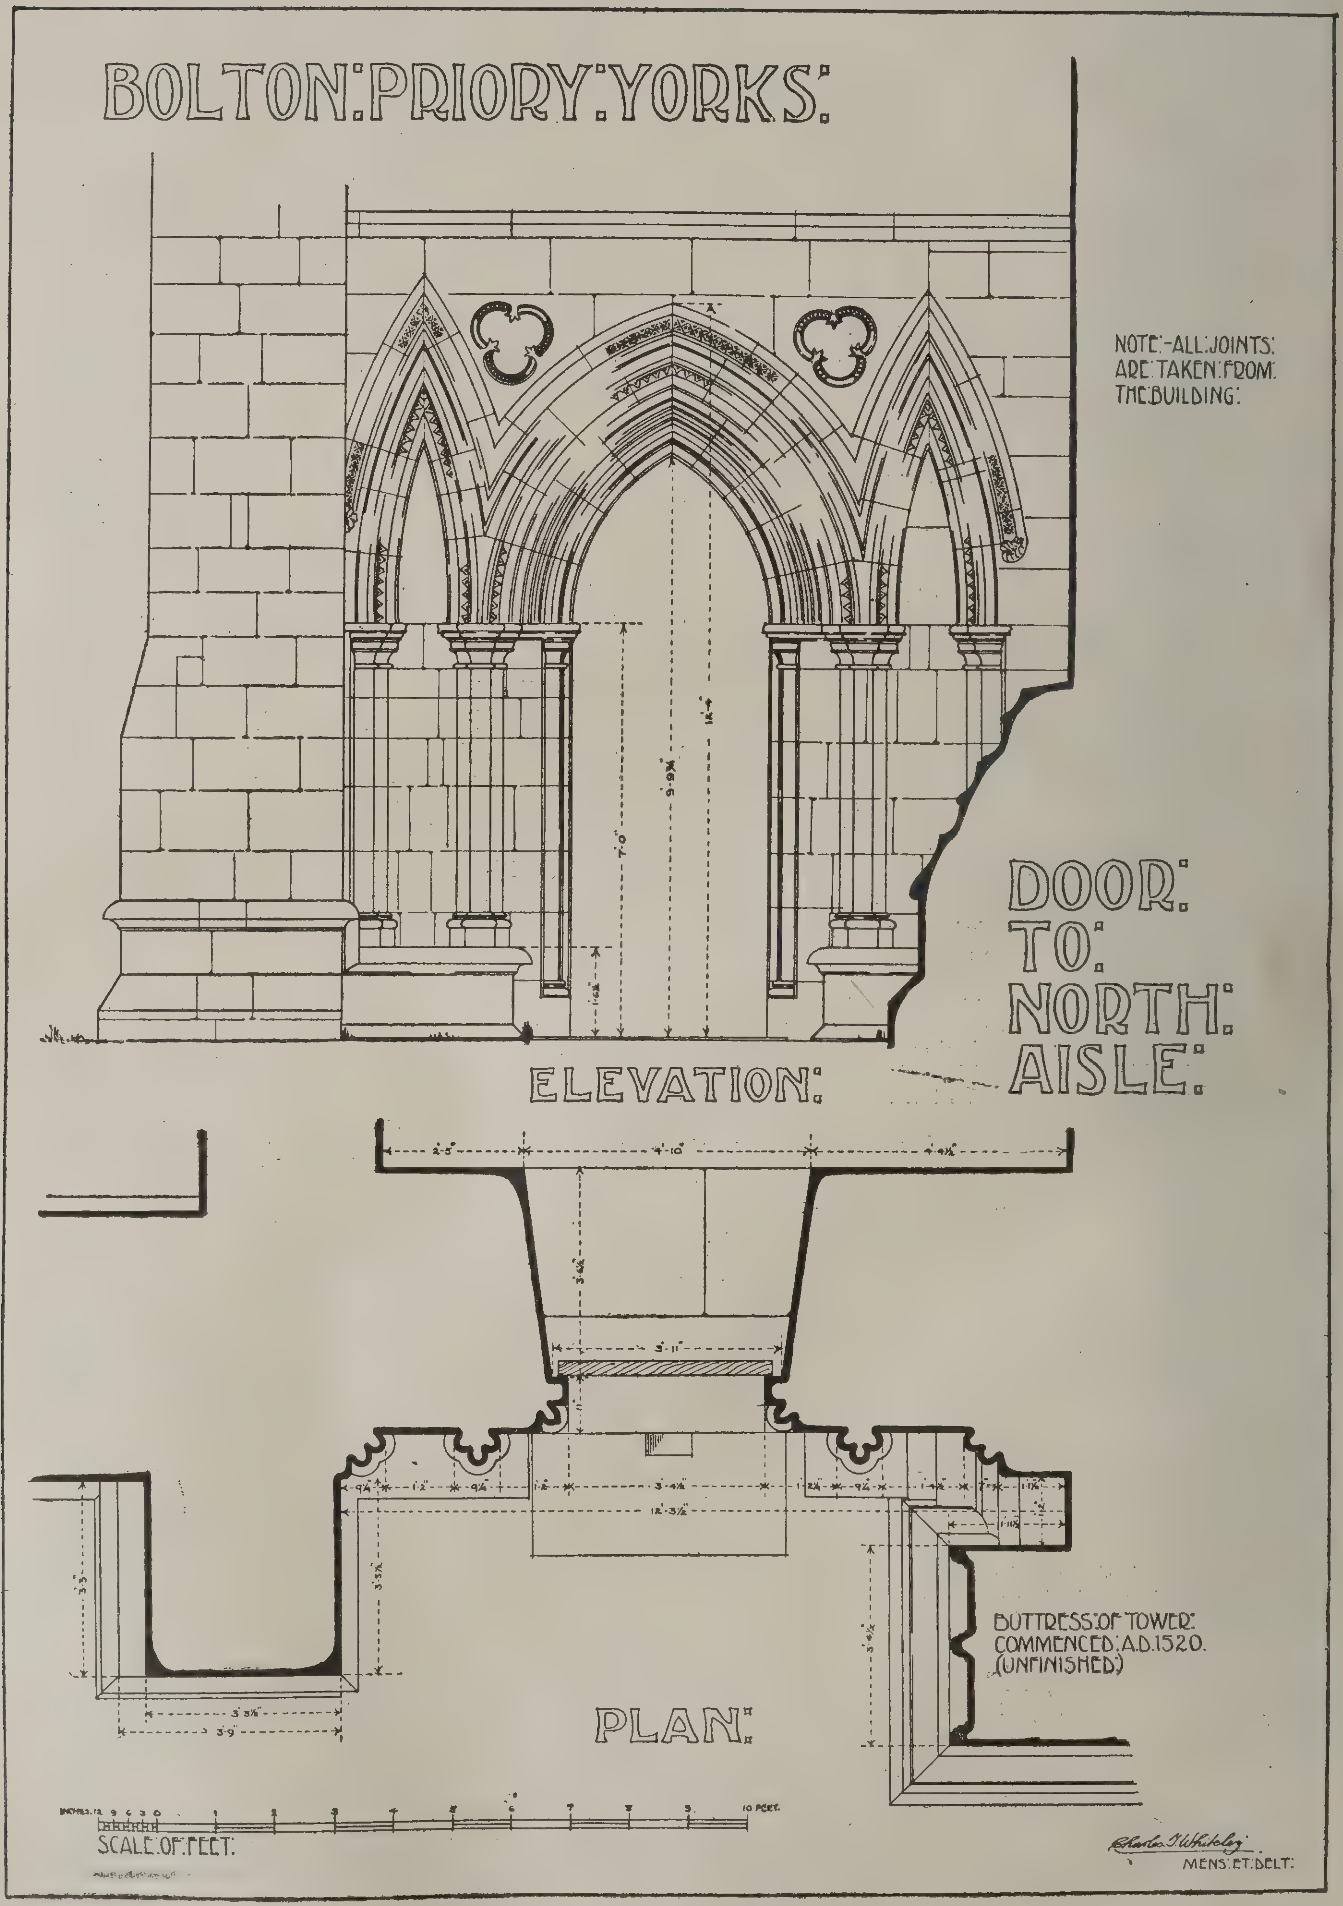
The choir and transepts were rebuilt in the fourteenth century almost from the foundations.

In 1520 a fine Perpendicular tower was commenced, but it had only reached a third of its height at the time of the suppression of the monasteries in 1536-9. Of the domestic buildings of the priory little remain except foundations. The cloister was small and had the usual doors to the nave and south transept. Only the foundations of the chapter-house remain.

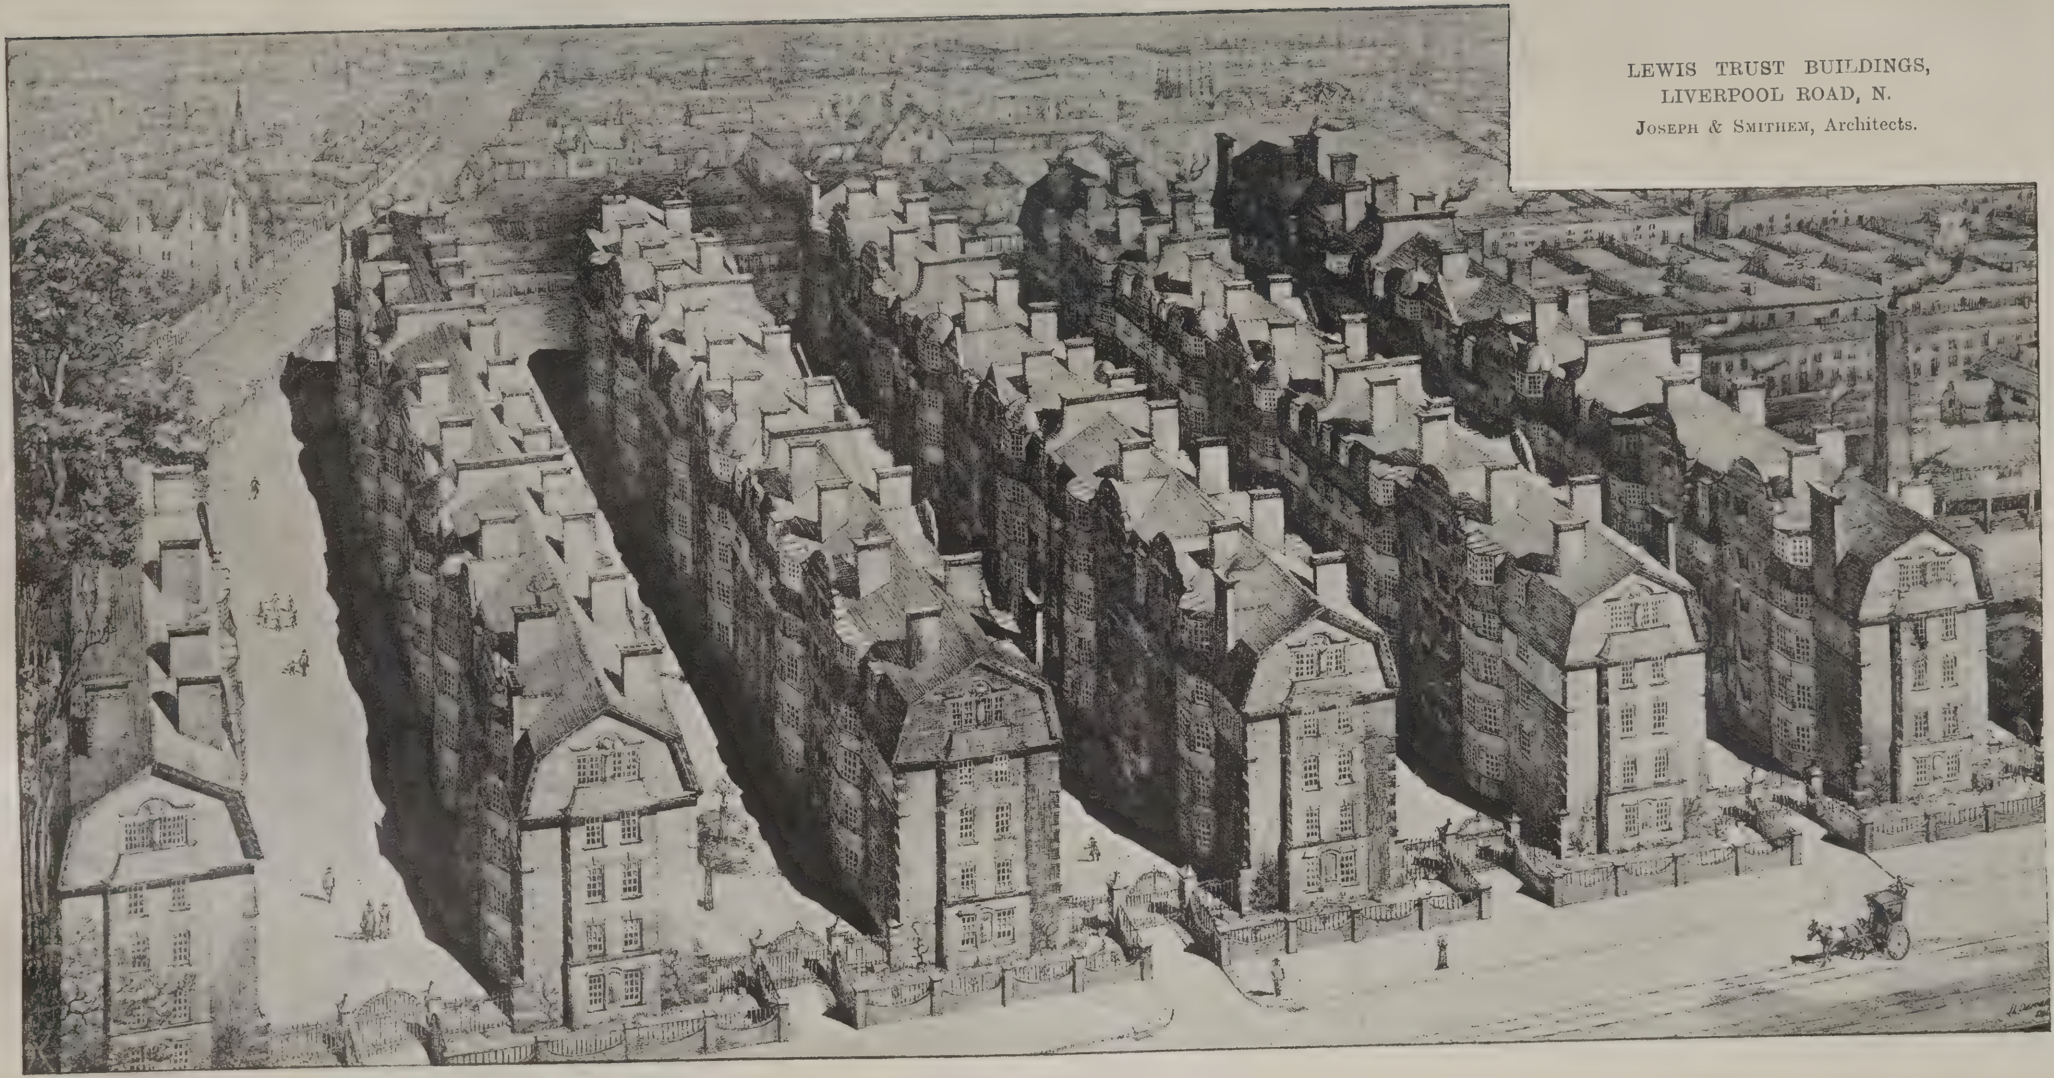
The dorter, or dormitory, ran south from the transept. The frater, or hall, took up the whole of the south side of the cloister, and was raised upon a basement. Beyond the cloister are considerable remains of buildings to the south and east which cannot be identified with certainty.

Ayr Dean of Guild Court have approved plans for alterations at St. Leonard's parish church and the erection of a hall at a cost of 2,100*l*., and for the erection of a church hall and vestry by Wallacetown United Free Church at a cost of 1,000*l*.

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.



Drawn by Mr. Charles T. Whiteley.



LEWIS TRUST BUILDINGS,
LIVERPOOL ROAD, N.
Joseph & Smithem, Architects.

## SAMUEL LEWIS DWELLINGS.

These dwellings, which were opened on Wednesday, the 6th inst., have been erected by the trustees upon a site having a frontage of 403 feet to Liverpool Road, N., and a return frontage of 292 feet to Flight's Yard, Islington, containing a superficial area of about 2½ acres. They consist of six parallel blocks and are five storeys in height. The buildings are separated by roadways or playgrounds 40 feet wide, and affording ample lighting and ventilating space to the tenements. The elevations are of an unusually attractive character, the great feature being the introduction of bay windows in artificial stone surmounted by copper domes, and the storeys in the roofs give a pleasant broken sky-line. All the elevations are faced with red Leicester bricks, relieved with dressings of artificial stone of a pale buff tint. The whole of the site has been surrounded by a dwarf glazed brick wall of an ornamental character, surmounted with cast-iron railings. The playgrounds are laid out with flower-beds, and at the end of these playgrounds shelters have been erected to enable the tenants to sit out in comfort protected from the wind. The landings and staircases are tiled from floor to ceiling, and the balustrades to the staircase are constructed of ornamental panel balusters, instead of the usual plain bars. The floors throughout are of fireproof construction, and the landings and pavings are formed of granolithic material.

The buildings will house 1,522 persons, there being rooms divided into 322 tenements as follows:—

Twenty-two one-room tenements, weekly rents from 2*s.* to 2*s.* 6*d.* according to position.

One hundred and fifty two-room tenements, weekly rents from 4*s.* 6*d.* to 6*s.* according to position.

One hundred and fifty three-room tenements, weekly rents from 6*s.* 6*d.* to 8*s.* according to position.

These rents include chimney sweeping and the free use of Venetian blinds and the drying-room. Perambulator and cycle sheds have also been provided for which a weekly charge of 1*d.* will be made. The rents proposed to be charged are considerably under those ruling in the neighbourhood for tenements with rooms of a much smaller area, and not nearly so well fitted up with cupboards and conveniences. The whole of the tenements have been built upon the "self-contained" principle—*i.e.* each with its own scullery and w.c. The single rooms and the living rooms have an average area of 180 feet. The bedrooms of the two-

A Porch

A Feature in the Elevations

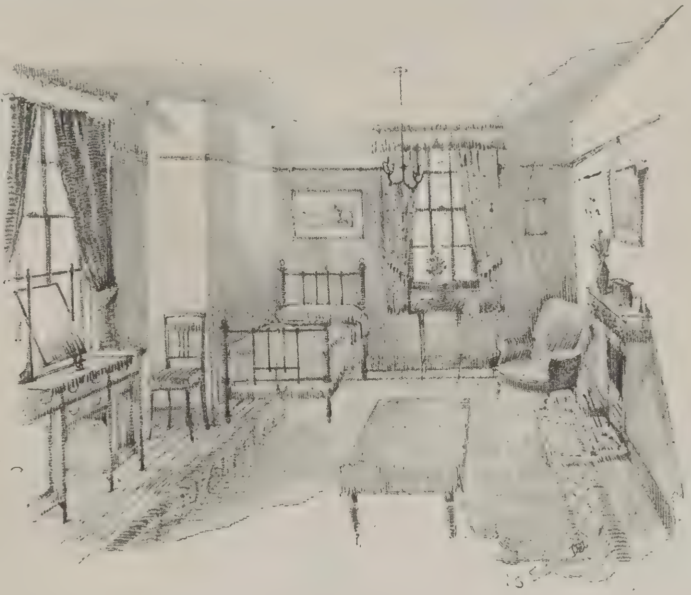
A Shelter and "Pram" Sheds

room tenements have an average area of 130 feet. The two bedrooms of the three-room tenements have an average area of 120 feet and 110 feet respectively. The scullery is not counted as a room.

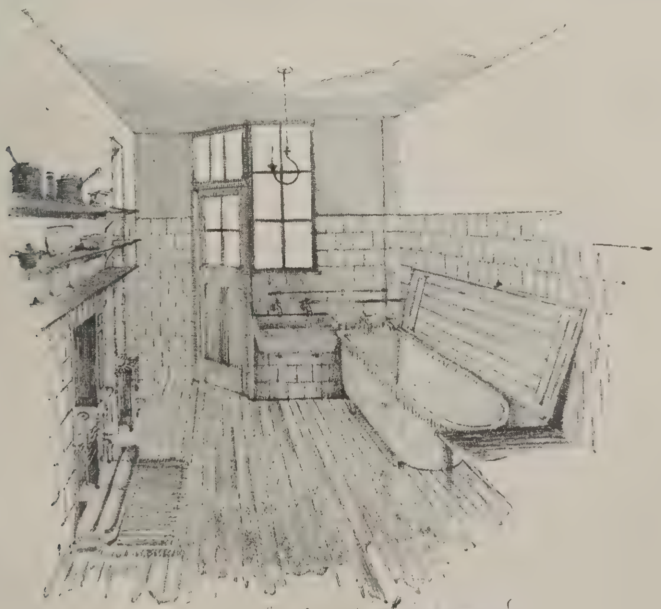
All the tenements are provided with entrance lobbies constructed of fire-resisting material, and in each lobby there is a small recess with hat and coat hooks therein. Every tenement contains a large scullery in which has been fitted a sink and a bath of enamelled cast iron of the strongest description, and also a portable iron copper. In addition there is a gas stove so that the tenants can cook their food throughout the summer months without using the range. The range is of a pattern suggested by H.R.H. the Prince of Wales, and patented by the architects, and has been greatly improved since its introduction. The fire can be transferred from the scullery to the living room after the cooking is done by means of an ingenious arrangement of an iron shutter between the two rooms. By the recent improvement this range in addition now heats the two rooms, cooks the dinner of the tenants, and also provides a constant supply of hot water to the bath and sink. The bath is covered with a table top so that when not in use as a bath forms a convenient table. The whole of the scullery has been tiled with a tile dado. A dresser with three tiers of shelves has also been provided. By this arrangement of the scullery it has been possible to allow the living room to be really a sitting room instead of a kitchen, and is made more pleasing by the addition of a bay which not only allows the sun to enter at all times of the day but also gives additional space. Leading from the scullery is an open balcony from which access to a larder and w.c. is obtained. The w.c. fittings are of automatic pattern and are of the strongest description. The w.c's. are tiled from the floor to ceiling. The larder is divided into two parts, the upper being provided with shelves and ventilated direct to the open air for the storage of food, and the lower part arranged as a coal-bunk.

A "Single" Room" Tenement

Rent Two Shillings per Week



The Bed-Sitting Room



The Kitchen-Scullery

The Balcony

Every bedroom is fitted with a fireplace and a large dress cupboard with hooks for hanging clothes.

Every room is fitted with Venetian blinds, and all the windows have special arrangements for ventilating the rooms when the windows are closed. Above all the tenement doors there are ventilating fanlights so as to secure a through draught from the spacious staircases, all of which are lighted by windows opening directly on to the roadways or playgrounds between the blocks. Every tenement is lighted by gas on the penny-in-the-slot system, and the staircase and playgrounds are also lighted by gas, and by an ingenious arrangement made for the first time in buildings of this character the superintendent is able to light or turn out the whole of the lamps throughout the buildings by means of a switch in his office. A drying room to enable the tenants to have their clothes or washing dried has been provided, where the heat is permanently maintained at a high temperature. A workshop is also provided for the use of the porters, so that any small repairs that are needed can be done on the premises.

The cost of the land and buildings has been approximately 95,000*l.*, and the rents have been adjusted to a scale that will, after providing for all outgoings, give a net return on the expenditure of over 3 per cent. per annum. The dwellings will be occupied by members of the working classes earning a maximum wage of 25*s.* per week. The architects are Messrs. Joseph & Smithem, of 83 Queen Street, Cheapside, E.C., and the builders Messrs. G. E. Wallis & Sons, Ltd., of Maidstone, Kent.

## ALUMINAMEL.

"Aluminamel" is, as its name implies, an enamel having pure aluminium for its base. Among its many invaluable properties is imperviousness to water, soap, soda, petrol, turps, benzoline, paraffin, &c., and also the fact that it will withstand heat up to 500° Fahr. It is applicable to every kind of material, whether it be wood, stone, concrete, glass, or metal, by simple application with an ordinary brush. A deposit of pure aluminium is thus left on the surface, which will withstand any of the above tests. One of its most valuable uses is for renewing metalwork fixed in position, or which for any other reason could not without great inconvenience be placed in a galvanising bath. It is also being extensively employed for covering ventilating fans, motor-car chassis, bridges, piers, railings, down pipes, baths, lampposts, standards, flywheels, heating apparatus, and other situations where the conditions are especially trying. Perhaps the severest of the many tests it has undergone during recent years is its use as a coating for the interior of the evaporators of marine and other engines.

Aluminamel possesses the great superficial capacity of from 1,200 to 1,500 super feet per gallon, according to the material on which it is applied. It is, therefore, apart from its indestructibility, very economical. Unlike much of the aluminium paint or enamel at present sold under English names it is of British manufacture. In addition to the above strictly utilitarian qualities the enamel is valuable for decorative purposes. A single coat is always sufficient to render any surface permanently bright and absolutely waterproof, while by the nature of aluminium it is incorrodible and untarnishable.

The sole proprietors and manufacturers of this desideratum are the British Specialities Co., 349 City Road, E.C., who put it up in airtight tins from pints to gallons—about 11 gallons going to the hundredweight. The tins, it is essential to remember, must be kept well stoppered when not in use, as the product dries and sets hard in five or six minutes. The manufacturers state that they are willing to despatch to any part of Great Britain and Ireland a sample gallon tin at list price, carriage and packing free.

## TRADE NOTES.

It has been decided to carry out the heating of the new County Offices at Dorchester, and Messrs. George A. Akers & Co., heating specialists, of 98 High Holborn, W.C., have been instructed to execute the work. This firm has also received instructions to carry out the heating of the large new printing works at Letchworth, for the builders, Messrs. Openshaw & Co., of Letchworth.

We have been requested to state that the business of the "Zeta" Wood Flooring Co., Ltd., has been purchased outright from the Receiver and Manager, but the change is only proprietary as Mr. William J. Bennett retains the general management of the new company, and will have the same executive staff associated with him as since the foundation of the old company in 1907.

We are advised that Mr. J. J. S. Davidson has resigned the managing directorship of the British Uralite Company, Ltd., of London and Higham, as owing to his other engagements he is unable to give the close personal attention that the interests of the company demand. Mr. Davidson is not severing his connection with the company entirely, as he will continue to act as a director. Under his management the company has been put on a sound financial basis; the factory has been reorganised, new markets have been developed for Uralite at payable prices, and the manufacture of Asbestone has been initiated to compete with Continental materials. Mr. Davidson has prepared a scheme for a new power system, and it is anticipated that when this is carried into effect the company may confidently look forward to a period of continued prosperity.

Mr. Edward Clements, aged 82, of 19a, Victoria Square, W.C., and of 51 Russell Street, W.C., of the firm of Messrs. Clements, Jeakes & Co., sanitary and domestic engineers, left property to the value of 30,437*l.*

## VARIETIES.

St. Mary's parish church, Peckham, London, S.E., is reported to be in such a state that rebuilding at an estimated cost of 2,350*l.* is absolutely required.

It is proposed to construct a new street connecting Orange Street and Trafalgar Square, and also to widen Orange Street and St. Martin's Street. The estimated cost is 2,200*l.*

Messrs. W. Mortimer & Son, architects, Lincoln, have prepared an amended plan for a new children's home to be erected by the Lincoln Board of Guardians at a cost of 1,200*l.*

Mr. Alex. R. Stenning, F.R.I.B.A., President of the Surveyors' Institution, gave a successful "At Home" at the Institution premises, 12 Great George Street, on the evening of Wednesday, April 6, which was attended by upwards of 350 members.

The King's Norton District Council have agreed, subject to the sanction of the Local Government Board, to purchase for 1,057*l.*, for the purpose of constructing baths at King's Heath, a piece of land adjoining the King's Heath and Moseley Institute, containing 4,250 square yards.

Mr. W. W. Lackie, engineer to the Glasgow Corporation Electricity Department, reports that the Committee should consider the question of erecting a new generating station. A site is suggested on the west side of Dalmarnock Road, with a frontage to the Clyde, and a branch of the Caledonian Railway running along its western boundary. The Committee approve generally of the report, but have decided to make further investigations in regard to the suitability of the site. The cost of the site will be about 20,000*l.*

The electric lighting committee of the Edinburgh Town Council recommend the erection of cooling towers at Dewar Place station. It is calculated that the immediate saving in coal will be 3,500*l.*, which may eventually be increased, as the undertaking develops, to three times that sum.

The Stafford Town Council have postponed decision on a proposed scheme for the construction of an entirely new street, 50 feet wide, from Victoria Square to Market Square, at a cost of 20,120*l.*, the principal items being 14,550*l.* for the purchase of the various freehold properties, and 3,550*l.* for the construction of the street.

The strike of painters in Colne has been submitted to arbitration. The men had demanded an advance of a penny an hour, and the employers took a vote as to whether they should offer the men a halfpenny, and found themselves equally divided. It was then agreed that the Board of Trade should be asked to arbitrate, and that the men should at once return to work on the old terms until the Board of Trade gives its award.

The memorial stone of a day school for the parish of Christ Church, Lichfield, was laid on Saturday. The site is near the old condemned school. The new school is being erected from plans by Mr. F. T. Beck, architect, of Wolverhampton, and will contain five classrooms, accommodating 192 elder children and sixty infants. The amount of the contract is 2,190*l.*, and is being carried out by Messrs. Thorneloe & Son, Lichfield. Two other Church schools in Lichfield—Frog Lane Boys' National and Wade Street Infants, both in St. Mary's parish—have also been condemned by the Board of Education.

Messrs. Cackett, Dick & Burns, architects, Newcastle-on-Tyne, have prepared plans converting the corn market at Hexham into an entertainment hall to contain an audience of 800 people, with a full-sized stage and all the usual adjuncts, and providing a kitchen, supper room, suite of cloak rooms, and lavatories for the purpose of the town hall, and making other alterations and improvements. They estimate the cost of converting the corn market into an entertainment hall at about 2,850*l.*, and the additions to the assembly rooms, including pitch pine floor, at 850*l.* The scheme is under consideration.

According to "Industrial Canada" for March, the erection is to be begun this year of a technical school at Toronto which is expected to cost more than 500,000 dollars (about 103,000*l.*). A naval college is to be built at Halifax at a cost of 150,000 dollars (about 30,800*l.*), with barracks for staff, &c. costing an additional 200,000 dollars (about 41,000*l.*). A new wing is to be added to the Quebec Provincial Legislative Buildings at a cost of 250,000 dollars (about 51,400*l.*). The sum of 150,000 dollars (about 30,800*l.*) is to be spent on extending the Place Viger Hotel at Montreal by the addition of 100 rooms. The Yorkshire Insurance Company intend to erect a ten-storey office building at Montreal at a cost of 200,000 dollars (about (41,000*l.*); the architects of the building are Messrs. Saxe & Archibald.

## NOTICE TO ADVERTISERS.

**Under no circumstances whatever can the Proprietors of this journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.**

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

## TENDERS, ETC.

*** *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2* p.m. *on Thursdays.*

## COMPETITIONS OPEN.

Edinburgh.—The Corporation invite competition designs for the erection of a new hall in Lothian Road, Edinburgh. They have appointed Sir Aston Webb, C.B., R.A., as assessor, Mr. J. A. Williamson, A.R.I.B.A., City Chambers, being associated with him. Three premiums are offered. Particulars and plans of the site will be supplied to competitors on payment of two guineas, which will be returned on receipt of a design in accordance with the conditions. Should architects, on receipt of the particulars, not desire to compete, the deposit will be returned, provided the papers are returned within four weeks. Mr. Thomas Hunter, town clerk, City Chambers, Edinburgh.

London.—June 15.—The Acton Urban District Council invite plans for schools at Rothschild Road for 850 pupils. Premiums of 100*l*., 50*l*., and 25*l*. are offered, but any premium awarded to the successful architect shall be merged in his commission of 3½ per cent. Deposit 10*s*. 6*d*. Apply after April 5 to Mr. F. A. Everitt, secretary, Education Department, Council Offices, Acton, W.

Pontefract.—April 29.—The Education Authority invite competitive designs for an elementary school from architects practising in Yorkshire. Deposit 1*l*. 1*s*. Mr. W. Haddock, town clerk.

Richmond.—May 21.—The Town Advancement Association offer prizes of twenty guineas and five guineas for a double-royal poster exploiting the attractions of the town. The Offices of the Association, 1 The Little Green, Richmond, Surrey.

Stockport.—May 2.—Architects desirous of competing for the designs of the library which the Corporation propose to erect are invited to send their names, with information as to their experience in and qualifications for carrying out such work, to Mr. Robert Hyde, town clerk, Town Hall, Stockport.

Walsall.—Designs are invited for the erection of a public elementary school (mixed) to accommodate 500 children at Bloxwich. Conditions of competition and plan of site from Mr. W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.

## LIVERPOOL ARCHITECTURAL SOCIETY.

The annual meeting of the Liverpool Architectural Society was held on the 18th inst., at 13 Harrington Street, Mr. T. E. Eccles, F.R.I.B.A., the president, occupying the chair.

The Council reported that the present membership of the society consisted of fifty-one fellows and seventy-three associates, compared with fifty-four fellows and seventy-seven associates at the close of last session. There are three hon. fellows, nine hon. associates, and twenty-three students—a decrease of five students during the year. The Royal Institute of British Architects having appointed a special committee to consider the question of the responsibility of architects with regard to dry rot, submitted the conclusions of the committee for the consideration of the Council of the Liverpool Society. The Council replied, strongly disapproving of the proposals of the Institute. The features to which the Council objected have been omitted in the R.I.B.A. pamphlet recently issued. The munificence of Mr. W. H. Lever to the University of Liverpool, by which the School of Civic Design is placed upon a permanent basis, and the old Blue Coat School buildings, now to be called Liberty Buildings, are preserved as the home of the School of Architecture, is, the report concludes, an act of liberality which calls for the appreciation of all interested in the art and profession of architecture.

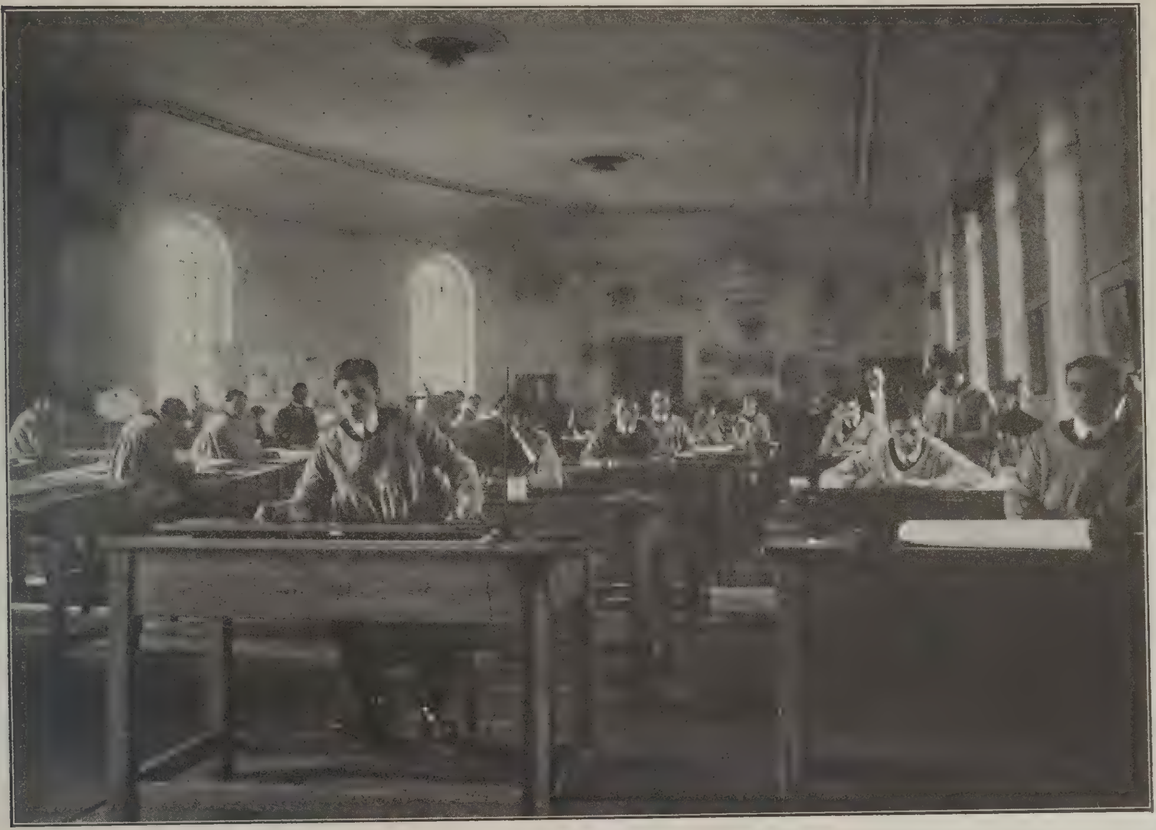
The report and accounts were adopted.

The following officers and members of the Council were elected for the ensuing year:—President, Mr. Arnold Thornely; vice-presidents, Mr. E. P. Hinde and Professor C. H. Reilly, M.A.; hon. secretaries, Mr. Gilbert W. Fraser and Mr. E. C. Aldridge; members of the Council, Professor Adshead and Messrs. W. Glen Dobie, J. Dod, T. E. Eccles, G. H. Grayson, M.A., P. C. Thicknesse, W. E. Willink, L. P. Abercrombie and T. F. Shepheard.

The retiring president made sympathetic reference to the death of Mr. Wm. Owen, of Warrington, an old and esteemed member of the society, and the loss which the society had suffered by the death of Messrs. T. Mellard Reade, A. F. M'Gregor Milligan and R. Lloyd Williams.

## SCHOOL OF ARCHITECTURE, LIVERPOOL.

By Professor C. H. Reilly.



MAIN STUDIO, FORMERLY CHAPEL OF OLD BLUE COAT SCHOOL.

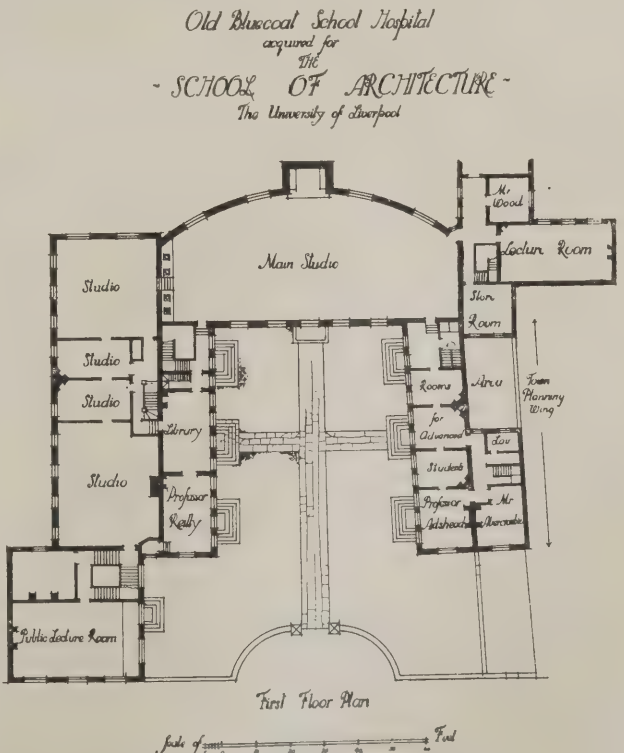
The old Blue Coat School of Liverpool, which through the generosity of Mr. Lever has now become the home of the School of Architecture, was built in the years 1716-7, and is a good and complete example of Queen Anne architecture—indeed, the only one Liverpool possesses. It is situated in a quiet side street called School Lane, but faces the main thoroughfare of Liverpool, Church Street, across the grass of the pro-cathedral churchyard.

The architectural interest centres in the buildings surrounding the court, which were the first to be built and have remained unaltered to this day. These the school now occupies. The main block facing the gateway consists of the dining-room and chapel over it, now the exhibition room and main studio of the school, two large rooms 90 feet by 40 feet, well lit with large windows on either side. The two wings were designed to accommodate twenty-five children each—girls on one side, boys on the other. As in a court of a smaller Cambridge college, three doors lead from the courtyard to either wing, though the dormitory plan above does not admit of separate staircases. Each door is emphasised by a little pedestal of stone steps with a flagged walk leading to it, giving a most picturesque and charming effect.

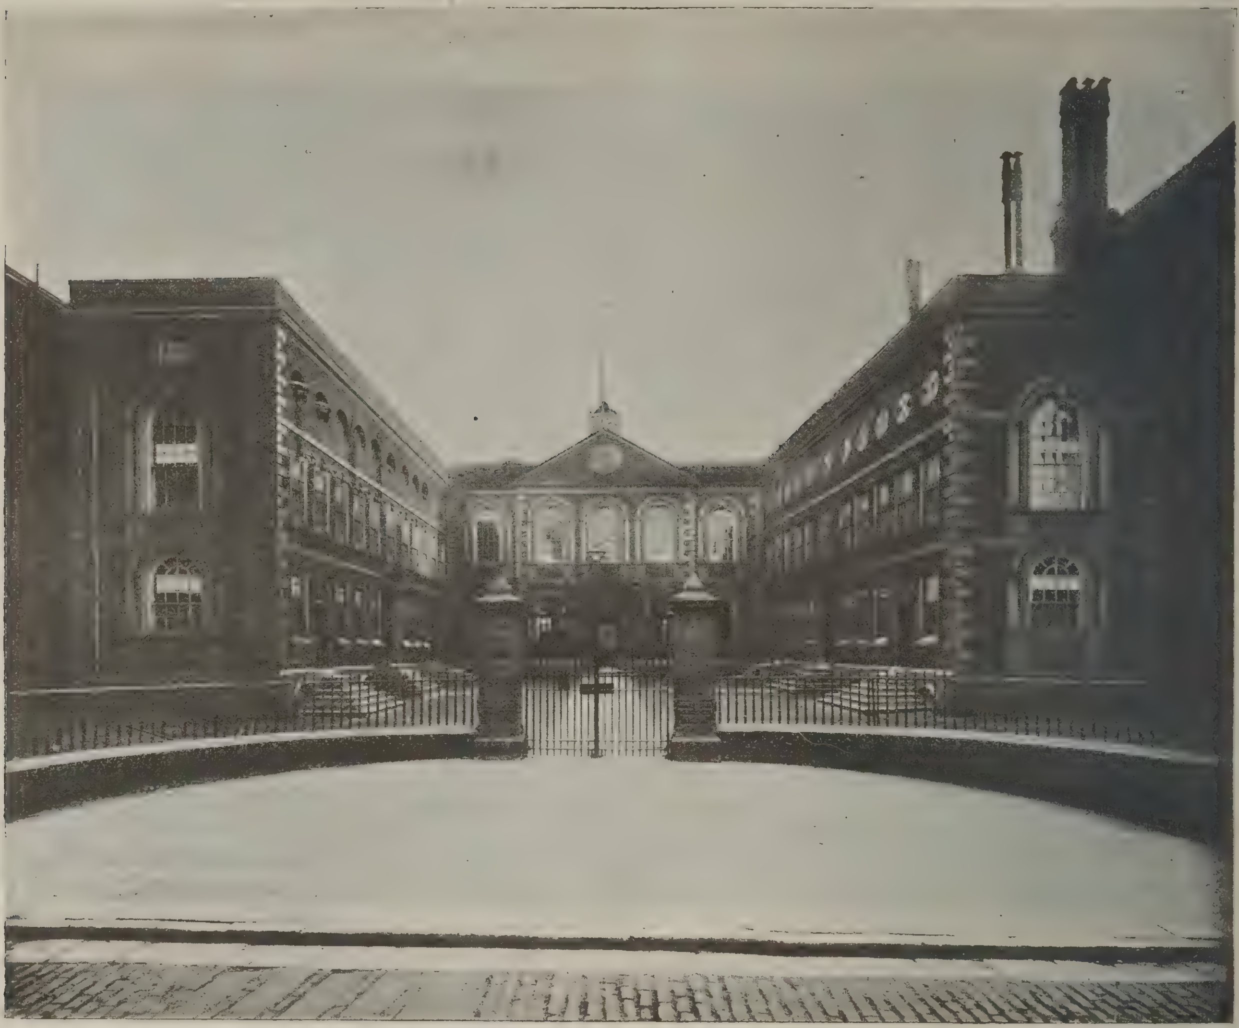
The windows in the flank walls, which are in excess in glass area of many a modern building and give ample light for studio purposes to the interior, are set well to the face of the brickwork, and by their broad frames and astragal bars carry through the sense of wall surface without any feeling of weakness. Indeed, these side façades offer a very practical solution of the problem of an office building where light is important, for even the rooms with the oval windows are well and pleasantly lit. Externally, the frieze of the elliptical windows under the cornice, well set in a field of plain brickwork, is a delightful feature.

The materials are small, hand-made red bricks and local sandstone. Liverpool, like the rest of the North of England, suffers from Ruabon red pressed bricks, so that on the score of brickwork alone the building was worth saving. The windows are glazed throughout with blown crown glass.

I have been unable to ascertain the name of the architect or master builder, but the detail is the traditional detail of the period, with just a hint of Inigo Jones's influence in the main doorway opposite the entrance gates.



An interesting motto on the chapel frieze, "Christianæ charitati promovendæ inopique pueritiæ ecclesiæ angli-



OLD BLUE COAT SCHOOL, LIVERPOOL.

canæ principiis imbuendæ sacrum anno salutis MDCCXVII," explains the original purpose of the building—a motto we mean to keep now that the purpose is changed.

I find from old accounts the cost of the building in 1717 was only 2,000*l.* to 3,000*l.*; the agreed purchase price to-day is 24,000*l.* to 25,000*l.* But in the eighteenth century the accounts also show it was possible to feed, clothe and educate a boy at the hospital for 8*l.* 12*s.* a year, while his architectural successor to-day costs 30*l.* That the training of the latter, however, will be the better for his new surroundings is not too much to hope for, and at any rate the thanks of architects are due to Mr. Lever not only for saving so fine a building from the imminent destruction that threatened it, but also for giving it to the service of our profession.

## WATERPROOF PORTLAND CEMENT.

That substances can be added to Portland cement to render it undeniably waterproof, even under pressure, we have pointed out in our leading article this week, and in confirmation of our statement that such compounds ordinarily do not weaken, but augment the strength of cement mortar, whether used as rendering, or as the matrix of concrete, we may refer to particulars before us of a series of tests by Messrs. Henry Faija & Co., whose reliability is unquestionable. These were made with "Solita," and summarised, give the results that an average of five samples of cement mortar, three parts sand to one cement, tested after seven days, showed an average tensile strength per square inch of 360 lb. without "Solita," and 368 lb. with "Solita." Tests after fourteen days with similar cement mortars gave an average of 421 lbs. without "Solita," and 425 lbs. with "Solita." The conspicuous advantage of a waterproof Portland cement that is actually stronger than one not waterproof is self-evident.

## THE CONCRETE INSTITUTE.

The deputation of members of the Concrete Institute have returned from Paris, where they have been making a special inquiry into the durability of reinforced concrete. For this purpose visits were paid to about a dozen important structures in and near Paris, including bridges, culverts, tunnels, reservoirs and buildings, all of reinforced concrete. These were of various ages, the oldest being the roof of a large house constructed no less than fifty-eight years ago by the late M. Coignet, whom many consider to have been the first inventor of this material.

The programme of visits was arranged by Professor Rabut, the chief engineer for new works of the French State Railways. The deputation were specially invited to dine with the Association des Ingénieurs des Ponts et Chaussées. In the absence of the President the visitors were received by M. Colson, Membre de Conseil de l'Etat, a former Inspector-General of this distinguished corps.

The visitors were also hospitably entertained by the Chambre Syndicale des Constructeurs en Ciment Armé, whose President, M. Edmond Coignet, is a son of the famous inventor, and by M. Hennebique.

The deputation consisted of Sir Henry Tanner, I.S.O., F.R.I.B.A., Mr. William Dunn, F.R.I.B.A., Mr. F. A. White, Mr. A. Ross, M.Inst.C.E., Mr. C. H. Colson, M.Inst.C.E., Mr. W. G. Kirkaldy, A.M.Inst.C.E., Mr. J. S. E. de Vesian, M.Inst.C.E., Mr. F. E. Wentworth-Sheilds, M.Inst.C.E., Mr. E. P. Wells, J.P., Mr. H. K. Dyson, Mr. H. K. G. Bamber, A.Inst.C.E., F.C.S., Captain Gibson-Fleming, R.E., Mr. G. C. Workman, Mr. P. W. Leslie, Mr. H. Anderson, and Mr. P. M. Fraser, A.M.Inst.C.E.

It is understood that the deputation were well satisfied with the results of their inspection, which will form the subject of a special report.

## MANCHESTER INFIRMARY SITE.

A MEETING of the Royal Infirmary Site Special Committee of the Manchester Corporation was held on Monday, the 11th inst., when a material step was taken towards ariving at a decision as to the disposal of the site. The Committee agreed to recommend the Council to adopt a scheme for the erection of a central library and a new art gallery only upon part of the area, and to authorise them to proceed with the necessary preparations for obtaining competitive designs from architects, with power to offer suitable premiums.

The report, which will be presented to the City Council on April 27, is as follows:—

At a meeting of the Council held on December 18, 1907, three reports of the Special Committee re Manchester Royal Infirmary site were submitted and considered, and the following resolution was adopted by the Council:—

"That the reports now submitted be approved, and that the Special Committee be instructed to prepare for submission to this Council a scheme embodying instructions to architects for competitive designs of a new building to be erected upon the Infirmary site for the purpose of meeting the requirements of the Libraries Committee, the Art Gallery Committee, and any other committee or committees which may be hereafter determined by the Council on the recommendation of the Special Committee."

The instruction embodied in such resolution was repeated in the resolutions appointing the Special Committee on November 9, 1908, and November 9, 1909.

Your Committee have held several meetings, and inquiries were made as to whether or not the Corporation are under restrictions as to the area or character of buildings which may be placed upon the old Infirmary site. As the result of these inquiries it has been ascertained that the Manchester Corporation Act, 1903, which vests the property in the Corporation, contains the following enactment, viz.:—

S. 68. The Corporation may, as and when they obtain possession of the said land, buildings, and hereditaments, appropriate the same or any portions thereof for public streets and open spaces as they may determine, and may also remove the existing buildings and erect and provide upon the said land such new buildings as they may determine with all necessary fixtures, fittings, furniture and equipment.

This power has not been modified by any other enactment, nor has any agreement or obligation on the subject been entered into by the Corporation. But in the report of the Special Committee dated August 30, 1906, and presented to the Council on September 5, 1906, after referring to the above enactment, the following paragraph appears:—

"It should be explained that the above provisions were obtained after the Council had received and approved on March 18, 1903, a report of the Special Committee, in which it was pointed out that the Infirmary authorities were desirous of selling their property in consequence of a decision of the trustees not to rebuild upon the present site; that public opinion was favourable to its acquisition upon reasonable and equitable terms with a view to the site remaining for all time as an open space unencroached upon by buildings of greater magnitude than those then existing."

Your Committee, believing that the Council would wish to keep well within the spirit of such paragraph, instructed the City architect to prepare a scheme of rebuilding to cover an area of about 5,500 square yards, and it having been ascertained that a building of reasonable height to meet the combined requirements of the Libraries Committee, the Art Gallery Committee, the Tramways Committee, and the Watch Committee would require a minimum area of 7,700 square yards, your Committee determined to present a scheme for the erection of a central library and art gallery only upon the area.

As regards the purposes of any buildings, the following resolution of the Council adopted on March 17, 1909, was submitted to your Committee, viz.:—

"That in the opinion of this Council any proposal for the utilisation of the Royal Infirmary site, or any buildings thereon, must provide for the occupany or use of such site or buildings for public purposes under the control of this Council."

Such resolution was repeated in the Committee's appointment made on November 9, 1909.

In compliance with the foregoing instructions and resolutions, the city architect has submitted a scheme for the erection of a library and art gallery. The proposed building will occupy an area of not more than 5,500 square yards, and the estimated cost of the new building will not exceed 250,000*l*.

Your Committee have carefully considered the city architect's report and plans, and they now submit them to the Council as a general outline of the scheme required by the above-mentioned resolution of the Council adopted on December 18, 1907.

Your Committee recommend the Council to adopt the scheme of building proposed in this report, and authorise the Committee to proceed with the necessary preparations for obtaining competitive designs from architects, with authority to offer suitable premiums therefor.

## TO PAY OR NOT TO PAY?

WHETHER an architect, having executed certain plans according to instructions, should refrain from asking for payment for them because the buildings were not erected, formed the subject of a heated discussion at the meeting of Bermondsey Board of Guardians on Thursday of last week.

Two years ago the Board instructed their architect, Mr. Newman, to report upon alternative schemes for rebuilding a workhouse at Tanner Street, or enlarging another institution so that the Tanner Street inmates might be transferred to it, and to submit sketch plans of his proposals.

The Board, for reasons of their own, shelved both schemes, and then because they had made no use of the plans objected to paying the bill, which at 1¼ per cent. on the estimated cost amounted to 1,392*l*. Negotiations followed and continued until the expiry of the old Board, when Mr. Newman, in order to get the matter settled offered to take 1 per cent., or 1,090*l*., providing that it was paid within a week, and that should the buildings be afterwards erected it should be considered as a payment on account.

When this offer came before the Board on Thursday one member, a Mr. Marryatt, was good enough to declare it would be a disgrace to the Board if the money was paid.

A Mr. Clarke, overlooking the work necessary to the production of a plan, which he was probably totally unable to appreciate, said they were paying the price of old masters for eight "penny bits of pasteboard."

Still another member, a Mr. Burton, moved a resolution to offer the architect 500*l*. or nothing, and it would be difficult to say where the matter would have ended but for the common sense of the Finance Committee's chairman, who plainly told the Board that they had ordered the plans with their eyes open, and would have to pay, if not willingly, at the order of a County Court Judge.

Even then the vote was only forced through with difficulty, the malcontents loudly declaring they would not sign the cheque.

## VARIETIES.

THE Ramsgate Educational Authority are about to erect at a cost of about 5,000*l*. another new school.

THE Congress of Chile have passed a law providing for the expenditure of about 90,000*l*., on the erection of public buildings.

THE Elgin Burgh School Board have decided to expend 2,500*l*. in additions and alterations at the Academy. The plans provide for six new rooms.

MR. BROWNRIGG, architect, 17 Clifford's Inn, Strand, W.C., has prepared plans for a new Secondary school for girls, which is about to be erected in Peterborough.

IN connection with the opening of the Brussels Exhibition which is to take place on Saturday, April 23, the Great Eastern Railway Company has arranged on and from to-day to issue cheap return tickets, first class 38*s*. 6*d*., second class 24*s*., available for fourteen days, viâ Harwich and Antwerp.

THE Edinburgh Town Council have adopted the recommendation by the electric lighting committee for the erection of three cooling towers at Dewar Place station, and the provision of exhaust steam turbines, &c., at a probable cost of 45,000*l*.

THE design of Messrs. R. B. Macoll & C. E. Tonge, architects, of Southport and Bolton, has been accepted by the Library Committee of the Wallasey District Council for a new building to be erected at Earlston at an estimated cost of 7,000*l*.

MESSRS. WILLIAM BAIN & CO., of Lochrin Ironworks, have taken off ten acres of ground at Souterhouse (Drumpellier estate), N.B., for the purpose of erecting a wire mill. Another well-known company are looking out for ground for a sheet mill.

THE Labour Department of the Board of Trade report that during March, in the building trades, employment, though still slack generally, was better than both a month ago and a year ago. The percentage unemployed among trade union carpenters and plumbers was 8.9 at the end of March, as compared with 10.6 in February and 13.3 a year ago.

The Agricultural and Horticultural College at Holmes Chapel is to be enlarged by the Cheshire Education Committee at a cost of 6,000*l.*

Mr. H. E. Clifford, F.R.I.B.A., Glasgow, has been appointed architect for the offices to be built for the Glasgow School Board on the site of the existing premises.

Messrs. Jenkins & Co., of Retford, have secured a contract for over 30,000*l.* for the erection of a gas plant for the Tokio Gas Company in Japan. The contract was secured after keen competition.

Mr. C. H. B. Quennell, F.R.I.B.A., has moved his offices to 21 Great Peter Street, Westminster, S.W., in the buildings of the National Society. His telephone number is Westminster 6162.

The Manchester City Council have authorised their Electricity Committee to obtain borrowing powers for 40,000*l.* for an extension of the undertaking.

The Whitehaven Town Council have decided to spend 2,340*l.* on new plant at their electricity works, and to apply to the Local Government Board for sanction to borrow 2,500*l.* for mains extensions.

A new school, accommodating 810 pupils, which was opened in Whitby Road, Sheffield, in August of last year, is to be enlarged, at a cost of 5,000*l.*, by the addition of a third department to accommodate a further 440 children.

Paisley Town Council intend to construct a new reservoir at Rowbank, near Howwood, at a cost of between 40,000*l.* and 50,000*l.* This will provide three and a half months' supply, bringing the total storage capacity for the town up to eight months' supply, which, it was explained, should meet the needs of the community for the next twenty years.

The Newton Abbot Urban Council have approved of the Surveyor's plans for the improvement of the market, comprising the construction of six lock-up shops, the erection of a market manager's house, and the conversion of the slaughter-house into a fire brigade station, at a total estimated cost of 1,200*l.*

Mr. N. G. Gedye, chief assistant to Mr. W. T. Douglass, civil engineer, Westminster, was yesterday appointed chief engineer to the Tyne Improvement Commission. Mr. Gedye, though only thirty-five years old, has had much experience in engineering work in Brazil, Peru, Mexico, and the Argentine. The annual salary attached to his new post is 1,500*l.*

Hamilton Dean of Guild Court last week passed plans presented by Mr. Thomas Weir, Quarry Street, for the erection of a steel workshop for the manufacture of nuts, bolts, and screws. The new works, which are to be built on the town lands near Hamilton West C.R. Station, will occupy 1¼ acres of ground. In extent the building will be 180 feet by 40 feet.

Mr. R. H. Mew, F.R.I.B.A., of the firm of Messrs. Alexander R. Stenning & Partners, 121 Cannon Street, E.C., has prepared a report on the condition of the thirteenth century church of St. Helen, Bishopsgate. He recommends the immediate renovation of portions of the interior and exterior stonework, and of some exterior brickwork, the repair of stained-glass windows, the renewal and painting of ironwork, and the cleaning and oiling of woodwork. The heating apparatus also requires renovation.

The Edinburgh Provincial Committee for the Training of Teachers propose to get additional ground at Moray House to provide (1) a central building containing in addition to all necessary accommodation for the training of the students, administrative offices and meeting rooms for the committees, and (2) a new demonstration school. The scheme will involve a sum of over 60,000*l.* Mr. A. K. Robertson, architect, has been instructed to prepare plans and specifications.

A Parliamentary return has been furnished showing the number of persons employed in slate quarries in North Wales during each of the years 1900 to 1909 inclusive. In 1900 the total number of slate miners was 5,041, of whom 2,295 were employed underground and 2,746 above ground. In slate quarries the total in 1900 was 9,481, 4,015 being employed inside and 5,466 outside. The total number employed in slate mines in 1908 was 3,301, those employed underground numbering 1,368 and above ground 1,933, while in slate quarries 8,056 persons were employed, 3,212 of whom were inside and 4,844 outside. In 1909 there were 3,118 employed in slate mines, 1,202 underground and 1,916 above ground, and in slate quarries 7,826 in all, of whom 3,105 worked inside and 4,721 outside.

The Leeds and Yorkshire Architectural Society on Wednesday evening, April 13, held the annual and first general meeting of session 1910-1, Mr. Sydney D. Kitson, M.A., F.R.I.B.A., the new president, taking the chair. The report read by Mr. Ralph W. Thorp, A.R.I.B.A. (hon. secretary), and the balance-sheet presented by Mr. R. Fielding Farrar, A.R.I.B.A. (hon. treasurer), both showed the Society's affairs to be in an eminently satisfactory state. The total membership was 167, against 165 last year. During the past session a town planning committee had been formed with the object of locally influencing the working of the Housing and Town Planning Act; while under the auspices of the Society the School of Architecture in connection with the School of Art was proving of advantage to Associates in preparing them in the subjects required for the R.I.B.A. examinations.

The half-yearly general meeting of the Liverpool Master Builders' Association was held on the 14th inst., Mr. R. Arthur Costain (president) in the chair. The President gave a résumé of the proceedings of the Council and various committees during the last six months, particularly mentioning the formation of (1) the Builders' Exchange; (2) the reference list which has been established with regard to architects, quantity surveyors, clerks of works, and specialists, &c.; (3) negotiations with the Lancashire County Council and the Liverpool Corporation with regard to equitable conditions of contract. The suggested alterations to the rules were unanimously carried, changing the term "honorary member" to "associate member," which includes the merchants engaged in the building trade as associate members and allows six associate members as representatives on the General Council of the Association.

A permanent exhibition of building materials and appliances was established at Montreal last year by the Master Builders' Association of that city, and is stated to be in direct touch with architects, contractors, proprietors, and prospective buyers. The exhibition is divided into fourteen classes—viz.—(1) Stone, all kinds except artificial; (2) bricks, cement, terra-cotta, and artificial stone; (3) lumber, interior and exterior woodwork; (4) wrought and cast iron, plain and ornamental; (5) sheet metal work, plain and ornamental; (6) roofing slate, tile, slag, &c.; (7) sanitary appliances, plumbing, steam fittings, radiators, steam heating, &c.; (8) heaters, ranges, grates, &c.; (9) plastering, metal lathing, substitutes for plaster; (10) ornamental tiles, fire-places, mantels, interior decorations; (11) hardware and artistic metal work; (12) stained, cut, plate, and ornamental glass; (13) paints, colouring, varnishes, &c.; and (14) gas fixtures, electric lighting, bells, tubes, &c. A certain space, varying in different classes, but generally about 72 square feet, is allotted to each exhibitor at an annual charge of $2½ per square foot. The room containing the exhibits is open for a certain number of hours each day, and in this way the goods of the exhibitors are advertised. In connection with the exhibition the association have recently established a reference library of trade catalogues relating to the building industry. There might here, it is suggested, be an opportunity for British manufacturers of building materials and appliances to exhibit their goods or catalogues. Communications on this subject should be addressed to His Majesty's Trade Commissioner, 120 Board of Trade Building, Montreal, or to the Secretary, Department of Permanent Exhibits, Builders' Exchange, Montreal.

The artistic sense of Venice has, says the British Consul in his annual report, been devoted to restoring, at any rate to some extent, the glories of the Campanile. The brick masonry of St. Mark's tower has been finished and the building of the belfry is being proceeded with. A new scaffolding has been fixed and the old one will soon be removed. The magnificent piece of architecture called the "Loggietta," as it was slightly elevated from the ground by Sansovino, is being reconstructed under the arches of the courtyard of the Doges' Palace. After its collapse measures were at once taken to collect all the precious fragments that could be recovered. Fortunately the bronze statues by Sansovino representing Minerva, Apollo, Mercury, and a God of Peace, together with the gates by the founder Gai, were not much damaged, and they were again put up in their pristine state. The terra-cotta Madonna with Child and St. John Baptist, also by Sansovino, that had been picked up in 1,600 fragments, was wonderfully restored by Pietro Zei. A great part of the material constituting the façade of the loggietta, such as columns, pedestals, pilasters, niches, &c., has been, wherever possible, restored or identically replaced. Its reconstruction may now be seen, minus the attic, which is now under reconstruction in another place, and will soon be removed there. With respect to the marbles and other materials employed, a most careful selection has been made, with a view of insuring an identical reproduction of the splendid monument that was buried under the debris of the Campanile.

## COMPETITIONS OPEN.

EDINBURGH.—The Corporation invite competition designs for the erection of a new hall in Lothian Road, Edinburgh. They have appointed Sir Aston Webb, C.B., R.A., as assessor, Mr. J. A. Williamson, A.R.I.B.A., City Chambers, being associated with him. Three premiums are offered. Particulars and plans of the site will be supplied to competitors on payment of two guineas, which will be returned on receipt of a design in accordance with the conditions. Should architects, on receipt of the particulars, not desire to compete, the deposit will be returned, provided the papers are returned within four weeks. Mr. Thomas Hunter, town clerk, City Chambers, Edinburgh.

LONDON.—June 15.—The Acton Urban District Council invite plans for schools at Rothschild Road for 850 pupils. Premiums of 100*l.*, 50*l.*, and 25*l.* are offered, but any premium awarded to the successful architect shall be merged in his commission of 3½ per cent. Deposit 10*s.* 6*d.* Apply after April 5 to Mr. F. A. Everitt, secretary, Education Department, Council Offices, Acton, W.

PONTEFRACT.—April 29.—The Education Authority invite competitive designs for an elementary school from architects practising in Yorkshire. Deposit 1*l.* 1*s.* Mr. W. Haddock, town clerk.

RICHMOND.—May 21.—The Town Advancement Association offer prizes of twenty guineas and five guineas for a double-royal poster exploiting the attractions of the town. The Offices of the Association, 1 The Little Green, Richmond, Surrey.

STOCKPORT.—May 2.—Architects desirous of competing for the designs of the library which the Corporation propose to erect are invited to send their names, with information as to their experience in and qualifications for carrying out such work, to Mr. Robert Hyde, town clerk, Town Hall, Stockport.

WALSALL.—Designs are invited for the erection of a public elementary school (mixed) to accommodate 500 children at Bloxwich. Conditions of competition and plan of site from Mr. W. Dawson Sadler, M.A., Director of Education, Council House, Walsall.

a great cu... ...ution may lie at the
this Lambeth experience.

Yes, your mackintoshes will cost you more. This is not a Free Trade joke; it's a grimly serious consequence of the rubber boom. Waterproofs have already been put up 20 per cent., and everything of which rubber forms a part is rising proportionately. As there are generally sympathetic movements in other directions, we may perhaps expect to see umbrellas also "going up." It is rather rough on us, when other trades are dull and everyone has to economise, that we should have to pay more for our tennis boots, our hot-water bottles, our golf balls, our goloshes, our ink-erasers, our rubber heels, and our elastic stockings. It's a benevolent wind indeed that blow's nobody harm. Aye, there's the rub—in fact, there's the rubber!

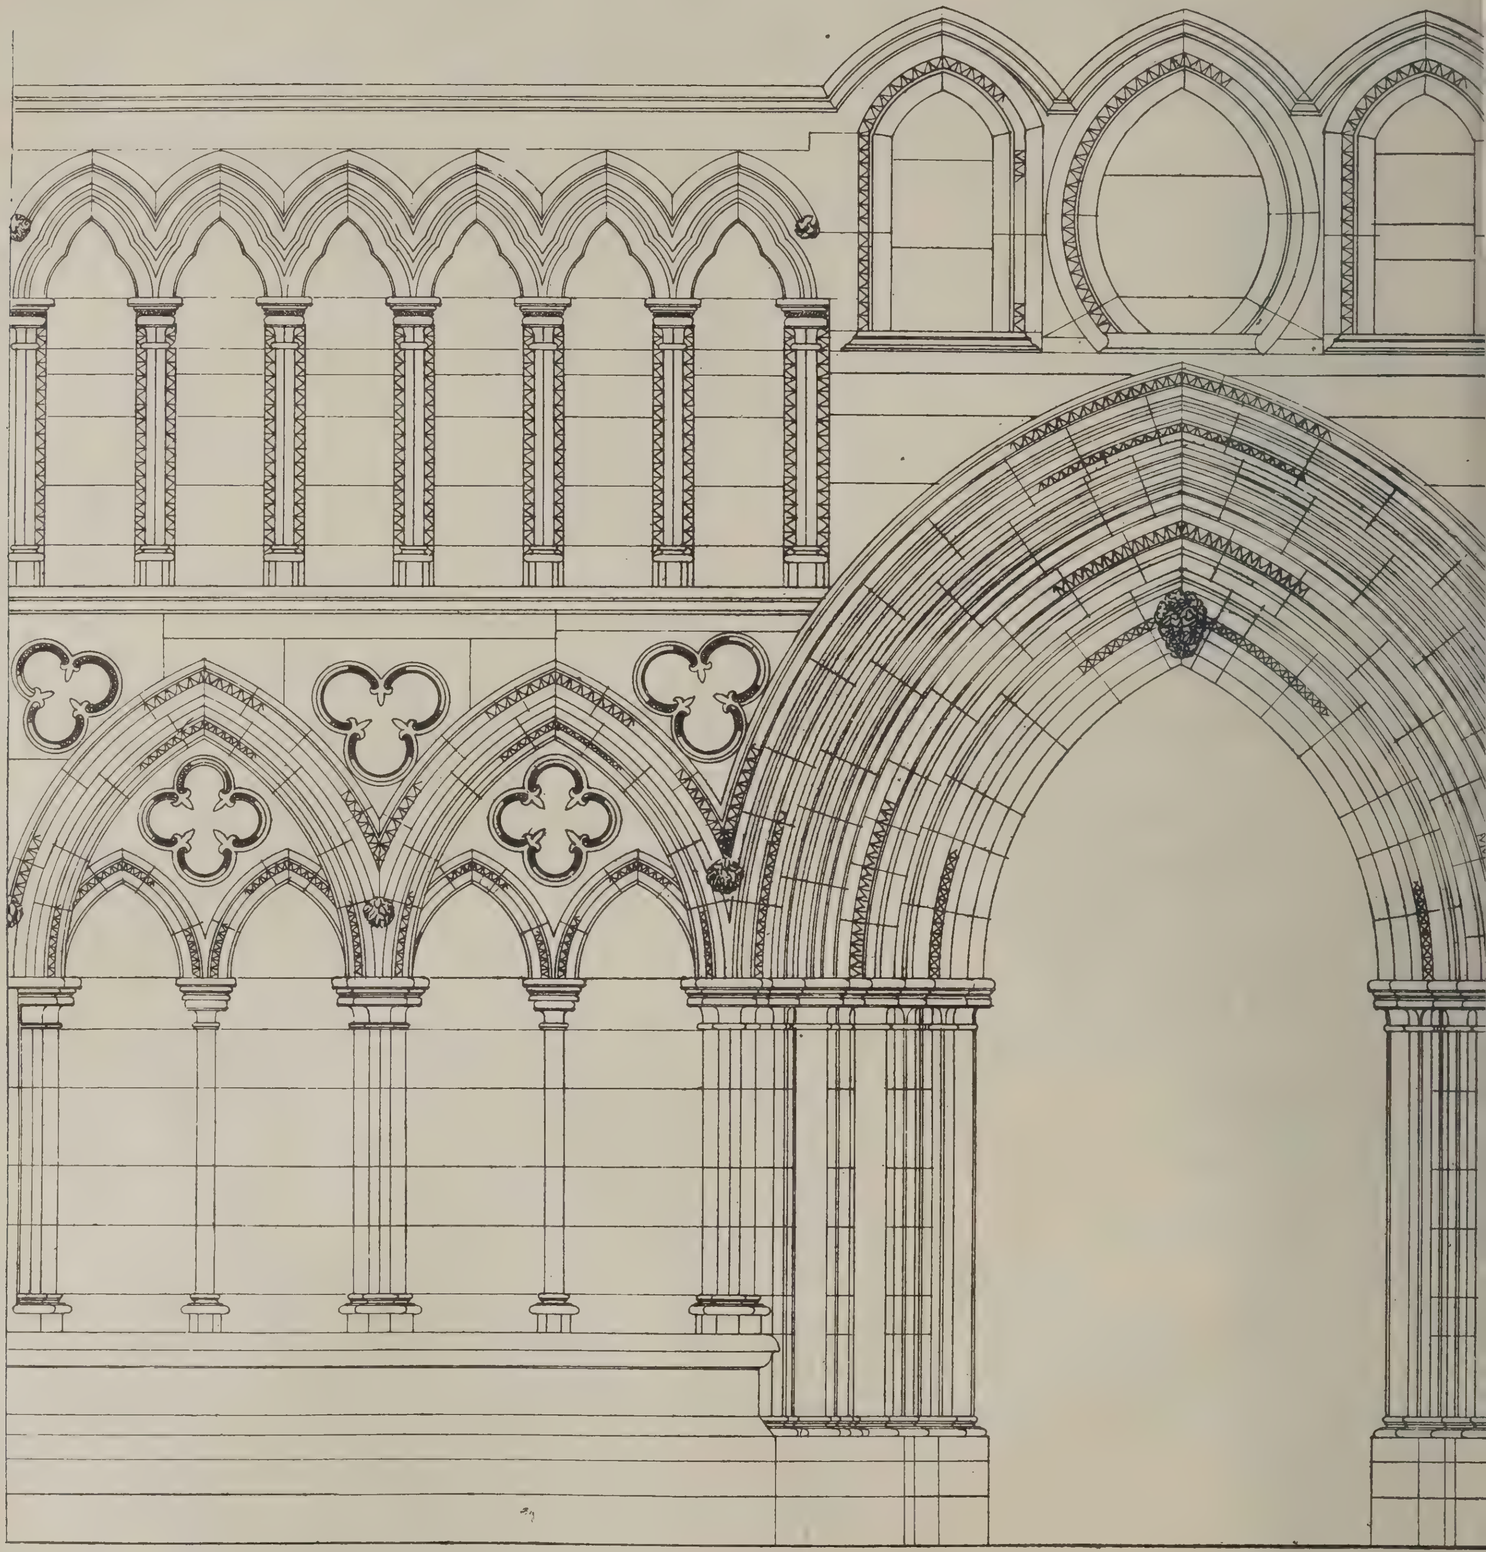
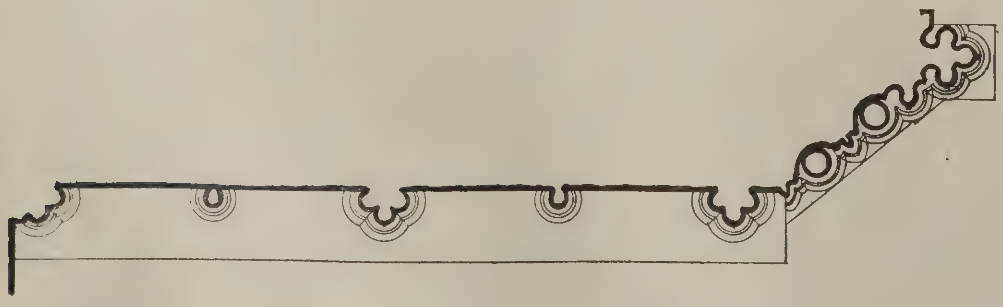
| Lawton & Pounder | 2,066 | 2 | 7 |

"THE ARCHITECT" STUDENTS'

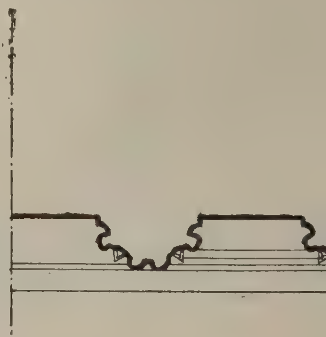
# 13TH CENTURY WEST FRONT · BOLTON



ELEVATION.

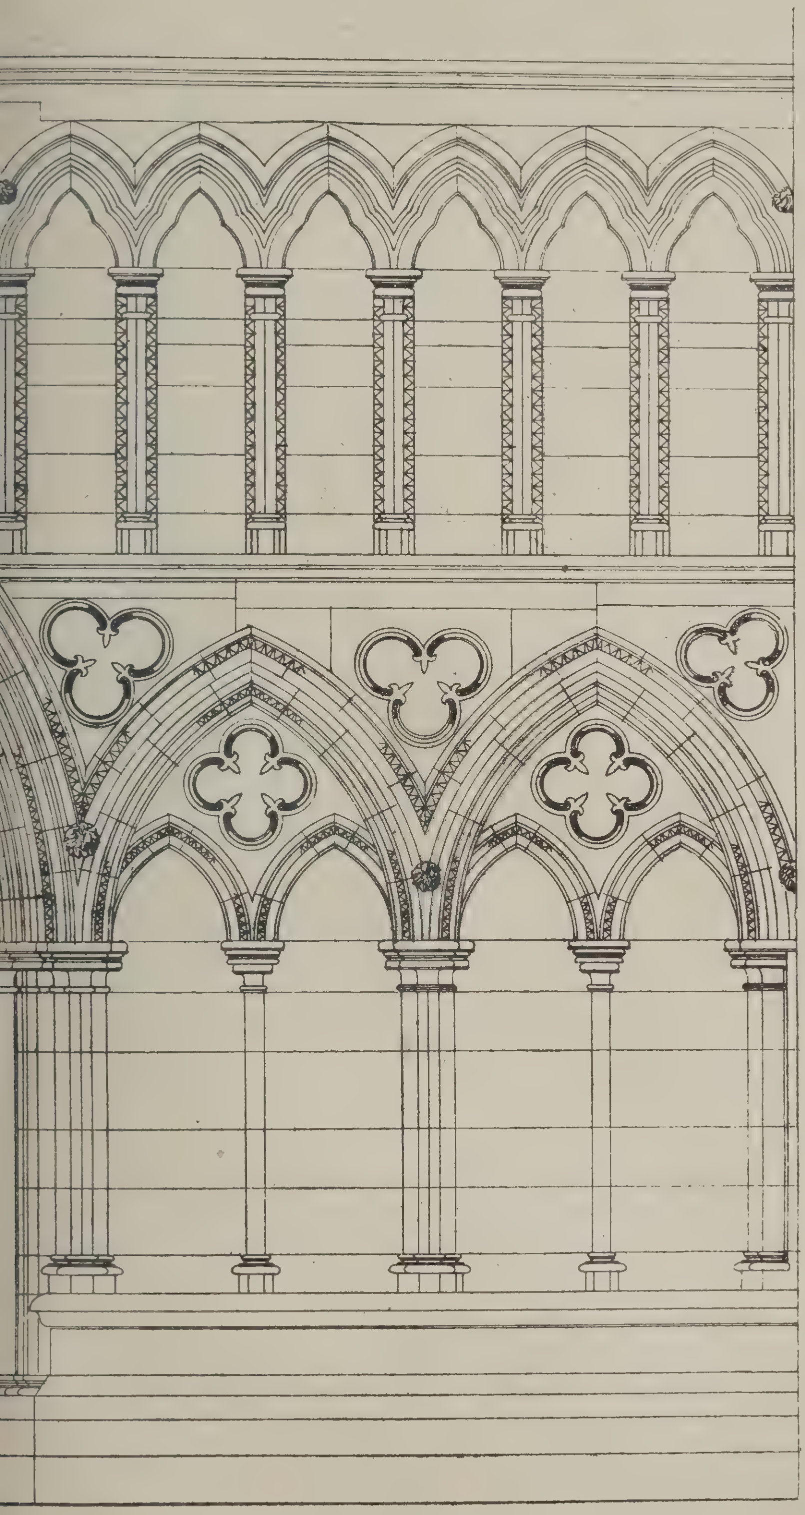


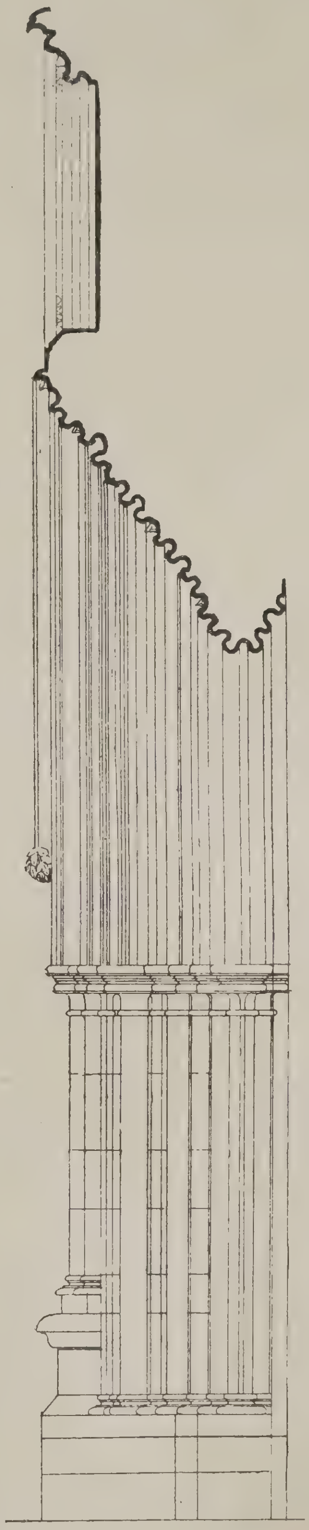
PLAN: LOWER ARCADE.



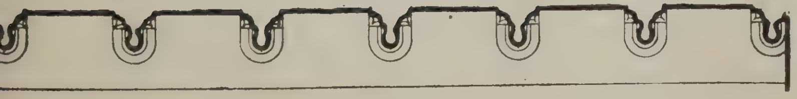
PLAN: UPPER ARCA

# ABBEY · YORKSHIRE · LOWER PORTION ·





SECTION.



MEASURED AND DRAWN BY "ESEK."

## BOLTON ABBEY, YORKSHIRE.

THE drawings represent the lower portion of the thirteenth century west front of Bolton Priory, Yorkshire. The Priory was founded about 1120 A.D., at Embsay, near Skipton, by the regular canons of St. Augustine, but some 30 years later was removed to its present situation. In plan the church takes the form of a Latin cross. The portion west of the crossing is used for service, the remainder is in ruins, probably on account of the rule that the nave was reserved for public use while the choir was kept exclusive for the canons. A good deal of Norman work remains in choir and transepts, and some fine wall arcading. The upper portion of the choir and transepts appears to have been rebuilt and Decorated windows inserted.

The nave retains much of its Early English character: the aisle is divided from it by four arches, and in the clerestory over are four lancet lights. The thirteenth century west front is perhaps the most beautiful of all the work, and is in a good state of preservation, owing to the protection afforded by the tower erected in the sixteenth century, but not completed before the Reformation. Had it been completed we should probably have had no thirteenth century west front, as the tower would probably have been connected to the nave. The presence of the tower makes measured work on the front very difficult, and no permission is granted for measurement or sketching inside the nave.

## COMPETITION.

SHEFFIELD.—Messrs. Morgan & Brace, architects, London, have been placed first in a competition organised by the Endcliffe Park Congregational authorities for designs comprising a church for 650, an institute school, and caretaker's apartments. The premium is 35*l*., and will not be merged in the commission. The assessor, Mr. Chas. Hadfield, F.R.I.B.A., placed second the design submitted by Messrs. W. Waddington & Sons, Manchester, and that of Messrs. Withers & Meredith, FF.R.I.B.A., London, third.

## TRADE NOTES.

A LARGE clock has just been completed for the Griffith John College, Hankow, Central China, which is fitted with Lord Grimthorpe's gravity escapement, striking hours, all up to date improvements added, by Messrs. W. F. Evans & Sons, Soho Clock Factory, Handsworth, Birmingham. The same firm have also completed three new turret clocks, and reconstructed three others, all for the North Shields Corporation, and also a turret striking clock for the Victoria Hospital, Damascus, Syria.

THE extensions to the Royal Infirmary, Sheffield, are being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues, supplied by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

THE Rex Roofing Co., Connswater, Belfast, have issued a small booklet dealing with their circular bow-and-string girder roof, which has come to be known as the "Belfast" roof. Single spans up to 100 feet are erected without intermediate support, and without bringing any lateral thrust upon the side walls. That is to say, it is cheap because the framework itself is of the lightest possible description, and cheap because the rest of the building can be designed on equally economical lines. The Rex flat roofing is in six layers, three being of their sheet asphalte, and three layers of Rex mastic applied in a liquid state. This roofing has on numberless occasions withstood the severest tests as to water-tightness, strength and durability. The felt does not require tarring oftener than once in three years. The Rex Roofing Co. do not claim that their roofs are incombustible, but the cases quoted below show the confidence with which they are regarded by engineers. The smithy of Messrs. Harland & Wolff, Ltd., at their White Star Shipbuilding Works, and the smithy and foundry of Messrs. Tangyes, Ltd., Birmingham, are covered with Belfast roofs; and in the latter case the furnace chimneys and cupolas come through the roofs. Messrs. Combe, Barbour & Combe, Belfast, have their cupolas quite close to their felt roofs. Messrs. Gregg, Sons & Phœnix's cupola and felt roof are within 2 feet of each other.

EDINBURGH Dean of Guild Court has granted an interim warrant for additions to the Edinburgh Hospital for Women and Children. The additions consist of extra wards and a new operating theatre.

## SAFES AND STRONG ROOMS.

IT is quite possible that the contents of His Majesty's private safe are of less value than those of many others far humbler. Yet to our mind there is something arresting in the announcement of the fact that among the works carried out by Messrs. Hobbs, Hart & Co., Ltd., was the King's private safe. It rather dwarfs such contracts, probably more important, as providing a self-contained and burglar resisting steel strong room in the private apartments at Windsor Castle, or that of erecting a suite of plate rooms, jewel room and jewel safe for Queen Victoria; still more does it dwarf the long list of important banking firms and commercial offices to which safes have been supplied. However, as already hinted, the reason for this is something akin to the sentimental, and flights of sentiment or fancy are directly opposed to the consideration of safes. The fact does remain, nevertheless, that the firm have been honoured by Royal appointment, and have also fitted treasury doors, reserve bullion safes, and principal doors for the head office and branches of the Bank of England. With such strong testimonials it seems superfluous to speak as to the quality of their work.

The gentle art of the burglar has to be met with a cleverness greater than his own. The body of the improved "Progress" D quality safe, for instance, is of ½-inch solid steel, flanged and bent at all angles and corners, the back plate being placed in position inside the body during the process of bending, and securely rivetted to the back flanges. The door is of Hobbs & Co.'s compound high and low carbonised steel, and best quality tough steel, to a thickness of 1¼ inches, the exterior plate being hardened drill proof. The lock-case is angle steel, dovetailed and rivetted together at the four corners and rivetted to the door by self hardening steel rivets. The door is secured by a series of patent "clutch" bolts. In the smaller sizes these are fitted at the front and back; in the larger sizes and in all double door safes they are fitted at all four sides of the doors. The system of "clutch" bolts is controlled by two of their "protectors" nine lever unpickable and gunpowder proof locks with two keys each. Fire resisting chambers of full capacity, charged upon Hobbs & Co.'s improved system, the chemical ingredients being packed in cartridge cases and the whole of the materials thoroughly dried to prevent rusting of the inner lining.

Messrs. Hobbs & Co. are not content with this, for they have other anti-burglar aids such as a special compound steel for doors, and a patented protection against the oxy-acetylene blow-pipe. Their "branch bank" strong room door is a combination of the best expedients for safety. It is not by the manufacture of safes alone that the firm have gained their reputation. One of their recent most successful productions is a "penny in the slot" automatic lavatory latch. This is made in two types; one will contain up to seventy-two pennies, and the other up to 144.

## INCORPORATED SOCIETY FOR PROMOTING THE ENLARGEMENT, BUILDING AND REPAIRING OF CHURCHES AND CHAPELS.

THIS Society held its usual monthly meeting on Thursday, the 21st inst., at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W.

Grants of money were made in aid of the following objects, viz.:—Building the church of St. Anne, Longsight, near Oldham, 200*l*.; rebuilding Holy Trinity, Kingsway, Middlesex, 200*l*.; and towards reseating and repairing Chelsea Old Church, Middlesex, 75*l*.; and Hanborough, St. Peter, near Oxford, 25*l*. The following grants were also paid for works completed:—Martley, St. Peter, Worcester, 50*l*.; Leytonstone, St. John the Baptist, Essex, 75*l*.; Kirkdale, St. Gregory, Yorks, 25*l*.; Wrenbury, St. Margaret, 15*l*.; Fincham, St. Martin, Norfolk, 20*l*.; Canton, St. Luke, Cardiff, 100*l*.; Silk Willoughby, St. Denis, Lincs., 30*l*.; Honington, All Saints, Suffolk, 30*l*.; and Cynllwyn-du, St. David, Glamorgan, 50*l*. In addition to this the sum of 234*l*. was paid towards the repairs of twenty-six churches from trust funds held by the Society.

The grants voted during the present year, amounting to 4,450*l*., have nearly exhausted the funds at the disposal of the committee. Liberal contributions are invited to enable the committee to vote substantial grants and to enable them to continue the valuable work which this Society has so successfully carried on during the past ninety-two years.

The annual general court will be held at 3 P.M. on Thursday, May 26, at the Church House, Dean's Yard, Westminster, when the chair will be taken by the Archbishop of Canterbury, president of the Society.

## ILLUMINATING ENGINEERING SOCIETY.

A MEETING of the above Society was held on Wednesday evening, the 14th inst., in the hall of the Royal Society of Arts, Professor S. P. Thompson, D.Sc., F.R.S. (President), in the chair, to resume the discussion on "Recent Developments in the Measurement of Light and Illumination," adjourned from a meeting held on March 15.

The following series of queries on the subject was prepared and issued to members in order to suggest a few points on which discussion would be valuable:—

1. Are the courses of instruction and experimental facilities at technical colleges and scientific institutions for the study of photometry adequate, and what changes are desirable in the existing methods to suit modern requirements?

2. What is the maximum sensitiveness (*i.e.* the smallest percentage change of illumination perceptible to the eye) at present obtainable from photometrical instruments in the laboratory? How should this sensitiveness be tested and expressed, and to what extent does it differ in the case of different individuals? In what directions may improvements be anticipated in the future?

3. What are the best modern methods of obtaining the polar curves of light-distribution and of measuring the mean spherical candle-power of different sources, and what possibilities are there of simplifying and improving such processes in the future? What are the best methods of deriving the mean spherical or mean hemispherical candle-power from such curves in the case of all illuminants?

4. As it is desirable that there should be international agreement on the subject of the commonly accepted method of measuring and expressing the intensity of illuminants of all kinds in order that results referring to different sources may be comparable one with another, on what basis should such comparisons of illuminating power be made, and what information should be included in a report of tests of this nature? Is it desirable that all lights should be compared in terms of mean spherical candle-power?

5. What is the best method of comparing the intensity of modern sources of light which differ in colour?

6. What are the main qualifications of an illumination-photometer for practical work? With what degree of accuracy can the illumination in streets and buildings be measured, and what limits of accuracy should at present be permissible?

7. Discussion of the exact value and significance to be attached to photometrical measurements in streets and buildings, and the possibility of framing and carrying out a specification relating to the conditions of illumination in such cases. To what authority is it desirable that dispute regarding such specifications and photometrical measurements should be eventually referred?

8. What are the best methods of studying and measuring daylight illumination?

The PRESIDENT said, although the business before them was the continuation of the discussion of the meeting of March 15, it was desired that on the present occasion they should confine their remarks practically entirely to the measurement of illumination and to the carrying out of the principles they were discussing a month ago. They had hoped and expected that Sir William Preece would open the discussion, but his health did not permit him to attend that evening. Happily Sir William Preece was represented more or less by Mr. Trotter, who had long been associated with him in experiments. The President said he wished also to mention that they had upon the platform various illumination instruments, and he thought it would be well if they could have from the exhibitors early in the evening practical demonstration and illustration of those instruments.

Mr. A. P. TROTTER said, before commencing the subject of illumination in its more practical applications he would refer, as he had been asked to do, to some remarks contributed by Mr. Sumpner on the direct measurement of mean spherical candle-power by diffusion methods. Dr. Sumpner said the quantity of light emitted by any form of lamp was measured by its spherical candle-power. The determination of that quantity was of commercial importance and a simple method of making the test was much wanted. The best known direct test was by the use of the Ulbricht globe. That globe, no doubt, he said, yielded good results in practice, but it had some defects which prevented its action from being quite accurate. It was the purpose of the paper to which he made reference, said Mr. Trotter, to briefly allude to those sources of error and in particular to discuss whether it was possible to obtain equally good or better results by using in place of the globe merely a rectangular box. Time did not allow, said the speaker, a further account of Mr. Sumpner's argument, but for the benefit of members the paper would be published in the transactions of the Society.

Mr. Trotter said that the subject chosen for that meeting was the photometry of illumination. Query No. 6 of the paper which had been circulated was as follows:—"What are the main qualifications of an illumination-photometer for practical work? With what degree of accuracy can the illumination in streets and buildings be measured, and what limits of accuracy should at present be permissible?" A member had suggested at the last meeting that there appeared to be too many different kinds of photometers, and he seemed inclined to wait until the best one had been decided upon. There were many kinds of pens and many French dictionaries, but nobody put off learning to write or to study French for such reasons. The fact was that the large variety afforded opportunity for different persons to suit themselves. It would be found that there is no "best" photometer, but each person would generally do the best work with the instrument to which he was accustomed, and if he happened to be the inventor of one there could be no possible doubt which instrument he would prefer. He considered that the first of the qualifications of an illumination-photometer, which in fact distinguished it from a portable candle-power photometer, was the provision of a horizontal test-plate having no obstructions, but a clear view all round. Illumination might be measured by measuring successively the candle-power of each lamp which contributed to the illumination and then calculating the combined effect. Such measurements might be made on inclined test-plates, but the total could only be considered on a horizontal plane. Most illumination-photometers could be used also as candle-power photometers. Some instruments such as the Martens, Krüss, and one of Weber's were intended for measuring the illumination on school desks, or at a lathe or bench in a workshop, and the instrument itself obstructed half of the view from the test-plate, and in cases of general illumination might obstruct half of the light. Such instruments were very useful for certain purposes, but were not suitable for measuring illumination in streets, railway stations, &c. The second qualification of an illumination-photometer was that the test-plate should be as matt as possible, that is, have no appreciable glaze, and should obey the law of cosines as closely as possible, that is, it should have no appreciable angle errors. The third qualification was a good lamp. In Germany a small benzine lamp was often used. The height of the flame had to be adjusted carefully. It could not be used until it had burned for ten minutes, and he did not know how long it would burn without adjustment. He preferred a small electric lamp worked from an accumulator. If it were switched on only during each reading, which did not take more than 20 seconds, the total over a long evening's work would not amount to more than about half an hour. It was easy to ensure that the lamp would not vary more than 2 per cent. in candle-power during an evening. He did not believe in using voltmeters or adjustable resistances. The fourth qualification was a practical range. The maximum need not be more than 4 foot-candles, but the minimum should reach 0.02 or lower. The minimum illumination for street lighting is sometimes specified as 0.1 foot-candle. It may be interesting to measure the higher values, but in case the lighting is deficient the most important one to be able to measure accurately is the minimum allowed. It is quite possible to make very fair measurements of 0.005 foot-candle, but the scale of the instrument must be expanded at the lower part to make this possible. The fifth qualification is capability for dealing with coloured lights. The speaker's personal opinion was that the value of the flicker photometer was overrated, but he admitted that good work was done with it in some cases. He considered that the principle of free and rapid motion of the adjustment, whatever it was, of the instrument was sufficient for all practical purposes. The sixth qualification was a convenient arrangement for measuring the angle of incidence, and the last was the important one of portability. The second part of the query related to the degree of accuracy. Any good instrument set up on a tripod should be able to give an accuracy of 2 per cent. But it was useless to attempt high accuracy in outdoor work. Irregularities in glass globes, dirt, variation of gas or electric pressure, and other accidental causes introduced unknown errors. If on repeating a number of measurements it was found that they lay within a range of 5 or 6 per cent., that is, not more than 2½ to 3 per cent. from the mean of the whole, the work might be considered satisfactory.

Mr. Trotter then showed one of his illumination-photometers, made by Messrs. Everett, Edgcumbe & Co., and explained its use.

Mr. LANCELOT WILD described some investigations he had made in the measurement of the sensitiveness of photometers. The Joly prism (paraffin) he said, gave an equality of brightness of 2.5 per cent., the Summance wheel 2.4 per cent. and 1.6 per cent. flicker, the Whitman sector gave 2.0 per cent. and 1.0 per cent. flicker, inclined cards 1.2 per cent., common Bunsen (viewed on one side) 1.2 per cent., the same viewed on both sides 1.5 per cent., special Bunsen (38 lb. Ford) viewed on one side .4 per cent. and flicker .8 per cent., the same viewed on both sides gave .8 per cent. of equality of brightness and .2 per cent. flicker. In the last case he presumed the better surface in the wax used helped towards better results. Special Bunsen (60 lb. Ford) viewed on one side gave .8 per cent. equality of brightness and the same viewed on both sides 1.2 per cent. and .4 per cent. flicker, the Lummer gave .7 per cent. equality of brightness.

Mr. CLARKE, an inspector of the Gas Light and Coke Company, said so far as his experience with photometers went, starting with the common Bunsen disc he could not share the opinion which had been expressed by some about it for he had found the disc a very useful piece of apparatus indeed. One could work with it for long periods without fatigue, and another of its advantages was that it permitted adjustments to be made while one was looking at the screen.

Mr. H. HARRISON gave a demonstration with a photometer made to his order.

Mr. P. J. WALDRAM urged that the educational authorities should be asked to provide greater facilities for the teaching of Photometry. The study of illumination for architects in architectural schools was absolutely non-existent, and he therefore believed that one of the chief duties of that Society was to emphasise the crying need for including photometry in an architectural curriculum. An immense amount of responsibility was thrown upon an architect in determining not only the amount of daylight his buildings would admit, but also the artificial illumination of them. With the architectural student it was not the fault of his receiving insufficient instruction that placed him in difficulties, but the fact that he had received no instruction at all.

Mr. B. E. EDGCOMBE and Mr. BOXALL (Great Western Railway Company) briefly joined in the discussion, and on the motion of the President the meeting terminated.

## VARIETIES.

THE Littlehampton Rural District Council have agreed to erect a refuse destructor in connection with the Wick drainage pumping site, and tenders are to be invited for the work.

THE St. George's Road Congregational Church, Bolton, has decided to erect new schools. A site has been purchased, and over 2,500*l*. has been raised towards the cost.

THE Tiverton education committee have decided to invite architects experienced in that class of work to submit designs in competition for an elementary school for boys.

THE Edinburgh Corporation up to last week received nearly a hundred applications from architects all over the country for the Usher Hall competition.

THE Ilkeston Corporation propose to spend 3,700*l*. on the erection of two chapels, lodge, &c., at the Park Cemetery. A tender for the work has been acceptional conditional to the approval of th Local Government Board.

THE Wolverhampton Town Council at their last meeting adopted a report from the electricity committee recommending extensions of the generating station, the provision of further plant, and erection of fitter's workshops, &c. The cost was estimated at 23,000*l*.

THE Council of the Surveyors' Institution have accepted an invitation from their Lancashire and Cheshire committee to hold the next country meeting at Liverpool, on May 26 and 27. Visits have been organised to various works and places of interest in the locality.

PLANS for a proposed new technical school at Doncaster, prepared by Messrs. Schofield & Berry, of Leeds, have been adopted. The site of the school is at the old Vicarage near the parish church, and the cost of the building will be about 10,000*l*.

THE contract for the new school which is to be erected at Sutton Valence consequent on the amalgamation of the Sutton Valence and Westminster schools has been secured by Messrs. Wallis, Ltd., of Maidstone, the amount of whose tender was between 28,000*l*. and 29,000*l*. There were fourteen firms in competition for the contract.

THE building trade depression seems to be passing slowly away. A distinct improvement is perceptible in the Sheffield district. Makers of tools used for building report that things are a little better in this country, and Colonial buying has considerably improved. Makers of many kinds of edge tools are fairly well occupied. There is nothing to complain of in the spade and shovel department both for home and export. Stove-grate makers are benefiting somewhat, but they complain of recurring spells of slackness.

THE Derbyshire education committee have been informed that the Board of Education are not satisfied with the progress made by the committee in regard to school buildings and accommodation. A programme of new work was in contemplation, which will necessitate the immediate engagement of four additional temporary architectural assistants.

THE partnership hitherto existing between Messrs. T. E. Scammell & A. R. Perkins, architects and surveyors, 11 John Street, Bristol, and Wotton-under-Edge, has now been dissolved by mutual consent, and the business will be continued by the aforesaid T. E. Scammell, P.A.S.I., under the style of T. Scammell & Son.

THE *Diario Oficial*, Chile, of March 1, contains a law providing for the raising of a loan of 1,100,000*l*., to be applied, with the exception of about 123,750*l*., to the erection of the town hall and to sanitary works in Valparaiso. The former work has already been contracted for; the contract for the sanitary works is to be given as the result of public competition.

THE Welsh slate trade, which has been in a state of depression for the past five years, presents symptoms which point to an improvement of a permanent character. For about two years Oakeley quarries, the chief quarries in the Festiniog district, have been working four days a week. It was last week announced that full time would be resumed at the Oakeley quarries next week or the week after. Another sign is that of late ships in Portmadoc, the port of Festiniog, secure slate cargoes easily.

THE new church of St. Wilfrid, Bognor, was dedicated by the Bishop of Chichester on Saturday, April 23. The portion of the church completed consists of the chancel, chapel, vestries, organ chamber, transepts, and three bays of the nave, and with the addition of a temporary west end gives accommodation for 800 adults. The work has been carried out by Messrs. J. Jarvis & Sons, builders, of Hackney, at a total cost of about 8,000*l*., from the designs and under the supervision of Mr. Geo. H. Fellowes Prynne, F.R.I.B.A., architect, of Westminster, S.W. The style is of fifteenth century type, and the materials used are Kentish rag external facing, with Box ground dressings and brick facing and Bath stone dressing internally.

THE Worshipful Company of Makers of Playing Cards offers "The Company's Prize" of 15*l*. 15*s*. for the best design for the backs of playing cards, illustrating the subject of "Locomotion: Past, Present, and Future." The "H. D. Phillips Prize" of 10*l*. 10*s*. is also offered by the company for the best design on any other subject. The designs selected are to be the absolute property of the company, and one will be reproduced for the pack of cards to be presented by the company to its livery and guests at the Inauguration Banquet. Designs must be sent in by June 24 to W. Hayes, the clerk of the company, Guildhall, London, E.C., from whom particulars of the conditions can be obtained.

ANOTHER turbine steamer, the *St. Petersburg*, intended for the Great Eastern Railway Company's Harwich-Hook of Holland service, was launched at Clydebank, N.B., on Monday. The new boat will be fitted with wireless telegraphy, submarine signalling, and all the modern improvements in respect to heating, ventilation and lighting. The vessel which is 343 feet long, 44 feet broad, will have a speed of 21 knots per hour, and accommodation for over 300 first-class passengers. A special feature is a number of cabins each fitted with accommodation for one person; the greater part of the remainder of the cabins will contain two berths only. The *St. Petersburg* is expected to be placed on the service in July, after which date there will be only turbine steamers.

YEAR after year the Shakespeare festival grows in importance and covers a longer period—this year from April 22 to May 14—when Stratford-on-Avon will give itself up to Shakespeare's plays, a number of which were no doubt conceived by the immortal bard in this old English town, with its old English people, and the old English tongue everywhere around you. Stratford-on-Avon is delightful in the sweet springtime. To enable those in the Metropolis to visit these scenes of Merrie England, the Great Central Railway Company have arranged a convenient service of express trains by their short route, and cheap tickets at the fare of 6*s*. 6*d*. return are issued from Marylebone several days during the week. The arrangements are specially suitable for attending the matinée performances in the Memorial Theatre on April 22, 26, 27, 28, 30, May 2, 3, 5, 7, 10, 11, 12, and 14, and visitors can return in good time the same evening.

The Same—After Treatment.

**CERESIT**

**WATERPROOFING**

**FOR CEMENT, CONCRETE, ETC.**

CERESIT absolutely prevents the penetration of moisture or damp in brick, stone, or concrete structures, even under a pressure of more than 70 pounds per square inch.

CERESIT costs practically nothing in labour. It is not mixed with the prepared mortar, but dissolves itself in the water with which the mortar is made.

CERESIT is not an experiment. It is being used with complete success on hundreds of foundations, building walls, dams, bridges, reservoirs, etc.

Write to-day for the Ceresit Book. It will tell you all about it.

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

## TENDERS, ETC.

⁂ *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2* P.M. *on Thursdays.*

## COMPETITIONS OPEN.

EDINBURGH.—The Corporation invite competition designs for the erection of a new hall in Lothian Road, Edinburgh. They have appointed Sir Aston Webb, C.B., R.A., as assessor, Mr. J. A. Williamson, A.R.I.B.A., City Chambers, being associated with him. Three premiums are offered. Particulars and plans of the site will be supplied to competitors on payment of two guineas, which will be returned on receipt of a design in accordance with the conditions. Should architects, on receipt of the particulars, not desire to compete, the deposit will be returned, provided the papers are returned within four weeks. Mr. Thomas Hunter, town clerk, City Chambers, Edinburgh.

| Sandell & Sons, Worthing (*recommended*) | 1,340 | 0 | 0 |

## CORRESPONDENCE.

### Waterproof Building.

Sir,—With reference to the article "Waterproof Building" which appeared in your issue of the 22nd ult., we beg to say that it has caused us great inconvenience that Ceresit should be confounded with Medusa and Solita. We must point out to you that Ceresit is not a powder, and that is one of the principal advantages of our material. As you will no doubt appreciate, the mixing of powders in exact proportions is very difficult to do, the result being that the waterproofing material is unevenly distributed throughout the mass. Our material Ceresit takes the form of a paste about the consistency of butter, which is diluted with water in the proportions of one part Ceresit to ten parts water, resulting in a milky fluid. This mixture is then poured direct to the cement mortar in place of the ordinary diluting water. Thus you insure absolutely the waterproofing quality of the entire mass.

We should be glad if you would kindly rectify this mistake through the medium of your journal at your very earliest convenience, and oblige,

The British Ceresit Waterproofing Co., Ltd.
London, S.W.: May 4, 1910.

## COMPETITION.

Liverpool.—The Corporation recently invited architects practising in Liverpool to submit designs for the Walton and Fazakerley Free Library, to be erected at a cost of not more than 7,000*l*. Mr. W. E. Willink, F.R.I.B.A., the assessor, has published his award. The three selected designs were as follows:—(1) Messrs. Briggs, Wolstenholme & Thornley; (2) Mr. R. Wynn Owen, A.R.I.B.A.; and (3) Mr. T. Taliesin Rees, F.R.I.B.A., and Mr. F. B. Hobbs, A.R.I.B.A.

## TRADE NOTES.

A large clock has just been erected in the tower of St. Luke's Hospital, Halifax, by John Smith & Sons, Midland Clock Works, Derby. It is fitted with all the latest improvements, and made generally to the designs of the late Lord Grimthorpe. The same firm have recently erected large clocks in the same neighbourhood at Elland Town Hall, Sowerby Church, and West Vale Church.

The Easton Lift Company, Ltd., inform us that owing to the increase of business they have been compelled to obtain larger premises in London. They have therefore vacated the workshops at College Street, Lambeth, together with the offices at Broad Sanctuary Chambers, Westminster; and the address of their head office, where all communications should be sent, is now "Express" Works, Short Street, Southwark, S.E. (five minutes from Waterloo Station). The new premises afford increased facilities for quick delivery generally, and for prompt attention to repair work.

The British Stone and Marble Co., Ltd., announce that an interesting exhibition of their material and products will shortly be held at Caxton House, Westminster, S.W., to which architects, surveyors, builders and contractors are especially invited. Their stone is a true stone, homogeneous throughout, and made from best quarry débris on the basis of the processes of nature.

The Welsh slate trade continues to improve, and following on the resumption of full time at the quarries in Festiniog after three years of work at four days a week comes an announcement of an increase in wages in other Festiniog quarries.

The Matlock Urban Council have appointed a subcommittee to organise a competition for obtaining designs for a pavilion to be erected on the Hall Leys estate, which will be developed as a pleasure ground.

A White Paper shows that under the Appropriation Acts, 1907, 1908, and 1909, the Board of Education, up to March 31 of the present year, had paid 20,850*l*. in England, and 32,520*l*. 16*s*. 6*d*. in Wales, in respect of special grants for the building of new public elementary schools.

Messrs. Liddle & Brown, architects, Newcastle-on-Tyne, were on Tuesday instructed by the Wallsend Town Council to prepare plans and estimates for a swimming bath 100 feet long and twelve slipper baths, to be erected behind the municipal buildings.

The estates and finance committee of the Dublin Corporation strongly recommend that immediate steps be taken for the erection of the proposed additional municipal offices on land already purchased in Lord Edward Street. The city architect estimates that the cost of the work will be 50,000*l*.

## KELLY'S BUILDING TRADES DIRECTORY, 1911.

The appearance of the eleventh edition of Kelly's Directory of the Building Trades is no small event. The preceding edition was issued in 1906; and in the interval there have been such ceaseless changes that a revised edition was becoming more and more desirable.

The book contains 2,530 pages (exclusive of indices), and about 300,000 classifications. It is designed to give complete lists of all the various professions, trades, and businesses connected with the constructive arts, and the aim of the publishers has been to make each new edition more complete and accurate than the preceding one. No distinctions are made in the Directory; a small town, if a builder carries on business in it, finds its place in it equally with the large provincial city or the metropolis itself. The work is as reliable as it is possible to make a book of so large and comprehensive a character. It contains: (1) Lists of the metropolitan, county and borough surveyors; (2) every ascertainable name (inclusive of architects) in the towns and villages alphabetically arranged under each county in England, Scotland and Wales, and under each trade; (3) the names under each particular trade in London and its suburbs, alphabetically arranged; (4) the names for the rest of England, Scotland and Wales similarly arranged; (5) the names for Ireland arranged under towns and trades; and (6) the names for the Channel Islands and Isle of Man, also arranged under towns.

The whole of the names given in the Directory have been personally checked by canvassers, and their returns afterwards arranged by a staff of specially trained clerks. Messrs. Kelly can claim an enormous amount of experience in this class of work, and it is safe to say that their present edition is as complete as it could be made under existing conditions. It is just over forty years since the first Building Trades Directory was brought out, and by now "Kelly's" has become indispensable.

## VARIETIES.

Duns School Board have adopted proposals for the enlargement of the Berwickshire High School, Duns. It has been resolved to instruct a firm of Glasgow architects to prepare final plans for the extension and specifications in terms of the Scotch Education Department's requirements. The probable estimate of the cost is 5,530*l.*

A fund is to be raised for a memorial to the late Dr. King, Bishop of Lincoln. The scheme approved will embrace two memorials, the first a statute or recumbent figure of the late prelate, to be placed in Lincoln Cathedral, and the second the completion of the fund for building the Memorial Church of St. Luke in Grimsby.

The Westminster City Council have, it is announced, determined to light Victoria Street, Regent Street, Piccadilly Circus, St. James's Street, and Pall Mall by high-pressure gas lamps with mantles instead of by electricity. The tenders of the gas companies and the electricity companies, it is said, showed a difference of between 30 and 80 per cent. in favour of gas.

The West Riding education committee have decided that in view of colliery developments a new elementary school be provided in the township of Balby. It is estimated to cost 8,400*l.*, and will make provision for 700 pupils. They have also accepted tenders of 4,471*l.* for the Loxley new school, Bradfield, and of 6,963*l.* for the Horsforth new school.

The plans for the pavilion to be erected on the Low Green, Ayr, by the Corporation have been passed at the Dean of Guild Court. The building is to cost 6,000*l.* It will be built of brick and rough-cast, and will have accommodation in the auditorium and galleries for about 2,500, while there will be tea rooms and other accommodation. The architect is Mr. J. K. Hunter, Ayr.

The Ecclesiastical Commissioners have notified the Bishop of Liverpool that they will accept the Lady chapel when consecrated as the cathedral church of Liverpool for the time being. This means that the chapel will for all purposes have the full status and dignity of a cathedral, in which full cathedral services, ordinations, and other functions of the Church may be held. There was some legal doubt at first whether the Lady chapel could be so used.

At the monthly meeting of the Barrow Town Council, the gas and water committee reported that terms have been agreed to between the Corporation and Messrs. Wm. Kennedy, Ltd., in the dispute with respect to their contract for the construction of the embankment at Seathwaite Tarn and the intake in the River Duddon. The contractors claimed 31,264*l.* as balance owing to them, and they have accepted 11,000*l.*

Messrs. Morrison & Mason, contractors and builders, Polmadie, Glasgow, have secured the contract for the construction of the new Government graving dock at Portsmouth. The dock is to be large enough to accommodate the largest *Dreadnought*, and it is expected that the work of construction will occupy from three to four years. The contract price is about 1¼ million sterling.

The Argyllshire county authorities have under consideration a proposal to construct a road from Ballachulish to Kinlochleven, where the works of the British Aluminium Company are located, and where there is a population of over 4,000. If proceeded with the new road will not only serve Kinlochleven but will form a new route through Scotland, opening up to motorists a region along the west coast now closed. The estimated cost is 16,000*l.* Two routes have already been surveyed.

Messrs. Sheppard & Lockton, architects, Newark, have prepared plans for the St. Leonards (Newark) Charity Trustees, who have decided to utilise some of their surplus funds for the erection of twelve cottage homes for aged and worthy poor. A nominal rent to avoid the taint of charity will be charged the tenants, and the accommodation provided will comprise a living room, bedroom, pantry, and usual out-offices.

The Manchester Society of Architects held their annual general meeting on April 27, when the officers, Council, and committees for the ensuing year were elected. Mr. P. S. Worthington, M.A., F.R.I.B.A., was re-elected as president, for a second year; Messrs. Edgar Wood, A.R.I.B.A., and John Brooke, F.R.I.B.A., are vice-presidents; and Mr. Isaac Taylor, F.R.I.B.A., hon. secretary.

Messrs. Holcombe, Betts & West will sell by auction on May 24 at the Mart, Tokenhouse Yard, E.C., an important freehold estate in Kilburn, known as "The Grange." The estate comprises about 9½ acres, it has an extensive frontage of 330 feet to the High Road, Kilburn, 413 feet to Messina Avenue, and 106 feet to Hemstall Road. It is within four miles of Charing Cross and stands in a prosperous neighbourhood. The auctioneers will also offer three freehold shops, known as Nos. 260, 262 and 264 High Road, Kilburn.

Edinburgh Dean of Guild Court last week granted a warrant to the First Church of Christ Scientist to erect a church at Inverleith Terrace. The church will be of stone, and will accommodate 630 people. Underneath there will be a hall to hold 180, and on the same level there will be accommodation for libraries, reading-rooms, and schoolrooms. A large tower will be placed at the entrance end with two flanking staircase turrets. Mr. Ramsay Traquair is the architect.

The Bacup education committee have accepted the scheme of the County Education Department for a new elementary science school in the district, to serve as a preparatory school to a big secondary school which is being built by the Corporations of Bacup and Rawtenstall at Waterfoot. It is recommended that the county architect should prepare plans for a building containing a lecture-room, a laboratory (with the necessary store-rooms), cookery and laundry departments, and class-rooms.

"The Pictures of 1910" again appears in its familiar light brown colour; and the *Pall Mall Magazine* publishers have provided once more a delightful picture-book, which gives a very excellent idea of the more prominent examples of painting and sculpture to be seen at the Royal Academy. The selection has, as usual, been done very wisely, and the reproductions are for the most part excellent. This shilling annual may be heartily recommended to anyone who cannot "do" the Academy at all, or who is curious to get a general idea at once as to its contents, or to those who have been, but who retain only a blurred impression as to what was to be seen.

The Council of the Institution of Civil Engineers have made the following awards for papers during the session 1909-10:—A Telford gold medal to Mr. C. M. Jacobs (New York); a Watt gold medal to Mr. J. D. Watson (Birmingham); a George Stephenson gold medal to Mr. D. A. Matheson (Glasgow); Telford Premiums to Messrs. F. C. Buscarlet (Sunderland), A. Hunter (Glasgow), I. C. Barling (Tynemouth), J. Dalziel and J. Sayers (Derby), and J. Shaw (Birkenhead); and the Manby Premium to the late Mr. C. W. Hodson (London). The thanks of the Council have been conveyed to their colleague, Dr. C. A. Harrison, for the paper contributed by him. The awards for papers published in the proceedings without discussion and for students' papers will be announced later.

THE organisers of the second Municipal and Health Exhibition which opens at the Royal Agricultural Hall, London, on May 7, promise several novel and interesting features for this year. One of the most prominent will be a model municipal cottage. This cottage, the construction of which was only begun on Saturday last, and will be completed by the opening day, will be found to be an excellent example of what a model cottage should be. Another feature will be a specially built roadway some 300 feet long and 16 feet wide, demonstrating the various methods of road making now extant. A number of firms have arranged to lay various sections so as to afford an opportunity of comparing the different materials and methods used in dustless roadmaking. The trade exhibits are representative, and are too numerous to be mentioned here in detail, but every requirement for municipal enterprise will be found in the big hall at Islington. The Exhibition closes on May 14.

THE Council of the London Master Builders' Association met on April 21, when the president (Mr. Leonard Horner) occupied the chair. The organisation committee, of which Mr. F. Higgs was reappointed chairman, reported that the canvassing among builders and contractors, who are not members of the Association, was meeting with success, and several firms have joined. The committee also suggested a standard to be observed in accepting associate members, and the suggestion was adopted by the Council. Some cases were reported of estimates being called for for large works without quantities being supplied, together with one instance where the bills of quantities had to accompany the tender. The objections of the Association to such proceedings were forwarded to the architect in each case with satisfactory results. In response to a request from the Board of Trade, Mr. Wm. Shepherd, Mr. F. G. Rice, and Mr. Walter Lawrence, junr., were nominated to represent this Association on the advisory committee for London about to be formed in connection with the Labour Exchanges.

AT the last meeting of the Midleton Rural Council, Ireland, a curious crux arose in connection with the scheme for the erection of labourers' cottages in the Union. The usual advertisements for the erection of twenty-seven cottages in different parts of East Cork were inserted in the newspapers, but not one tender was received. It is considered that the cause might be that the amount allowed for the building of the cottages was insufficient. The amount specified for each cottage would be 170*l*., and that sum includes the building of the cottage, the cost of the plot of ground, the expense of fencing, and the incidental expenses. The building of the cottage in each case would be about 130*l*. After considerable discussion, the following resolution was adopted unanimously:—"That we, the Midleton Rural Council, having failed in our effort to get tenders from builders for the erection of labourers' cottages in Midleton Union—in fact, no tender has been sent in, although we advertised for contractors—the Council request the Local Government Board to inform them how they may now proceed with the building of the cottages, the opinion of the Council being that contractors will not be got to build them at the estimated sum of 130*l*."

AT the annual general meeting of the Institution of Civil Engineers, held on April 26, the result of the ballot for the election of officers was declared as follows:—President, Mr. Alexander Siemens; Vice-Presidents, Dr. W. C. Unwin, Mr. R. Elliott-Cooper, Mr. Anthony G. Lyster, and Mr. Cuthbert A. Brereton; other members of Council, Mr. John A. F. Aspinall (Liverpool), Mr. B. Hall Blyth (Edinburgh), Mr. John A. Brodie (Liverpool), Mr. William B. Bryan, Colonel R. E. B. Crompton, C.B., Mr. Wm. Davidson (Australasia), Mr. E. B. Ellington, Mr. Maurice Fitzmaurice, C.M.G., Mr. J. P. Griffith (Ireland), Sir Robert A. Hadfield (Sheffield), Dr. Charles A. Harrison (Newcastle-on-Tyne), Mr. Walter Hunter, Mr. G. R. Jebb (Birmingham), Mr. Harry E. Jones, Sir Wm. Thomas Lewis, Bart., K.C.V.O. (Aberdare), Mr. Hugh D. Lumsden (Canada), Sir Thomas Matthews, Hon. Charles A. Parsons, C.B. (Wylam-on-Tyne), Mr. Alexander Ross, Mr. J. W. Shores, C.M.G. (South Africa), Mr. Francis J. E. Spring, C.I.E. (India), Mr. John Strain (Glasgow), Sir Frederick R. Upcott, K.C.V.O., C.S.I., Sir Philip Watts, K.C.B., Mr. W. B. Worthington (Derby), and Mr. A. F. Yarrow (Glasgow). This Council will take office on the first Tuesday in November 1910.

---

WHITSUNTIDE ON THE CONTINENT.—Return tickets at reduced fares, available for fourteen days, will be issued to Brussels for the International Exhibition, *via* Harwich and Antwerp. Passengers leaving London in the evening reach Brussels next morning after a comfortable night's rest on board the steamer. In connection with the Oberammergau Passion Play, the first representation of which takes place on the 16th inst. and the last on September 25, the Great Eastern Railway Company has arranged to supply inexpensive return tickets and to register baggage to Oberammergau, also to Garmisch Partenkirchen. Passengers can travel either *via* the Hook of Holland and Munich or *via* Antwerp and Munich. For visiting Holland special facilities are offered by the British Royal Mail Harwich-Hook of Holland route. From the Hook of Holland through carriages and restaurant cars are run to The Hague and Amsterdam, in the North and South German express trains to Cologne, Bale, and Berlin, reaching The Hague and Amsterdam early next morning, Cologne at noon, Bale and Berlin in the evening. The Danish Royal Mail steamers of the Forenede Line of Copenhagen will leave Harwich for Esbjerg (on the west coast of Denmark) on Friday, May 13, and Saturday, May 14, returning Tuesday, May 17, and Wednesday, May 18. The Swedish Royal Mail steamers will leave Harwich for Gothenburg on Saturday, May 14, returning from Gothenburg on Saturday, May 21.

---

To obtain the greatest benefit from your holidays there is no doubt that a change of air is most essential. The country is now looking its best, and the various facilities for comfortable and expeditious travel should be a further inducement to spend the Whitsun recess away from home. We have a copy of the A.B.C. programme issued by the Great Central Railway Company. There are over 300 seaside and inland health resorts in the Midlands and the North, including Liverpool, Isle of Man, and West Coast, Cleethorpes, Scarborough, and East Coast, which can be reached in quick time at very low fares, and the choice of destination stretches from the Midland Counties to the far North of Scotland. To those not willing to go so far away, the Vale of Aylesbury, Chiltern Hills, and Stratford-onAvon should particularly appeal. Shakespeare's country is quite an earthly paradise, and the poet's associations with Stratford are so intensely interesting that no Englishman can afford to miss them. Those wishing to undertake a walking or cycling tour, visiting the beauty spots of Middlesex, Herts, and Beechy Bucks are given a wide range of tours at low fares. Express corridor trains with buffet car accommodation will leave Marylebone at suitable times on Friday, Saturday, Sunday, and Monday, May 13, 14, 15, and 16, and full particulars of times of departure, fares, and other information are contained in this programme, which may be obtained free at Marylebone Station, any of the company's town offices and agencies, or by post from Publicity Department, 216 Marylebone Road, N.W.

---

THE South Eastern and Chatham Railway will issue for the Whitsuntide holidays cheap tickets to Brussels (for the International Exhibition) each day from May 11 to 16, *via* Dover-Calais, Folkestone-Boulogne, and Dover-Ostend by express services leaving Charing Cross at 9 A.M., 2.20 P.M., and 9 P.M., returning from Brussels on any day within fourteen days, and by any service. Cheap tickets will be issued to Paris by express services, *via* Folkestone and Boulogne, leaving Charing Cross at 10 A.M. and 2.20 P.M. on May 12, 13, 14, and 15, also on the same dates by the night mail service, returning from Paris at 8.25 A.M. or 2.30 P.M., *via* Boulogne, or at 9.15 P.M., *via* Calais, any day within fourteen days. A cheap excursion to Boulogne will leave Charing Cross at 2.20 P.M. on Saturday, May 14, and Sunday, May 15, returning at 11.45 A.M. or 6.30 P.M. on Whit Monday. Cheap return tickets, available for eight days, will be issued to Boulogne and Calais from May 11 to 16 inclusive, also to Le Touquet and Paris-Plage, *via* Folkestone and Boulogne. On Whit Sunday and Whit Monday special day excursions will be run to Boulogne and Calais. Special cheap eight-day return tickets to Amsterdam, The Hague, Scheveningen, and other Dutch towns, *via* Queenboro', and Flushing, will be issued from May 11 to 16 inclusive. Cheap eight-day return tickets to Ostend will be issued from May 11 to 16 inclusive. Cheap tickets to the Belgian Ardennes will be issued by the Calais, Boulogne, and Ostend routes. During the holidays the Continental services will run as usual. A special restaurant car express service to Switzerland (first and second class), *via* Dover, Calais, Laon, and Bâle, will leave Victoria at 8.50 P.M., and Charing Cross at 9 P.M. on May 13. Special arrangements have been made for holiday-makers over the company's home lines.

## COMPETITIONS OPEN.

Ashton-on-Mersey.—Architects practising within ten miles of Sale desirous of competing for proposed Sunday schools in connection with the Wesleyan Chapel are invited to communicate with Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

Edinburgh.—The Corporation invite competition designs for the erection of a new hall in Lothian Road, Edinburgh. They have appointed Sir Aston Webb, C.B., R.A., as assessor, Mr. J. A. Williamson, A.R.I.B.A., City Chambers, being associated with him. Three premiums are offered. Particulars and plans of the site will be supplied to competitors on payment of two guineas, which will be returned on receipt of a design in accordance with the conditions. Should architects, on receipt of the particulars, not desire to compete, the deposit will be returned, provided the papers are returned within four weeks. Mr. Thomas Hunter, town clerk, City Chambers, Edinburgh.

Ireland.—August 23.—The Meath County Council invite architects practising in Ireland to submit plans and specifications for county offices to be erected at Navan. Apply to the Secretary, Meath County Council, Navan.

London.—June 15.—The Acton Urban District Council invite plans for schools at Rothschild Road for 850 pupils. Premiums of 100*l.*, 50*l.*, and 25*l.* are offered, but any premium awarded to the successful architect shall be merged in his commission of 3½ per cent. Deposit 10*s.* 6*d.* Apply after April 5 to Mr. F. A. Everitt, secretary, Education Department, Council Offices, Acton, W.

Richmond.—May 21.—The Town Advancement Association offer prizes of twenty guineas and five guineas for a double-royal poster exploiting the attractions of the town. The Offices of the Association, 1 The Little Green, Richmond, Surrey.

Whitley Bay (Northumberland).—May 17.—For provision and erection of a shelter seat in an open space on the Promenade, Whitley Bay. Mr. A. J. Rousell, A.M.I.C.E., surveyor, Council Offices, Whitley Bay.

The City Corporation of London has decided to spend 20,000*l*. on public slaughter-houses at Islington Cattle Market, to meet present requirements and the increased demands which will be made in the near future, as private slaughter-houses in the northern districts of the Metropolis have been abolished.

A demand has been presented to the master builders of Swansea for an advance of a half-penny per hour in the wages of builders' labourers, who number about 200. The Union official has received a letter from the Master Builders' secretary as follows :—" Your letter has been duly laid before my committee, and I have been instructed to reply stating that there has been no labourers' society recognised for many years by this Association, and there is no code of working rules in existence. At the same time, I may say that it is the intention of each builder to deal with the labourers working for them individually." The Union will now call a further meeting of the men and send each builder an application for the advance.

Mr. A. A. Hudson, barrister-at-law, the arbiter appointed by the Board of Trade to consider the claims made by the joiners of Glasgow for a forty-four-hour week and an advance of 1*d*. per hour in wages, has now issued his award. This is to the effect that the by-laws shall remain unaltered for another year. The men put forward a demand for an eight hours working day for the first five days of the week and four hours on Saturday, making a week of forty-four hours, as compared with the present week of fifty hours. They also asked for an advance of wages from 9*d*. to 10*d*. per hour. The employers, on the other hand, asked for a working week of fifty-one hours, and they declined to grant any advance of wages. They wished the men to work one hour longer on Saturday than they do at present, so that they might stop at the same time as their other tradesmen.

---

We understand that Messrs. Wallis Bros., Ltd., of Maidstone, have been successful in obtaining the contract for new buildings in connection with the Royal Academy of Music in Marylebone Road, London. The approximate price is 50,000*l.*

Mr. J. Walker, assistant to Mr. Dick Peddie, architect, Edinburgh, has been appointed architect to the Local Government Board, in connection with the application of the Housing and Town Planning Bill in Scotland.

Mr. J. R. Thomson, architect, of 5 High Street, Rothesay, formerly sub-factor of the Bute Estate, and designer of many prominent public buildings in the district, who died on March 6 last, aged sixty-eight, left personal estate valued at 4,491*l.*, of which 3,301*l.* is Scottish estate, in addition to which he left real estate of the estimated capital value of about 10,000*l.*

## THE STANDARDISATION OF PAINTS.

THE "Paints Standards" Sub-Committee of the Royal Institute of British Architects has made an interim report to the Science Standing Committee.

The terms of the reference included directions to make an initial search in current literature with a view to ascertaining what has already been done in the matter of standardisation. This investigation has involved the preparation of extracts from a large number of volumes, and the matter collected, though containing facts of great value, proves to be mostly of too technical a character to be translated directly into simple practical terms suitable for use by the profession, and it would appear that but small effort has been made, at least in this country, to deal with the question of standardisation at all, though practical men with whom the Sub-Committee came into contact confirmed the opinion that some standards are desirable. It will further be evident that in the absence of any standards any precise specification is impossible. The Secretary of the American Institute of Architects has been interrogated as to the attitude of the profession towards this question in the United States, but, as yet, no reply has been received. The investigation so far undertaken has, however, impressed the Sub-Committee with the following facts:—(1) That adulteration in paint materials is very common, although it can be shown, generally speaking, that the best materials are the most economical when renewal is considered; (2) that legal definitions are very difficult of formation, and are often based too much upon mere chemical composition without regard to other properties; (3) that the physical condition, particularly that of the size of the particles of solid ingredients, is of very great importance, and that could this be standardised it would form one valuable basis for specification. The durability of paint, given a suitable vehicle, appears to depend, as in the case of concretes, to a very large degree upon the use of scientifically graded aggregates. The absence of any standard of fineness of grinding, moreover, renders it impossible to mix paints to definite tints by using given weights of constituents, which is a great hindrance to the practical man. A short monograph, suitable for the lay reader, embodying a description of the chief characteristics of paint materials, is in course of preparation by the Committee, and it is hoped to present it shortly.

## THE MUNICIPAL EXHIBITION.

AT the Royal Agricultural Hall, Islington, N., there was opened on Saturday of last week the second Municipal and Health Exhibition. Though the stands are not as numerous as on the last occasion the range of the exhibits is wide.

The first stand is that occupied by the *Limmer Asphalte Paving Co.*, who show samples of their material in various stages, and as finally sold for different purposes. The firm have also constructed a section of the Exhibition roadway laid in situ.

*Henry Balfour & Co., Ltd.*, Fife, are represented by a Barker & Hunter's patent reversible concrete mixer and tar macadam machine, capable of producing from 35 to 40 thoroughly mixed batches of concrete or tar macadam per hour. *The Clee Hill Granite Co., Ltd.*, show setts, macadam, rough stone for breaking, and chippings, all of which have been supplied to many of the principal local authorities of England and Wales.

*The British Ceresit Waterproofing Co., Ltd.*, Caxton House, S.W., demonstrate the impermeability of cement mortar treated with Ceresit by subjecting a thin slab to the pressure of a column of water 8 feet high. The slab, however, remains quite dry. This is only confirming the report given last year by the Royal Testing Office of Berlin as to its waterproofing qualities and its resistance to tensile and compressive strains. Ceresit is, we believe, unique in being sold as a paste. On the job it is mixed with the usual diluting water in the proportion of 1—10 or 1—12 and then poured on to the dry cement or concrete, which it is claimed renders it waterproof however poor the ingredients may be. It is found that 1 square yard of mortar $\frac{3}{4}$ inch thick requires 1 lb. of Ceresit, and 1 square yard of mortar 1 inch thick requires $1\frac{1}{4}$ lb. of the paste. With a medium pressure of water it is sufficient for the wall plastering to be 1 inch or $1\frac{1}{4}$ inch thick. Ceresit is applicable both to the interior and exterior of buildings, and is recommended for use in a variety of situations. It is important to remember that the material penetrates throughout the plaster coating and renders the entire thickness waterproof.

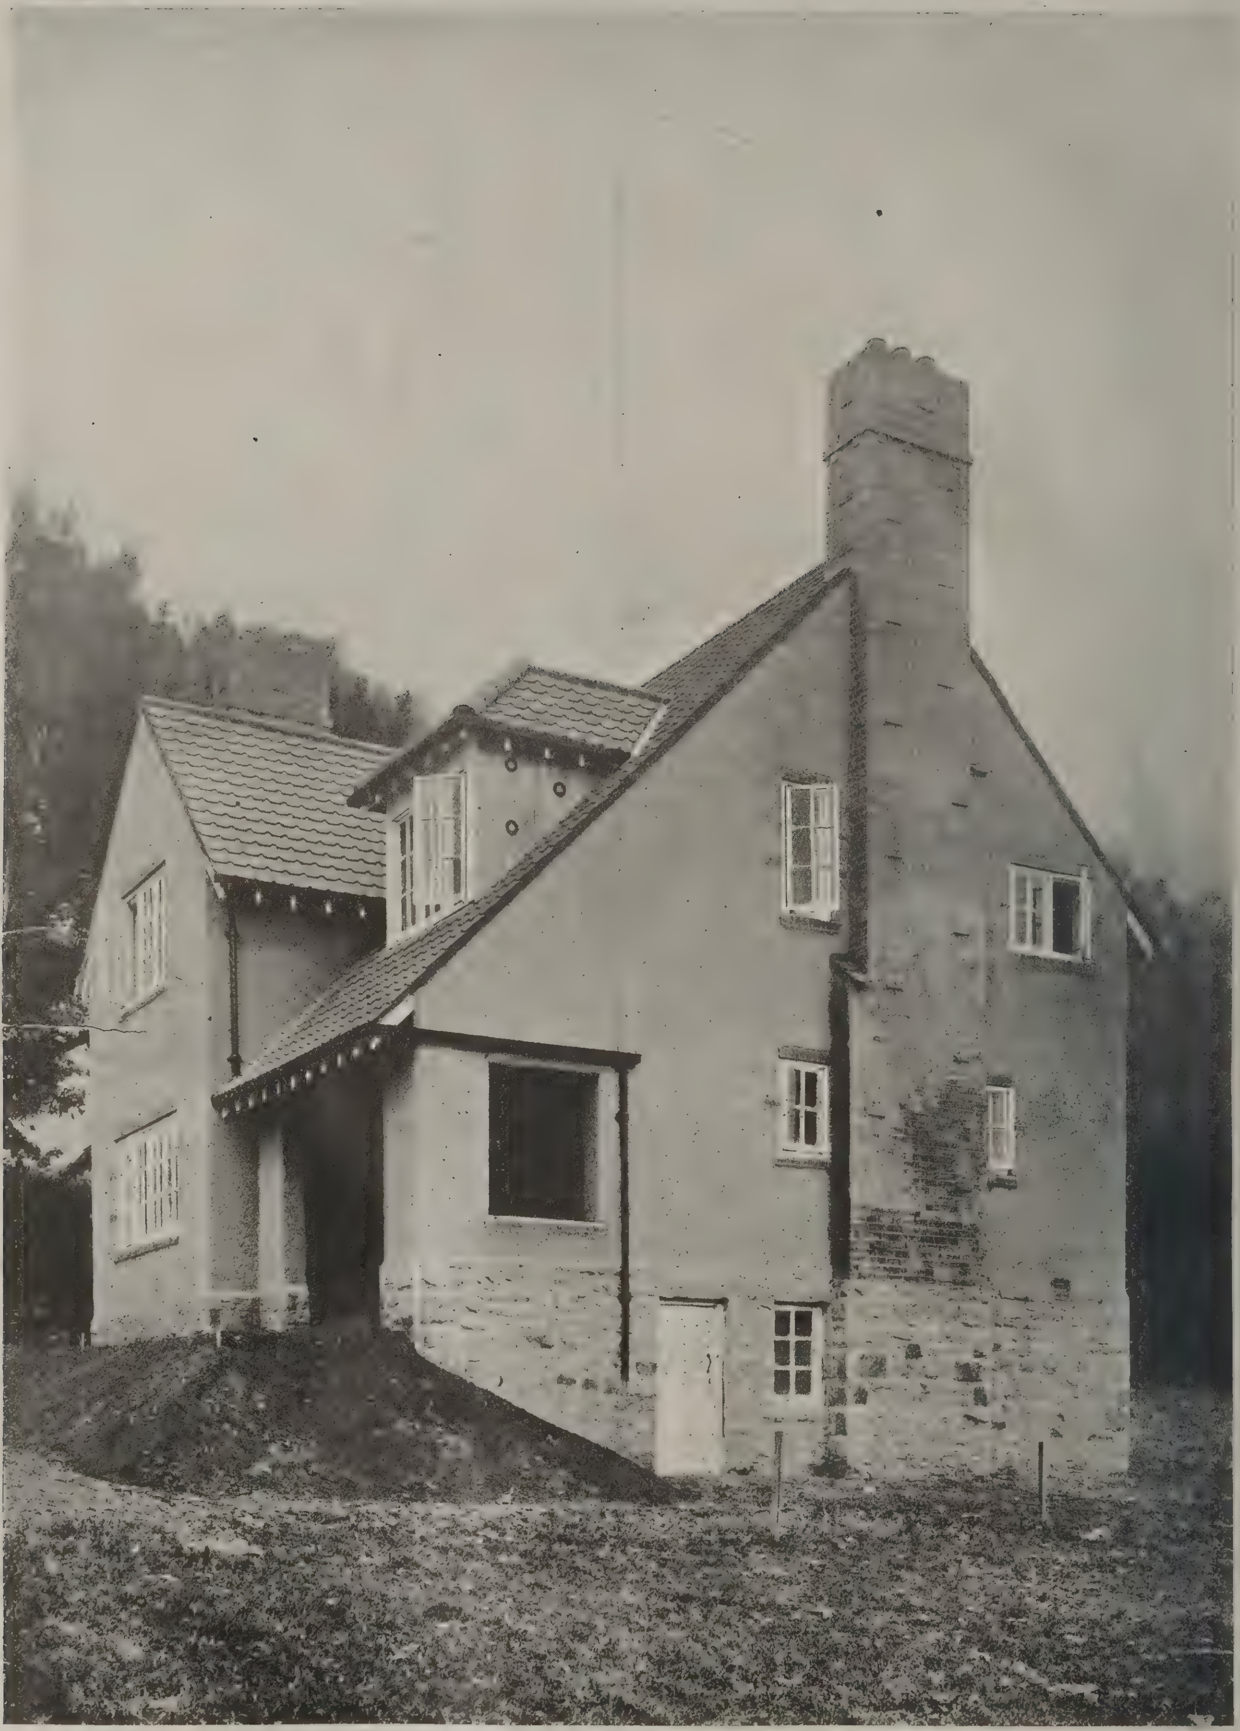
*Messrs. Cookson & Co., Ltd.*, show samples of their "Crescent" brand white lead and other of their products. *The British Cork Asphalte, Ltd.*, have laid two specimens of "cork adamant" jointless flooring, as well as samples of their other materials, including Corkite, Corketa, and Cormastik. *Messrs. Babcock & Wilcox, Ltd.*, have in operation a water-softening plant of 500 gallons per hour capacity, as well as models of a chain grate stoker and a boiler fitted with superheater. *Moffats, Ltd.*, lighting engineers, show the Lucas inverted lamp, the improved Lucas light for thoroughfares, and a Lucas light adaptation. *The Acme Flooring & Paving Co.* (1904), *Ltd.*, is among the firms who have laid a section of the Exhibition roadway in the hall; their Acme sectional woodpaving has been adopted in the past by many London and provincial authorities. *The Cubitt Concrete Construction Co.* display a large moulded column of reinforced concrete executed in Medusa white Portland cement and treated with Medusa waterproof compound. This is one of a contract now being executed at Government House, Salisbury, Rhodesia. This white cement complies with all the requirements of the British Standard Specification. On the same stand are examples of reinforced Siegwart pipes and poles, and a specimen partition wall of concrete plastered with finishing coat of white Portland cement and reinforced with "Hy-rib" metal.

One of the novelties and one of the features of the Exhibition has undoubtedly been at Stands Nos. 21 and 24, where the *Metal Jointing Co., Ltd.*, 71 Strand, W.C., have been giving constant demonstrations of their system for jointing metals. The efficiency of their "Amalgaline" is a never-failing source of astonishment and delight to all who see it for the first time. "Amalgaline" is a thin metallic flux $\frac{1}{500}$ inch thick, treated with a composition so as to prevent the formation of oxides. If a joint is required in a lead pipe the process is as follows:—A patent tool cuts the ends to a dead true in the form of a spigot and socket; a piece of the ribbon is inserted between the surfaces; heat is applied by a blow-pipe or blow-lamp and the ribbon quickly melts and the metals amalgamate. The resulting joint is as strong as it is neat and will resist any twisting or bending strain or test under hydraulic pressure. The whole operation is of the utmost simplicity and is completed in an incredibly short time. As proof of the perfect amalgamation we might mention that when the pipe was sawn open it was impossible to detect the joint in the thickness of the metal. The Metropolitan Water Board after a searching test accepted this method of jointing as satisfactory. The firm's interesting exhibit is divided into three sections—(1) sanitary and water, (2) electrical, (3) marine and chemical. It is evident that "Amalgaline" is possessed of a great future.

*Messrs. Thos. Parsons & Sons*, 8 Endell Street, W.C., call stands Nos. 22 and 23 "Ye Olde Varnish House," and have been at considerable pains to display their varnishes and enamels. The doors and panels are resplendent with British-made Endelline, while British-made Endelflat gives a dignified decoration for walls, ceilings, lincrusta, &c. There are also samples of their cheaper enamel, Lacreite, as applied on Clark & Co.'s Xelite Plaster. The interior of the stand affords a notable object lesson to the many house owners and house decorators who are now carrying out or about to carry out their spring cleaning and painting. Messrs. T. Parsons & Sons have behind them all the prestige accruing from a century's experience in varnish making.

*Messrs. Doulton & Co., Ltd.*, have a severely practical exhibit. It comprises London-made stoneware pipes (Dorset clay), Midland stoneware pipes, the "Borough" street gully, &c. Conspicuous on the stand is the length of stoneware pipe demonstrating their well-known patent "Grouted Composite" joint for the construction of watertight sewers in waterlogged ground. *Palmer's* travelling cradles are shown together with one of the firm's suspended steel cages and their patent ladder scaffold. The company enjoy a unique reputation for this special class of work. An interesting feature of the stand is the finishing operations being carried out on their patent wire scaffold lashings, which are made in 15-foot lengths. *The St. Pancras Ironwork Co., Ltd.*, show a steel single folding door, a "check" door, a straight staircase, and a spiral staircase of special construction. *Messrs. C. Jennings & Co.*, Bristol, have a variety of woodwork. *Featherstone's Automatic Adaptor and Fire Valve Co.* show how simple and effective a combination tap and adaptor is for household purposes. It can be substituted for any tap and comes into automatic operation immediately the hose is extended.

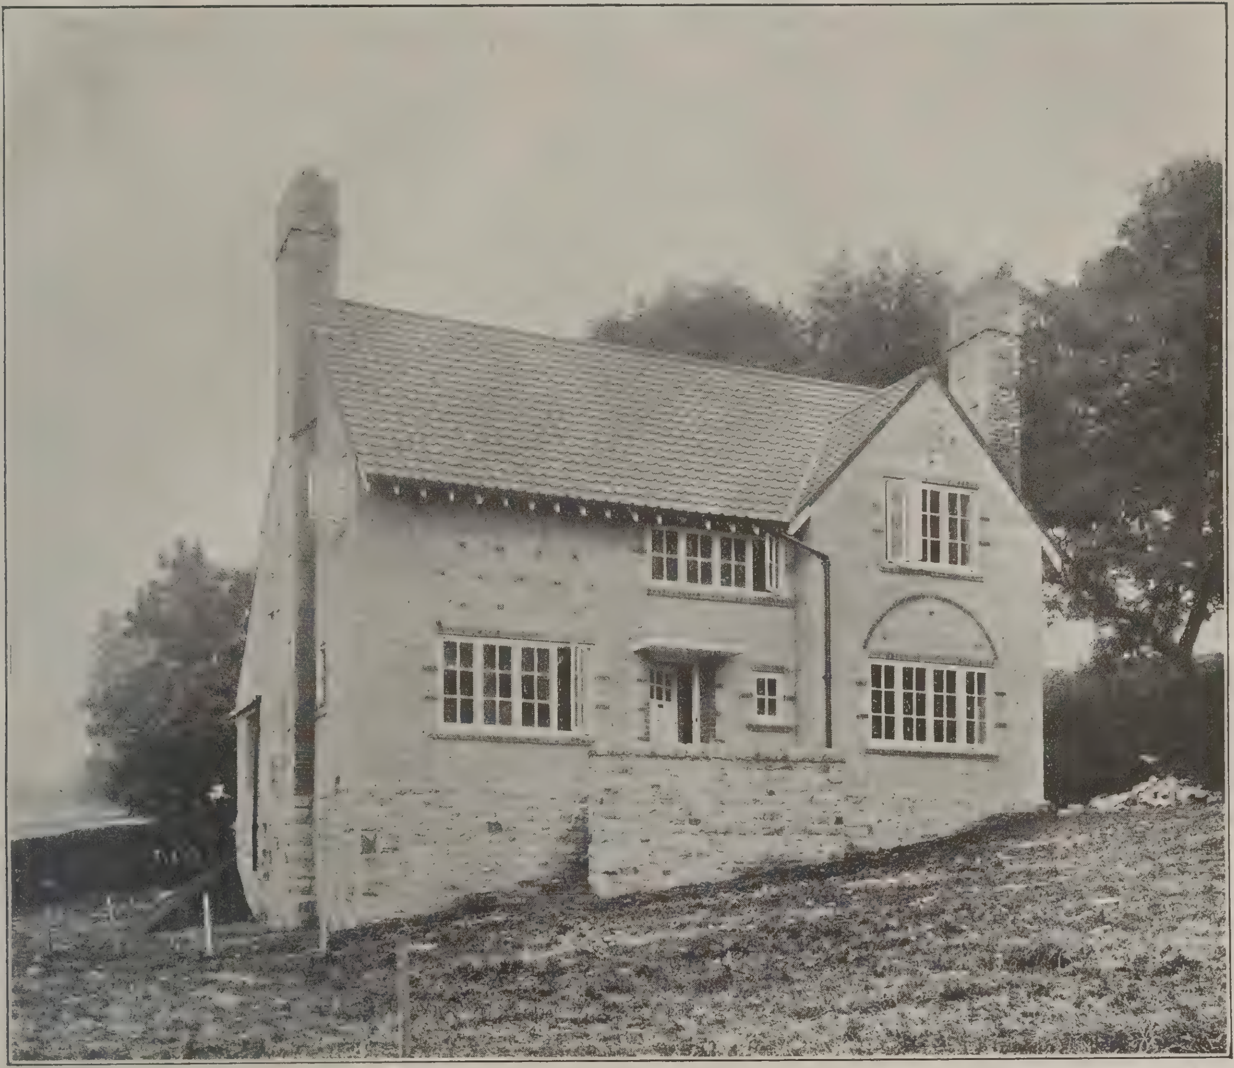
THE Chester education committee on Tuesday approved the plans for the new city and county school, where accommodation will be provided for 120 boys and 150 girls. The site of the new building is in Handbridge, and the estimated cost is about 11,000*l*.

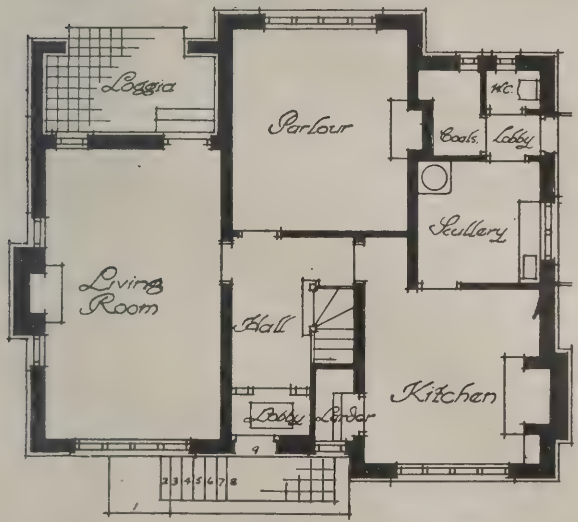


COTTAGE AT HEXHAM-ON-TYNE.—Mr. Edward Cratney, Architect.

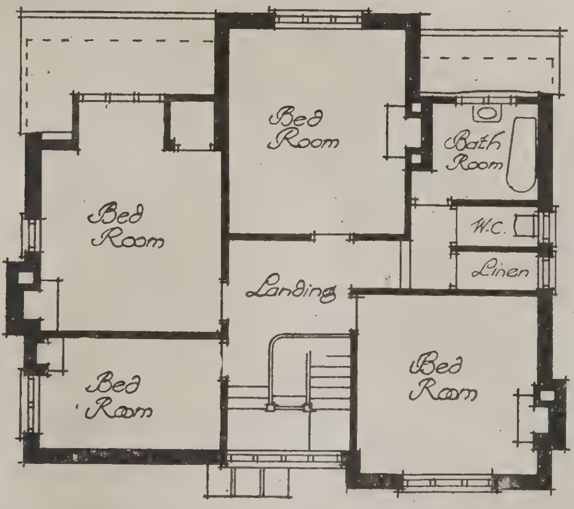
## COTTAGE ON THE WHETSTONE HOUSE ESTATE, HEXHAM.

This cottage, which forms the first of a series to be erected on the above estate, is situated on sharply sloping ground. Advantage has been taken of the sloping ground to plan a large garden or general store-room under the living-room, with an entrance and window, on the lowest side of the house. The external walls are 11 inches thick, built with a hollow space, and of common local bricks. The exterior is rough-casted with two coats of Portland cement dashed with white Derbyshire spar. The base of the walls up to the ground floor level is built of local rubble. The chimney stacks are faced with "Lumley" red pressed facing bricks. The floor of the loggia, the steps, and the landing at the entrance are paved with bricks on edge set in cement. All the internal joinery has been kept quite square, and the interior, generally, is finished quite simply. Green's special French tiles were used on the roof, and Couzen's hinges to the opening sashes of the casement windows. The accom-





Ground Floor Plan



First Floor Plan

COTTAGE AT HEXHAM-ON-TYNE.—MR. EDWARD CRATNEY, Architect.

---

modation, beside the garden or store-room on the sub-ground floor, includes a large living-room opening on the loggia, a parlour, small lobby and hall, kitchen, scullery, and offices on the ground floor, with four bedrooms, bathroom, linen-room, &c., on the upper floor. The builder was James I. Murray, of Hexham. The facing bricks were supplied by the Lumley Brick Company; the grates, mantels, door furniture, and bells by Emley & Sons, of Newcastle; and the electric wiring, &c., was carried out by the Hexham Electric Supply Company. The cottage was designed by, and erected under the supervision of Edward Cratney, architect, Wallsend-on-Tyne.

## COMPETITION.

LEEDS.—The Leeds Industrial Co-operative Society, Ltd., announce that in the competition for designs and plans for their new business premises and offices to be erected in Albion Street, the authors of the premiated designs by the assessor, Mr. F. E. L. Harris, A.R.I.B.A., of Manchester, are as follows:—First prize (100*l*.), Messrs. Bradshaw & Gass, Bolton; second prize (50*l*.), Messrs. Latrobe & Weston, Bristol; third prize (25*l*.), Messrs. Thomas Newby & Son, Manchester.

## THE INSTITUTION OF CIVIL ENGINEERS.

AT a recent ordinary meeting of this Society, Mr. J. C. Inglis, President, in the chair, the paper read was "The Use of Reinforced Concrete on the Wabash Railway, U.S.A.," by E. R. Matthews, Assoc.M.Inst.C.E., and A. O. Cunningham, M.Am.Soc.C.E.

This paper described the methods of design and construction employed in the use of reinforced concrete for various structures on the Wabash Railroad. Railway engineers were among the first in the United States to recognise the advantages of using reinforced concrete in engineering construction, and this material has now been used extensively on the railways there, more particularly in the building of bridges, culverts, subways, and retaining walls.

The Wabash Railroad Company was one of the pioneers in such construction, having commenced its use as early as 1902. This railway is one of the leading lines in the Middle West, and has a total length of 2,500 miles. Its headquarters are at St. Louis, and it extends to the cities of Chicago, Detroit, Toledo, and Buffalo on the east of the Mississippi River, and to Kansas City, Des Moines, and Omaha on the west.

In the paper examples of bridges, culverts, and pipes in reinforced concrete were described. In designing the structures referred to the live load was assumed to be equivalent to two coupled "consolidation" engines and tenders, followed by a uniform train-load, placed so as to give the greatest stress in the structure. Impact stresses, which were taken as equal to the square of the maximum live-load stress divided by the sum of the dead- and live-load stresses, were allowed for, and the working stresses were obtained by combining the maximum dead-load, live-load, and impact stresses. The unit stresses allowed were:—

| | Pounds per square inch. |
|---|---|
| Steel, tension on net section of rod | 18,000 |
| Steel, bond on deformed bars | 100 |
| Concrete, compression in cross bending | 800 |
| Concrete, direct compression | 600 |
| Concrete, shear (diagonal tension) in plain concrete | 30 |
| Concrete, shear (diagonal tension) when web is properly reinforced | 100 |

the steel bars being specified to have an elastic limit of 55,000 to 65,000 lbs. (24.5 to 29 tons) per square inch, and the concrete to consist of one part of Portland cement, two of sand, and four of stone or gravel. In proportioning the concrete and steel the formulas devised by Professor Talbot, of the University of Illinois, were employed. Most of the reinforcement used consisted of corrugated bars in the form invented by Mr. A. L. Johnson. These bars are square in section, with corrugations on all four sides, the sides of the ribs being practically at right angles to the axis of the bar. The bars are rolled from high-carbon steel, with a breaking stress of about 105,000 lbs. (47 tons) per square inch, and an elastic limit of 66,600 lbs. (30 tons) per square inch.

The concrete was what might be termed a wet mixture, it being the usual practice in the United States in reinforced concrete work to put in the concrete in this manner. The advantages of so doing are, first, that a more dense and homogeneous concrete is obtained, and, secondly, that the reinforcement becomes better imbedded, every portion of it being well covered by the cement; rusting of the metal is thus prevented.

The authors stated that any fear as to the excess of water weakening the concrete has been proved to be groundless by the experiments carried out by Mr. G. W. Rafter for the State Engineer's office of New York.

Among the bridges described were the Sangamon River Bridge and a bridge in Forest Park, St. Louis.

The Sangamon Bridge is a double-line, four-arched skew-bridge with abutments and arches of reinforced concrete and piers of solid concrete, reinforced at the base and toes. Each pier is carried on timber piles driven into very stiff clay. The angle of skew is 45 degrees; each arch has a semicircular square span of 61 feet in the clear, and a skew span of 100 feet between centres of piers. The arch rings are heavily reinforced with upper and lower ribs of 1-inch square rods 12 inches apart, crossed by 1-inch square rods about 4 feet apart, laid parallel with the piers. The joints in the ribs are formed by overlapping the rods. The minimum cover over the reinforcement is 2 inches, and the thickness of the concrete below the ribs in the arches varies from 6 inches at the crown to 24 inches at the springing. The features of particular interest in this bridge are the abutments and the method of providing square bearings for the arch-ribs at the skew-backs. The abutments are practically boxes divided by horizontal and vertical partitions into four compartments. The slab for carrying the road-bed is reinforced with longitudinal rods 24 inches and transverse rods 4 inches apart, the ends of alternate rods being bent up at an angle of 45 degrees. The cost of this bridge was 25,100*l*.

The Forest Park Bridge consists of concrete abutments carrying an 80-foot double-line through-girder bridge. The abutments are of the hollow type, namely, thin reinforced face-walls supported by counterforts resting on slab foundations. The principal features are the curved wing-walls, the concrete fascia and balustrade carried by the outside girders, and the other ornamental concrete work. The counterforts not only carry the girders, but also act as ties to hold the face-wall of the abutments. The reinforcement in the abutments consists of ¾-inch square corrugated rods. The bridge floor is of concrete 8 inches thick, and is reinforced in both faces with ½-inch rods. This floor-slab is carried on 15-inch steel I-beams, which are rivetted by connecting angles to the webs of the girders, and are spaced 18 inches apart between centres. This substructure and the ornamental work were constructed by contract, but the railway company erected the steelwork themselves. The cost was 4,565*l*., but this included the removal of an old bridge and its stone substructure; also a large amount of excavation on account of increasing the width of the opening, and the necessary temporary bridging to provide for the traffic. As this bridge was built during the St. Louis World's Fair, and as more than 300 trains crossed it per day, it was impossible to remove the extra earth and the old bridge with trains, so that it was necessary to do this work with teams at a higher cost.

Illustrations were given of alternative arrangements of solid reinforced concrete floors for various types of bridges, the cost of which varied between 16*s*. and 20*s*. per lineal foot of floor 13 feet wide. Where it was necessary to have a watertight floor a mixture of one part of cement and three parts of coarse sand was used, but where water-tightness was not necessary, *e.g.* where the bridge crossed a stream, the slab was made of the normal 1 : 2 : 4 concrete. In connection with the waterproofing of reinforced concrete structures, allusion was made to a bridge built two years ago over Junction Avenue, an important street in Detroit. This is a solid-floor plate-girder bridge, which it was necessary to make absolutely watertight, and the waterproofing on the top of the main floor was specified to consist of a 1-inch coating of Wunner bitumen emulsion, cement, and sand. This was not done, however, the bitumen emulsion being mixed directly in the main body of the concrete, making this particular work rather expensive, but satisfactory, as no leaks have occurred since the bridge was erected. The steel-plate girders are each 72 inches deep and 61 feet 7 inches in length over all, and between them are 12-inch steel I-girders, on which the floor system is carried. The floor beams are surrounded by concrete, which is reinforced with ½-inch square longitudinal and transverse rods. The upper surface of the concrete is covered with a 1-to-3 bitumen mortar, which consists of 2 lbs. of bitumen emulsion to every sack of cement (90 lbs.) and 300 lbs. of sand. The cost of this floor was 2*l*. 14*s*. 5*d*. per lineal foot.

Standard designs were adopted for reinforced concrete box culverts for spans rangings from 4 feet to 20 feet. In the larger sizes the reinforcement in the top and bottom slabs and the side walls is supplemented by diagonal reinforcement at the four angles of the section.

Reinforced concrete pipes were made in 3-foot sections with a diameter varying from 2 feet to 4 feet. The reinforcement consists of woven-wire fencing, supplemented by ¼-inch longitudinal bars. In the construction of the pipes inside and outside forms are used, the casing being 2 inches in thickness, and lined with No. 20 gauge galvanised iron. The 4-foot pipes are 4 inches in thickness, the inside and outside reinforcement having a 1-inch covering of concrete.

The cost for a 3-foot length is approximately:—

| | *s.* | *d.* |
|---|---|---|
| 2 feet in diameter | 13 | 6 |
| 3 ,, ,, | 18 | 4 |
| 4 ,, ,, | 23 | 8 |

and the form is estimated to cost 4*l*. 1*s*. 8*d*.

It was formerly the custom to use pipes 8 feet in length, but in order to make them of this length it was found necessary to use derricks in handling the forms, and platforms to do the pouring from. Further, in shipping 8-foot lengths it was necessary to pay particular attention to blocking, so that the pipes would not roll and break themselves to pieces. For these reasons it was decided to build a pipe of such length that the forms could be handled by two men, and could be filled from the ground without the use of platforms. It is still found necessary to load the pipes by means of derricks, but they can be shipped on end and unloaded and placed in position without machinery.

No special test-loads were used to test a structure after it is completed, as this was considered unnecessary. Inspections are made on all bridges on the Wabash Railway, including, of course, reinforced-concrete structures, by a competent inspector once every month. The engineers in charge of the divisions on which the bridges are situated also inspect them each half-year.

None of the many reinforced-concrete structures on this railway have needed any repairs since they were built. They are very rigid under loads, and their appearance indicates that they will outlast any other kind of structure, and require no maintenance. A great many have now been in the track more than five years, carrying loads very nearly as heavy as the live load used in designing them. Attempts have been made to determine the deflection in reinforced-concrete structures due to train-loads, but none can be detected under ordinary measurements.

It is considered that sufficient time has now elapsed to demonstrate the fact that reinforced concrete is reliable; it is undoubtedly permanent, and as good, if not better, than cut stone for the construction of bridges, culverts, and similar work; it is certainly cheaper. Compared with steel, reinforced concrete is altogether superior, as it requires no maintenance. It is thus in most cases preferable to other kinds of construction, and is used where possible on the Wabash Railroad.

## HOURS AND EARNINGS IN THE BUILDING TRADES.

The Board of Trade recently issued the third volume of the report of an inquiry into the earnings and hours of labour of workpeople of the United Kingdom. The two volumes previously issued related to the textile trades and the clothing trades respectively; the latest Yellow Book deals with the earnings and hours of labour in 1906 of workpeople employed in the building and woodworking trades.

The total number of workpeople employed in the United Kingdom in those trades is estimated at approximately 1,250,000, and of these about one million belong to the different branches of the building trades. They include a large proportion of skilled workmen, many of whom served an apprenticeship of from three to seven years. Roughly one-third are bricklayers and masons and their labourers, one-third carpenters and joiners, and one-sixth painters, decorators and glaziers. In response to the inquiry, returns covering 180,000 workpeople, or about 14 per cent. of the estimated total number employed, were received from employers, and of these 95 per cent. were time workers.

This proportion is less than was obtained in the textile and clothing trades owing to the fact that in the building trades, in which the number of employers is very great, schedules were sent only to a limited number in each town or district. The 5,000 returns received were furnished by both large and small employers and, in the opinion of the department, are sufficient to serve as a basis for an accurate statement of average earnings, owing to the widespread prevalence in these trades of standard time rates of wages for the principal classes of workpeople. In nearly every town of importance rates of wages and hours of labour have either been fixed by agreement between representative bodies of the employers and the workpeople or, if not the subject of formal agreement, are well recognised. As a consequence a small number of returns from a given town is usually fairly representative of local conditions.

The particulars obtained as to earnings were as follows:—(1) A return showing the number of workpeople employed and the total amount of wages paid in the last pay-week, or other ordinary week, in each month of 1906, together with the total wages bill for the year; and (2) a return showing the individual earnings of all workpeople employed in one week of 1906, the week for which particulars were asked in the case of the building trades and the construction of harbours, &c., being an ordinary week in the summer, and in the case of saw-milling, machine joinery, &c., and cabinet making, &c., the last pay-week of September; the latter being the week to which the returns for the inquiry as a whole relate.

For all the workpeople in the building trades included in the returns the average net earnings per head in an ordinary week in the summer of 1906 were 28*s.* 6*d.* The average for men was 31*s.* 6*d.*, and for improvers and apprentices of all ages and lads and boys under twenty years of age 10*s.* 3*d.* Excluding the large proportion who worked either less or more than the ordinary hours in that week the average full time earnings of all workpeople were 28*s.* 1*d.*, of men 33*s.* and of improvers, apprentices and lads and boys 9*s.* 7*d.* The average full-time earnings of the principal classes of skilled men (bricklayers, masons, carpenters and joiners, slaters, plumbers, plasterers, and painters) in that week were 36*s.* 4*d.*, and of labourers were 24*s.* 5*d.* In these trades the earnings of workpeople in towns with a population of and above 100,000 are shown separately from those of workpeople in towns of less than 100,000, and as was to be expected earnings in the great towns are found to be higher than in the smaller towns.

In the construction of harbours, docks, roads, sewers, &c., the average earnings of all men, including those who worked less or more than full time, in an ordinary week in the summer of 1906, were 27*s.*, and of those who worked full time 31*s.* 10*d.*, while for lads and boys the corresponding averages were 13*s.* 1*d.* and 13*s.* 6*d.*

In the saw milling, machine joinery, and wood box and packing case making industries, the average earnings of all workpeople included in the returns in the last pay-week of September, 1906, were 22*s.* 7*d.*, the average for men being 27*s.* 1*d.*, for lads and boys 9*s.* 8*d.*, for women 11*s.* 7*d.*, and for girls 7*s.* 10*d.*

In the cabinet making and allied trades, including shop fitting and chair making, the average earnings of all workpeople in the last pay-week of September, 1906, were 25*s.* 3*d.*, the average for men being 32*s.* 1*d.*, for lads and boys 8*s.* 10*d.*, for women 12*s.* 9*d.*, and for girls 6*s.* 1*d.*

It should be borne in mind in any comparisons which may be made between the earnings of workpeople employed in the building trades and construction of harbours, docks, &c., and those of workpeople in saw milling and cabinet making, that the earnings in the former trades are lower in winter than in summer, the number of hours constituting a full week being usually less in winter, and the climatic conditions not so favourable.

From the tables it would appear that in London wages are well above the general level for the rest of the United Kingdom, the next highest district on the whole being the Northern counties and Cleveland. The lowest paid district is Ireland.

In the building trades separate figures are given for towns with a population of and above 100,000 and for towns with a population of less than 100,000, the results showing that, taking the United Kingdom as a whole, the average earnings in summer of men working a full week were 4*s.* 10*d.* higher, and the average weekly working time in summer 2.4 hours shorter, in the large towns than in the smaller.

The average hours constituting a full week (exclusive of mealtimes and overtime) in summer, so far as returned, were 52.9. The full-time earnings of the men, the great bulk of whom were paid at hourly rates of wages, were therefore equal to an hourly rate of slightly less than 7½*d.* The average hours constituting a full week in winter were 45.9, so that on the same basis the full-time earnings of men in winter would average about 28*s.* 8*d.*, or 13¼ per cent. below the summer wage of 33*s.* Regarded from another standpoint, the reduction of hours in winter may be looked upon as involving a loss of working time amounting on the average to seven hours per week during a period of 14.3 weeks, or the equivalent on the basis of summer hours of 1.9 full weeks per annum. On the average, for every ten workpeople required to carry on the work of the building trades in summer, only about nine were required in winter. The wages of apprentices, who form the bulk of the lads and boys, are usually computed on a weekly basis, and do not vary in winter.

The general course of employment throughout the year, as shown by the returns, may be briefly described as follows. The number of workpeople employed rose rapidly from January to April, rising above the average for the year at the end of March, and reaching the maximum at the end of May; then falling in June and July to a point below that in April, but rising again at the end of August nearly to the level of May. After August the number again declined, and at the end of October was lower than in March, the number in the last week of October being just below the average for the year. A further fall took place in November and December. In the great towns the fluctuations shown by the table were somewhat less on the whole than in the smaller towns. In London and some other of the great towns, there were two distinct seasons, one in the spring and the other in the late summer, the number employed falling considerably in June and July. In the smaller towns the maximum was usually reached in the early months of the summer, the number then falling gradually until the end of October, after which the fall was more rapid. In Scotland, in anticipation no doubt of the annual term for house-letting (which is in May), the season was earlier than in England, the maximum being reached at the end of April; in Ireland it appears to have been later.

Average earnings followed much the same course as the numbers employed, except that the rise and fall were greater, owing to the reduction in hours in the winter months.

The returns relating to workpeople employed in the building trades which were obtained as a result of the inquiry made by the Board of Trade in 1886 as to the rates of wages in various industries—the only previous inquiry of a nature similar to the present one—do not allow of comparison with the results now presented, inasmuch as the earlier inquiry was far more limited in scope, covering only some 4 per cent. of the number of workpeople embraced by the present inquiry. While, however, it is not possible to compare the results of the two inquiries directly, the information available as to the rates of wages paid in the principal occupations in these trades in 1886 and 1906 respectively is very considerable, and as the 1906 inquiry shows that the standard wages are very generally paid the result of a comparison of the standard wages recognised at the two dates would probably not differ materially from that of a comparison based on the averages of the wages actually paid for a full week.

From the recorded changes in rates of wages in the building trades published annually by the Board of Trade it is possible to show approximately the relative positions of wages for a series of years. On page 58 of the Thirteenth Abstract of Labour Statistics the changes in rates of wages in the building trades in the years 1879-1908 are combined and expressed by the system of "index numbers," the year 1900 being represented by 100. For 1886 the index number was 84.45, and for 1906, 100.00, the latter figure being about 18 per cent. higher than the former.

Rates of wages in the building trades in the years immediately preceding and following 1886 and 1906 were practically stationary, and whether the averages for the particular years or for the five-year periods 1884-88 and 1904-8 respectively be compared, the percentage advance in hourly rates is the same.

The average number of days per annum on which building operations were, as a rule, suspended for holidays was 9.5 in towns with a population of and above 100,000, and 8.6 in towns with a smaller population. The number varied considerably from district to district. Since practically all the workpeople were paid at hourly rates, there was no payment of wages for holidays; but on certain of these days, if work for any reason was required to be carried on, double the ordinary rates were usually paid.

## VARIETIES.

Mr. G. E. Beaumont, sanitary surveyor, has prepared plans for a small-pox hospital to be erected by the Wortley Rural District Council, at a cost of 2,000*l.*

Mr. R. Frank Atkinson, F.R.I.B.A., has been appointed by the Midland Railway Company architect for the proposed work to the Adelphi Hotel, Liverpool.

The Barnsley Town Council propose to apply to the Local Government Board for their sanction to the borrowing of 13,200*l.* for the erection of a new school in Grove Street.

The Inverkeithing Town Council have commissioned an architect to prepare a plan for the laying out of the Council's grounds at Jamestown for feuing in view of the developments at Rosyth Naval Base.

Stranraer Dean of Guild Court have approved the plans of the secondary school which is to be erected in Lewis Street. The building has accommodation for 260 pupils. The cost is estimated at about 9,000*l.*

The National Association of Master House Painters of England and Wales are completing their arrangements for their annual convention and exhibition, which is to be held in the St. George's Drill Hall, Newcastle.

Weybridge Urban District Council have approved a scheme submitted by the Surrey Education Committee for the erection of a technical institute, on land belonging to the town, at a cost of 3,884*l.* of which the Council are to find 1,292*l.*

Mr. J. Walker Smith, burgh engineer, Edinburgh, has, it is understood, been appointed head engineer under the Town Planning Act to the Scottish Local Government Board. Mr. Smith was appointed burgh engineer for Edinburgh in September 1908, in succession to Mr. Massie.

The Dudley Education Committee recommend the Town Council to borrow 2,500*l.* towards the cost of a hostel in connection with the training college, to accommodate fifty students, the sum being 25 per cent. of the estimated total outlay, the remainder to be found by the Government.

Mr. Lever has paid 100*l.* to Mr. E. Prestwich, a third-year student of the School of Architecture, for the right to use his scheme for laying out the central portion of the village round the church at Port Sunlight. Mr. Prestwich's design was placed first in the recent competition held in the school for prizes Mr. Lever offered for this subject. Mr. Prestwich, therefore, in addition to his prize of 20*l.*, gets a further 100*l.*, and has the pleasure of seeing his work actually carried out. Mr. Prestwich is the son of Mr. J. C. Prestwich, architect, of Leigh, Lancashire.

The minutes of George Heriot's Trust, Edinburgh, bear that at a meeting of the Heriot-Watt College committee a letter was read from the secretary of the Edinburgh College of Art desiring the co-operation of the governors in the institution of a diploma course in architecture, which would include (1) a course of study in the subjects taught in the College of Art, and (2) a course of technical subjects taken at the Heriot-Watt College. A sub-committee, consisting of the convener, Professor Darroch, and Mr. R. C. Millar, was appointed to confer with representatives of the governing body of the College of Art, and thereafter to report.

The Swansea Hospital Board on the 6th inst. accepted a scheme for alterations and additions at a cost of about 25,000*l.* It provides for the raising by one storey of the whole of the north and south wings, and the enlargement of the western block of the north wing (casualty department and Patti ward) to provide an enlarged casualty department, displacing the dispensary with recovery rooms provided with four beds for doubtful cases. In the south wing there will be two new wards for eight and twenty-six beds. Altogether the additional beds will be eighty-four, and each wing roof will be flat, available for recreation and open-air treatment. Mr. Glendinning Moxham, F.R.I.B.A., Swansea, is the architect.

## RAILWAY HOLIDAY ARRANGEMENTS.

With the near approach of Whitsuntide one's thoughts naturally turn to the early summer holiday, and the possibilities afforded by the railways of making the most of the short vacation by taking advantage of one of the numerous excursions by rail, river, or sea, in order to sample some likely locality for the subsequent and longer holiday. In this respect the "Emerald Coast" is always a source of attraction to the holiday-maker at Whitsuntide, and taking into account the varied and interesting nature of the journey, of which 158 miles are by rail, and over 300 miles by sea, it would be difficult to select a more economical trip than that to St. Malo and back, via Southampton, announced by the London and South-Western Railway, at a fare of 24*s.* 6*d.*, third-class rail and second-class on steamer. These tickets will be issued from Waterloo on the Thursday and Saturday before Whitsun, and will be available for return any day of sailing up to fourteen days. St. Malo is an excellent centre for the many quiet, pretty watering-places and the quaint inland villages of beautiful Brittany. There will also be similar bookings, at the same fare, to Havre, from which Etretat, Trouville, Honfleur, and other noted resorts in picturesque Normandy are easily accessible. A feature in connection with the availability of these tickets is the alternative of returning from either St. Malo, Havre, Granville, or Cherbourg plus fare between ports. Another attractive excursion is from Waterloo to Southampton, thence across the Channel to Havre, and from Havre to Rouen by steamer up the river Seine, passing through some of the most beautiful parts of the lovely Seine Valley. The inclusive return fare, Waterloo to Rouen, is 28*s.* 6*d.*, and the tickets will be issued on the Friday and Saturday before the holiday. Holders of fourteen-day excursion tickets to Paris, fare 26*s.*, can break their journey at Havre or Rouen, either going or returning. Other favourite objectives at this time of the year are the well-known holiday grounds of Devon and Cornwall, to which the London and South-Western Railway Co. is running fast excursions from London (Waterloo) on the Friday night and Saturday morning, including Ilfracombe, Bude, Padstow, Exeter, Dartmoor, Plymouth, Exmouth, &c. There will also be the usual bookings to the Isle of Wight, Southsea, New Forest, Bournemouth, Swanage, Weymouth, Sidmouth, and other places in the Sunny South and South-West. Tourist and week-end tickets (all classes) will be issued by the corridor, luncheon, and dining-car trains to the South and West of England. To insure comfort en route most of the principal expresses will be duplicated on the few days before the holiday. Full details of cheap facilities, &c., are given in the company's holiday programme, obtainable at their stations and offices, or from Mr. Henry Holmes, superintendent of the line, Waterloo Station, S.E.

## NOTICE TO ADVERTISERS.

**Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.**

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.*

## TENDERS, ETC.

⁂ *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

## COMPETITIONS OPEN.

ASHTON-ON-MERSEY.—Architects practising within ten miles of Sale desirous of competing for proposed Sunday schools in connection with the Wesleyan Chapel are invited to communicate with Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

EDINBURGH.—The Corporation invite competition designs for the erection of a new hall in Lothian Road, Edinburgh. They have appointed Sir Aston Webb, C.B., R.A., as assessor, Mr. J. A. Williamson, A.R.I.B.A., City Chambers, being associated with him. Three premiums are offered. Particulars and plans of the site will be supplied to competitors on payment of two guineas, which will be returned on receipt of a design in accordance with the conditions. Should architects, on receipt of the particulars, not desire to compete, the deposit will be returned, provided the papers are returned within four weeks. Mr. Thomas Hunter, town clerk, City Chambers, Edinburgh.

IRELAND.—August 23.—The Meath County Council invite architects practising in Ireland to submit plans and specifications for county offices to be erected at Navan. Apply to the Secretary, Meath County Council, Navan.

LONDON.—June 15.—The Acton Urban District Council invite plans for schools at Rothschild Road for 850 pupils. Premiums of 100*l*., 50*l*., and 25*l*. are offered, but any premium awarded to the successful architect shall be merged in his commission of 3½ per cent. Deposit 10*s*. 6*d*. Apply after April 5 to Mr. F. A. Everitt, secretary, Education Department, Council Offices, Acton, W.

BRABY & CO.
For IRON and STEEL ROOFS and STRUCTURAL WORK.

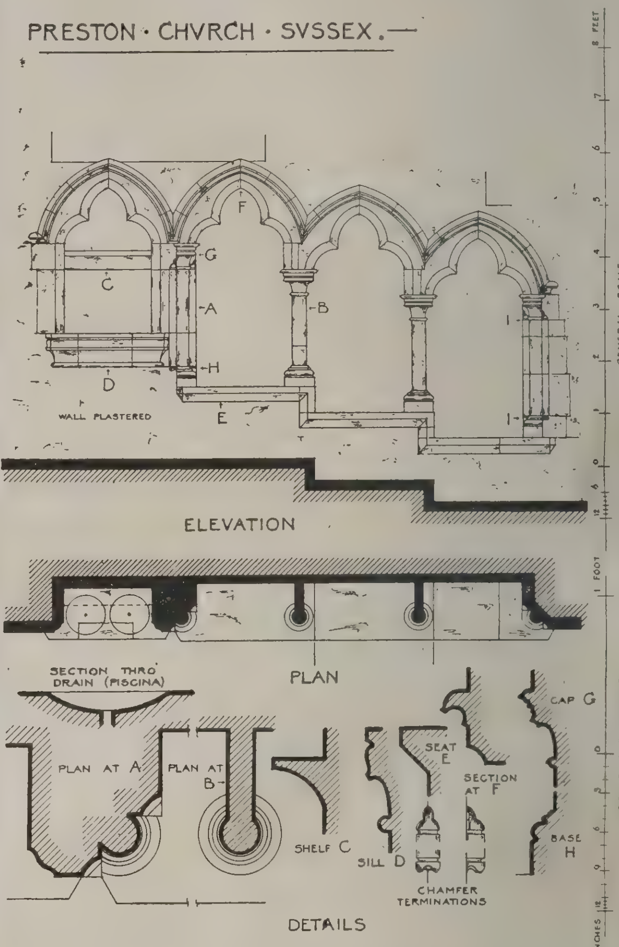
MR. JOHN YOUNG, F.R.I.B.A., died on the 15th inst., in his eighty-first year, at Guildford Lodge, Brentford, Essex. Mr. Young was elected an associate of the Royal Institute in 1860, and retired in 1902.

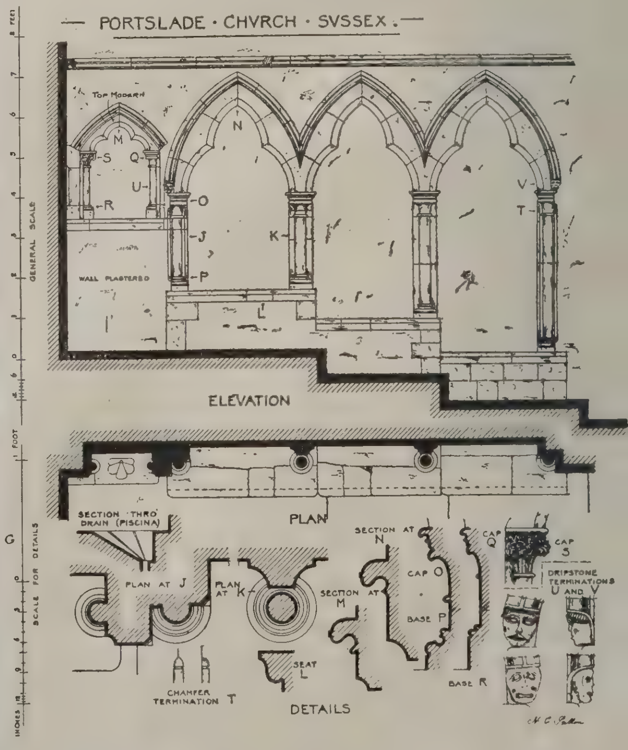
## EARLY ENGLISH PISCINÆ AND SEDILIA.

PRESTON, once a village, now forms part of the northern suburb of Brighton. The church contains much work of interest, and, during its restoration in 1870, on the removal of the whitewash some very fine mural paintings were brought to light.

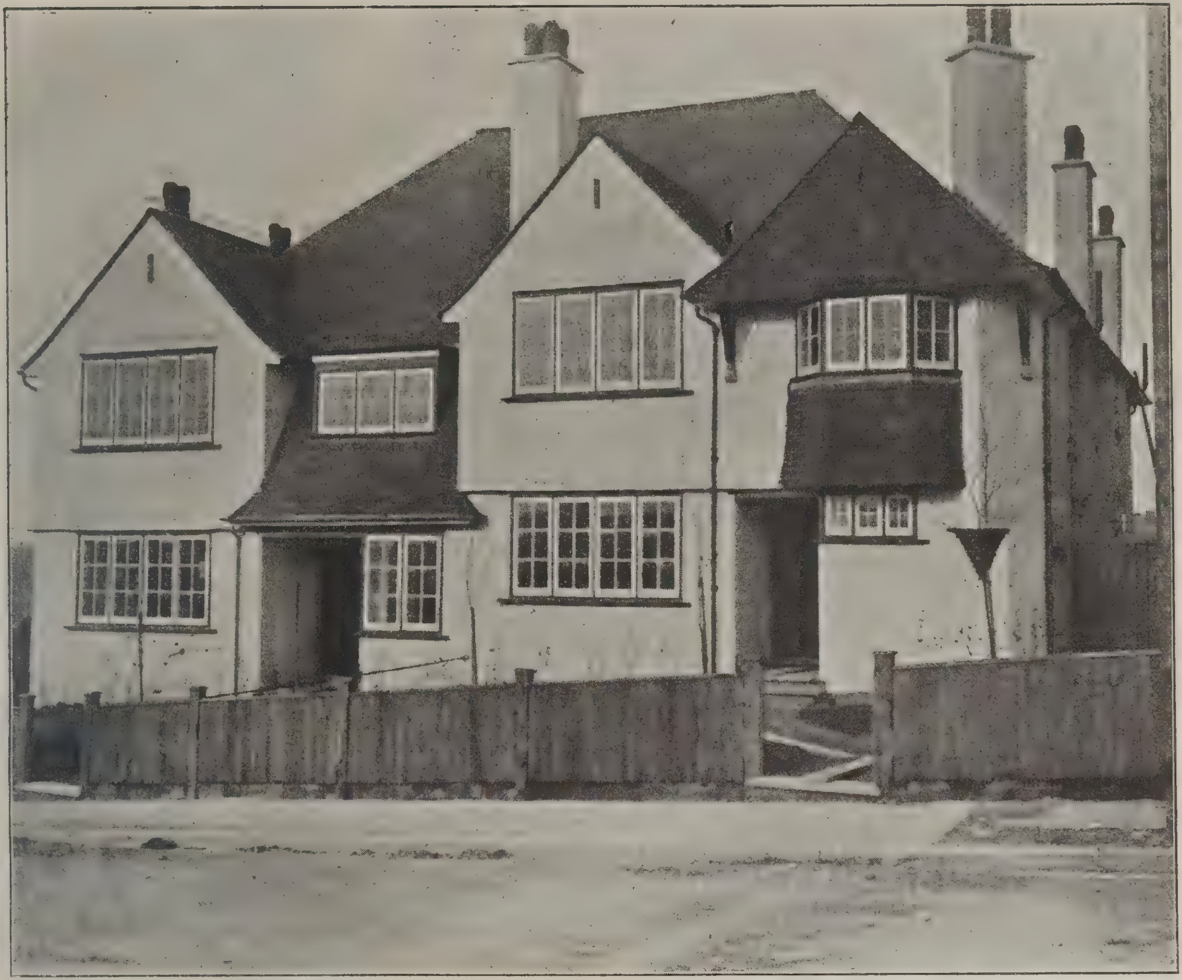
There is a beautiful altar tomb in the chancel, and a curious old font has been preserved.



Portslade lies between Brighton and Shoreham, and its church, with a tower almost entirely hidden by ivy, has a good timber roof covered with large stone slates.



The similarity between the Preston and Portslade sedili will be noticed in the stepping seats, the shafts and the trefoi arches within pointed ones.



HOUSES AT CARSHALTON, SURREY.—Mr. J. Bruce Merson, Architect.

## HOUSES AT CARSHALTON, SURREY.

This pair of semi-detached houses was built last year in Hill Road, Carshalton, Surrey, by the Carshalton District Development Co., Ltd., for whom they were designed by Mr. J. Bruce Merson, architect. As the road is very steep the houses were designed to meet this, and to avoid the ugly break in roof line which the change of level would cause. The walls are built of brick roughcasted outside, the roofs are covered with red tiles and the woodwork of all doors and windows is painted green, while the window sashes are painted a cream colour.

## VARIETIES.

Mr. E. J. Silcock, M.Inst.C.E., F.S.I., 11 Tothill Street, S.W., has arranged to take over the engineering part of the practice carried on by Mr. W. H. Simpson, A.M.Inst.C.E., of Leicester.

Mr. John Wilson, architect, Edinburgh, has been appointed architect to the Scottish Local Government Board under the Town Planning Act. In our issue of last week we stated that the appointment had been given to Mr. John Walker.

New banking premises are about to be erected at Swansea for the London and Provincial Bank, Ltd., the site being opposite their present offices in Wind Street. Mr. Glendinning Moxham, F.R.I.B.A., Swansea, has been appointed their architect to carry out this work.

The Royal Archæological Institute will hold their annual meeting at Oxford from Tuesday, July 19, to Thursday, July 28, with headquarters at the Randolph Hotel. Lord Curzon of Kedleston, Chancellor of the University, has accepted the presidency of the meeting.

According to the *Moniteur des Intérêts Matériels* (Brussels) of May 1, the Roumanian Ministry of Finance at Bucharest will shortly invite tenders for the construction of slaughter-houses at Turu-Severin and Burdujeni. The cost of each abattoir is estimated at 60,000*l*.

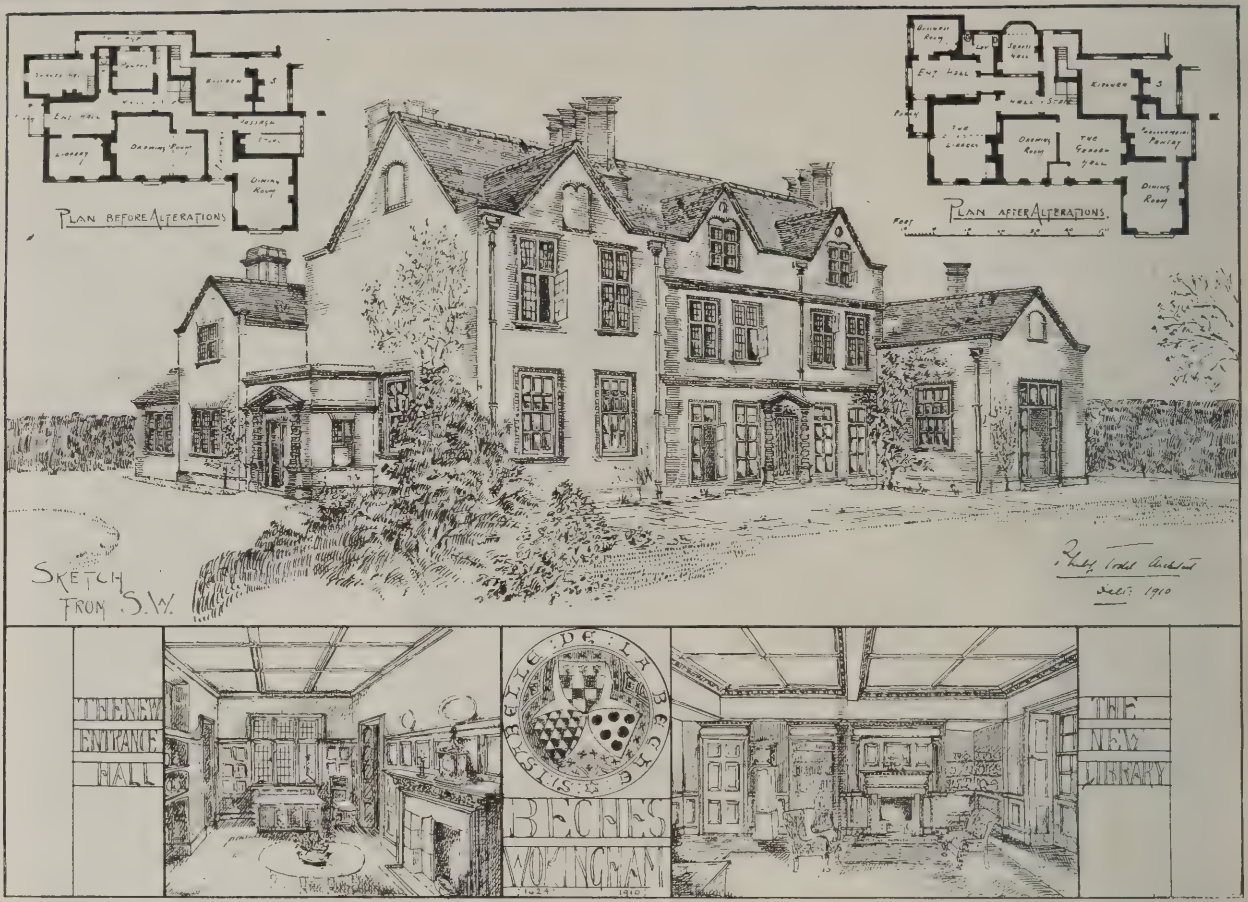
The Cowes Harbour Commissioners have decided to apply to the Board of Trade for sanction to a loan not exceeding 6,000*l*. for the construction of a new breakwater from the esplanade wall in a northerly direction across the Shrape mud bank. The scheme, which will provide further mooring facilities for yachts, has the approval of the Admiralty.

The Cathcart School Board have decided to provide extra school accommodation at Battlefield school. New buildings will be erected to provide 1,200 school places, and Messrs. M'Whannell, Rogerson & Reid, Glasgow, were appointed architects, and Messrs. D. Wilkie & Son, Glasgow, measurers.

Messrs. Easton, Gibb & Co., the Rosyth Naval Base contractors, have placed an order for 1,500,000 tons of sand for their work at Rosyth. The removal of the sand is to go on immediately, and the daily output is to be 200 tons. This contract has been let to Mr. F. G. Yooll, Edinburgh, who has secured permission to remove the sand from the Grangehall Estate, which extends along the shore for over a mile to the west of the town.

The Usher Hall committee, with a view to providing information for the architects sending in competitive plans for the Usher Hall, Edinburgh, have been carrying out boring operations at Grindlay Street. The object is to discover at what depth rock is to be found, and boring was conducted at five different places. A report of the results will be drawn up and issued to the competing architects. It is understood that a good foundation will be got at a depth of 16 feet.

The streets and buildings committee of Edinburgh Town Council last week considered an application from the architect of the new United Free Church offices in George Street for permission to lay granite slabs for the pavement in front of their new buildings. The church authorities in their application made stipulation that they would lay it and maintain it to the satisfaction of the city authorities. By the casting vote of the Convener, the committee, keeping in view the experience of other cities, agreed to recommend that



THE MANOR HOUSE OF BECHES, WOKINGHAM

the request be not granted, the main objection to granite being its slippery surface when it is worn.

The Imperial Trade Correspondent at St. John, New Brunswick, reports to the *Board of Trade Journal* that the Grand Trunk Pacific Railway has purchased 70 acres of land at the head of Courtenay Bay, on which it is proposed to construct large railway terminal facilities. It is expected that tenders will be invited this summer by the Federal Government for the construction of warehouses on the west side of the harbour of St. John. The dredging for another berth is almost completed, and operations will be continued to provide for more wharves. It will be necessary to demolish the present harbour lighthouse beside the channel, and to erect a new one further inshore.

The Glasgow Town Council have adopted a minute of the finance committee recommending the purchase of property in Renfrew, Rose and Dalhousie Streets, adjoining the Corporation premises, now occupied by the Royal Glasgow Institute of Fine Arts. The purchase price is 14,500*l*. The Art Institute at present pay a rental of something like 1,400*l*. for the premises. Their lease would expire in two years, and they practically intimated to the Corporation that unless considerable alteration was made upon the buildings they would be under the necessity of terminating their tenancy. There are heavy insurance risks upon the present premises of the Institute, and many people refused to give loan pictures simply on account of the great danger that existed from an outbreak of fire.

The Glasgow Dean of Guild at their meeting last week, besides passing the lining for the Exhibition buildings in Kelvingrove Park granted the following linings:—The Rev. H. Wallace, Barrachnie, to erect a hall, &c., in connection with the Congregational church in Westmuir Street. The Clyde Football Club, Ltd., Shawfield Park, to erect a grand stand, with dressing rooms, baths, board room, and offices within the ground at Shawfield. The Western Property Company, Ltd., 34 West George Street, to erect four tenements of dwelling houses in York Drive, Hyndland. The School Board of Govan, to erect a school at the junction of Airlie Street and Clarence Drive, Hyndland. David Anderson, spirit merchant, 171 Westmuir Street, to erect a tenement of dwelling houses and shops at the north-east corner of Westmuir Street and Back Causeway.

## BECHES, WOKINGHAM.

This interesting old brick house is described in Lysons's history of Berkshire as the manor-house of the De la Bêche family, hence its name.

The property, with the manor, passed by marriage of the daughter and heiress of Robert de la Bêche to one John Whitelock about 1450.

The central portion of the present house was built in 1624. Additions and alterations have been made at various dates, the position of the entrance altered and passages cut off the old rooms.

The house has recently been restored and remodelled under the superintendence of Mr. Philip Todd, and without disturbance of the external walls a considerable amount of passage room has been converted into useful space and the old rooms restored to their original size.

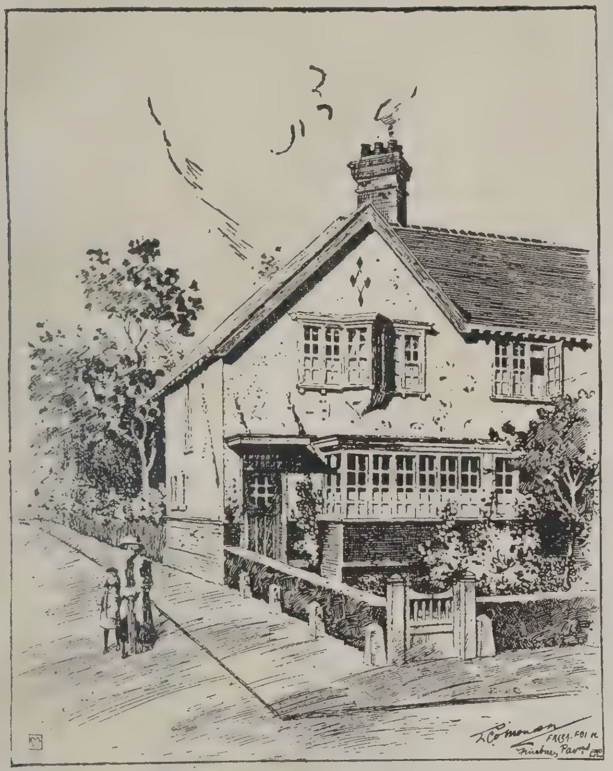
The old front entrance doorway, dated 1624, which was walled up, has been opened out as a garden entrance.

The whole of the works, including oak panelling and decorations, have been executed by Mr. E. C. Hughes, builder, of Wokingham.

## THE MODERN MUNICIPAL COTTAGE.

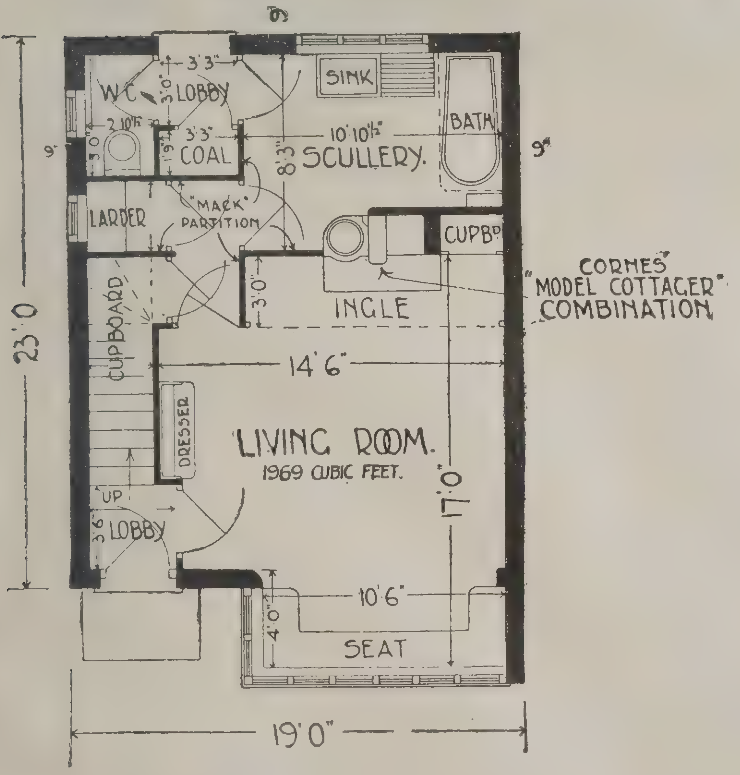
This cottage was specially designed for, and erected at the Second Municipal and Health Exhibition, Royal Agricultural Hall, London. It has been erected by Mr. J. Cornes, author of "Modern Housing in Town and Country," and Mr. J. A. King, the owner of Highams Park Garden Village, as an object lesson in how to obtain a commercial return upon capital invested on the housing of the working classes.

It is estimated to cost from 160*l*. to 175*l*., according to position and facilities for building in the neighbourhood. It can be built in pairs or in blocks of four, with a back entrance opening in the centre, and the design shows the end of a block, or one of a pair. The accommodation provided is:—On the ground floor: Living room, 14 feet 6 inches by 17 feet, = 1,969 cubic feet, measured into the bay window; scullery

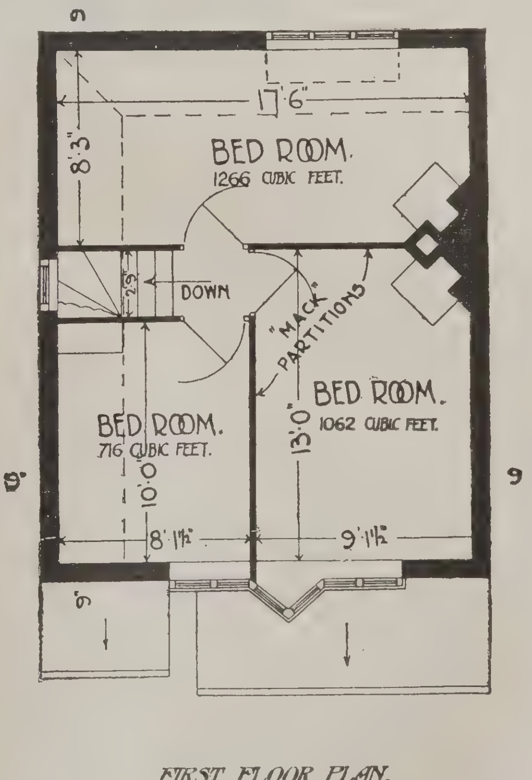


bathroom 11 feet by 8 feet 3 inches, with larder, coal store, w.c. and cupboards, all under the main roof. On the first floor:—Three bedrooms, 13 feet by 9 feet 1½ inches, 17 feet 6 inches by 8 feet 3 inches, 10 feet by 8 feet 1½ inches, = 1,062, 1,266 and 716 cubic feet respectively; the staircase is easy and commodious.

Particular attention is drawn to the large bay window in the living room with its seat, and to the cosy ingle nook in which the fireplace is situated centrally, free from draughts.



*GROUND PLAN*



*FIRST FLOOR PLAN.*

*Scale of feet*

The w.c. or earth closet is reached by an open lobby, which obviates any necessity for occupants going into the wet.

The cottage is fitted with hot and cold water, and a porcelain enamel cast-iron bath, attached to a Cornes model cottager combination kitchener, which is fitted between the kitchen and scullery or bathroom, and economises space, coal and labour. The copper is heated by the kitchen fire. The heat from this fire passes round the radiating front and back of the copper, and the boiler is accessible from the scullery or bathroom. Hot water, which is on the low pressure system, can be drawn in the scullery. One of the salient features of the apparatus is that there is no risk of explosion inasmuch as there is nothing sealed, and the whole fitting can be manipulated with ease and safety. The range has a lifting fire with a specially constructed firebox, with a view to economy of fuel.

The external walls, internal partitions, as well as the ceilings, are fire-resisting and verminproof, built of "Mack" plaster slabs, manufactured solely by J. A. King & Co. ("Mack" fireproofing), 181 Queen Victoria Street, London, E.C., works at Hayes, Middlesex; Rawcliffe, Yorks, &c. They occupy only one-half of the floor space an ordinary brick or lath and plaster partition would, thereby reducing the cubical cost of the buildings and saving considerable frontage where several houses are erected. They have been tested by the British Fire Prevention Committee to a temperature of 2,250° Fahr., with the best result on record. Effect in the treatment of the ceilings is obtained simply by laying the "Mack" slabs on fillets between the joists. The manufacturers supply the "Mack" slabs for use in every class of building, from such as Windsor Castle to a workman's cottage.

The joinery is well made, all the frames are solid, and has been executed by the Eagle Steam Joinery Works.

The interior of the cottage is finished with "Sirapite" plastering, and the woodwork has been stained and varnished internally and painted externally.

The architect is Mr. E. C. P. Monson, F.R.I.B.A., F.S.I., &c., of Finsbury Pavement House, London, E.C., who has made a special study of the housing of working classes, and who, as architect to the Sutton Trust, has in hand model dwelling schemes involving an outlay approximating to 500,000*l*., and accommodating about 10,000 people.

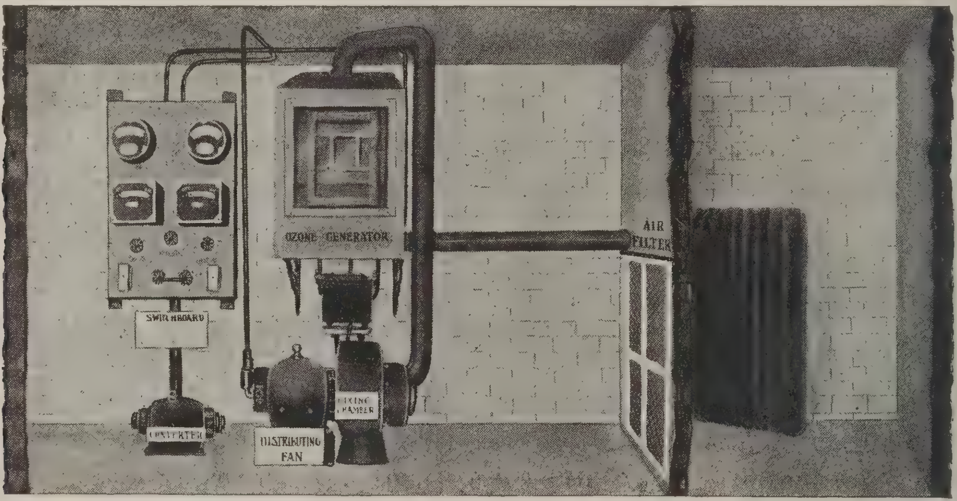
The following were the various contractors:—"Mack" walls, partitions and ceiling slabs, J. A. King & Co. ("Mack" fireproofing), 181 Queen Victoria Street, London, E.C.; "Cornes model cottager" range, boiler and bath combination, Cornes & Haighton, 240 High Holborn, London; joinery throughout, Eagle Steam Joinery Works, Plymouth; slating, battens and ridges, Froude & Dawson, Watford, Herts; plastering internally and externally, Murray & Son, 52 Wavendon Avenue, Chiswick, W.; glazing, British Luxfer Prism Syndicate, Ltd., 16 Hill Street, Finsbury; sanitary fittings, W. Farrer, Ltd., 39 Victoria Street, S.W.; oak paling, Major & Co., Hull; painting inside and out, Major & Co., Hull; the "Durabar" combined draught excluder and weather bar, The Durabar Co., 15 Palace Chambers, Hereford.

## OZONAIR VENTILATION.

Among the many handsome buildings which within the past few years have sprung up along Oxford Street a prominent place in the order of merit must be accorded to the new premises designed by Mr. John Murray, F.R.I.B.A., 11 Suffolk Street, S.W., for Messrs. D. H. Evans & Co., Ltd. They have come to be accepted as a happy solution of the many difficulties which beset an architect in carrying out this class of work. The exterior is doubtless already known at first or second hand to most of our readers. A pleasing façade does not, however, necessarily mean a successful building, for the interior is, after all, the part that matters most. Fortunately Mr. Murray has been equally happy in his plan and general arrangements as he was with his exterior design.

One of the most awkward of the many problems facing an architect entrusted with the erection of a great shopping rendezvous like the premises of Messrs. Evans must be the ventilation.

At the same time on it a great deal depends, for it is one of the few points on which the non-technical judgment of the customers has the best right to be heard. It is interesting to study the system adopted there for the reason that this particular difficulty seems to have received a conspicuously satisfactory solution. This opinion has been arrived at by the writer after a thorough perambulation of the building, commencing at the boiler-room in the sub-basement, and ascending finally to the kitchens on the fourth floor.



There is now a bewildering choice open to the architect in methods of ventilating on a large scale. But there can be little use in here detailing the various alternatives which offered themselves to Mr. John Murray; it is preferable to go direct to a brief account of that which has actually been installed. That is to say, we shall speak without further parley of the Ozonair system.

Some people who ought to be better informed seem to labour under the impression that the Ozonair system consists simply of the introduction of manufactured ozone into the vitiated air of a room. Such a proceeding, they argue, is in practice unworkable from the fact that if the ozone is to have any appreciable effect it must be introduced in such quantities as to become in itself a nuisance. Such a conception of the system of Ozonair, Ltd., 96 Victoria Street, Westminster, S.W., is wofully incomplete. It is true that ozone is introduced to replace that destroyed by the emanations which always arise when a number of persons congregate together and from other causes. But this is only one part of what happens. The plant is really that of a complete system of true plenum ventilation with the all-important addition of an ozone generator. What happens is briefly something like this: the outside air is drawn in by an electric fan through a water screen placed in the basement, and so filtered; next through a mixing chamber, where it is enriched by an infinitesimal proportion of pure ozone (the ozone being supplied from the generator); and finally the combined cleaned air and pure ozone is distributed throughout the building in such quantities as may be desired by tubes and ducts. In addition the chamber is fitted with a coil for heating or cooling the air prior to distribution. The main duct is of galvanised steel and is 10½ feet by 3½ feet section; through it can pass up to 50,000 cubic feet of air per minute if necessary, the exact quantity being under perfect control. From this main duct lead off a large number of other smaller ducts communicating with cunningly arranged flues which discharge the ozonised air through regulators at a height of about 7 or 8 feet from the ground.

The admixture of ozone is necessarily a very small proportion, since its odour is so pungent that one volume of ozone makes an appreciable difference to two and a half million volumes of air. Nevertheless it is the absence of this minute quantity of ozone that makes the principal difference between bracing sea air and the stuffy atmosphere of a basement. There was an excellent proof of the efficiency of the Ozonair system in the fact that the atmosphere in a sub-basement leading out of the boiler room about 25 feet below ground, and without any communication with the outside air was absolutely fresh. This was in striking contrast with the feeling experienced in a few parts of the building which at the time of our visit had not yet been linked up with the system. The ventilation is effected entirely without draughts, and it makes no difference whether the windows are opened or closed.

Ozonair, Ltd., are well known on the Continent and in America, in fact, they have branches all over the world. It is a remarkable fact that abroad and in America property owners as a matter of course set aside a good proportion of the cost of the building for the purposes of ventilation and heating, 10 per cent. being a common proportion.

The accompanying illustration and the following description will give a very good idea of the Ozonair system. The photograph is a sectional view of the plant. Commencing on the extreme right is the inlet chamber for the fresh air. The air can be either cooled or heated in this chamber. It is then drawn through the filter, which cleans it of all the smuts and at the same time absorbs all the deleterious gases, such as the ammonia and sulphurous acid gases which are always present in the air of large cities. The distributing fan, switchboard, and ozone plant are easily distinguished, and the whole plant is operated by the two regulating switches on the switchboard. The amount of air and also the proportion of ozone can be regulated at will.

---

The Council of the Institute of Metals have accepted an invitation from the Glasgow members of the Institute to hold the annual autumn meeting in Glasgow. This meeting will take place on September 21 and 22, on which days papers of scientific and practical interest will be read, and visits made to works of metallurgical interest.

At the last meeting of the Hants County Education Committee the buildings sub-committee recommended that a high school for girls be erected at Basingstoke at a cost of 8,505*l.*; that 265*l.* be spent in laying on gas at the Winchester High School for Girls; that 1,950*l.* be spent on erecting a new Council school at Shipton Bellinger, and 450*l.* in erecting a teachers' dwelling-house there; that 5,580*l.* be spent on erecting a new infants' Council school at Sholing; 235*l.* on converting the Sholing boys' into a girls' school, and 550*l.* on converting Sholing girls' and infants' into a boys' school; and 78*l.* on erecting an iron fence at Pear Tree Green Council school. Notices are to be given to local authorities of the intention of the committee to erect new public elementary schools at Andover for 200 children, Bishopstoke for 300 boys, Bitterne for 250 children, Colden Common (to serve Fair Oak, Owslebury and Twyford) for 120 children, Crofton for 220 children, Headley for 150 children.

## TRADE MARKS OF CONSTRUCTIVE MANUFACTURERS.

We have received from Jacques Gevers & Co., L'Agence de Brevets et Marques de Fabrique, 70 Rue Saint-Jean, Antwerp, the following list of trade marks published in January and February 1910:—

### ENGLAND.

*Cement.*

| | |
|---|---|
| “Protex” | George M. Callender & Co., Ltd., 25 Victoria Street, S.W. |
| “Doros” | Restall's Adamantine Plaster Co., Birmingham. |
| “Bœuf” | The Oxford Portland Cement Co., Ltd., Kirlington, Oxford. |

*Constructive Materials.*

| | |
|---|---|
| “Wilmex” | G. & T. Earle, Ltd., Wilmington, Hull. |
| “Randofize” | Randolph Meech, Dorsetshire. |
| “Rhigothermo” | James Keith & Blackman Co., Ltd., 27 Farringdon Avenue, London. |
| “Ootpito” | Joseph Lockwood, 25 Gordon Street, Glasgow. |
| “Bituna” | Vulcanite, Ltd., 7 Donegal Square, Belfast. |
| “Pudlo” | Kerner-Greenwood & Co., St. Ann's Street, King's Lynn, Norfolk. |
| “Protex” | George M. Callender & Co., Ltd., London, S.W. |
| “Elaterite” | George M. Callender & Co., Ltd., London, S.W. |
| “Tarvialithic” | Bristowe & Co., Ltd., Westminster, S.W. |
| “J. Sheehan” | John Sheehan, 110 Mortimer Road, Kingsland, London, N. |
| “Restall's” | Restall's Adamantine Plaster Co., Birmingham. |
| “Stoncrete” | J. & R. Thompson, Ltd., 128 Roden Street, Belfast, Ireland. |
| “Bic” | The British Improved Construction Co., Ltd., 47 Victoria Street, S.W. |
| “Drednaut” | Thomas Broad, Ltd., Graham Works, Worcestershire. |

### GERMANY.

*Cement.*

| | |
|---|---|
| “Hannoversche Fabrik Misburg” | Hannoversche Portland-Cement-Fabrik-Actiengesellschaft, Hannover. |
| “Martinol” | Corundin, G.m.b.H., Alsdorf, Rheinl. |

*Constructive Materials.*

| | |
|---|---|
| “Fama” (rayons de soleil) | Hannoversche Steinholzfabrik “Fama,” G.m.b.H., Hannover. |
| “Radical-Heyl” | Ary G. Weber, Steglitz. |
| “Antihumid” | Ludwig Kopp, Leipzig. |
| “Bitulithic” | Deutsche Quarriten, Bitulithio-Pflaster, G.m.b.H., Berlin. |
| “Tornado” | Gebrüder-Pierburg, Berlin. |

### BELGIUM.

*Cement.*

| | |
|---|---|
| “Rammer Brand” | |
| “Waterloo Brand” | Société Ame des Carrières Dumon, Tournai. |
| “Hirondelle Volant” (dessin) | |
| “Royal Tiger Brand” | |

---

The Council of the Institute of Metals announce that there has been established at the offices of the Institute a Pathological Museum for specimens of metals and alloys, the first contributions to the museum having been received from the President, Sir Gerard A. Muntz, Bart. This museum, which is the only one of its kind, ought to be of great service to all interested in the metallurgy of the non-ferrous metals, as it is intended that it shall contain specimens showing the various ways in which such metals as copper, brass, aluminium, &c., can fail either as a result of faulty manufacture or of improper usage.

# PROUT'S
# CONTINENTAL SKETCHES
## SUITABLE FOR PRESENTATION.

*Proofs on Thick Plate Paper in Handsome Portfolio, Cloth, Gilt Lettered, Size 21 inches by 15 inches, Price 42s. Net.*

**The work consists of 75 Plates, and was originally published at 30 Guineas. The Plates are the full size of Prout's Drawings, and are an exact reproduction by the**

## PERMANENT INK PHOTO PROCESS.

*Mr. RUSKIN, Author of "The Seven Lamps of Architecture," &c., &c., referring to these Drawings, says :—*

"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"Prout was, and he remains, the only one of our artists who entirely showed Turner's sense of magnitude; and of all forms of artistic susceptibility reverent perception of true magnitude is the rarest."

"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal him; there is no stone drawing, no vitality of architecture, like Prout's."

"His 'On the Grand Canal, Venice,' is an Arabian enchantment, his 'Street in Nuremberg' is a German fairy tale."

"Prout drew every lovely street in Europe."

"I have," says Mr. Ruskin, "both in my earlier books and in my lectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."

"The sharpest photograph is not half so natural."

"No architect, however accurate in his measurements—no artist, however sensitive in his admiration—ever gave the proportion and grace of Gothic spires and towers with the loving fidelity that Prout did. This is much to say; and therefore I say it again deliberately, there are no existing true records of the real effect of Gothic towers and spires—except only Prout's."

## THE PORTFOLIO INCLUDES THE FOLLOWING WELL-KNOWN PICTURES:—

Street in Nuremberg.
The Grand Canal and Church of St. Maria Della Salute, Venice.
The Ducal Palace and Pillars of St. Mark, Venice.

## NOTICE TO ADVERTISERS.

**Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.**

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.*

## TENDERS, ETC.

*** *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

## COMPETITIONS OPEN.

ASHTON-ON-MERSEY.—Architects practising within ten miles of Sale desirous of competing for proposed Sunday schools in connection with the Wesleyan Chapel are invited to communicate with Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

BELFAST.—The Senate of the Queen's University of Belfast are prepared to receive designs for the enlargement of the present buildings at a cost of about 52,000*l.* Assessor, Sir Aston Webb, R.A. Two premiums of 150*l.* and 100*l.*; particulars 2*l.* 2*s.*, returnable within three weeks, or on receipt of bona fide design. Mr. J. M. Finnegan, B.Sc., secretary, Queen's University, Belfast.

EDINBURGH.—The Corporation invite competition designs for the erection of a new hall in Lothian Road, Edinburgh. They have appointed Sir Aston Webb, C.B., R.A., as assessor, Mr. J. A. Williamson, A.R.I.B.A., City Chambers, being associated with him. Three premiums are offered. Particulars and plans of the site will be supplied to competitors on payment of two guineas, which will be returned on receipt of a design in accordance with the conditions. Should architects, on receipt of the particulars, not desire to compete, the deposit will be returned, provided the papers are returned within four weeks. Mr. Thomas Hunter, town clerk, City Chambers, Edinburgh.

IRELAND.—August 23.—The Meath County Council invite architects practising in Ireland to submit plans and specifications for county offices to be erected at Navan. Apply to the Secretary, Meath County Council, Navan.

LONDON.—June 15.—The Acton Urban District Council invite plans for schools at Rothschild Road for 850 pupils. Premiums of 100*l.*, 50*l.*, and 25*l.* are offered, but any premium awarded to the successful architect shall be merged in his commission of 3½ per cent. Deposit 10*s.* 6*d.* Apply after April 5 to Mr. F. A. Everitt, secretary, Education Department, Council Offices, Acton, W.

with marm
great cu ution may lie at the
this Lambeth experience.

Yes, your mackintoshes will cost you more. This is not a Free Trade joke; it's a grimly serious consequence of the rubber boom. Waterproofs have already been put up 20 per cent., and everything of which rubber forms a part is rising proportionately. As there are generally sympathetic movements in other directions, we may perhaps expect to see umbrellas also "going up." It is rather rough on us, when other trades are dull and everyone has to economise, that we should have to pay more for our tennis boots, our hot-water bottles, our golf balls, our goloshes, our ink-erasers, our rubber heels, and our elastic stockings. It's a benevolent wind indeed that blow's nobody harm. Aye, there's the rub—in fact, there's the rubber!

| Fowler | 12,603 | 0 | 0 |
| Gerrard & Sons | 12,600 | 0 | 0 |
| Costain & Sons | 12,598 | 0 | 0 |
| Wearing & Sons | 12,550 | 0 | 0 |
| Rothwell & Sons | 12,500 | 0 | 0 |
| Spencer | 12,500 | 0 | 0 |
| Haugh & Pilling | 12,339 | 0 | 0 |
| Hughes & Stirling, Bootle (*accepted*) | 12,250 | 0 | 0 |

## CAMPSALL.

For erection of walls, fencing, gates, and other work in connection with the burial ground at Campsall, near Doncaster.

| | | | |
|---|---|---|---|
| Mason | £357 | 11 | 6 |
| Bellamy | 350 | 0 | 0 |
| Broadhead & Co. | 347 | 6 | 6 |
| Spurr | 338 | 0 | 0 |
| Newton & Fisher | 335 | 4 | 0 |
| Attey, Campsall (*accepted*) | 320 | 0 | 0 |

## EAST KIRKBY.

For three houses, Welbeck Street. Mr. Walter H. Woods, architect and surveyor, Long Eaton, near Nottingham.

| | | | |
|---|---|---|---|
| Tate & Son | £629 | 10 | 0 |
| Bains | 618 | 0 | 0 |
| Coleman, East Kirkby (*accepted*) | 604 | 0 | 0 |

For four pairs of houses, Welbeck Street. Mr. Walter H. Woods, architect and surveyor, Long Eaton, near Nottingham.

| | | | |
|---|---|---|---|
| Coleman | £1,706 | 5 | 0 |
| Bains | 1,688 | 0 | 0 |
| Tate & Son | 1,679 | 10 | 0 |
| Hoole, Kirkby-in-Ashfield (*accepted*) | 1,650 | 0 | 0 |

## HAVANT (HANTS).

For drainage work at Farlington, for the Guardians.

| | | | |
|---|---|---|---|
| Spriggins | £3,279 | 0 | 0 |
| Croad | 3,165 | 0 | 0 |
| Mowlem | 3,150 | 0 | 0 |
| Atkinson | 2,941 | 9 | 9 |
| Wheeler & Co. | 2,931 | 3 | 9 |
| Farley & Co. | 2,872 | 7 | 9 |
| Bell | 2,797 | 0 | 0 |
| Douglas | 2,792 | 0 | 0 |
| Streeter & Co. | 2,765 | 19 | 10 |
| MUSSELLWHITE & SAPP, Basingstoke (*accepted*) | 2,675 | 0 | 0 |

## HIGH WYCOMBE.

For additions and alterations, &c., at Baptist Chapel, Holmer Green. Mr. ALFRED NASH, architect, High Wycombe.

| | | | |
|---|---|---|---|
| Clarke | £354 | 0 | 0 |
| Buckle | 335 | 0 | 0 |
| Wheeler & Sons | 320 | 0 | 0 |
| Moreton & Sons | 319 | 0 | 0 |
| Perfect | 310 | 0 | 0 |
| Harris | 309 | 0 | 0 |
| Harris & Co. | 285 | 0 | 0 |
| HAZELL, Hazlemere (*accepted*) | 275 | 0 | 0 |

## HORSHAM SOUTHWATER.

For tar-paving of the playgrounds, &c., at the Council school. Mr. HAYDN P. ROBERTS, A.R.I.B.A., County Education architect, Horsham.

| | | | |
|---|---|---|---|
| Tarmac, Ltd. | £180 | 0 | 0 |
| A. C. W. Hobman & Co. | 179 | 11 | 6 |
| North of England Asphalte Co. | 171 | 15 | 10 |
| Constable, Hart & Co., Ltd. | 159 | 0 | 0 |
| Wainwright & Co., Ltd. | 156 | 0 | 0 |
| Chittenden & Simmons, Ltd. | 154 | 2 | 3 |
| HOBMAN & Co., Peckham (*accepted*) | 151 | 0 | 0 |
| Architect's estimate | 155 | 0 | 0 |

## LONDON.

For construction of a new quay wall at the Council's Depot, Peckham Park Road, Old Kent Road, for the Camberwell Borough Council.

| | | | |
|---|---|---|---|
| Courtney & Fairbairn | £1,269 | 0 | 0 |
| Webb & Co. | 771 | 2 | 3 |
| Mowlem & Co. | 740 | 0 | 0 |
| Holloway Bros. | 725 | 0 | 0 |

| Pedrette | 650 | 0 | 0 |
| Yorkshire Hennebique Contracting Co. | 650 | 0 | 0 |
| Kavanagh | 617 | 0 | 0 |
| R. & E. Evans | 597 | 0 | 0 |
| Ansell | 595 | 0 | 0 |
| Smith | 589 | 0 | 0 |
| Chafen & Newman | 549 | 10 | 0 |
| Parker & Sons | 547 | 0 | 0 |
| Woodham & Sons | 530 | 0 | 0 |
| Cochrane & Sons | 520 | 0 | 0 |
| Rowlingsons & Co. | 498 | 0 | 0 |
| F. & H. F. Higgs | 496 | 0 | 0 |
| British Fireproof Construction Co. | 466 | 0 | 0 |
| West & Son | 429 | 15 | 2 |
| Muirhead & Co. | 419 | 0 | 0 |
| ANDERSON, Poplar (*accepted*) | 390 | 0 | 0 |

## MARSDEN.

For the erection of four houses in Green Lane. Messrs. AINLEY & HIRST, architects and surveyors, Slaithwaite.

*Accepted tenders.*

| | | | |
|---|---|---|---|
| A. & T. Haigh, Golcar, mason | £582 | 0 | 0 |
| Holroyd, Marsden, joiner | 240 | 0 | 0 |
| Firth, Marsden, plumber | 64 | 0 | 0 |
| J. & J. Bottomley, Marsden, plasterer and painter | 51 | 15 | 0 |
| Allison, Milnsbridge, tiler | 50 | 0 | 0 |
| J. & J. Bottomley, Marsden, concreter | 32 | 10 | 0 |

## SCOTLAND.

For the erection of a branch establishment at Lowvalleyfield, for the Dunfermline Co-operative Society, Ltd.

*Accepted tenders.*

| | | | |
|---|---|---|---|
| Clark, builder | £750 | 0 | 0 |
| Ramsay, joiner | 618 | 0 | 0 |
| Ure, plasterer | 150 | 0 | 0 |
| Thomson & Co., plumber | 73 | 0 | 0 |

## NEWCASTLE-ON-TYNE.

For erection of St. Mark's new parochial buildings. Mr. A. B. PLUMMER, diocesan architect, Newcastle and Tynemouth.

| | | | |
|---|---|---|---|
| Weir | £3,603 | 0 | 0 |
| Elliott Bros. | 3,591 | 10 | 10 |
| J. & W. Lowry | 3,481 | 14 | 11 |
| Easten | 3,480 | 0 | 0 |
| George & Son | 3,394 | 16 | 10 |
| MIDDLEMISS BROS., Newcastle-on-Tyne (*accepted*) | 3,393 | 16 | 0 |

## STIFFORD.

For carrying out distempering and painting works, at the children's homes, at Stifford, near Grays, Essex, for the Guardians of Stepney Union.

| | | | |
|---|---|---|---|
| Kingston | £595 | 17 | 6 |
| Heritier & Co. | 450 | 0 | 0 |
| Grays & Co. | 400 | 0 | 0 |
| Dainton | 398 | 0 | 0 |
| Aslett | 349 | 12 | 0 |
| Athey | 289 | 16 | 0 |
| NEWTON, Mile End, E. (*accepted*) | 240 | 0 | 0 |

## WALES.

For building a Masonic temple at Merthyr Tydfil, for the Loyal Cambrian Lodge of Freemasons (No. 110). Mr. C. M. DAVIES, architect, 112 High Street, Merthyr.

| | | | |
|---|---|---|---|
| Davids & Howell | £2,900 | 0 | 0 |
| Sullivan | 2,840 | 0 | 0 |
| JENKINS, Merthyr (*accepted*) | 2,800 | 0 | 0 |

For sewerage works, for Abertillery and Abercarn Urban District Councils. Mr. J. WILLIAMS, engineer, Council Offices, Abercarn, Mon.

| | | | |
|---|---|---|---|
| Peters | £913 | 0 | 0 |
| Johnston Bros. | 809 | 2 | 0 |
| Jones & Jones | 777 | 5 | 6 |
| Smith | 754 | 9 | 2 |
| LEWIS, Aberbeeg (*accepted*) | 649 | 2 | 6 |
| Jones | 638 | 10 | 0 |
| Davies, Ball & Co. | 501 | 14 | 3 |

For erection of a masonic lodge and caretaker's house, for the Worshipful Master and Brethren of the Forest Lodge of Freemasons. Mr. R. ORTON DOWDSWELL, architect, Cardiff.

| | | | |
|---|---|---|---|
| Jones Bros. | £1,075 | 0 | 0 |
| DAVIS, Bargoedstall, Bargoed (*accepted*) | 935 | 0 | 0 |
| Architect's estimate | 960 | 0 | 0 |

For erection of premises at Tylorstown, for the Ferndale Industrial Co-operative Society. Messrs. W. M. LEWIS & T. N. MORGAN, architects, Pontypridd.

| | | | |
|---|---|---|---|
| Williams | £5,599 | 0 | 0 |
| Jenkins & Sons | 5,468 | 0 | 0 |
| D. Richards | 5,320 | 9 | 6 |
| Isaac | 5,298 | 10 | 0 |
| Thomas & Co. | 5,230 | 0 | 0 |
| Rees & Co. | 5,181 | 12 | 8 |
| A. Richards | 5,061 | 2 | 6 |
| Davies & Howell | 5,056 | 4 | 5 |
| Davies & Sons | 5,018 | 0 | 0 |
| Turner & Sons | 4,898 | 0 | 0 |
| Evans & Bros. | 4,871 | 0 | 0 |
| Jones & Son | 4,850 | 11 | 8 |
| Humphreys | 4,800 | 0 | 0 |
| Colbourne | 4,776 | 3 | 9 |
| Evans | 4,595 | 4 | 6 |
| NIBLETT & DAVIES, Cardiff (*accepted*) | 4,540 | 14 | 2 |

## WINDSOR.

For alterations and repairs to the Cottage Homes at Englefield Green, for the Windsor Board of Guardians.

| | | | |
|---|---|---|---|
| Pizzey & Son | £395 | 0 | 0 |
| Hendry | 390 | 0 | 0 |
| Buckeridge | 377 | 0 | 0 |
| Potbury | 340 | 0 | 0 |
| Beauchamp | 339 | 0 | 0 |
| Roberts | 304 | 16 | 0 |
| KING & SON, Englefield Green (*accepted*) | 275 | 14 | 9 |

---

THE streets and buildings committee of Edinburgh Town Council, who have under consideration the appointment of a successor to the burgh engineer, who has resigned on being appointed chief engineer to the Scottish Local Government Board, have agreed to recommend the Town Council to advertise the vacancy at a salary beginning at 600*l*., and rising to 800*l*.

## DISTRICT SURVEYOR'S CLAIM FOR FEES.

AN important question regarding the liability of a district surveyor to claim for fees under certain sections of the London Building Act was decided by the Divisional Court of the King's Bench Division, comprised of the Lord Chief Justice and Justices Channell and Coleridge, on Tuesday. The case came up on the appeal of Messrs. Galbraith Brothers, builders, from the decision of the stipendiary magistrate of Lambeth, the respondent being Mr. Bernard John Dicksee, the district surveyor for Newington. Mr. Dicksee in the court below sued the builders for 16*l.* 7*s.* 6*d.*, which he contended was due to him for work done as district surveyor during the building of the John Ruskin School for Mentally Defective Children, in Newington.

From the special case stated by the magistrate for the purposes of the appeal, it appeared that the appellants entered into a contract with the London County Council to build the school in question, and in May 1908 respondent wrote to them requesting a building notice under the London Building Act, 1894. As the decision by the High Court in the case of the "London County Council *v.* The District Surveyors' Association and Willis" was contemplated, it was subsequently arranged that the question of giving such building notice should be delayed until the decision was given. However, the respondent did certain work in connection with the building operations in his capacity of surveyor, and after the decision in the case referred to had been given, he again wrote to the builders for the building notice, at the same time sending in an account for his services rendered, which the builders refused to pay, contending that the buildings came amongst those specified within a section of the Act, and were exempt, and in consequence the respondent had no duties to perform, and could claim no fees. It was contended on Mr. Dicksee's behalf that under the Act of 1894 he was entitled to receive a building notice, and that the building was not such a one as was exempted under section 201, sub-section 5. Therefore he had duties to perform for which he could claim fees. The magistrate decided that the building was exempt within section 201, sub-section 5 of the Act, but notwithstanding that the fees claimed by the surveyor were rightly payable by the builders, and he gave judgment for Mr. Dicksee for the amount claimed. The question for the court was whether he was right in that decision.

After hearing Mr. Montague Lush, K.C., who was for the appellants,

The Lord Chief Justice said he thought the appeal was an attempt to render ineffective the judgment in the previous case which the court had decided, viz., "The London County Council *v.* The District Surveyors' Association and Willis." Mr. Lush had said that in that particular case there was nothing to be done by the surveyor, but that did not follow, for if the building did not require watching then the surveyor got his fees for doing little. Mr. Lush had also argued that if the surveyor could not show that he had done something from which the Council benefited he was not entitled to his fees, but of course that could not be upheld. They had come to the conclusion that the decision of the magistrate was correct, and the appeal would be dismissed with costs.

Justices Channell and Coleridge concurred, and the appeal was accordingly dismissed.

Leave to appeal was granted on Mr. Lush's application.

## VARIETIES.

THE Federal Council of Switzerland have been authorised to arrange for the erection of two grain warehouses at Altorf Station at a cost of 39,720*l.*

THE late Mr. Owen Jones, of 27 Grey Road, Walton, Liverpool, builder, left 32,278*l.* gross, of which 875*l.* is net personalty.

MR. T. HYSLOP URE, architect, has been instructed by the Dunfermline Parish School Board to prepare plans for a new school at Limekilns.

THE Leeds Improvements Committee recommend the City Council to arrange for an auction some time in the autumn for the sale of surplus lands belonging to the Corporation.

THE Belper Rural District Council on Saturday adopted a scheme prepared by Mr. R. Cordon, C.E., for a sewerage scheme and sewage disposal works for the parish of Crich. A loan is to be applied for amounting to 11,500*l.*

THE Glasgow Corporation last week adopted the Sewage Committee's minute containing the recommendation that the contractor be instructed to proceed with the construction of the North Renfrew west intercepting sewer. The estimated cost of the sewer on the adjusted prices is 29,925*l.* 9*s.* 6*d.*, or three times the amount originally expected.

THE Monmouthshire Local Education Authority have given notice of their intention to erect new schools at Ynysddu (550 scholars), Blackwood (550), Abercarn (300), Wattsville (550), and Pontymolle (650). The schools at Fleur-de-lis and Rumney are to be enlarged by 200 places and 120 places respectively.

THE York City Council adopted by a large majority the recommendation to erect in Exhibition Square a full-size statue of William Etty, R.A., the York artist. Mr. W. W. Hargrove, as sole surviving trustee of the Fine Art Exhibition, had offered to contribute 262*l.*, the total cost of the statue and work being 300*l.*

THE Senate of the University of Glasgow at a meeting have resolved to confer the honorary degree of Doctor of Laws (LL.D.) on Mr. John James Burnet, A.R.S.A., F.R.S.E., F.S.A.Scot., F.R.I.B.A., corresponding member of the French Architectural Society and of the American Institute of Architects.

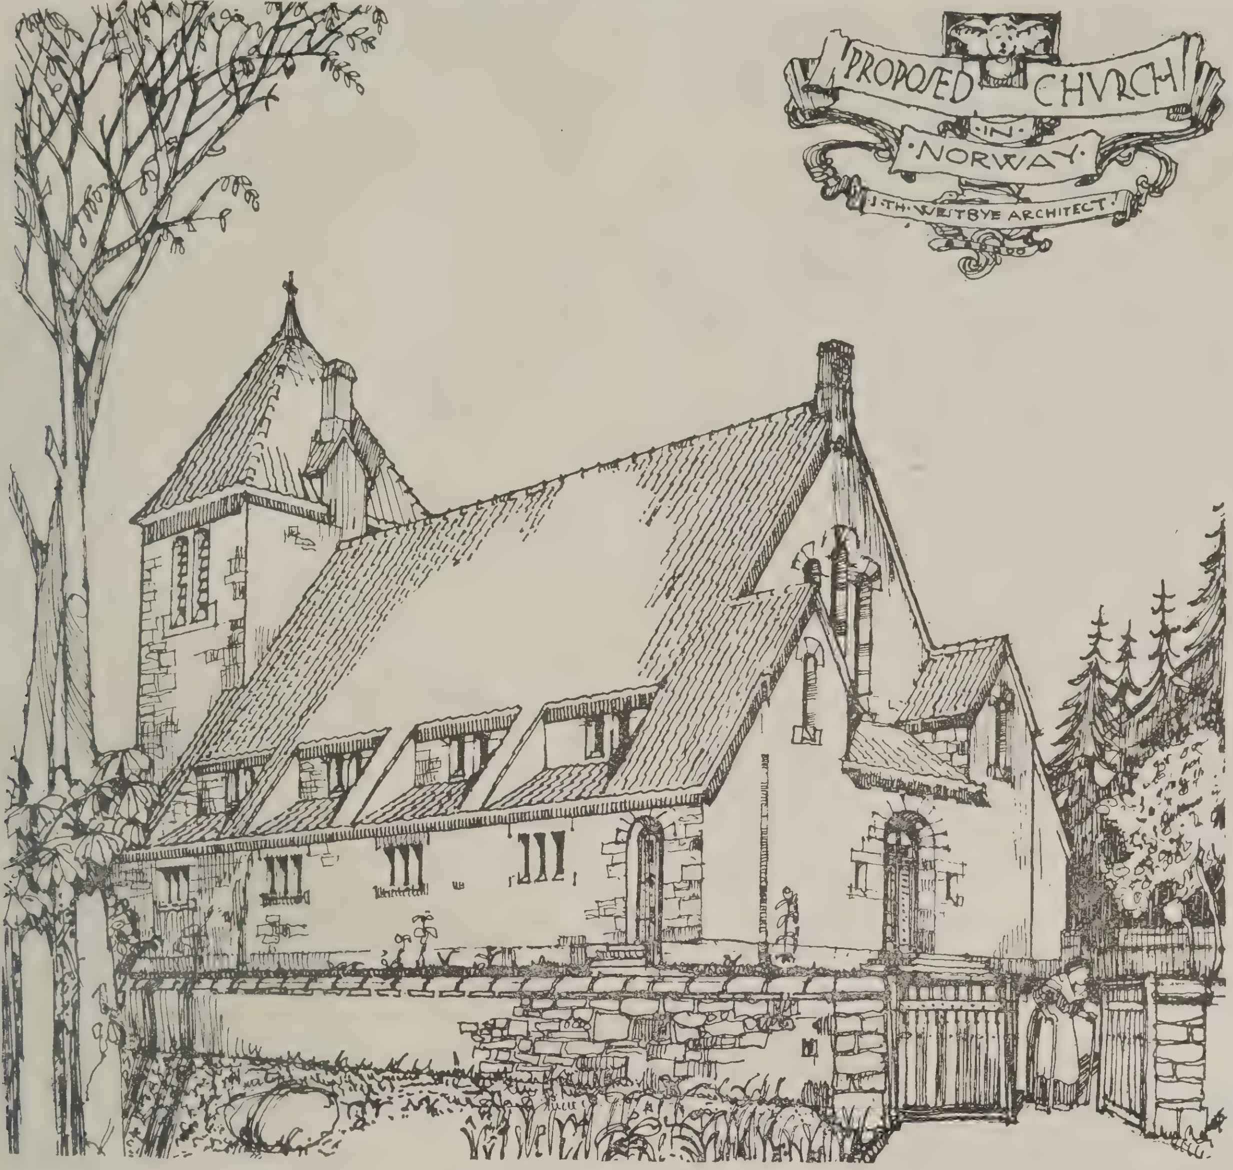
IN order to meet the want for working men's dwellings in Byfleet, a company is being formed, under the Industrial and Provident Society Act, to build about 80 cottages on the north side of Byfleet Station. The cottages will be let at the lowest rents possible to insure a maximum return of 4½ per cent. The plans for laying out the roads, and for the drainage, were submitted to the Chertsey Rural Council at their last meeting, and were passed by them. Mr. Raymond Unwin is the architect to the scheme.

A COMPANY is being promoted with a capital of 35,000*l.* for the purpose of providing a promenade pier and pavilion at Whitley Bay, Northumberland. The pier will have a total length, including the jetty at the extremity, of about 850 feet, with a minimum width of 40 feet, and a maximum width of 120 feet. The pavilion will be erected immediately to the right of the entrance, and abutting on the promenade. It will contain a concert hall or theatre capable of accommodating about 1,500 people.

THE Edinburgh School Board have approved plans submitted by Mr. J. A. Carfrae, architect, for the supplementary school in M'Leod Street, showing the necessary provision for practical instruction located in a building two storeys high, which it is proposed to erect along the north side of the ground. This building, which is intended to be of brick, will be 360 feet long. On the ground floor there will be four workshops and three cookery rooms, each containing 1,080 square feet, a staff-room, and two stores. On the upper floor there will be four workshops and two laundry rooms, each also containing 1,080 square feet, and practical science room, measuring 1,475 square feet, and one store. The building approved is distinct from the main elementary school to be erected on the M'Leod Street site. The main building will be placed on the south part of the site, and will accommodate 960 pupils in 24 class-rooms.

THE Edinburgh Dean of Guild have granted the Grand Lodge of Freemasons of Scotland warrant to take down the present buildings at 96 and 98 George Street, Edinburgh, and erect new buildings in their place. The new hall will accommodate 780 persons. On the first floor will be the offices, including a board-room and Grand Master's room. The second floor has two halls and accommodation for the use of daughter lodges. The elevation to George Street is to be of polished stone, and the design follows the style of architecture which characterised the buildings erected in Edinburgh at the end of the eighteenth century. The interior of the hall will be panelled on the lower portion, and suitable provision is made for an organ behind the platform. The total cost will be about 30,000*l.* The plans have been prepared by Mr. A. Hunter Crawford, F.R.I.B.A.

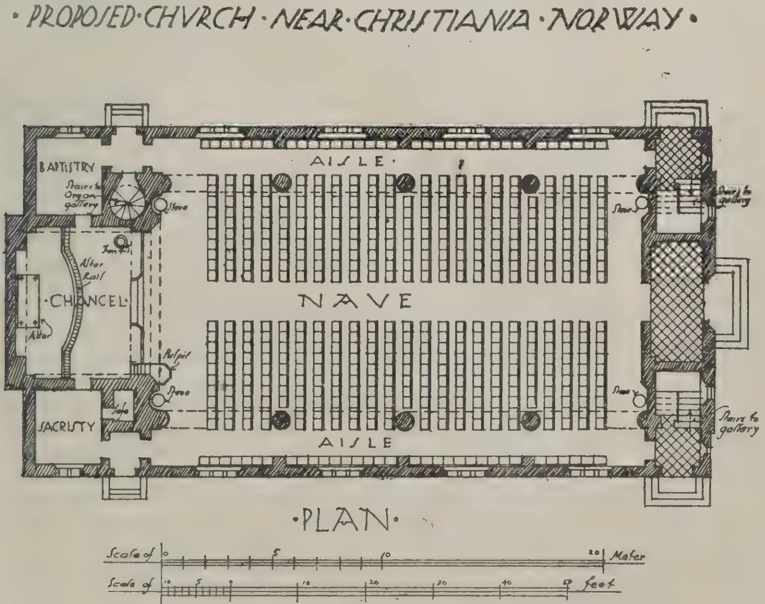
THE Belfast Corporation last week authorised the issue of Corporation Stock to the amount of 300,000*l.* The total amount to be devoted to various city improvements, and it is all to be issued for immediate expenditure, which has already received the sanction of the Local Government Board. 83,000*l.* is to be devoted to the extension of the asylum at Purdysburn; 50,000*l.* for capital expenditure in connection with the gas works; 40,000*l.* for improvements in the electricity department; 25,000*l.* for tramway extensions; 20,000*l.* for permanent paving of streets; 20,000*l.* for the erection of a public abattoir; 12,800*l.* for footpath improvements and street widening; 7,000*l.* for the purpose of widening Castle Street, one of the main thoroughfares of the city; 3,000*l.* for the completion of the quay wall at the refuse destructor works at Laganbank; 3,000*l.* for the erection of a bridge over the Lagan at Stranmillis; 2,700*l.* on account of the Sydenham and Knock drainage scheme; 2,750*l.* for the erection of a disinfecting station at Laganbank Road; and 750*l.* for the erection of a bridge over the Great Northern Railway at Donegall Road.



## PROPOSED CHURCH NEAR CHRISTIANIA, NORWAY.

The site for this church is magnificently placed, being on the top of a hill overlooking seven counties. It is proposed to use granite as the main material as it is obtainable on the spot. The pantiles for the roof and tower will be of local manufacture. The scheme of the plan is a typical example of a country Lutheran church, and shows seating accommodation for 800. This includes the choir, who would be seated in a gallery over the south aisle.

The design has been kept simple and severe in character in order to harmonise with the surroundings. The architect is Mr. J. Th. Westbye.



---

## THE ILLUMINATING ENGINEERING SOCIETY.

The holding of the annual general meeting on Monday, May 23, terminated the first session of the Illuminating Engineering Society. This Society, it will be recalled, was formed last year in order to bring together engineers, architects, members of the medical profession, and others interested in illumination, in order that an impartial and international platform might be provided for the discussion of problems of this kind. The work of the last session has fully demonstrated the usefulness of this Society. There has been a steady growth in the number of articles in the technical press, and in papers read before societies, dealing with various aspects of lighting. Municipal authorities are coming to take a more active interest in street lighting, and gas and electrical supply companies now pay much attention to the conditions of illumination enjoyed by the consumer. In addition, the most recent reports of the Factory Department of the Home Office and of the medical officer to the London County Council show that the importance of good lighting in schools and factories is now more fully appreciated. Good illumination, it is now felt, is not a luxury, but a necessity.

The first year's work of the Illuminating Engineering Society has proved two things; firstly, that the discussions, in which representatives of different systems of lighting took part, were of a perfectly amicable character; and secondly, that there would not be the least difficulty in the future of finding plenty of matter for discussion.

During the session the membership has steadily increased, and is also of a very representative character, including gas and electrical engineers, representatives of systems of lighting using oil, petrol air, and acetylene, professors in technical colleges, medical men, architects and surveyors, manufacturers of lamps, shades, and reflectors, &c. What is equally satisfactory is that the Society has been able to secure the co-operation of so many leading authorities in this country, on the Continent, and in the United States. During the past session the first three distinguished honorary members of the Society have also been elected. They are Sir William Preece, one of the earliest to study the measurement of illumination; Sir Joseph Swan, one of the inventors of the electric incandescent lamp, and Professor A. G. Vernon-Harcourt, the inventor of the ten candle-power Pentane standard of light.

A special feature of the past session has also been the co-operation of eminent corresponding members of the Society, many of whom have participated in the discussions of the Society. The Society hopes that in the future their international attitude will be influential in the promotion of common agreement and standardisation of photometrical terms and processes, &c. In this work they will have the benefit of the co-operation of the American Illuminating Engineering Society, who have already passed a resolution expressing their desire for mutual assistance on the part of the two bodies.

The Society has also received an official invitation to be represented at the International Medical Congress to be held in Brussels this year, and proposes to send delegates. At this Congress the question of the hygienic conditions of factories and schools, and the effect of light on the health of employees, will be studied in connection with the engineering aspects of illumination.

During the past session five monthly meetings of the Society have been held. The inaugural meeting took place on November 18, 1909, and was followed by four discussions in 1910 on "Glare, its Causes and Effects," and "The Measurement of Light and Illumination" respectively. At the inaugural meeting the President, Professor S. P. Thompson, D.Sc., F.R.S., delivered his inaugural address, in which he summarised the intentions of the future work of the Society, and Sir Boverton Redwood, Mr. A. P. Trotter, Professor J. S. Haldane, Mr. W. M. Mordey, and Dr. R. M. Walmsley expressed their sympathy with the movement.

The subsequent meetings dealt with subjects of wide public interest and attracted a considerable amount of attention outside the Society. Now that so many different systems of lighting, many of them of great brilliancy, are available, it is a matter of considerable consequence to understand exactly what is meant by a "glaring" system of illumination, and to know how to avoid such an effect by the judicious placing of lights and the use of shades, &c. This subject received special attention from oculists and members of the medical profession, many of them taking part in the discussion, and afterwards becoming members of the Society.

The next two meetings, devoted to "The Measurement of Light and Illumination," also proved most successful. A feature of the proceedings was the exhibition by the inventors of different types of instruments, and the demonstration of their actual use in practice. The contributions to these discussions by foreign members of the Society, including Dr. L. Bloch (Berlin), Dr. L. Bell (Boston), Professor A. Blondel (Paris), Dr. M. Corsepius (Cologne), Dr. H. Krüss (Hamburg), Professor Rumi (Genoa), Dr. K. Stockhausen (Dresden), Professor R. Ulbricht (Dresden), Professor L. Weber (Kiel), and many others, were of exceptional interest.

The first anniversary dinner of the Society, which took place on February 10, also proved most successful.

The occasion served to show how fully the work of the Illuminating Engineering Society receives the support of other older bodies, and how wide is the nature of the subject with which it proposes to deal.

In the next session it is again proposed to devote the monthly meetings of the Society to subjects of general interest, and arrangements are being made for papers on such subjects as the lighting of streets, shops, libraries, schools, &c., and the recent developments of gas and electric lighting, &c. During the past year the Society has gained support in many influential quarters, and it is hoped during the next session to extend still further its circle of sympathisers and its scheme of operations.

## FUNDAMENTAL CONSIDERATIONS IN ENGLISH TOWN PLANNING.*

In this paper I shall endeavour to answer two questions, viz., "Why are town extension plans necessary in Great Britain?" "What are the fundamental conditions to be followed in order to secure the best town extension plans?"

Before endeavouring to provide answers to these questions may I venture to point out that at the present time in England you have in your desire to arrive at wise decisions on this point the great advantage of dealing with an absolutely open question, for your methods of town extension planning have yet to be developed? It is a matter of vital importance that you should educate a strong public opinion (for without a strong public opinion nothing of real value can be secured) on this subject, and the British people should understand that the good health of the nation will in future depend on the wise preparation of these plans. In Germany "the town makes the people," who are shaped and moulded by the laws which they are bound to obey. In countries in which individual liberty is the basis of social life the contrary, however, holds good, "the people make the town." This is especially the case in Great Britain at the present time.

In these days when we desire to get to work quickly there is not a little danger of forgetting these elementary principles. As a proof of this let me draw your attention to the strong desire shown day by day to apply "en bloc" in one country the methods followed in another country, without giving time to reflect on the insanity of such a course.

It is necessary to protest with energy against this "five minutes' system" of eagerly copying on entering into one's own house that which one has seen in the house of one's neighbour. This "five minutes' system" has produced so many errors in town planning in the various European countries that it is important that I should definitely draw your attention to the real danger of such a course.

In studying the life of the people in the centuries immediately preceding the Christian era—centuries in which a high degree of civilisation was reached—we are struck with the keen sense of natural laws possessed by these people and the adaptation of their daily life to these natural laws. In their dwellings and in their buildings of all kinds they consciously strove to find the best forms to suit the conditions of climate and consequently the needs of daily life of the individual citizens. The planning of their small boroughs and their ideal little cities is almost perfect.

It will not be too much to say that amongst these ancient people there was almost a complete equilibrium between beauty and utility—between the expression of material life and of moral life. This condition of equilibrium was nearly attained by the Greeks and in a large measure by the Romans. In all countries of the world it may be said that a similar condition of equilibrium is possible of attainment wherever men are gathered together in cities.

In those countries in which the mildness of the climate renders it possible that life can be spent in a large degree in the open air, the method of planning towns will be quite different to that in places where the climate is either much colder or more humid, and where, as a result life cannot be spent out of doors to the same extent. Numerous and eloquent examples could be given of this.

Coming now to the consideration of the fundamental conditions of town extension planning in detail let me urge that the climatic conditions of each country should first of all determine the conditions under which the people are housed.

This would at first sight seem to be a truism, but it is a truism which is far from being generally recognised. Whether the climate is wet or dry, subject to extremes of temperature in summer or in winter, whether the sunless days of the year are more or less numerous, whether certain prevailing winds render necessary special modification in the method of building—all these should be determining causes in regard to methods of constructing dwellings. The importance of these special climatic conditions affecting the country as a whole should never be lost sight of when the work of designing dwellings for the people is under consideration. If we compare the climatic conditions of the beautiful country of Tuscany for a moment with the climatic conditions of Lancashire we shall find the two extremes of conditions governing town extension planning. In one country parks and promenades on the borders of the city can with advantage be provided in a much greater extent than in the other country. The people of Tuscany can at all times leave their dwellings to visit these places. In Lancashire, on the other hand, open spaces and gardens ought to be in the close vicinity of the dwellings in order to enable the people to secure fresh air without travelling far from their homes.

---

* A paper entitled "Consideration of the Fundamental Conditions which should govern Town Extension Planning in Great Britain." Prepared for the National Town Planning Council by Monsieur Augustin Rey, Architecte, Paris, Membre du Conseil supérieur des Habitations à Bon Marche, Corresponding Member of the International Committee on Tuberculosis.

The variety of climatic conditions imposes, therefore, a similar variety of methods in preparing town extension plans.

It is equally important that we should have clearly in mind the fundamental interests which must be served in making future plans for city developments. These fundamental interests are concentrated almost entirely on one point, viz., the need for incurring such expenditure as shall be of direct service either to the health or the happiness of the people, and the reduction of the expenditure which is only profitable to a small section of the community. No man increases his vital power by placing a mass of lead on his shoulders instead of covering his body with warm clothing. It is exactly the same with the inhabitants of a town.

In examining the town expenditure which is to-day incurred in the organisation of town life, one finds that this expenditure can be placed in four categories:—

(1) Cost of land occupied by public roads, free spaces and parks, and public buildings; (2) cost of constructing streets, water supply and other similar works of public service, and especially the maintenance of public parks; (3) cost of general municipal administration; (4) cost of health and hygiene administration in the different parts of the city.

In the municipal budgets of rapidly extending cities the chapters relating to the prices paid for land needed for (1) the making of public ways and the widening of streets found too narrow for the increasing traffic, (2) the purchase of land in order to clear congested areas, (3) the purchase of land for the purpose of buildings, and (4) the purchase of land for general public works, are together responsible for the expenditure of great sums of public money. As a result only small sums of money are available for that part of health improvement which consists in providing open spaces in the vicinity of congested dwellings, providing pure air and light for these dwellings or for the provision of parks, &c.

In this lack of capital is to be found the principal cause of bad hygiene in our cities. The uninterrupted increase in the price of urban land which is found operating everywhere in great cities thus adversely affects the municipal budgets of these cities. The lack of sufficient municipal means affects all matters concerning the development, and especially the hygiene of the city. On the one side the capital of the community is swallowed up by the unproductive purchase of land, and on the other hand the capital used to improve conditions of life in the town becomes every day more insufficient.

The present anti-social conditions have as a definite result the continual increase of "dead capital," as we call it in France, and the interest to pay the necessary charges on this dead capital becomes a more crushing burden as years pass by.

The method which it is necessary for municipal activity to take in the future is the reverse of this present system. The city ought to use every effort to diminish in very great proportions the amounts expended in the raising of values of town lands, for these sums are "dead capital" as far as the great mass of citizens are concerned. On the other hand the city should increase expenditure on all those things which will be productive of health and hygiene for the people.

Instead of using capital to legitimate and consolidate the growing price of land in the city, the municipal authority should use all its resolution, all its intelligence and all the capital it can raise for the purpose of improving the conditions of the working-class quarters and increasing by every possible means the value of the capital of life—a capital which in a progressive community should be always increasing and improving.

It is this increase in the value of human life which is essentially the capital of the people—and not the increasing value of the land on which they live—and one of the means of attaining this end is undoubtedly to be found in the rational organisation of town extension.

In this task Great Britain has a singular superiority as compared with other European nations. In this country at the present day you have a system of land ownership under which the possession of great areas of land—including the land on which several of your great towns stand—is still in the hands of a few owners. In regard to extension plans this is a unique position and one which, if in other respects there are certain disadvantages, is in this matter of town planning a most valuable auxiliary feature.

It should be recognised that in order to produce their full fruits the preparation of town extension plans should be directly related to the purchase of great areas of land at uninflated prices by municipalities in the interest of the general public. The law should clearly authorise and definitely encourage local authorities to deal with the problem in this way.

Most certainly they should not be compelled, as at present, to seek the permission of the central authority before making these purchases. It is necessary that your Parliament should realise that it is not in the national interest that local authorities should in these matters of hygiene and municipal development—questions of primary importance to each district—not be held in tutelage like infants whose every step must be watched.

The wealth of a great nation is built up of the wealth of all those centres which we call towns. It is possible that in this matter of municipal freedom some towns are under the control of committees filled with responsible men of good sense—men who know what are the best and most business-like steps to take.

At the International Congress on Hygiene held in Berlin in September 1908, this subject was considered and the Congress passed the following resolution as embodying the general opinion of hygienists:—"In order that limits may be placed to land speculation it is desirable that municipalities, representing as they do the special interest of public hygiene, should possess large areas of land bought at cheap prices, and on this municipal land should encourage in whatever way they deem best—allowing for local conditions—the building of dwellings which shall be economical in cost and shall satisfy the laws of hygiene." A most interesting example of this has been given by the city of Ulm in Würtemberg. Let me give you a brief account of the methods which have been adopted by this city to deal with speculation in land.

Under the energetic guidance of an enlightened municipality this town has prepared a definite programme and without hesitation has used the municipal credit of the city to buy large areas of land. Ulm has realised that this question of the land is at the root of the housing question, and that it is only by keeping down the price of land over a long period of years that the healthy house can be created and maintained.

The municipal council of Ulm bought under advantageous conditions the land comprised in the old fortifications of the city and followed up this purchase by other most important operations. To-day Ulm actually possesses 80 per cent. of the total area of the town. Without approving entirely this municipalisation of land one is bound to realise the great advantages which result from this policy in the construction of suitable dwellings and the healthier life of the people.

They lease their land for 100 years, and in addition lend the greater part of their capital for the construction of the houses, and at the end of the leasehold period the town will be able to purchase the houses at their actual value.

The financial position of the city is a most prosperous one as a result of this land policy, and the rates of the city have been reduced. This remarkable example of logical municipal development and tenacity of administration in the interests of the community must be attributed to the remarkably able Oberburgermeister, Herr Otto Wagner.

On examining in the cold light of science the causes of increase of land values in great centres of life what do we find? What gives to these urban lands their great value—a value which in some cases is a colossal increase as compared with former values? Is the increase not due entirely to the work, the activity, and the industry of the people as a whole? The present iniquitous method which seeks to impose itself on all the people who fill our cities and which seeks to leave them bound hand and foot by land speculation, must give place to methods which shall be more equitable and which shall take into account the superior interest of the whole of the inhabitants in their desire to live under conditions of normal health.

We are beginning to realise the misdeeds (one ought almost to say the criminal misdeeds) that land speculation has wrought in great cities in opposing the health of the people—the true wealth of a country. The land in which men are gathered together in cities will one day be regarded as a commodity in which it will be criminal for men to speculate.

There is a direct relation—and on this point statistics are quite clear—between the price of the land in those districts in which the majority of the inhabitants of a town live and their sanitary condition. Dear land shuts out the sun—the purificator "par excellence"—from the interior of dwellings. It denies to those who dwell in these houses their human share of pure air.

Cheap land, on the other hand, renders unnecessary the construction of those abominable dwellings of several floors, one of the plagues of modern humanity, and against this type of dwelling all reflective citizens should protest in whatever country they are found.

Our wiser descendants will without doubt pass strong laws forbidding the erection of block dwellings.

Cheap land means the family home bathed in fresh air and surrounded with sufficient space to enable the direct rays of the sun to exercise their regenerating influence. Dear land has incontestably been responsible for the bad state of our cities. Land kept at reasonable prices will, on the other hand, minister to the joy of the people. The question of the purchase of large areas of land at low prices is therefore one of fundamental importance in the establishment of rational plans of town extension.

The success of town extension depends before all on the solution of this question of cheap land. In possessing large areas of such land the town can be the master in determining the price of the land and in securing that the execution of works of general well-being and public works shall be carried out.

(*To be concluded.*)

## TRADE NOTES.

The "England" Works of North Street, Leeds, have removed their London offices from 73A Queen Victoria Street, to 295 Ivydale Road, S.E.

Messrs. Griffiths & Co., Ltd., of London Wall, E.C., have secured the contract at 4,250,000*l*. for the construction of a new railway in the Republic of Chili.

Messrs. W. & J. R. Hunter, Ltd., timber merchants, of 5-11 Bethnal Green Road, London, E., request us to announce that their telephone numbers are 6143 Central (for inward calls), and 2702 London Wall.

A large clock has just been erected in the parish church tower, Pytchley, Northants, which shows time on a dial 6 feet 6 inches across, and strikes the hours on a large tenor bell. The work has been carried out by John Smith & Sons, Midland Clock Works, Derby, who made the clocks in the neighbouring churches of Rothwell, Orlingbury, and Irthlingborough.

Messrs. J. B. Joyce & Co., Whitchurch, Salop, have received instructions from the West Riding County Council to make a large clock for the new training college now in course of erection near Bradford. It will strike the hours on a bell weighing 6 cwt., and show time upon four dials 6 feet in diameter, for illumination at night. The clock will contain all the best and most modern improvements. The same firm are making a large clock for the Refuge Assurance offices, Manchester, with four dials, 12½ feet diameter, and another for St. Peter's Church, Macclesfield. They have just fixed a large striking clock at Thornton-le-Moors Church, near Chester, and are now fixing a striking clock at St. Joseph's College, Dumfries.

Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester, have recently supplied their patent Manchester Stoves, with descending smoke flues, to the Women's Hospital, Soho Square, London; the extensions to the Guildford Union and the new Infirm Block, Warrington Workhouse Infirmary, are being warmed and ventilated by means of Manchester Stoves and Grates; the new schools, Scartho, near Grimsby, and Dr. William's School, Dolgelly, are being warmed and ventilated by means of the Manchester Grates; and the Princes Hall, Hull, is being ventilated by means of this firm's patent Exhaust Roof Ventilators. Messrs. E. H. Shorland & Brother, Ltd., have also supplied their Warm Air Ventilating patent Manchester Grates for the offices of Messrs. Foster Brothers, Gloucester, and the Council Offices, Cottingham.

## TRADE CATALOGUES.

Messrs. Grey & Marten, Ltd., City Lead Works, Southwark Bridge, S.E., have recently issued a cloth-bound priced catalogue which extends to nearly four hundred pages, of which the index alone occupies nine. The first section deals with ranges, register stoves, mantelpieces, and accessories. The next section is devoted to sanitary goods like baths, lavatory basins, closets, and plumbers' brass work; then follows such builders' ironmongery as rim locks, and door furniture of all kinds, electrical fittings, rain-water fittings, gas fittings, pumps, and a miscellaneous assortment of other goods. The catalogue is well printed on high-class paper.

The Pyramid (K. B. & S.) Brand of Portland Cement has been known in this country for close upon half a century; to be exact, it was in 1853 that Messrs. Knight, Bevan & Sturge first produced this well-known brand. Some millions of tons have been sent out of their works since then, and the quality has been steadily improving ever since. Ten years ago the firm transferred their business to the Associated Portland Cement Manufacturers (1900), Ltd., and under the new control the whole of the plant has been reconstructed and put abreast of the latest scientific ideas. An excellent illustrated pamphlet has been prepared to suggest how the material is prepared and how successful it has proved both in actual use and in laboratory tests. It is a noteworthy fact that the list of the more important works where the "Pyramid" Brand has been used is almost entirely made up of foreign contracts.

S. W. Francis & Co., Ltd., have, of course, their fine premises in Gray's Inn Road (Nos. 64-70), London, W.C., and from them come the latest improvements in wood, steel, and iron revolving shutters, as well as shop front fittings of all descriptions. Their 1910 illustrative and descriptive price list will give much valuable information and many useful suggestions in specifying fronts for banks, shops, public buildings, &c. Particular attention is called to their new Patent No. 4 Steel Hinged Self-acting Wood Shutter as a "speciality," for style and quality, combined with the simplicity of its working. This shutter is manufactured from the best pine, in uniform convex laths, connected with patent steel hinges. They are attached to stout barrel cases and charged with steel spiral springs of the best possible manufacture, and possess the striking feature that they are the only springs that run throughout the entire breadth of shutter and bearing, thereby ensuring against the deflection from unevenly distributed weight. Messrs. Francis & Co. have shutters specially designed to meet the variety of purposes for which they are now installed. It would appear from the price list that the firm have won the confidence of architects and engineers, for they have put up work at a great number of electric stations, garages, markets, railway termini, banks, and theatres. We can well believe that there is scarcely a town in the Kingdom which does not contain some of their work.

"Electricity Applied to Light and Power" is the title of a well illustrated booklet issued by Messrs. Drake & Gorham, Ltd. It is described as a treatise on the application of electric current to every phase of country house and estate requirements. The second part of the book is occupied with a long list of their electric light installations and subsequent testimonials. Practically every page contains photographs of buildings and plant which give it additional interest.

Messrs. Bristowe & Co., Ltd., Broad Sanctuary Chambers, 20 Tothill Street, Westminster, S.W., and at Blackpool, have sent us an excellent little catalogue of their H. H. Sanitary Fittings. The most striking characteristic of these is their modernity. It would seem as if the firm do not turn out an article for the simple reason that it is a successful line with other firms, but that they only enter the field when they have devised some cardinal improvement on existing types. Thus the catalogue illustrates and describes baths, lavatories, closets, sink gullies, and grease traps; in each article there is some distinctive feature which reveals the expert mind. The improvements are not a mere alteration of a minor detail made for the sole purpose of rendering the article technically different, they are genuine advances. It may be often observed that sanitary fittings have been designed with an almost exclusive regard to their appearance, and at a considerable sacrifice of efficiency. The H.H. fittings, while by no means lacking the attraction common to a fitting of high make and finish, have been primarily designed to remedy those defects in principle and detail which are to be found in existing types. Their combined footbath and children's bath, for instance, only occupies 2 feet 9 inches by 2 feet 6 inches of floor space and affords an effective bath with only 6 to 8 gallons of water. The water comes from a mixing tank overhead, raised about 9 feet from the floor. It can be supplied from existing hot water arrangements, or from an independent water heater. The improvements of the H.H. closet are particularly in respect to the patent junction with metal soil pipe, the removal of the necessity for a solder joint in the wall, the increased water area, and improved flush pipe joint. The H.H. iron grease trap is designed to meet a growing necessity for the prevention of grease entering the waste pipe stack when the scullery sinks are on the upper floors of a building. The catalogue illustrates and describes these and other plumbing specialties which have been put on the market after lengthy tests by Messrs. Bristowe & Co., Ltd.

## COMPETITIONS OPEN.

Ashton-on-Mersey.—Architects practising within ten miles of Sale desirous of competing for proposed Sunday schools in connection with the Wesleyan Chapel are invited to communicate with Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

Belfast.—Sept. 5.—The Senate of the Queen's University are prepared to receive designs for the enlargement of the present buildings at a cost of about 52,000*l*. Assessor, Sir Aston Webb, R.A. Two premiums of 150*l*. and 100*l*.; particulars 2*l*. 2*s*., returnable within three weeks, or on receipt of bona fide design. Mr. J. M. Finnegan, B.Sc., secretary, Queen's University, Belfast.

Edinburgh.—July 9.—The Corporation invite designs for the erection of a new hall in Lothian Road, Edinburgh. They have appointed Sir Aston Webb, C.B., R.A., as assessor, Mr. J. A. Williamson, A.R.I.B.A., City Chambers, being associated with him. Three premiums are offered. Particulars and plans of the site will be supplied to competitors on payment of two guineas, which will be returned on receipt of a design in accordance with the conditions. Should architects, on receipt of the particulars, not desire to compete, the deposit will be returned, provided the papers are returned within four weeks. Mr. Thomas Hunter, town clerk, City Chambers, Edinburgh.

Ireland.—August 23.—The Meath County Council invite architects practising in Ireland to submit plans and specifications for county offices to be erected at Navan. Apply to the Secretary, Meath County Council, Navan.

London.—June 15.—The Acton Urban District Council invite plans for schools at Rothschild Road for 850 pupils. Premiums of 100*l*., 50*l*., and 25*l*. are offered, but any premium awarded to the successful architect shall be merged in his commission of 3½ per cent. Deposit 10*s*. 6*d*. Apply after April 5 to Mr. F. A. Everitt, secretary, Education Department, Council Offices, Acton. W.

## CONTRACTS OPEN.

Bewcastle, near Carlisle.—June 17.—For the mason work required in erection of a girder bridge at Bailey Mill, Bewcastle. Mr. James Murray, surveyor, Kirklinton, Carlisle.

Birkenhead.—June 13.—For plastering three wards at the Union Infirmary, Church Road, Tranmere. Mr. John Carter, clerk, Poor Law Offices, Birkenhead.

Birkenhead.—June 14.—For building repairs at the Guardians' stable and yard, Oliver Street, Birkenhead. Mr. John Carter, clerk, Poor Law Offices, Birkenhead.

Bridgwater.—June 7.—For alterations, cleaning and renovation of parts of the interior of the municipal offices and town hall. The Borough Surveyor, Municipal Buildings, High Street, Bridgwater.

Bristol.—June 10.—For the extensions of the infirmary, comprising the erection of new wards for about 180 beds, operating theatres, and casualty department, on a site in Marlborough Street. Deposit 10*l.* Messrs. Bernard & Son, quantity surveyors, 26 Orchard Street, Bristol.

Bentham.—June 10.—For the builder, joiner, plumber and painter works required at the Head Teacher's House, Bentham Lower Council School. Education Architect, County Hall, Wakefield.

Carlisle.—June 6.—For the whole of the works required in erection of additions to wash-house at Fusehill Workhouse. Mr. George Armstrong, architect, 24 Bank Street, Carlisle.

Chadderton.—June 18.—For erection of wash-houses, &c., in connection with the caretakers' house at Eustace Street and Stanley Road schools. Mr. J. Whitehead, clerk to the committee, Education Offices, Chadderton, Lancs.

Charney Bassett.—June 7.—For erection of a small holding dwelling-house and farm buildings at Charney Bassett, Berkshire. Mr. W. E. C. White, County Land Steward's Office, Assize Court, Reading.

Chester.—June 13.—For building a fire-station at the premises in Northgate Street. Deposit 1*l.* Mr. James Strong, architect, 11 Dale Street, Liverpool.

Chislehurst.—June 15.—For erection of a post-office. Deposit 1*l.* 1*s.* The Postmaster, Chislehurst. H.M. Office of Works, Storey's Gate, London, S.W.

Dewsbury.—June 6.—For the various works required in alterations and additions to the Gladstone Liberal Club. Messrs. Kirk, Sons & Ridgway, F.R.I.B.A., architects, surveyors and valuers, Market Place, Dewsbury.

Durham.—June 14.—Sole tenders are required by the Durham Education Committee (1) for alterations and additions at Black Boy Council school; Mr. F. H. Livesey, architect, Newgate Street, Bishop Auckland; (2) for alterations and additions at Eldon Council school and caretaker's house at Murton Colliery; Mr. F. E. Coates, Shire Hall, Durham; (3) for manual instruction room at Cockton Hill; Mr. W. Rushworth, Shire Hall, Durham.

East Preston.—June 6.—For erection of a verandah to the infirmary, and the conversion of existing premises as a meat store, at the workhouse, East Preston, Sussex, for the Guardians of East Preston Union. The Chairman of the Board, East Preston, near Worthing.

Farnham.—June 21.—For certain repairs to be executed to Tilford East Bridge. Deposit 10*s.* 6*d.* Mr. Arthur J. Stedman, surveyor, South Street Chambers, Farnham.

Farnham.—June 21.—For erection of proposed cottages at their Ash and Hindhead depôts, for the Farnham Rural District Council. Deposit 10*s.* 6*d.* for each cottage. Mr. Arthur J. Stedman, surveyor, South Street Chambers, Farnham.

Forest Hall.—June 6.—For erection of proposed police station at Forest Hall, Northumberland. Deposit 2*l.* 2*s.* Mr. J. A. Bean, county architect, The Moot Hall, Newcastle-on-Tyne.

|---|---|---|---|
| MUSSELWHITE & SAPP, Basingstoke (*accepted*) | £1,776 | 0 | 0 |

## PARK LANGLEY, KENT.

ALTHOUGH it is not quite a year ago since the first sod was turned at this picturesque estate, which is on the outskirts of Beckenham, Kent, there are already some thirty houses in occupation, with more than double this number practically completed.

The estate has been planned by Mr. Reginald C. Fry, of Clifford's Inn, W.C.

It has an area of some 700 acres, and the houses will stand upon a sand and gravel soil at heights varying from 200 to 300 feet above sea-level. Each purchaser or tenant will possess, with his house, a frontage of about 50 feet and a depth of 200 feet.

Gas, electric light, and water are laid on the estate, and the laying out and construction of the roads have been entrusted to a thoroughly competent engineer.

Taking Napoleon's conception of Paris as a model, the centre of the property is occupied by a large circular court, from which broad avenues radiate to the verge of the estate, whilst other roads form outer circles around the centre, in which will be built the shops for the use of tenants.

Messrs. H. & G. Taylor are the proprietors, and the following are a few of the sub-contractors:—Enamel and paints, Messrs. Thos. Parsons & Sons, of Mitcham, Surrey; stoves, Messrs. Bratt, Colbran, The Carron Company, and Brooks, Phillips & Co. The tiles are supplied by The Keymer Brick and Tile Co., Sussex, and Messrs. Tucker & Co., of Loughborough, and the bricks by Messrs. C. H. Norris, Ltd., of Erith, Kent. Messrs. Mander & Co., of Wolverhampton, are doing the oak graining, and the Turk system of drying is being universally employed.

## TRADE NOTE.

THE British Uralite Company (1908), Ltd., announce their removal to more commodious offices at 85 Gresham Street, London, E.C. The Company are able to make an important announcement regarding the regulations made by the various insurance companies, whose regulations are very strict as to the premiums to be charged. On wood partitions where these are protected by Uralite ½-inch in thickness, a reduction in insurance to the extent of 1*s*. per cent. is allowed.

## VARIETIES.

IT is proposed to erect a new public hall in the High Street, Broadstairs.

PLANS have been approved by all the authorities concerned for the enlargement of the Dunfermline and West Fife Infectious Diseases Hospital, at a cost of 10,308*l*.

MR. OSBORNE, architect, Blyth, has prepared plans for a council chamber and municipal offices to be erected at Ashington, at a cost of about 3,000*l*.

A PROJECT is on foot to erect a theatre at Gosforth on a piece of vacant land at the foot of Salter's Road. It is said that the promoters intend making a handsome and up-to-date building.

THE streets committee of the Middlesbrough Corporation on Tuesday decided to rebuild the butchers' market at a cost not exceeding 2,500*l*., and to make provision for sixty-eight stalls. The butchers' market was destroyed by fire in November last.

THE Council of Armstrong College, Newcastle-on-Tyne, have been officially informed of a gift of 10,000*l*., as a memorial to King Edward VII. The money will be devoted to the erection of a new School of Art, towards which the Council will contribute 8,000*l*. and a site.

THE Cardiff public works committee were informed last week that the lowest tender for the erection of a workman's cottage at Lavernock for the use of the valve attendant was 600*l*. Mr. Harpur, city engineer, explained that the high cost was due to the cost of haulage and the increased cost of labour at Lavernock.

THE British Acting Vice-Consul at Dardanelles (Mr. C. E. S. Palmer) reports that an exhibition of antiquities is shortly to be opened at that place. This is the first stage of an attempt to divert the tourist traffic from Karanlik Liman to Dardanelles. If the scheme promises well, the building of an hotel and the improvement of the road to Erenkeni would be undertaken.

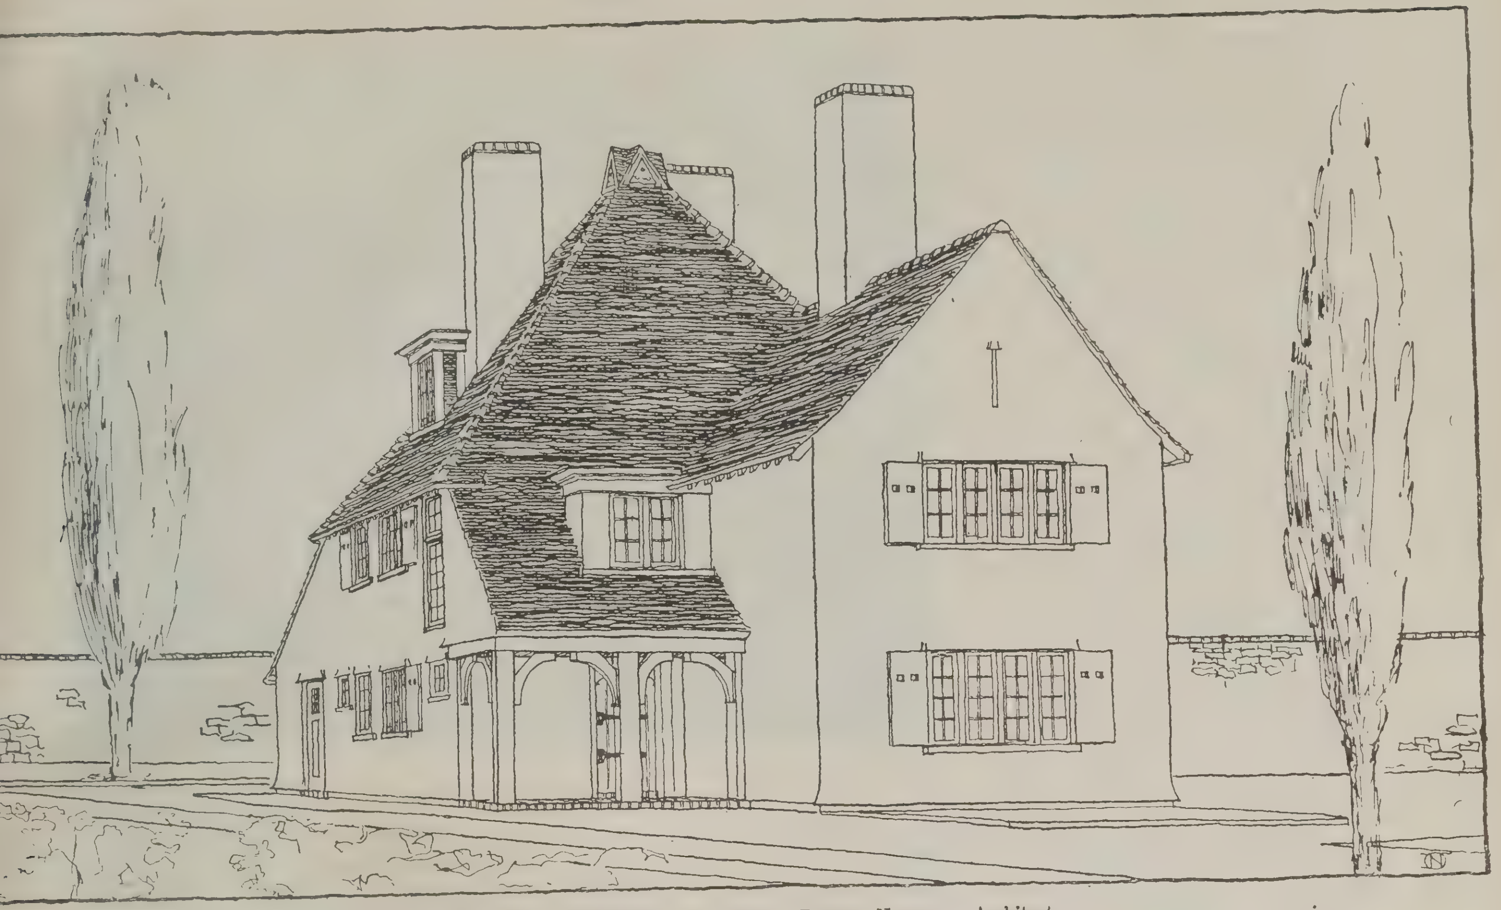
THE Governors of the North Staffordshire Infirmary have decided that structural alterations found necessary should be proceeded with, and an appeal is to be made at once to the public. The late King laid the foundation stone of the Infirmary in 1866, and it is proposed that the new work should be a memorial to his name. It is intended to form an appeal committee with a view to raise at least 35,000*l*.

THE fiction contained in the June number of *Pearson's Magazine* is quite up to its usual standard of interest. A new series of clever, fantastic stories has started under the general title of "Professor Peterson's Experiments." They relate, in a very diverting manner, the peculiar experiences that befell a modern scientist who dabbled in the mysteries of ancient Egypt. Among the contributors to this issue of *Pearson's Magazine* are E. Phillips Oppenheim, Roy Norton, Brinsley Moore, and many other well known writers.

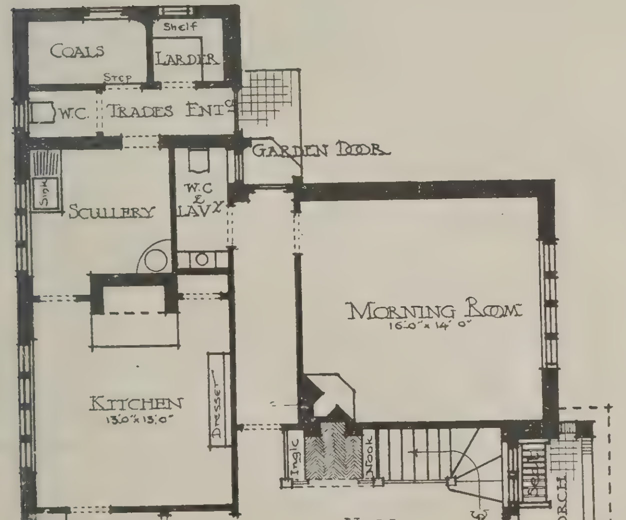
TIVERTON Town Council last week discussed whether there should be an open competition for the plans for the new boys' elementary school. The education committee had submitted as a compromise against the Council's last proposal for open competition, that the competition should be limited to eight architects of repute. Various amendments were proposed, and the voting, after two hours' discussion, was taken. One to confine it to Devon, was rejected. The proposal to throw the competition open to the county, with 50*l*. and 25*l*. premiums, was carried by 11 to 10 votes. Upon this being put as a substantive resolution another amendment was moved that Mr. Ashford (architect, Tiverton Middle schools, now in course of erection) be instructed to prepare plans. This finally became the determination of the Council by 11 votes to 10.

BUILDING in Montreal is very active this year, and the *Builders' Exchange* states that all previous records of that city will probably be exceeded. Including the operations projected by the Canadian Pacific Railway to the extent of $6,000,000, there are now about $12,000,000 worth of railroad, departmental stores, and other business and public buildings being started, under way, or completed. Blocks of dwellings containing a thousand flats are being built in the north end of the city, while unusual activity prevails in all the suburbs in building houses and flats, of which there has for some time been a scarcity in the city. The larger works were mostly projected last year, but during the first four months of the present year permits to the extent of $3,500,000 were issued, being $1,500,000 in excess of the figures for the same period in 1909.

A COUNCIL meeting of the London Master Builders' Association was held on May 26, when the President (Mr. Leonard Horner) took the chair. The Council approved the recommendations made with reference to affiliation fees, and appointed a committee to consider and report upon the question of measurement of slating and roof tiling. Cases were reported where sub-contractors were specified to do work usually done by builders, and action was determined upon in order to check this growing and objectionable practice. Amendments of the agreed form of building contract, proposed by a branch of the National Federation, were considered and referred to the Institute of Builders for consideration. A Parliamentary Bill to amend the law relating to Trade Unions was referred to the parliamentary committee.

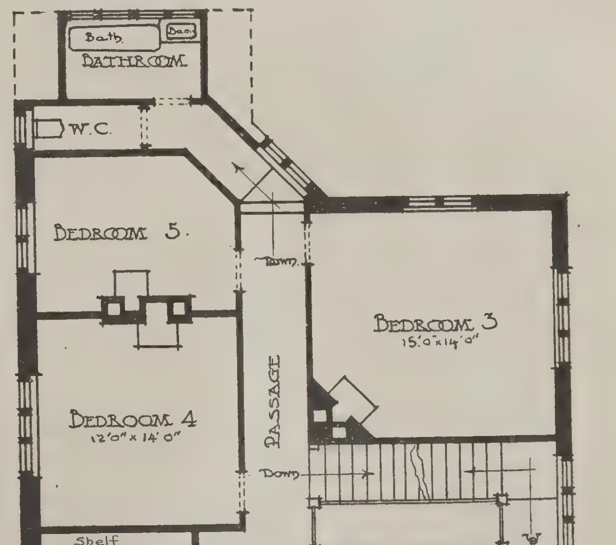


HOUSE IN FERNDOWN, DORSET.—BRYANT NEWBOLD, Architect.



HOUSE IN FERNDOWN - DORSET

~ GROUND FLOOR ~



BY BRYANT - NEWBOLD ARCHITECT

- FIRST FLOOR - -

## POLISHED WOODWORK.

The growing use of polished wood floors has aroused something akin to keen rivalry between housewives as to the quality of surface presented. This apparently simple operation, however, requires something more than good intentions as many of these competitors discovered. Fortunately the Ronuk Company invented a Sanitary Floor Polish, which at once solved the difficulties. Although its use presented no difficulties the company followed up and completed their invention by organising a Polishing Contract Department with a special staff of workmen.

The increasing demand for their services in private houses has led the Ronuk Company to open a new London depot at 16 South Molton Street, W. This showroom, which was opened last week, is panelled in oak, and is a fine example of high-class English joinery. The floor is laid with oak blocks, and both flooring and panelling have been treated and polished by the Company's own staff of workmen. They furnish a striking testimony to the perfection of finish obtained by the "Ronuk" Improved Sanitary Method. The same applies to the heavy oak beams in the ceiling and to all the wood fittings.

The showroom, as will be seen from the accompanying illustration, is entirely unlike a shop. It is furnished with carved oak Jacobean chairs, tables, Persian rugs, with blue and white Delft china on the ledges over the panelling.

## THE CORROSION OF METALS.

Engineers, metallurgists and users of non-ferrous metals will be interested to learn that the Council of the Institute of Metals have decided to undertake an investigation into the causes of the corrosion of non-ferrous metals by sea water, acids, &c., and by other chemical and electrolytic reactions. A committee known as the Corrosion Committee of the Institute of Metals has been appointed for the purpose of carrying out the investigation. The following are the names of the gentlemen constituting the committee:—Sir Gerard Muntz, Bart., chairman of the committee (president of the Institute of Metals); Professor H. C. H. Carpenter, M.A., Ph.D. (of the University of Manchester); Engineer Captain G. G. Goodwin, R.N. (Deputy Engineer-in-Chief, Royal Navy); Professor A. K. Huntington, Assoc.R.S.M. (King's College, London); Mr. J. T. Milton (Chief Engineer Surveyor, Lloyd's Register of British Shipping); Mr. A. Philip, B.Sc., Assoc.R.S.M. (Admiralty Chemist); Mr. Leonard Sumner, M.Sc. (of the Broughton Copper Co., Ltd.); Professor T. Turner, M.Sc. (of the University of Birmingham); Sir William H. White, K.C.B., F.R.S. (Past-President of the Institute of Metals).

The first meeting of the committee was held at the offices of the Institute, Caxton House, Westminster, S.W., on May 24, all the members being present with the exception of Sir William White, who has just left for a visit to the United States of America. Realising the magnitude of the task before them, and the vast number of ramifications to which such an investigation must lead, the committee have decided in the first instance, to confine their attention to the question of the corrosion of condenser tubes in marine engines and in stationary engines using foul water or being subject to violent electrolytic action such as often occurs in electric power stations. Before commencing experimental research the committee propose to have prepared an epitome of such information on the subject as is already available from previous research in the same direction. Mr. G. D. Bengough, M.A., of the Metallurgical Department of the University of Liverpool, has been asked to undertake this work and to become a member of the committee. On the completion of the work by Mr. Bengough, it will be submitted to the committee, who will then consider what steps shall next be taken in the matter of further investigation and experimental research, with a view to elucidating the various mysteries of corrosion which are the source of so much trouble and anxiety both to users and manufacturers of articles composed of copper and its alloys.

Professor H. C. H. Carpenter, M.A., Ph.D., of the University of Manchester, whose work for the Alloys Research Committee of the Institution of Mechanical Engineers, is so well known and highly appreciated, has kindly undertaken to act as honorary secretary to the committee.

The result of the committee's researches will be at the disposal of the members of the Institute of Metals, which already includes in its membership most of the leading manufacturers and users of non-ferrous metals, and doubtless those who have not as yet thought it worth their while to associate themselves with the Institute, will in view of the useful and most important work which it has now initiated be anxious to join its ranks. This trouble of corrosion is one which has long given infinite cause of annoyance and anxiety to all who have to deal with non-ferrous metals, and above all to marine engineers, and it cannot fail to be a matter of general congratulation amongst engineers that the solution of the problem has now been undertaken seriously by a body so competent to deal therewith as the Institute of Metals, which comprises within its membership makers, users and scientists, and, therefore, has at its disposal information such as no other body possesses or could hope to possess.

The annual general meeting of the Cardiff, South Wales and Monmouthshire Architects' Society was held in their room, No. 6 High Street, Cardiff, on the 30th ult., when Mr. Cecil L. Wilson, F.R.I.B.A., was elected president for the ensuing year. Other officers and members of the Council were also duly elected. The accounts of the Society were shown by the hon. treasurer to be in a very satisfactory condition, and a report was read by the hon. secretary recording the various exhibitions of drawings held in the Society's room, the visits paid by members to works under construction, &c., and other matters of business transacted by the Society during the past twelve months. Various suggestions were made as to the future work of the Society, and there is a good prospect of interesting outings during the coming summer, and of instructive papers to be read at the winter's meetings.

The Hexham Urban Council held an extraordinary meeting on Monday to reconsider last week's decision regarding the purchase of the Abbey grounds. The Chairman read a letter from the Benson family of Allerwash, offering an additional 500*l*. to their gift of 1,000*l*. towards the purchase of the grounds. A petition signed by leading townsmen was also received guaranteeing 500*l*. After discussion, a resolution was unanimously carried that, subject to the Local Government Board's approval, the Council agree to purchase the Abbey grounds from Lord Allendale for 6,000*l*. The grounds, which are 5¼ acres in extent, are beautifully timbered, and are adjacent to Hexham Abbey.

## FUNDAMENTAL CONSIDERATIONS IN ENGLISH TOWN PLANNING.*

(*Concluded from last week.*)

It seems quite fitting that municipalities should watch over the evolution which day by day seems to be more and more necessary. Entrusted with the administration of the general interests of the community, the municipality seems better fitted than any other body in the State to know what is necessary to the well-being and future welfare of the inhabitants of the city.

It will be a great illusion to expect that much light and leading will be given in these questions by Central State Departments. It is true that the central authority ought to trace the direct lines of the movement and, by passing laws (having as much elasticity as possible), should indicate the general methods to be applied. When, however, the State is not content with this high mission and undertakes to foresee and to determine in the most minute details the conditions to be imposed on muncipalities, a condition of affairs is created which involves the destruction of local initiative.

Such a State policy strikes at the best traditions of the local life of counties and of provinces. It destroys that local patriotism which is the most solid feature in building up national patriotism.

Each country should adopt general methods of municipal administration. The application of these methods should, however, be determined by local conditions and the needs and customs of the people. From the point of view of town-extension planning it would be a great mistake for one country to adopt purely and simply in all details a method which has given certain results in another country. In this relation it must be urged that the methods of town-extension planning which have accomplished so much in Germany do not seem to be applicable to Great Britain.

Without seeking to examine the motives of those who today are in Germany building up colossal fortunes on land speculation at the expense of the community (a fact which seems to be unrecognised in Germany), we must recognise that the great German cities are being forced in a path of development absolutely beyond measure and under conditions which nothing can justify. The insatiable desire to increase at all costs the size of their towns carries with it the germ of great reaction in the future. To an intelligent observer there would seem to be a kind of mutual understanding between a certain category of land speculators and the interests of great bankers, who under the pretext of public health see in this aggrandisement of the towns an opportunity of increasing the value of the land and the obtaining of enormous great profits as a result. One would hardly care to state in Germany the figures of enormous gains already secured in the great cities as a result of their town-extension plans. The city of Ulm, however, seems to have found the right land policy, thanks to the Oberburgermeister, Herr Otto Wagner, who for eighteen years has been at the head of the municipality.

The goal of town-extension plans should be above all the betterment of the housing conditions of the great mass of the people. Generally speaking, in the great cities of Germany which have adopted town-extension plans the Housing Societies which occupy themselves with the task of providing workmen's houses are not yet strong. They have the greatest possible difficulty in extending their operations in face of the private syndicates of land speculators. These syndicates have secured in advance all possible land profits, and by preventing these Housing Societies from securing cheap land have directly attacked the health and the happiness and the life of the people.

In Great Britain, with your eminently practical spirit—a spirit without prejudice and above all anti-theoretical—you have an opportunity of finding a rational solution in this question of town-extension planning. As I have already pointed out you are in a specially favourable situation. Your condition compares favourably with that of Germany, in which the municipalities will sooner or later find themselves in great difficulties as a result of the great increase in land values.

In France the situation is of another kind. The great number of small owners of land, a consequence of that "régime de liberté" which is one of the glories of France, renders the preparation of town extension plans a very difficult task, and it is necessary, therefore, that we should adopt a wide range of methods in solving our problem. None of these difficulties exist in Great Britain. It may also be said that—compared with Germany—great land speculation is non-existent with you as a result of the fact that the few great landlords are not free to sell their land. These circumstances which are to-day so favourable to you ought to render it possible for you to develop a method of town-extension planning which should be almost a perfect one, and which should in the future make the cities of Great Britain the modern cities "par excellence."

Your plans of town extension must moreover be carefully safeguarded against the adoption of projects which are too monumental. This perhaps is one of the leading characteristics of German thought to-day—and seems bound to lead the great cities of Germany by steady steps in the downward path to great municipal deficits.

It is not by providing perspectives and grandiose monuments that we shall make our cities healthy and our people happy. This method of planning simply creates in the public mind a false conception of grandeur—a grandeur not related to simple life and to home life.

That which the cities of Great Britain should in the future strive to attain is such a solution of this problem as shall secure public roads which shall be beautiful and pleasant, but above all economical in construction and maintenance. Great Britain has already given Europe many good examples in this field of work. It is necessary that you should develop your town extension work along this same line.

In my opinion, the garden city should be regarded as an ideal to which the older towns should endeavour to mould their developments even though they cannot hope to secure this result. It is above all things necessary in England to create a strong public opinion against the Americanisation of your towns—a tendency which in Continental cities there is such a desire to follow. There should be a peaceful war waged by those who are disinterested advocates of town planning against the block dwelling, and all advocates of better housing conditions should be together in this fight.

You with your national tenacity of purpose should remain faithful to the small house—the house for one family. By the adoption of the zone system you will be able to concentrate the buildings for commerce and for manufacture in certain districts clearly outlined in advance and subject to special rules regarding height of building, &c.

In the other parts of the city each citizen must be able to establish his home—the nest of the family, the loved dwelling in which the children are born and grow up. Your towns must refuse to permit the erection of block dwellings—the worst infliction of modern life.

One of the dominant features of English life—one of the traits which affect so vitally the temperament of your people —is the love of nature, a love instilled into your people from the earliest age. This love of nature is expressed in the strong desire to have a garden to cultivate, the love for flowers in windows and flowers in the rooms. On seeing a little country cottage one is struck with the care shown in the cultivation of plants. It would seem that with you the affection for flowers is almost equal to the affection for your fellow creatures.

There is nothing really more beautiful than the real English country cottage. Surrounded by verdure it takes harmonious form. The small windows seem to be set in a frame of climbing plants. As for the garden it seems almost a living poem. It would seem as if in the English garden nature had been caressed by the human hand. The little porch over which hang the climbing roses, the arbour on which the honeysuckle climbs, together make a setting which seems to make life well worth living. The human man finds himself in his proper setting in possessing his garden, his plants, or his flowers and his fruits.

Let us here realise that it is because the garden is lacking in the towns that life is so abnormal and men give themselves more and more up to the desire for alcohol and for unhealthy distractions.

The moral influence of the garden is considerable. It commences in the earlier years of life and is manifested in the joy which the child shows when it sees around it the marvels of nature. Place a group of ordinary children in a big room, even a great room, and in a little time you will hear the noise of quarrels and even of blows. Place the same band of youngsters in a garden and the quarrels are transformed into cries of pleasure. All is before them, the joy of life, the playing in fresh air, the interest in flowers, herbs, plants and insects.

Give these children a small plot of garden to cultivate and you will see how closely they watch the growth of each plant, and with what joy they bring the first fruits of their garden to you.

---

* A paper entitled "Consideration of the Fundamental Conditions which should govern Town Extension Planning in Great Britain." Prepared for the National Town Planning Council by Monsieur Augustin Rey, Architecte, Paris, Membre du Conseil supérieur des Habitations à Bon Marche, Corresponding Member of the International Committee on Tuberculosis.

After all the child is the "father of the man," and it will be right to say that the man is only a child with an added number of years. His tastes are modified in course of time, but do not change in reality.

The workman bends down over his tools all the day, and he becomes enervated and his temper suffers. The noise and the absence of fresh air all affect his nervous system. He goes in his leisure hours to an unhealthy public house and endeavours to find there forgetfulness of his daily labour.

Give him a garden and he becomes cheerful, his chest expands under the influence of the pure air. Bending over his spade he looks with pleasure at the "mother earth" which will render to him in vegetables, in flowers, and in fruits all that which he has given to it in labour. The attraction of unhealthy pleasures disappears as if by enchantment before the irresistible attraction of the earth. The earth on which he is born, which gives to him a long life and subsistence, and to which he will go for his last long sleep—it is this earth to which belongs all life, this earth which men ought to cultivate, which men love to cultivate and which gives back in joy and fertility all men's hours of labour.

Let men have a foothold on the earth and you will find yet again the right equilibrium between the physical and moral. The life of overcrowded cities kills them morally and atrophies the love of men for the land. Nature, if only we will love it a little, can give all health, joy, and happiness, and from it the human family can obtain by daily labour the means of life.

The child grows strong in the garden, the man seeks his rest there, and the housewife seeks there the food which will help her in the economies of her household. It is for this reason necessary that we should carry all we can of country life into the town and place around the dwelling of the workman that verdure which constitutes the true ornamentation and the most beautiful of all ornamentation for our modern cities.

Great Britain will do well to remain the country which has most fully preserved the cottage with the garden. You are not yet invaded with the block dwellings, which are veritable "Hades" for the workmen's families, and which slowly degrade and throw out of equilibrium the health and happiness of the people.

Who has not had under his eyes the picture of the squalid little home overcrowded with children without proper place to play? Obliged to continually interfere in the children's quarrels, living in a closely confined dwelling, badly designed, the wife loses her temper. The father comes home to an overcrowded dwelling of crying children and bad-tempered wife, and his only idea is to escape from it all to the nearest public house.

All this can be changed in the cottage. The children can have their proper place to play, and the mother can give her attention to the home.

Let me, therefore, most strongly urge you in elaborating your extension plans to conserve and increase your English cottages. The other countries must follow you in the path of progress as opportunities come to them. The work of developing the cottage life of the people will be a work much more lasting for the happiness of the people than the unhealthy aggrandisement of towns which waste the health of the people and only secure grandiose and monumental features.

I come now to the last point of my paper, which is that the most practicable means of giving to a town extension plan an indisputable hygienic value is to be found in the limitation of the number of persons per acre. This method ought to be taken as a fundamental principle to be recorded in every local law in Great Britain, in order to completely avoid the overcrowding of dwellings and the shutting out of air and the light from dwellings.

If this vital principle be adopted the good results of town-extension planning will be widespread and even in the old quarters of a town, overcrowded and unhealthy as they are, their final depopulation and clearance will follow. It is absolutely necessary to bring home to the human conscience the truth that the human bees were not made to be placed one above another but to live spread out on the surface of the earth. It is the destiny of man to profit by the fruits of the earth and to enjoy the vegetation which has been created to give him pure air to breathe in order that he may procure subsistence and maintain in equilibrium his physical and moral condition.

Finally, let me summarise in the following paragraphs that which seems to be the most essential for you to obtain in this great country in regard to town extension, viz. your policy on this question of the land. You have great enterprise and should succeed. Great Britain is ready for such a policy, and by her happy destiny she can succeed in a great reform—a reform without which no other reforms can be regarded as complete.

### A LAND POLICY FOR TOWN PLANNING.

1. *The Purchase of Land by Municipalities of the Towns.*—By a law of the State all the cities of Great Britain should have special privileges to buy land (and if necessary all the land), whether situated in their boundaries or in a wide suburban area.

2. *The Purchase of Land by Annuities.*—In order not to overburden the budgets of the municipalities the purchase of such land, the price of which should be fixed by special commissioners, should be payable by annuity bonds.

3. *Land thus acquired by Municipal Authorities should never be Sold but Let.*—The land thus included in the municipal possessions should never be sold, but let for building on long leases with special clauses limiting the number of houses to the acre, prescribing conditions in regard to rent and providing specially for the construction of suitable dwellings for the people.

4. *Conditions for Future Land Purchase.*—In all future purchases the price of land for the widening of public roads and for procuring sites for public buildings should be in a direct relation to the value of the land already acquired for the purpose of town planning.

## ALEXANDRA WHARF.

To the great majority of our readers Alexandra Wharf, Tidal Basin, Victoria Docks, E., is well known by name, and many of them are acquainted with it, and the proprietors, Messrs. Hahn & Co., from visits paid to the Wharf for the purpose of inspecting the enormous stocks to be found there, which comprise every variety of Foreign Hardwood. These necessarily form but a small proportion of Messrs. Hahn & Co.'s numerous customers, who in most cases are content to leave to them the filling of their orders.

A short description, therefore, of the Wharf and its stocks, as seen by us on a recent visit, will doubtless prove of interest.

Alexandra Wharf occupies an important position on the Thames, and covers an area of four acres, having a depth of 900 feet, and a river frontage of 200 feet, where cargoes can be received at all states of the tide.

A light railway runs from the river frontage round the Wharf, and, by it, stocks being received are promptly conveyed to that part of the Wharf in which is stored the particular kind of Hardwood being discharged. A Railway Siding running into the Wharf enables trucks to be loaded expeditiously and despatched direct to all parts of the country. It will be seen, therefore, that Alexandra Wharf in area, in facilities for unloading and despatching, occupies an extremely favourable position.

But still more important to the user of Hardwoods must be the extent and quality of the stocks to be seen there, their condition, whether thoroughly seasoned, and country of origin. He cannot fail to have his attention immediately arrested by the immense stock of Wainscot Oak, of which there are no less than 6,000 logs, the pick of the Forests of Austria and Russia. Further, they are bone-dry and ready for immediate use, whether for constructional work in Churches, Public Buildings, &c., or for Bank or Shop Fittings.

Logs of Mahogany, Teak, Birch, Walnut, &c., thoroughly dry, are there also in large quantities, the selection of Mahogany being exceptionally fine.

All these Hardwoods are seasoned by natural means, artificial drying having no place on Alexandra Wharf. A special section of the Wharf is devoted to manufactured Oak, Maple, and Teak Flooring, the extent of the stock being quite in keeping with the other sections.

Within the last few weeks there has begun that improvement in the Building Trade so long hoped for, and there is every indication of it not only continuing but steadily increasing. It behoves the user of Hardwoods to take care that his stock is replenished while the present low prices continue, otherwise he will undoubtedly be obliged to make his purchases in the near future at higher rates.

SOUTH POLE EXPEDITION.—Messrs. Robert Boyle & Son, ventilating engineers, 64 Holborn Viaduct, have supplied the ventilators for the iron huts to be used in connection with Captain Scott's expedition to the South Pole.

## COMPETITIONS OPEN.

Ashton-on-Mersey.—Architects practising within ten miles of Sale desirous of competing for proposed Sunday schools in connection with the Wesleyan Chapel are invited to communicate with Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

Belfast.—Sept. 5.—The Senate of the Queen's University are prepared to receive designs for the enlargement of the present buildings at a cost of about 52,000*l*. Assessor, Sir Aston Webb, R.A. Two premiums of 150*l*. and 100*l*.; particulars 2*l*. 2*s*., returnable within three weeks, or on receipt of bona fide design. Mr. J. M. Finnegan, B.Sc., secretary, Queen's University, Belfast.

Edinburgh.—July 9.—The Corporation invite designs for the erection of a new hall in Lothian Road, Edinburgh. They have appointed Sir Aston Webb, C.B., R.A., as assessor, Mr. J. A. Williamson, A.R.I.B.A., City Chambers, being associated with him. Three premiums are offered. Particulars and plans of the site will be supplied to competitors on payment of two guineas, which will be returned on receipt of a design in accordance with the conditions. Should architects, on receipt of the particulars, not desire to compete, the deposit will be returned, provided the papers are returned within four weeks. Mr. Thomas Hunter, town clerk, City Chambers, Edinburgh.

Ireland.—August 23.—The Meath County Council invite architects practising in Ireland to submit plans and specifications for county offices to be erected at Navan. Apply to the Secretary, Meath County Council, Navan.

London.—June 15.—The Acton Urban District Council invite plans for schools at Rothschild Road for 850 pupils. Premiums of 100*l*., 50*l*., and 25*l*. are offered, but any premium awarded to the successful architect shall be merged in his commission of 3½ per cent. Deposit 10*s*. 6*d*. Apply after April 5 to Mr. F. A. Everitt, secretary, Education Department, Council Offices, Acton, W.

a great cu ... ution may lie at the this Lambeth experience.

Yes, your mackintoshes will cost you more. This is not a Free Trade joke; it's a grimly serious consequence of the rubber boom. Waterproofs have already been put up 20 per cent., and everything of which rubber forms a part is rising proportionately. As there are generally sympathetic movements in other directions, we may perhaps expect to see umbrellas also "going up." It is rather rough on us, when other trades are dull and everyone has to economise, that we should have to pay more for our tennis boots, our hot-water bottles, our golf balls, our goloshes, our ink-erasers, our rubber heels, and our elastic stockings. It's a benevolent wind indeed that blow's nobody harm. Aye, there's the rub—in fact, there's the rubber!

## JEWELLERS' ART SCHOOL, BIRMINGHAM.

The Museum and School of Art Committee of the Birmingham City Council, in their report at the meeting of the City Council on June 7, stated that they found it necessary to ask for powers to enable them to provide at once for the extension of the Vittoria Street School for Jewellers and Silversmiths. When this school was founded at the Ellen Street Council school with the co-operation of the Birmingham Jewellers' and Silversmiths' Association in 1888 it was looked upon as an experiment. In 1890 the Council sanctioned the acquisition and adaptation of some jewellery works in Vittoria Street for the housing of the school. The school has since developed in such a remarkable degree that it now holds a high position amongst the schools of art in the kingdom, and it has long been necessary that it should be provided with a more suitable and properly equipped building. In a previous report the committee stated that extensive structural alterations had been carried out to the school building on the advice of the city surveyor in order to provide adequate means of escape in case of fire. These alterations curtailed the accommodation in rooms which were already overcrowded, and rendered the new life room practically useless. Every department of the school is overcrowded, and further accommodation is urgently needed for additional classes in important branches of the metal work trade, such as die-sinking, engraving, tool-making, repoussé, flat hammering, &c. It is also necessary to provide accommodation for advanced classes in the subjects already taught. Students can only be taken up to a certain point in their studies owing to lack of space, and consequently it is impossible to give as thorough a training as is necessary in certain subjects. The committee endeavoured to obtain possession of land in the immediate vicinity of the school, and negotiations were entered into with the leaseholders of the surrounding property, but it has not been possible to obtain possession of any leases excepting upon exorbitant terms. The only good result of these endeavours was an undertaking entered into by the Governors of the King Edward's School Foundation, who own the land upon which the school stands, and also all the land immediately surrounding it, that when the leases of this property fall in in 1920 the Museum and School of Art Committee shall be granted the option of taking on lease such land as they need for the extension of the school premises. The committee were thus placed in the position of either obtaining an extension of their school at an unreasonable expense, or of finding an alternative site. They were unanimously of opinion that the present situation in the centre of the jewellers' quarter is an admirable one and should not be abandoned; moreover removal would be very costly. It was decided to attempt to carry on the work of the school in the present building until 1920, in spite of the great inconvenience and consequent detriment to its development. But the need for extension has lately become so pressing and urgent that the committee were unable to delay the matter any longer. Moreover, the Board of Education requested that serious consideration should be given to the inadequacy of the school premises and they have asked that steps shall be taken, without delay, to provide the additional accommodation which they consider is so urgently required. At the same time that the committee received this communication from the Board of Education it came to the knowledge of Messrs. Grimley & Son, the agents recently employed by the committee in their negotiations, that it would be possible to obtain the leasehold interest in a plot of land of 1,175 square yards, situated on the south side of the school, with a frontage to both Vittoria Street and Frederick Street, for the sum of not more than 1,000*l*. The committee recommended the Council to sanction the purchase of this lease, which will enable them to build on 400 square yards of the land, having a frontage of 56 feet to Vittoria Street, and to so extend the school as to provide adequate accommodation for the urgent needs of the present, and at the same time enable the existing building to be used to much greater advantage. The other part of the land is held under a sublease for the remainder of the term and is not available for extension. The lease expires in 1920, at the same time as the one upon which the site of the present school building is held; and, in order to both justify the committee in erecting a building on this land and also to provide for the future development of the school, the committee asked for permission to approach the Governors of the King Edward's School Foundation requesting them to at once enter into an agreement to grant a fresh lease to the Corporation of the whole site from 1920. This would render unnecessary any future removal of the school. If satisfactory terms are arranged with the Governors (and there is reason to believe that the Corporation will receive every consideration at their hands) the committee will at once draw up a scheme for the extension of the school, together with an estimate of the cost, for presentation to the Council. The committee remind the Council of the fact that this school is conducted at comparatively little expense to the ratepayers of Birmingham. The gross annual expenditure during the last few years has amounted to about 2,025*l.* Towards this expenditure the Board of Education has contributed 850*l.*, the Birmingham Jewellers' and Silversmiths' Association 530*l.* (annual contribution 450*l.*, prize fund 25*l.*, and fees of students 55*l.*), the members of the Jewellers' and Silversmiths' Association 55*l.* in fees, and the City Council 545*l.*

At a meeting of the City Council on Tuesday the report was adopted.

## REINFORCED CONCRETE BINS.*

AMONG the varied uses to which reinforced concrete is now put the construction of bins for the storage of materials of various kinds, the author considered, took an important place. Reinforced bins had been constructed for holding grain, coal, cement, ore, broken stone, sand and other materials. It seemed established now that not only did reinforced concrete possess in a supreme degree the qualities of fire-resistance and long life, in which respects it was superior to steel, that had been used largely for the construction of silos in preference to timber, but it originally cost no more, and sometimes less than steel, while the cost of frequent painting and repairs was saved. Steel bins cost 50 to 100 per cent. more than timber bins of moderate size.

Reinforced concrete bins were classified by the author into two main divisions:—(1) Those of large size without separate divisions, and having relatively large area in respect to height; and (2) those of cellular construction, having compartments of rectangular, square, round, or hexagonal cross-section. The silos in both divisions were usually charged with materials from the top either by direct dumping from railway waggons or carts or by means of conveyors.

The first division chiefly became the problem of the retaining wall so far as design was concerned. The paper described some reinforced concrete bins of this type. Such bins are usually required to discharge material by gravitation, and they were most often built with bottoms sloping one way to two sides, or to all sides, and delivering the material through side gates.

The second division entailed rather different mathematical analysis in the design, and the paper was chiefly concerned with the description of reinforced concrete bins of such cellular type, which likewise discharged their contents by gravitation, but generally, because of their shaft-like arrangement, were made to discharge the material directly under them from their lowest point through a centric or eccentric hole, and occasionally through side openings. These cellular silos might be again subdivided into (1) suspension bunkers; (2) circular bins; and (3) hopper bins. The first were constructed by suspending from two side girders the bottom, which was curved to assume the form of the equilibrium polygon, the stresses in the containing surface of a truly formed suspension bunker thus being purely tensile ones. In this connection it might be remarked that some suspension bunkers had been built of steel plates with a reinforced concrete lining. The circular bins (the second subdivision) were constructed with spherical or conical bottoms and the stresses were circumferential tension and vertical compression in the cylindrical sides, and tangential and circumferential tension in the bottoms. The third subdivision included the square, rectangular, and hexagonal bins, in which there were bending stresses introduced as well as direct tensile and compression stresses. The square hopper bins were perhaps the more usual type of reinforced concrete bin in this country.

The calculation of the pressures upon the side walls and bottoms of bins, the author stated, had been the subject of a fair amount of experiment and theorization, but in those of large size the lateral pressure was determined by the ordinary retaining wall theories, about which there has been a great deal of theorising and very little experimentation. The theorists, however, worked upon two main lines of thought, namely, that of Coulomb's theory of the prism of maximum pressure and Rankine's theory of conjugate stresses. Though the variants on these two theories were very numerous, there were really only two mathematical processes of treating the same fundamental idea. They were only special cases of a single general equation.

The paper then gave formulæ for retaining walls, shallow and deep bins, circular bins, suspension bunkers, and special applications of reinforced concrete, together with tables containing experimental data and diagrams to save labour in designing bins.

Some tests have shown great increase of pressure when material was in motion in bins, but only in the cases where discharge openings were at the sides, which established the importance of such openings being in the centre, for the pressures in motion with side openings were in some cases four times as great as when at rest. When, however, the grain was discharged at the centre, the maximum variation did not exceed 10 per cent.

Reinforced concrete, apart from its fire-resisting qualities and long life, possessed some distinctive advantages as regards resistance to stresses in bins. It so happened that the horizontal reinforcement in the walls of cellular silos when resisting the bending induced by one cell being loaded while the adjoining one was empty, was not called upon to develop more than half the anchorage resistance that would require to be developed with all pockets filled simultaneously. Likewise when the anchorage stresses were greatest the bending was nil, because adjoining pockets were filled. Therefore the reinforcement for the walls afforded at the same time the best anchorage for them, and it served both functions in turn.

The corners of cellular bins in the interior of a collection were usually considered to be completely fixed, and therefore the moment at the centre was taken as $pl\,\frac{2}{24}$ and in the corners as $pl\,\frac{2}{12}$, where $p$=the unit pressure. In order to obtain the greater resistance moment thus required at the corners recourse was usually had to the expedient of doubling the thickness of the walls there so as to use the same amount of horizontal reinforcement. The splaying of these corners serves other advantageous purposes in theory and practice.

It was not easy to get exact figures of the cost of erection of various bins and silos, especially in this country. In America the reinforced concrete storage bins at the Santa Fe Elevator, Chicago, Ill., cost 20 cents per bushel of storage capacity, whereas the timber working house at the same place cost $1 per bushel of storage capacity, exclusive of power plant; the machinery was, however, unusually expensive, and this made the cost high.

The working house of the Santa Fe reinforced concrete elevator at Argentine, Kas., cost 60 cents per bushel of storage capacity, exclusive of power plant, while the bins there cost 20 cents per bushel.

Regarding this country a silo containing 449,000 cubic feet of grain, with bins 8 feet square, worked out at 8*d.* per cubic foot of grain capacity, or 6*d.* per cubic foot of total cubical extent. Bunkers standing on legs containing 10,280 cubic feet worked out at 1*s.* 5*d.* per cubic foot of coal capacity, and 7*d.* per cubic foot on total cubical extent, while others somewhat larger cost $11\frac{1}{4}d.$ per cubic foot of coal capacity, or $5\frac{3}{4}d.$ per cubic foot on total cubical extent. Some maize silos in London for 167,400 cubic feet of material cost 1*s.* per cubic foot of grain capacity, or 6*d.* per cubic foot total cubical extent. Some silos in Dublin containing 33,000 cubic feet of grain cost $7\frac{3}{4}d.$ per cubic foot of grain capacity.

THE new drainage scheme for Newquay will cost 12,300*l.*

THE new station on the London, Tilbury and Southend Railway is to be opened next month. The Southend Chamber of Commerce has passed a resolution thanking the General Manager of the L.T. & S.Ry. for the excellent service of trains provided to London and Southend.

THE buildings sub-committee of Nottingham recommend that, as they consider increased efficiency and economy result from single-storey schools, the consent of the Board of Education should be obtained for purchasing an additional strip of land at the Cameron Street corner of the Haydn Road site, having an area of about 3,050 square yards, at 4*s.* 9*d.* per yard, in order to allow the erection of three single-storey schools upon the site.

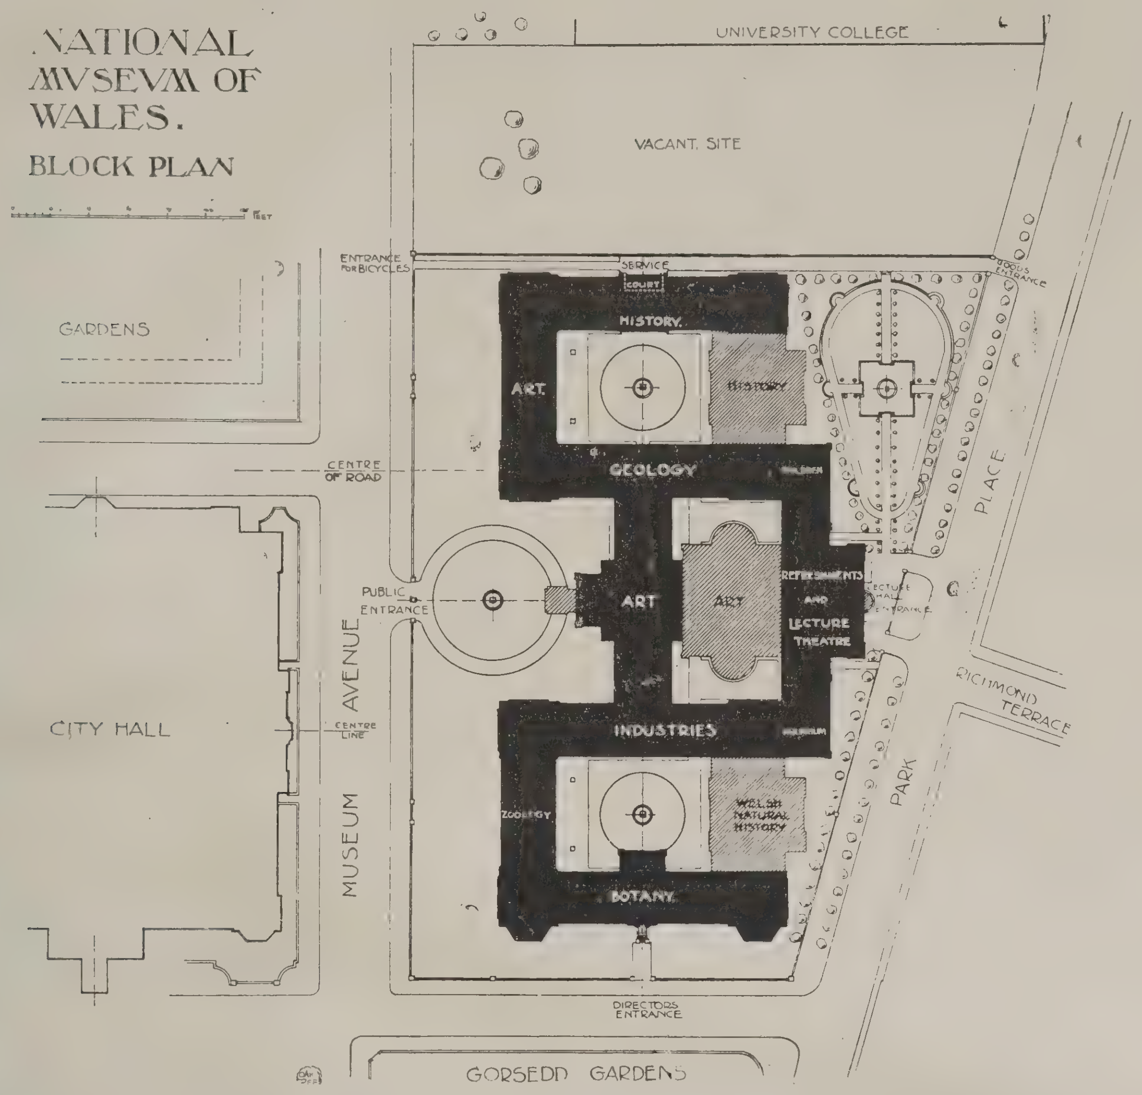
* A paper read on May 26 at the tenth ordinary general meeting of the Concrete Institute at the Royal United Service Institution, Whitehall, by Mr. H. Kempton Dyson, Secretary, Concrete Institute.



## CLAIM AGAINST AN ARCHITECT.

The case of Raikes *v.* Power, before Mr. Justice Darling and a special jury in the King's Bench Division on Tuesday, the 7th inst., was actually heard upon defendant's counterclaim against plaintiff and Mr. Charles O. King, architect.

The plaintiff on the counterclaim, Mr. William Mailes Power, picture dealer, sought to obtain damages against Mr. R. T. Raikes, managing owner of the estate in which plaintiff's shop at 123 Victoria Street, S.W., is situated, and Mr. King, architect for the estate, because of what he alleged to be their negligence in the building of a picture gallery for him, as the result of which a large number of valuable paintings were injured by damp and mildew.

Mr. Clavell Salter, K.C., counsel for plaintiff, said his client rented the shop from Mr. Raikes in January, 1908, at a rental of 500*l.* a year. There was a covenant in the agreement providing that Mr. Power should have liberty to build a picture gallery in the yard at the back of his shop. Another agreement was entered into by which it was arranged that Mr. King should draw up plans and specifications for the erection of the gallery, and that the work should be carried out by the estate workmen under his supervision. About the end of March, 1909, the building was completed, and, as Mr. King had assured Mr. Power that the gallery would be ready for immediate use, pictures were hung on the screen in April. Some weeks afterwards Mr. Power found that the pictures were being injured by damp and mildew, and on examination he discovered that although Mr. King, following the usual practice in building picture galleries, had separated the hanging screen from the wall by battens, he had neglected to provide for the ventilation of the space between them. The enclosed air was therefore stagnant, and gradually collected moisture, which penetrated the matchboarding of the screen and attacked the pictures hung upon it. Mr. Power now claimed 58*l.* odd expended by him in restoring the damaged pictures, and 240 guineas for 24 weeks' loss of the letting value of the gallery.

Defendant denied negligence and said the damage caused to the pictures arose from plaintiff's hanging pictures on the screen before the walls were dry. Mr. King, by his counsel, Mr. Foote, K.C., admitted that he had neglected to provide apertures for the ventilation of the space between the screen and the wall, but said his architect's fee of 25 guineas, which he was willing to forego, was sufficient to cover any damage caused by lack of ventilation. Mr. Raikes denied any liability or any part in the erection of the building beyond allowing his workmen to build it for Mr. Power at cost.

Among the pictures alleged to have been damaged were a Hogarth, a Gainsborough, a Lawrence, a Rembrandt, a Turner, a Michel, a Romney, and one by Sir Joshua Reynolds.

Evidence was called on behalf of Mr. Power to the effect that his claim was reasonable in amount and that the damage was caused by the lack of ventilation behind the screen.

The evidence called on behalf of Mr. King went to show that the damage to the pictures and loss of letting rent for the gallery were much over-estimated. Mr. Marchand, of the Goupil Gallery, and Mr. Philip Robson, A.R.I.B.A., also expressed the strong opinion that Mr. Power did not take proper precautions to dry the walls of the gallery by means of artificial heat, as he ought to have done. Mr. Robson said he could have dried the gallery in a fortnight by the use of braziers of coke stood upon tin.

The jury found that Mr. King had been guilty of negligence and awarded Mr. Power 45*l.* damages against that gentleman. They found also that Mr. Raikes had not been guilty of negligence.

One hundred guineas having been paid into Court by the defendants on the counterclaim His Lordship gave judgment in favour of both Mr. King and Mr. Raikes and ordered the balance of the money in Court to be paid out to them.

---

Mr. A. Ernest Prescott, borough engineer and surveyor of Eastbourne, has been nominated as president of the Institution of Municipal Engineers for the year 1910-11.

## ACETYLENE LIGHTING.

THE lighting of small villages, country houses, cottages, and so on, by means of acetylene has long been accepted as giving the utmost satisfaction. Since its value was first established many improvements have been effected which still further increased its advantages. One such is controlled by Messrs. C. C. Wakefield & Co., 27 Cannon Street, E.C., and is known as the "Carbic Light." Carbic consists of carbide specially prepared and compressed into cylindrical shapes by a patent process so that every particle is impervious to atmospheric moisture, being susceptible only to moisture in liquid form. The Carbic cakes are placed in a very simple generator, and the action is dependent solely upon the balance of pressure between the water and the gas, so that the installation is easily looked after. Before distribution the gas is thoroughly washed and chemically purified, either in the generator or, in the case of larger installations, in a separate purifier. In a third size, suitable for 10 lights and upwards, the apparatus consists of either one or two simple generators connected with an automatic pressure-regulating gas bell; this ensures a uniform pressure at the burners, and is necessary in cases where a number of lights are liable to be turned on or off simultaneously. The smallest and cheapest is size 1220, which consists of the generator, but without a washer, being fitted with cotton wool purifier only. A charge of two No. 5 cakes of Carbic at 3*d.* each maintains one light of 20-candle power for 10 hours, or two lights for five hours. The price of this is only 1*l.* 15*s.*, being half the cost of the same generator fitted with a washer. No. 2 generator may also be had in two sizes. Size 2410 maintains 10 lights of 20 c.p. each for eight hours on a charge of four sixpenny cakes of Carbic. The price of this is 8*l.* 5*s.* The largest size is No. 32,510; this will maintain 40 lights of 20 c.p. each for five hours, and costs 17*l.* 10*s.* The gas in the cheapest as well as in the most expensive is generated without any smell, and gives a rich pure white light free from haze and odour. The piping and fittings are similar to those used for ordinary gas, and incandescent mantles may be employed as well as the special burners. The plant is of surprising compactness in each of the sizes, and it appears to be as reliable as it is simple in its working.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT the Business General Meeting of Monday, 6th inst., the Officers, Council, and Standing Committees for the ensuing Session were declared duly elected, in accordance with the Scrutineers' Report, as follows:—

### THE COUNCIL.

*President.*—Leonard Stokes.

*Past-Presidents.*—Thomas Edward Collcutt; Ernest George.

*Vice-Presidents.*—Reginald Blomfield; Alfred William Stephens Cross; Edward Guy Dawber; Ernest Newton.

*Hon. Secretary.*—Henry Thomas Hare.

*Representatives of Allied Societies.*—Henry Clement Charlewood (Northern Architectural Association); John Bennie Wilson (Glasgow Institute of Architects); Percy Scott Worthington (Manchester Society of Architects); William Morton Cowdell (Leicester and Leicestershire Society of Architects); Arthur Stansfeld Dixon (Birmingham Architectural Association); Robert Evans, jun. (Nottingham Architectural Society); Sydney Decimus Kitson (Leeds and Yorkshire Architectural Society); Arnold Thornely (Liverpool Architectural Society); John Watson (Edinburgh Architectural Association).

*Members of Council.*—Maurice Bingham Adams; John James Burnet; Walter Cave; Max Clarke; William Flockhart; William Adam Forsyth; James Sivewright Gibson; John Alfred Gotch; Edwin Thomas Hall; George Hubbard; Henry Vaughan Lanchester; Edwin Landseer Lutyens; A. Beresford Pite; Andrew Noble Prentice; Halsey Ralph Ricardo; Henry Heathcote Statham; Sir Alfred Brumwell Thomas; Paul Waterhouse.

*Associate Members of Council.*—Sidney Kyffin Greenslade; Charles Edward Hutchinson; Charles Herbert Reilly; Harry Inigo Triggs; Herbert Winkler Wills; Arthur Needham Wilson.

*Representative of the Architectural Association.*—Arthur Keen [*F.*].

*Auditors.*—John Hudson [*F.*]; William Henry Burt [*A.*].

### THE STANDING COMMITTEES.

*Art.—Fellows*: Walter Cave; Edward Guy Dawber; William Flockhart; Henry Thomas Hare; Gerald Callcott Horsley; William Richard Lethaby; Robert Stodart Lorimer; Edwin Landseer Lutyens; Edwin Alfred Rickards; John William Simpson.—*Associates*: William Henry Bidlake; Thomas Davison; Thomas Geoffry Lucas; Walter John Tapper; Septimus Warwick; Edgar Wood.

*Literature.—Fellows*: Frank Thomas Baggallay; John Alfred Gotch; Sir Charles Archibald Nicholson, Bart.; George Halford Fellowes Prynne; Halsey Ralph Ricardo; Frederick Moore Simpson; Richard Phené Spiers; Henry Heathcote Statham; Charles Harrison Townsend; Paul Waterhouse.—*Associates*: Frank Lishman; Herbert Passmore; Charles Edward Sayer; Cyril Wontner Smith; Arthur James Stratton; William Henry Ward.

*Practice.* — *Fellows*: William Henry Atkin-Berry; Howard Chatfeild Clarke; Max Clarke; Alfred William Stephens Cross; George Hubbard; Joseph Douglass Mathews; Alfred Saxon Snell; Henry Tanner, jun.; Thomas Henry Watson; William Woodward.—*Associates*: Kensington Gammell; Edward Greenop; Edwin Richard Hewitt; Herbert Hardwicke Langston; Harry John Pearson; Augustus William Tanner.

*Science.—Fellows*: Harry Percy Adams; Bernard Dicksee; William Dunn; Frederic Richard Farrow; Matt. Garbutt; Francis Hooper; George Hornblower; John Murray; Charles Stanley Peach; Herbert Duncan Searles-Wood.—*Associates*: Henry William Burrows; Charles John Marshall; Alan Edward Munby; Digby Lewis Solomon; Ernest William Malpas Wonnacott; Ernest Alexander Young.

The following members were elected:—*As Fellows*: Ernest Robert Barrow; Arthur William Cooksey; William Bruce Dawson, and Horace Gilbert.—*As Associates*: George Luard Alexander; Walter John Beall; Noel Waugh Hadwen; Joseph Fearis Munnings; David John Roberts; Hartley Sutcliffe; Edward Alexander Taylor, and Morris Thompson.

## ARCHITECTURE NEW SOUTH WALES.

THE annual report of the Department of Public Works for New South Wales for the year ending June 30, 1909, makes interesting reading, and more especially that part of it submitted by Mr. W. L. Vernon, the chief of the Architect's Branch.

As in the two previous years, the Branch has been kept actively engaged in endeavouring to keep pace with the large amount of building operations, both in hand, to be entered into during the current year, and projected for the future, together with many professional services which are not represented by either the preparation of designs or the expenditure of moneys.

The statement of the Departmental Accountant shows that payments amounting to over 460,070*l.* passed through his hands in connection with building operations, and upwards of 1,588 Government building contracts were entered into during the year.

The permanent staff numbers eighty-two officers, many of whose claims for consideration have been favourably dealt with during the year by the Public Service Board. There is, however, according to the report, a serious want of encouragement to good officers in the absence of any automatic improvement to their positions and salaries.

The Branch has at present in its employ upwards of ninety-six temporary officers, rendered necessary by the strict curtailment in numbers of the permanent staff and the requirements of so active a period of building operations.

*General Review.*—The preparation of the annual report was thought to be a fitting occasion on which to review and generally compare its accomplished works with those of similar departments under English-speaking Governments elsewhere.

In the following notes Mr. Vernon does this briefly as far as relates to the Architect's Branch of the Public Works Department of New South Wales.

The Government has always given its professional advisers a free hand in attaining a fairly high character in its architectural work, and it has never stinted the means for providing institutions of a technical and special character necessary for a modern community. Generally speaking, it may be claimed as the result that New South Wales ranks amongst the most advanced in this respect. It certainly maintains its lead amongst the States and Dominion in Australasia.

It is therefore all the more important to carefully place the results of its operations under a close scrutiny and review in order to find out wherever it is possible to make still further advances and avoid any retrograde steps. Every day the more cultivated perception on the part of the general public of the true principles of Art as applied to architecture renders this most desirable, while the technical and scientific requirements of the Service demand a watchful contemporary knowledge of all that is progressing elsewhere in such matters.

The essentials necessary in the work of the branch are therefore:—

1. Architectural "quality" in its designs.
2. Adaptability of its buildings to their special uses.
3. The taking of full advantage of the use of improved materials and methods of construction.
4. Application of business methods in building operations and expenditure.

1. *Architectural "Quality" in Design.*—The year just closed has seen the completion up to definite stages of two notable buildings, specially designed with a view to the advancement of the art education of the people, as well as for housing their artistic and literary treasures. I refer to the National Art Gallery and the Fisher Library.

The western façade of the National Art Gallery is now, in the simplicity of its Grecian Ionic character, complete, and may be regarded as the only building of its class south of the line in which the purity of the style has been so rigidly adhered to.

Its educative value in establishing the standard with which to compare the general and sometimes miscellaneous productions of Classic architecture throughout the community is already established, and, as such, it is hoped, will always have a modifying influence.

At present the full effect of this design is not obtained, owing to the adjacent ground contour rising some four or five feet above the general level of its base, the improvement of which is awaited with considerable interest.

The frontage of this façade embraces two longitudinally-placed galleries, the external walls of which are devoid of fenestration, and purposely of quiet tone in their architectural detail, though enriched with a series of bronze panels designed in high relief by sculptors of established reputation, with a central columned portico dominating the design, and giving by a broad flight of steps public access to the galleries. The design is balanced by two flanking pavilions, each also with circular-fronted and deeply-recessed exemplifications of the Ionic.

All four façades of this building—the western and southern complete, the eastern partially so—will in course of time complete an example of this, "par excellence," most beautiful of the Classic orders.

Internally the gallery possesses for its display of sculpture a spacious vestibule, circular ended with twin domes and enriched entablatures wholly constructed in stone, with Kempsey marble column shafts and ceramic mosaic pavement.

The picture galleries themselves are in their architectural treatment in unison with that of the building as a whole.

(*To be continued.*)

## HOME ARTS AND INDUSTRIES EXHIBITION.

THE twenty-sixth annual exhibition of the Home Arts and Industries Association was opened in the Royal Albert Hall on Wednesday last, and it will close after to-morrow the 11th inst. The Association is a society for teaching the working classes such handicrafts as woodcarving, repoussé, inlaying, leather work, basket-making, and encouraging lace-work, embroidery, pottery, &c. The present exhibition is the product of 200 different centres in the United Kingdom. In most cases the object of the classes is to afford occupation to villagers in the evenings, or at periods of the year when their ordinary occupation is suspended, and at the same time to help and encourage them with the extra earnings accruing from the sale of their work. In some instances the stalls are described as Developed Industries, which means that the industries are self-supporting, with all time workers and paid management, and having an agency or depot. An instance is the Ruskin Pottery, Birmingham, which commenced as an amateur class and now employs sixteen people. It may here be mentioned that there is an exhibit of the pottery at the Venice Fine Art Exhibition; all of it has been sold, the greater number of pieces going to Italian museums. Another notable instance of a developed industry is the Potter's Art Guild at Compton, which is under the direction of Mrs. G. F. Watts, and permanently employs sixteen men and boys. The stall of sculpture work at the present exhibition should not be missed by visitors. But the greater number of the classes are fully entitled to be described as Home Arts and Industries. The quality attained is generally of a very high character, and reflects the greatest credit on the amateur and professional teachers who sacrifice many hours of leisure in a patient effort to instil into villagers a desire to spend their free hours well and profitably. It may be that their efforts are rendered easier by the fact that these industries must be part of the sub-conscious instincts of their pupils whose fathers and mothers, or grandfathers and grandmothers practised them before all handwork was crushed under the juggernaut of machinery.

## VARIETIES.

NEW artillery barracks costing 16,000*l.* are to be erected at Dover Castle.

WE have received an inquiry for Tuttle & Bailey's Ventilators. Can any reader supply us with maker's name and address?

THE Lochmaben School Board, N.B., have adopted plans for the enlargement of the school at a cost of 1,350*l.* The plans were prepared by Mr. J. B. Gladstone, architect, Lockerbie.

THE Bridlington Town Council are negotiating for the purchase of the People's Palace for the purposes of a town hall. The property has been offered to the Council for 4,500*l.* The estate has recently changed hands.

H.M. TRADE COMMMISSIONER for South Africa reports that authorisation has been given for the construction on the Central South African Railways of new stations and yards (1) at Braamfontein, at an estimated cost of 96,388*l.*, and (2) at Germiston, at an estimated cost of 70,000*l.*

THE South-Eastern and Chatham Railway are carrying out extensive alterations at Rochester at a total expenditure of 90,000*l.* A new station is to be built and additional platforms constructed. The South-Eastern and Chatham and Dover sections of the line will be linked up and new bridges erected.

THE Doncaster Rural District Council have instructed Messrs. D. Balfour & Son, of London and Newcastle-on-Tyne, to prepare a scheme of main sewerage and sewage disposal for Edlington and Warmsworth, which are rapidly increasing owing to the construction of new collieries in the district.

MR. ALFRED E. WHEELER, having terminated his engagement with Messrs. Z. D. Berry & Sons, Westminster, is now in business as a heating, ventilating, and electrical engineer at 12 Theobald's Road, W.C. In the new venture he has the co-operation of Mr. C. J. H. Ridley, who had been associated with the same firm for a period of twenty-five years. The firm is therefore Messrs. Wheeler, Ridley & Co.

BLACKPOOL Town Council have decided to extend the marine parades northwards in front of the cliffs 260 yards and widen the parades near the north pier at a total cost of 60,000*l.* The cliffs scheme will consist of a lower walk 25 feet wide and a high promenade 100 feet wide. The latter will form a departure from the rest of the sea defence works by having a greensward surface. This could be done without increasing the rate, which remains at 5*s.* 4*d.*

THE Sheffield Corporation Electric Supply Department has resolved to reduce the price of current by one-half to publicans. The present rate is 4*d.* per unit, and in future the licence-holders will be charged only 2*d.* per unit. The reason for this is that the pressure upon the department ceases about eight o'clock at night, but the department has to use the same machinery to produce the current which is then required for the remainder of the night, and wishes to gain more subscribers among those who use the supply in the later hours.

THE management of the Crystal Palace arranged with Mr. C. Grahame White to give a series of exhibition flights in the Palace grounds on Tuesday afternoon last, the 7th inst., which proved very successful. These were carried out under the auspices of the Aerial League of the British Empire on the actual aeroplane upon which the aviator made his gallant attempt from London to Manchester. In preparing the ground for the flights the League sought the advice not only of Mr. Grahame White himself but also of several of the leading aeronautical experts, and extensive preparations were made to render it suitable for the purposes of aviation. The event proved to be of a most interesting character, and we understand that the management will endeavour to arrange that these flights shall be made weekly during the summer months.

## THE NEW MESSINA.

THE sudden catastrophe of December 28, 1908, which in a few moments annihilated the city of Messina and exacted a death toll of upwards of 50,000 lives, rendering the survivors houseless, produced as a natural sequence an abrupt cessation of all commerce, but the boundless and universal benevolence extended to the sufferers, in conjunction with the recuperative power of the Latin race, has, in a comparatively short space of time, brought about an appreciable resumption of business activity. Fortunately the port did not suffer from the effects of either the eathquake or of the tidal wave which followed, with the exception of a certain amount of damage to the quays. The railway connections also remained relatively intact, consequently there is no material reason, says the British Vice-Consul in his annual report, why Messina should not regain, to a large extent, its former commercial importance.

During the first few months of 1909 relief stores, timber, and materials for the construction of temporary buildings were poured into the district, creating such a demand for manual labour that the wages of the working classes rose considerably.

Extensive villages of wooden, corrugated iron and steel-cored concrete dwellings, shops, churches, and schools soon sprang up in the district immediately adjacent to the ruined city. A certain activity of movement in the recovery from the débris of damaged iron work, lead, and like materials for shipment to other districts soon manifested itself, and as the year wore on the export of Messina produce proper, viz., lemons, peel in brine, wine, oil, walnuts, nuts, &c., was resumed.

The work of clearing away the ruins of the city goes on steadily, and the official plan for the new city is on the point of being promulgated.

Among the present population great confidence exists that the restoration of Messina and its recovery of its former prosperity may be looked for in a by no means distant future; that this confidence is not so Utopian as at first sight it might appear is shown by a comparison of the exports for 1909 with those of 1907, since with a population reduced by some 100,000, and in spite of material obstacles, a really important export trade has been done.

The new city as it at present exists, consisting of buildings as described above, is exceptionally well lighted by electricity, the new streets are well laid out, effectively macadamised, surface drained and efficiently policed, to which may be attributed the fact that the general health of Messina since the earthquake has actually been above the normal standard of previous years.

The work of repairing the quays has commenced, and when completed is expected to give greater facilities for loading and discharging merchandise than hitherto.

*New Industries.*—Two factories have been started for the manufacture of liquorice juice, one in Messina itself and one at Policara. An important factory for the manufacture of citric, tartaric and sulphuric acids and chemical products on an extensive scale is to be erected as soon as a suitable site has been allotted by the authorities. It is expected that it will give employment to quite a large number of hands. The population of Messina, according to the municipal returns up to December 31, 1907 (those for 1908 were destroyed), including the suburbs, was 167,824. The present population is now estimated by the municipal authorities to be between 50,000 and 60,000 (no actual census has been taken since the earthquake).

## THE CITY AND GUILDS OF LONDON INSTITUTE AND SCULPTURE.

THE report of the Council presented at the annual meeting of the members of the City and Guilds of London Institute contains in more than one place reference to the success gained by past and present sculpture students.

In the report congratulations are given to Mr. W. Goscombe John on his election to the full membership of the Royal Academy. Mr. Goscombe John was one of the first four students of the Institute who gained the Gold Medal and Travelling Studentship of 200*l.* of the Royal Academy between the years 1883 and 1889. All of them have since been elected Associates of the Royal Academy — Harry Bates, A.R.A., is deceased; Mr. F. W. Pomeroy, A.R.A., Sir George Frampton, R.A., and Mr. Goscombe John, R.A. It will be noticed that Mr. John is the second to obtain full membership. Of the four sculptors who have attained the rank of Royal Academician two are past students of the Institute, and of five who have attained the rank of Associates two (Mr. Pomeroy and Mr. W. R. Colton) are also past students of the Institute.

That the spirit which actuated the oldest students is shared by the younger receives a remarkable testimony in the Royal Academy competitions of December last, when of the seven prizes offered by the Academy, six were awarded to students of the Institute.

At the last competition of the Royal Academy for the gold medal and travelling studentship of 200*l.* in sculpture the award was made to Alfred Buxton, who has attended the department during the past nine years, under Mr. Gilbert Bayes. Mr. Bayes was himself a former student of the department who also gained the same award from the Royal Academy. The Council understand that Mr. Buxton also attended for about the same period the Westminster School of Art under Mr. E. G. Bramwell, a former student of the Institute's Kennington school, who gained the City and Guilds sculpture studentship and also a City and Guilds travelling studentship. Since the establishment of the Institute's two art schools, students of the modelling sections of these two departments have gained this medal and travelling studentship of the Royal Academy for sculpture at nine out of fourteen competitions—twice from Finsbury and seven times from the South London school.

The efficiency of the work of the modelling section of the South London School of Technical Art is, says the report, indicated ultimately in the results of the competition for the sculpture studentship. This studentship is only open to students of three years' standing. A subject for a modelled design is announced every year, and six months allowed for its execution. As far as possible the subject chosen is one calculated to give the students an opportunity of exhibiting their capacity to conceive and execute a piece of architectural sculpture embodying the results of their studies in construction, composition, and decoration founded upon their work in the studios from the antique and the life. The subject announced was "A Mural Monument to a Naval Hero." Seven models, some in clay, others cast in plaster, were submitted. These were judged by Mr. W. Robert Colton, A.R.A., a former student of the school, who reported on them as follows:—"I may say at once that the ability of the students greatly pleased me, and that I strongly recommend that a smaller prize should be given to the student who obtained the second place. The first two examples were so nearly equal in merit that not only in justice, but also for the encouragement of so good a student, I feel that the Institute should, if at all possible, make a second grant." On this report the committee awarded the studentship to S. R. Cameron, and as an exceptional award made a grant to E. S. Frith, who was placed second in the competition, to enable him to spend a few weeks examining some of the masterpieces of sculpture abroad. The school is distinctly a professional school—that is to say, the students are not amateurs, but men who are earning their living in some art work. This is shown by an analysis of their occupations as follows:—

*Modelling Section.*—Sculptors, carvers (wood and stone), and modellers, 23; moulder, art metal worker, terra cotta modeller, picture-frame designer, taxidermist, stockbroker; total, 29.

THE Education Committee of the London County Council have arranged the following art lectures for teachers, 1910-11:—"Man and his Architecture," by Mr. H. Ricardo, F.R.I.B.A. (ten lectures), estimated cost 52*l.* 10*s.*; "Greek Art, with special relation to the collections in the British Museum," by Professor E. A. Gardner, University College (ten lectures), estimated cost 60*l.*; "Pictures in the National Gallery," by Mr. A. J. Finberg (ten lectures and ten demonstrations), estimated cost 63*l.*; Lectures at Victoria and Albert Museum—Industrial Art, by Mr. B. A. Spencer (twenty lectures), estimated cost 63*l.*

THE Norman Undercroft in Westminster Abbey is now open to the public on the payment of a small fee. This is a range of five vaulted bays entered from "Dark" Cloister, which by the removal of partitions has been made into one long chamber. This Undercroft forms the substructure of the old dormitory of the monks, part of which is now Westminster School, and is adjacent to the Pyx Chapel. The great interest of these buildings lies in the fact that they form the only complete portion now remaining of Edward the Confessor's building.

## NOTICE TO ADVERTISERS.

**Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.**

## EDITORIAL NOTICES.

*The Editor will always be pleased to examine drawings or articles with a view to publication, but cannot be responsible for the safety of those sent, though every reasonable care will be taken. Contributors desiring payment should clearly state their wishes. No payment will be made until after publication, and a commission to prepare articles or drawings does not necessarily imply acceptance or approval.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*We have upon our staff a very eminent Barrister, who will be glad to answer in the columns of this paper any legal question that may be of interest to our readers. All letters must be addressed "Legal Adviser," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit the insertion of lengthy communications.*

## TENDERS, ETC.

⁂ *As great disappointment is frequently expressed at the nonappearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 p.m. *on Thursdays.*

## COMPETITIONS OPEN.

Ashton-on-Mersey.—Architects practising within ten miles of Sale desirous of competing for proposed Sunday schools in connection with the Wesleyan Chapel are invited to communicate with Mr. J. O. Barrow, Barker's Lane, Ashton-on-Mersey.

Belfast.—Sept. 5.—The Senate of the Queen's University are prepared to receive designs for the enlargement of the present buildings at a cost of about 52,000*l*. Assessor, Sir Aston Webb, R.A. Two premiums of 150*l*. and 100*l*.; particulars 2*l*. 2*s*., returnable within three weeks, or on receipt of bona fide design. Mr. J. M. Finnegan, B.Sc., secretary, Queen's University, Belfast.

THE FISHER LIBRARY, SYDNEY, NEW SOUTH WALES.

## ARCHITECTURE IN NEW SOUTH WALES.

(*Continued from last week.*)

*The Fisher Library.*—There has been secured for Australian students of architecture in the Sydney University buildings, and in this its latest addition, an example of a peculiarly British type that may be safely claimed to present in its general features and its correctness of detail the true spirit of the Perpendicular Gothic.

Designs and estimates of cost of a suitable building were prepared, and the scheme having been fully inquired into by the Parliamentary Standing Committee on Public Works, and recommended for adoption under the provisions of University of Sydney (Fisher Library) Act, 1901, the undertaking has been realised. After seven years of continuous work, and at a cost of 72,000*l*., the building now, in July 1909, stands complete.

It was a happy inspiration that led the Senate in its early days to stamp its immediate and future buildings with the graceful and characteristic style of the British Perpendicular Gothic—a type which admits much individuality and rich effects not obtainable in the colder and more unbending lines of Pagan Classic.

Building operations were commenced on January 23, 1902, and for several years the fabric quietly progressed under but little public observation, the basement storey in hard Purgatory stone, and the upper portions in the best Pyrmont, for which Sydney is famous, until the topmost finial was reached, and the appropriate and emblematic enrolments executed by one of the best Gothic carvers in Australasia, his services extending over a continuous period of three years.

Every detail of the stonework and of the construction was carefully worked out by the draftsmen, and the quality of the work itself shows that the handicraft and cunning that built the masterpieces of England is still to be found with the stonemasons of New South Wales.

The designing and construction of the Library roof itself was necessarily a matter of great consideration; the adoption of the fan-traceried stone groining exemplified at Christ's College, Cambridge, was (generous as the Government was disposed to be) out of the question, but in adopting the alternative of the hammer-beam roof—also characteristic of the style—it was possible to construct an enduring example in and memento of the fast-disappearing cedar of the east coast of Australia. The quantity required for the Library roof was 175,000 superficial feet, and to obtain this 300,000 superficial feet had to be secured. The immediate result of so large an addition to local requirements was such that the price advanced from 5*d*. to 8*d*. and 10*d*. per superficial foot.

The quantity of 175,000 feet will perhaps be better realised when it is understood that 300 logs, each of 1,000 superficial feet, 16 feet by 3 feet diameter, had to be felled and transported to Sydney.

This type of hammer-beam roof is purely the product of English soil, nothing on the Continent being comparable with it, either in construction or outline.

Its chief characteristic is the method by which the thrust is brought low down, thereby lessening the horizontal pressure against the walls.

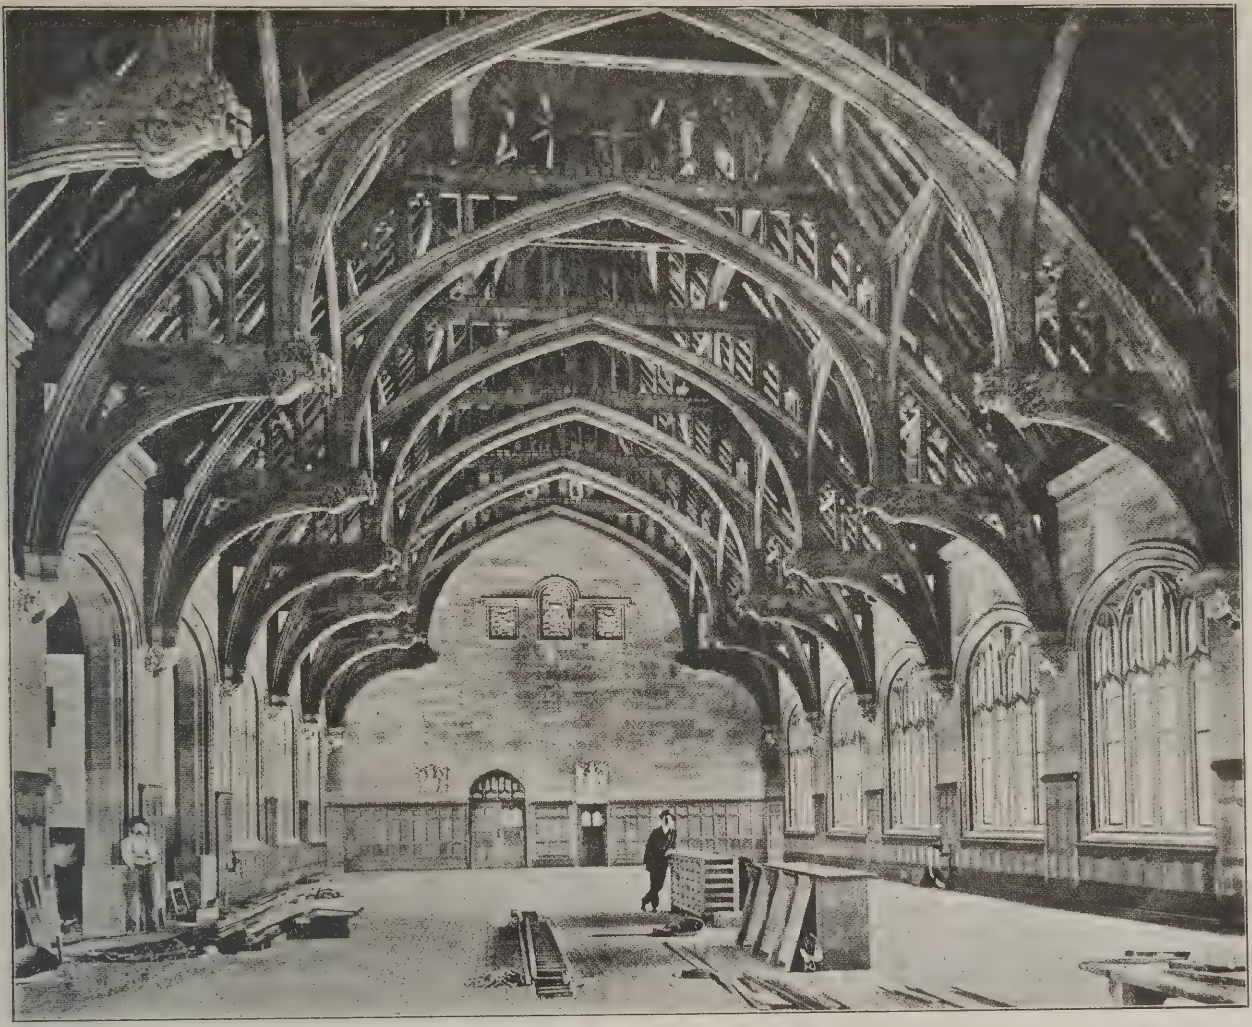
The most beautiful and wonderful in the long series of this type of roof is that of Westminster Hall, the original meeting-place of the British Parliament. It was erected by Richard the Second in A.D. 1397, and remains untouched and without alteration to the present time.

Pugin gives the following dimensions of the principal roofs of this type in Great Britain, to which are added those erected at the University of Sydney:—

| | Span Width. | Height. | Length. |
|---|---|---|---|
| Westminster Hall ... | 68 | 85 | 238 |
| Fisher Library, Sydney | 50 | 58.6 | 122 |
| Guildhall, London ... | 48 | 55 | 153 |
| Great Hall, Sydney ... | 46.6 | 70 | 135 |
| Hampton Court ... ... | 40 | 45 | 108 |

A very interesting comparison can therefore be made, and it may be claimed that both the Fisher Library roof and that of the Great Hall take high rank amongst these architectural triumphs, the first-named standing second only in span (which is the crucial feature in roofs of this description) to that of Westminster.

2. *Adaptability of Buildings for their Special Uses.*—It has always been the policy of the Branch to closely associate itself with the responsible and able officials in the



THE FISHER LIBRARY, SYDNEY, NEW SOUTH WALES.

Government Service controlling the various departments and their institutions, and to ensure that their views are studied and their special requirements provided for. Consequently the Government Architect has endeavoured to ensure the fullest applicability of these buildings, resulting in their general design and arrangements (as distinct from their extent) bearing favourable comparison with those of similar purpose elsewhere.

In the designing of hospitals for the insane of the more modern type, Kenmore stands perhaps as an example of an institution symmetrically congregated in all its parts; and generally in principle, but subject to exigencies of site, is being followed by that now being designed for Orange, each of these institutions being designed with capacity up to 900 patients. A new departure in hospital designing, as far as New South Wales is concerned, is already in course of development at Morisset, a most attractive estate on the western shores of Lake Macquarie, and also of similar capacity to Kenmore Hospital. Here Dr. Sinclair, the Inspector-General of the Insane, is putting into practice his special views, and the Branch has already designed and erected the first buildings of a segregational scheme, in which the completed whole, while bearing a proper relation to each other, will be arranged with as marked an absence of "institution," but with suggestion of "community of homes" as is possible. The nature of the site specially lends itself to this ideal.

Already the first pavilion for males to accommodate 100 patients has been erected and temporarily occupied at a cost of 10,000*l*., or 106*l*. per bed. It contains on the ground floor:—Dining-room, 42 feet by 38 feet; two dormitories, 53 feet by 38 feet; seven single rooms, together with dressing-room, lavatories, and pantry. And on the first floor are three well-lighted dormitories, extending over the whole area of the building. The floor space per head is 44 superficial feet, and the building is of brick with stone dressings.

Amongst the buildings recently erected at the hospitals for the insane at Gladesville, Kenmore, Rydalmere, and Parramatta, are special admission blocks or mental hospitals of the most recent type, and designed for the special observation of patients before classification.

The group of these buildings at Parramatta may be taken as typical. It consists of one wholly detached ward each for males and females, and each ward is so arranged as to admit of treatment of three separate groups of patients.

There are also to each ward two dormitories, each containing ten beds, and four single rooms for more acute cases. Each dormitory and the group of single rooms is provided with a separate day-room, bath-room, pantry, &c.

The administrative block specially attached to this group of wards is placed between them, and contains matron's and nurses' quarters, examining-room, operating-room, and visitors' waiting-room on the ground floor, and nine staff bedrooms on the first floor.

The whole group, when completed (one ward at present ready for occupation) will have cost 14,000*l*.

Dr. Sinclair's scheme is a distinct advance so far as the designing of hospitals for the insane in New South Wales is concerned. The buildings are intended to accommodate the newly-arrived patients, who are placed there under special observation for periods varying from one to six months. Whilst in these admission blocks these patients are not considered to be inmates of the institution in the full sense of the term, and if discharged from these direct, they avoid to a great extent the stigma which is so generally considered to attach to the insane.

The standard cost of the State Hospitals for the Insane, in which the accommodation is most liberal, the appliances and fittings of the latest and best types, and the designs, both externally and internally, attractive to the eye, does not exceed 250*l*. per bed for the acute, and 200*l*. per bed for chronic cases.

(*To be concluded.*)

## THE ALEXANDRA SLATE QUARRIES.

IT is something over 200 years since the use of Welsh slates became general throughout the country. The exploiting of this great industry was primarily due to the businesslike instincts of Mr. Richard Pennant, a Carnarvonshire landowner, who converted a purely local industry into one with ramifications all over the globe. In no country in the world has the art of slate quarrying reached such proportions as in the British Isles, and especially in North Wales, where the working of slate mines and quarries is the staple industry of the mountainous regions of Merionethshire and Carnarvonshire.

No. 1 PIT—WEST SIDE.

A typical instance of a progressive quarry is that of the Alexandra Slate Co., Ltd., which is situated on the summit of Moel Tryfan, near Nantlle, in Carnarvonshire. This quarry stands about 1,400 feet above the sea-level and geologically is very interesting. Indeed, some years ago the Royal Society thought fit to send a committee down to investigate the traces of glaciers which are to be found in the deposits of shell and sand in the neighbourhood. It may here be mentioned that the slate bed in North Wales starts at Aber, on the north coast, extends through Bethesda, Llanberis, Moel Tryfan, through the Nantlle Valley, and turns towards the sea-coast at Clynog.

No. 1 PIT—SOUTH SIDE.

In the Alexandra Quarry there are three formations, viz. red, blue, and purple. The slate is obtained out of three pits, of which the deepest is over 400 feet below ground level. The slate is in the first place loosened by blasting. This is done by drilling holes in the rock by compressed air. The compressors are of the Ingersoll Rand type, and the drills are of various makers. Next the explosive is inserted, and, after the men have taken shelter, is fired, which loosens the solid slate and renders it easy for the men to finally bring it down. The blocks are then removed from the quarry by means of the hoisting machinery, which is of the pit headgear and blondin types. The latter is the latest method of hoisting and permits of the waggon being stopped or lifted at any point on the cable way. The instructions to the blondin engine-driver are given by ship's telegraph from the edge of the quarry.

The blocks having been brought to the ground-level are conveyed in trucks to the sawing mills, which are elaborately equipped for the rapid production of finished slates. On reaching the mills the blocks are lifted from the trucks by hand cranes and are then split by the slatemakers preparatory to being sawn across the grain, after which the slates are again split and finished by machine dressers. The sawmill is worked by a suction gas engine. This, it is interesting to note, works out at about one-fourth the cost of steam power.

No. 3 PIT.

SAWING MILL.

The finished slate is finally packed into trucks and conveyed on the private railway which links the quarry with Bryngwyn, nearly two miles distant. Here it runs on to the North Wales narrow gauge railway, and finally to all parts of the kingdom.

The head office of the company is on the Slate Quay at Carnarvon. This office and the quarry are in communication, a private telephone having been laid down along the intervening four miles.

---

"To and Fro—The Key to London," has completed its first year of existence. This valuable sixpenny monthly guide has increased in popular favour as the public have learned to appreciate its unquestioned usefulness. The area covered has during the year been extended to the suburbs wherever a tram, 'bus, motor-'bus, or District train runs. The instructions for use have been still further simplified, and various corrections, with alterations in arrangement, &c., have been made. Japanese instructions have been added to the French, German and Spanish.

THE general purposes committee of the Gillingham Town Council have been instructed by the Council to take into consideration the question of the provision of a town hall for the borough, the need of which has long been felt. The buildings at present at the disposal of the Council are only of a temporary character, and are quite inadequate for a town of the size and importance of Gillingham.

## TRADE NOTES.

The Midland Heating and Ventilation Co., Ltd., of Upper Trinity Street, Birmingham, have secured the contract for heating the Royal Scottish Academy, Edinburgh.

A large clock with Cambridge chimes and 7-feet dials has just been erected in the parish church, Chatteris, Cambs., by John Smith & Sons, Midland Clock Works, Derby. It is fitted with all the latest improvements and generally to the designs of the late Lord Grimthorpe, and is guaranteed by the makers to maintain time with great accuracy.

Visitors to the Royal Agricultural Show, which opens at Liverpool on June 21, should look in at Stand No. 78, where Messrs. Merryweather & Sons will have a large exhibit of fire appliances and water-supply apparatus, suitable for country houses, farms and estates, as well as a selection of their patent spraying apparatus. A special feature of the exhibit is the various types of motor fire engines. There will also be horse and hand draught steam fire engines, fire hose and fittings, and several novelties in the shape of petrol-driven pumps for water supply, fruit spraying, and irrigation.

Messrs. Wm. Potts & Sons, Ltd., clock manufacturers, Leeds and Newcastle, have recently erected large clocks at the following places:—Bretton Park, Wakefield, for the Rt. Hon. Lord Allendale; Cleckheaton secondary school, Yorks; Selaby Hall, Co. Durham; Hull Garden City, Hull, East Yorks. They are now erecting a memorial clock and bell at the Mechanics' Institute, Marsden, Yorks, and an illuminated clock for Spennymoor, Durham, an illuminated chime clock for Ebchester parish church, Co. Durham, and an hour striking clock for Whaddam Church, near Bletchley, Bucks.

Messrs. Sibley & Co., Bridge House, Queen Victoria Street, E.C., have put on the market a w.c. cistern which promises to be free from those minor defects which are still continued in the usual types. Its name, "Newland's Patent Double Flush Water-Waste Preventer," shows its main improvement. The cistern is divided into two chambers in order that a second flush may be obtained immediately after the first without waiting for the cistern to refill. The refilling is rapid as the water is not even partly shut off until the water-line is reached; when this is done the striking handle is thrown into position automatically. The filling is practically silent owing to the anti-syphoning tube being placed in a lower chamber than the syphoning tube. A tap is fixed to the inflowing pipe, so that when the house is empty or the weather frosty the supply can be cut off. The improved syphoning plungers are each coned at the top on the inner side; this enables them to be made 5 lb. lighter and at the same time causes the water to absolutely syphon at each operation, thus overcoming the annoyance of having to pull the handle two, three, or more times before the water flushes.

## VARIETIES.

The Hereford fruit market is to be extended and improved at a probable cost of 5,000*l*.

Chemical works are to be erected in Maryport, West Cumberland, on a site close to the docks.

The Surbiton Urban Council have given their approval to a new sewerage scheme which it is estimated will cost 63,500*l*.

Mr. H. L. C. Brassey, M.P., has promised to completely restore Wood Newton Church, Northamptonshire, in memory of the late King Edward.

The Berkshire Local Education Authority have given formal notice of their intention to erect a school for about 220 children in Thatcham.

The Chilian Government are raising a new loan, of which 1,100,000*l*. is to be expended on continuing the reconstruction of Valparaiso.

The Ecclesiastical Commissioners have made a grant of 400*l*. to meet an equivalent amount for the erection of a parsonage at Bobbing, near Sittingbourne.

Plans for the erection of property representing a value of, roughly speaking, 17,000*l*., were presented at the Dunfermline Dean of Guild Court last week.

Mr. Nathaniel Armstrong, Dilston Cottage, Newcastle-on Tyne, formerly well known in the building industry, left estate valued at 31,480*l*. gross, with net personalty 15,187*l*.

The Leeds City Council have given public notice of their intention to erect an elementary school for about 550 children in Lawns Lane, Farnley.

The Governors of George Heriot Trust, Edinburgh, accepted a gift by Mr. H. J. Blanc, R.S.A., of 500*l*., to provide a bursary for a pupil of the school who desired to devote himself to the study and practice of the art of architecture.

The *Diario Oficial*, Uruguay, of April 26, publishes a decree earmarking a sum of 241,000 pesos (about 51,000*l*.) for the construction of 210 rural schools, and for the provision of scholastic materials.

A Local Government Board inquiry will be held on the 21st inst., into the application by the Berks County Council for permission to borrow 19,276*l*. for the provision of county offices in the Forbury, Reading.

The designs of Mr. J. W. Winter, architect, of Sheffield, for the erection of a Primitive Methodist church and schools at South Elmsall, near Doncaster, have been accepted. His designs for a school church at Kinsley have also been adopted.

Olantigh Towers, Wateringbury, Kent, the mansion belonging to Mr. W. E. Sawbridge-Erle-Drax, which was destroyed by fire some years ago, is to be rebuilt at a cost of about 10,000*l*. Messrs. Wallis Bros., of Maidstone, have secured the contract.

The streets committee of the Court of Common Council in answer to a letter from the Southwark Borough Council, have expressed the opinion that the fees payable to district surveyors in respect of "additions, alterations, or other works," made to existing buildings, required revision.

H.M. Consul at Buenos Aires (Mr. A. C. Ross, C.B.) reports that at the close of 1909 the building trade in Buenos Aires was very active. Owing to the increased value of land in the business part of the city, that portion of it is being practically rebuilt with steel frame houses.

A Local Government Board inquiry was conducted last week in the Newport Town Hall, by Mr. H. R. Hooper, M.I.C.E., L.G.B. Inspector, relative to the Corporation's application for leave to borrow 31,255*l*., as additional capital for the purpose of the electricity undertaking. The money is to be expended on the purchase of improved plant.

The Birmingham cathedral tower committee has just issued an appeal for the remainder of the funds required to enable it to carry out its work. The outer casing of the tower, which has remained untouched since its erection 200 years ago, has for some time past shown signs of decay, and restoration is an urgent necessity.

There will be held during the present season an exhibition of the work of the late George du Maurier, of *Punch* and "Trilby" fame. A very representative collection is being got together, and it will comprise some of his most famous drawings. The exhibition will cover a period of over twenty years from 1874 to his death in 1896, and will be held under the title of "Society in late Victorian days," at the Leicester Galleries, Leicester Square.

The Glasgow Corporation Tramways Department have been granted lining for the erection of a sub-power station in New Bridge station, Partick. This station is to take the place of the present station in Hayburn Street, which has been found too small. The new station will receive power direct from Pinkston, and will transform the current as required for the tramways in the district. The estimated cost of the buildings is 7,000*l*.

A special number of *The Local Government Journal and Officials' Gazette*, with an illustrated supplement, has been published to commemorate the 2,000th issue of that old-established paper. In referring to these interesting facts the Editor says:—"The paper was founded more than thirty-eight years ago for the purpose of opposing centralisation, and of supporting, encouraging and improving self-government, particularly in the Metropolis, where it was chiefly threatened."

H.M. Consul-General at Budapest (Mr. Esmé Howard, C.V.O., C.M.G.) reports that there is very great activity in the building trade at Budapest this year, and that orders have been given for nearly the whole available supply of bricks. The municipality of Budapest are erecting two brick works of their own with a yearly capacity of 70,000,000 to 80,000,000 bricks; these works it is hoped to have in working order next year. This year they propose to use cement for various buildings, such as workmen's dwellings and possibly a hospital.

At the last meeting of the Basford District Council, the authority controlling the district surrounding the city of Nottingham, the medical officer of health (Dr. Wray) declared that if the Town Planning Act were enforced in that area it would mean the closing of one-third of the houses. If he reported on all the property which did not comply with the Act, he would not be safe in any parish. The Chairman said that under one or other requirement of the Act, five out of six houses in the district would have to be condemned, and the population would be homeless. The medical officer was directed to draw up a special report.

At the last meeting of the Glasgow Dean of Guild Court the principal linings granted were:—Glasgow School Board, to alter and add to Anderston special school, Hydepark Street, and to erect offices at 125 to 133 Bath Street; Arthur Mechan's trustees, brassfounders, to erect buildings at 38 Elliot Street; Smith's Glasgow Crucible Co., Ltd., to alter and erect buildings in Fauldhouse Street and Bilbao Street; Alexander F. Sinclair, to erect buildings in Manor Road, Bellahouston.

Asphalt.—The aggregate quantity of asphalt exported from the province of Syracuse, Sicily, during the year 1909 was 94,449 tons; of this amount 46,795 tons of rock asphalt, 4,227 tons of powder in bags and 1,845 tons in blocks of compressed bitumen were shipped from Syracuse. The various destinations of these exports from Syracuse were:—America, 1,000 tons; Austria-Hungary, 2,039 tons; United Kingdom, 6,394 tons; Egypt, 2,020 tons; Germany, 27,957 tons; Greece, 2,555 tons; Netherlands, 6,407 tons; Italy, 1,142 tons; Spain, 130 tons; Colombo, 550 tons; Calcutta, 1,050 tons; Russia, 450 tons; Braila, 973 tons.

"The City of London Year-Book and Civic Directory" for 1910 (London: W. H. & L. Collingridge) is the long-established "City of London Directory" in a new form. The main difference is that the customary coloured map, together with the streets, trades, and commercial sections, have been omitted. The chief contents of the annual as now issued are the Corporation and London County Council directories; lists of members on the Stock Exchange, Lloyd's and the Baltic; Livery Companies' guide and list of members; the House of Commons 1910; information as to the City schools, hospitals, charities, churches, Territorial Forces; and the usual short section giving biographical notes on prominent City people. The volume is both admirable and valuable.

The manager of the Carlisle Labour Exchange states in regard to the expected scarcity of bricklayers in West Cumberland, and the proposal to bring men from Belgium, that he is at present obtaining particulars of all the available men in the United Kingdom, and expects to be in a position to supply the class of bricklayers wanted for the erection of coke ovens. The firm who have the work in hand have intimated that they will avail themselves of the Labour Exchange organisation, so that the men who have been used to this class of work will be brought by the Carlisle Exchange from the various towns as required.

The Paisley Town Council have decided to have the work in connection with the extension of the Powbank reservoir entered on at the end of June. This extension will be practically a new reservoir, formed to the south of the present one, and when completed the storage capacity at Powbank will be fully 1,100,000,000 gallons, giving over 100 days' supply. At the present time the supply is equal to 4½ months, and with the additional storage it will be equal to about eight months, which will be quite sufficient to meet the requirements of the town for the next twenty years. It is estimated that the cost of the Powbank extension will be about 50,000*l*.

New iron works are to be put up at Palermo, Sicily, during the present year, through the initiative of the Società Anonima Ferri e Metalli, which has a capital of 70,000*l*. The works will occupy an area of 52,000 square metres near the Lolli Station. It is estimated that the mean production of iron and steel will be 50 tons per diem in piping of 1 millim. thickness, round and square iron of 5 to 70 millims. section, "poutrelles" or joints of 180 millims. section, and profile iron of 100 millims. The works will have 12,000 horse-power; the accessory machinery will be worked from a central electric plant. The municipality of Palermo is said to have granted ten years' exemption from town dues on products introduced into the town, and other facilities, while the Chamber of Commerce has also waived its tax for the same period.

The contract for a scheme of water supply for the town of Woburn, Bedfordshire, including part of the Woburn estate, for his Grace the Duke of Bedford, has been let to Mr. John Lant, Newcastle-on-Tyne. The work embraces the laying of a considerable number of miles of 6, 4, and 3-inch cast-iron pipes with stop, scour, and air valves, pillar wells, &c., as well as the necessary connections up to the boundary properties. The water is to be procured from a reservoir at Bowbrickhill Heath, which gives ample pressure over the district to be supplied. The engineers are Messrs. D. Balfour & Son, of London and Newcastle-on-Tyne. A scheme of main sewerage and sewage disposal along with a complete scheme of surface water drainage is also to be carried out by the same contractor.

The Buildings Sub-Committee of the London County Council Education Committee estimate an expenditure of 32,000*l*., which will be chargeable wholly to maintenance account. One of the items is the strengthening of hall floors for physical exercises. This item appears for the first time. The general question of the vibration of hall floors has been under consideration for some time. The architect is engaged in making a special survey, and up to the present time has presented his report on 226 schools, leaving about 280 schools still to be reported upon. In some of the cases the upper floors can only be used under certain limitations, while in others all mass movements are prohibited. A scheme for dealing systematically with the strengthening of these floors will be drawn up and considered in connection with the annual schedule of minor improvements to schools.

The Building Industries Association, at a meeting held on the 9th inst., at Anderton's Hotel, Fleet Street, unanimously decided to amalgamate with the Land Union. The chairman, Mr. H. R. Selley, said the Association was not losing its identity, as its committee would still be there *en bloc*. The following resolution was carried unanimously:—"That this meeting of builders and others, being subscribers and supporters of the Building Industries Association, having heard the resolution of their committee, which was unanimously adopted, hereby confirms such resolution, and instructs its treasurer to close the accounts and hand over any surplus to the Land Union for propaganda work, and further pledges itself to support in every way the Land Union in its strenuous opposition to the new land taxes. It further resolves that the names of such of the members of the present committee who are willing to become members of the Land Union be submitted to the Council of the Land Union for election to its building and allied trades committee."

An interesting exhibition of pictures by M. Robert Demachy, a well-known French photographer, is now on view at the House of the Royal Photographic Society, 35 Russell Square, W.C. Some fifty-seven examples, being the pick of his past year's work, are on the walls, and represent his latest development in the use of the new oil printing process, by which the photographic picture is made visible by the addition of a specially prepared oil pigment, thus affording great scope for personal interpretation of the subject. M. Demachy has clearly demonstrated the power the new printing process places in the hands of a man gifted with that artistic feeling. The exhibition will remain open free to the public daily till July 30, 11 A.M. till 5 P.M., Saturdays 11 A.M. till 2 P.M.

Messrs. W. H. Smith & Son have offered the London County Council a rent of 265*l*. a year for a lease for 99 years of a site on the west side of Kean Street, Kingsway. The site, which is the only remaining piece of vacant land at this part, has an area of about 2,470 square feet with a frontage to Kean Street of about 34 feet 8 inches. The offer is made subject to the condition, amongst others, that no objection will be raised to the building on the site being erected to a height of 60 feet, the width of the street being 40 feet. The Building Acts committee state that they will be prepared to consider such an application. The site has not been submitted to auction, but boards have been erected on which notices have been displayed intimating that the land is to be let. The offer is considered reasonable, and its acceptance is recommended.

The constant succession of burglar reports which appear in the daily papers, not to mention the numerous instances which never gain publicity, show that the burglar's art is in no danger of decay from lack of enterprising followers. Indeed this calling is followed with an energy and skill which would assuredly gain honour if applied to other spheres. Unfortunately until this perverse use of genius ceases it has to be met by cleverness greater than its own. Much time and money has been expended on inventions which should defy the entry of or opening by unauthorised persons. Many have failed when professionally tested; others of scarcely greater use being too expensive for an ordinary purse. Consequently there is still plenty of scope for further research. The problem has special attractions for some people and new ideas are constantly appearing. One such is now being shown by Mr. S. Lichtenfeld, at 300 Regent Street, W. The principle of this invention is that at the mere approach of any unauthorised person towards a protected door, safe, window, stairs, or the like, the electric lights over the whole house are illuminated automatically; they can only be switched off again by someone in possession of the secret mechanism. At the same time the device summons the police; if desired it can also be made to sound an alarm inside or outside the house. The apparatus involved is so compact as to be conspicuous for its absence; in fact if desired it may be placed completely out of sight. Its efficacy is none the less most striking, judging by the experiments.

…se, … n with marm…
a great cu… ation may lie at the
this Lambeth experience.

Yes, your mackintoshes will cost you more. This is not a Free Trade joke; it's a grimly serious consequence of the rubber boom. Waterproofs have already been put up 20 per cent., and everything of which rubber forms a part is rising proportionately. As there are generally sympathetic movements in other directions, we may perhaps expect to see umbrellas also "going up." It is rather rough on us, when other trades are dull and every one has to economise, that we should have to pay more for our tennis boots, our hot-water bottles, our golf balls, our goloshes, our ink-erasers, our rubber heels, and our elastic stockings. It's a benevolent wind indeed that blow's nobody harm. Aye, there's the rub—in fact, there's the rubber!

There was a Simple … Exhibition last week in … treet, W. … the exhibits was a

## POMPEII AND ITS FALL.

"THE Fall of Pompeii," now being reproduced in the spacious and beautiful grounds of the Crystal Palace, is based on Lord Lytton's well-known work. Five hundred and fifty performers are taking part in the spectacle, besides a number of horses, camels and elephants. The scene is laid in the public place or forum of Pompeii, to the left and right of which stretch other buildings and portions of the city reproduced from the records and plans of the excavations made. Messrs. Pain have given careful attention to the reproduction of the architecture, costumes and ceremonies of the great city of Pompeii. The magnificent picture is 500 feet in length and 80 in depth, the huge stage being 350 feet by 50 feet. The spectacle is divided into three parts and includes many novel and exciting features. The music has been specially written for the occasion, and the whole of the ground is lit up by powerful arc lamps and controlled by Pain's electrical contrivances.

## CLOISTERS TO CHRIST CHURCH CATHEDRAL, OXFORD.

THESE cloisters were constructed to connect the refectory with the chapter-house and cathedral, and some twelfth-century buildings which were in the way were removed to make way for them. The foundations of these buildings, however, were left, and are still under the cloister close. The cloisters were erected about the end of the fifteenth and beginning of the sixteenth century, and are to the south of the cathedral. They are reached by the public from the staircase hall of the banqueting chamber.

Sir Gilbert Scott, in 1870, while restoring the cathedral, also restored the archway and window to the left of it in the detail elevation.

The chapter-house which is situate on the east side of the cloisters, is of a somewhat unusual shape, being a rectangle on plan. It is in the Early English style, with a fine five-light window at one end, and a vaulted roof. Underneath the window is the stone let in the wall by Wolsey, taken from Ipswich when Wolsey removed Cardinal's College from that town to Oxford. The entrance Norman doorway from the cloisters is a good and ornate example, and has a small window on either side, each being divided into two lights by a small shaft with cap and base.

The stone employed in building the cloisters, like the rest of the buildings in Oxford, has weathered very badly, and is crumbling away in every direction.

THE Rev. Selwyn Image has been elected Slade Professor of Fine Art, in succession to Mr. C. Holmes, who recently resigned the position upon his appointment as director, keeper, and secretary of the National Portrait Gallery.

MR. T. M. CAPPON, F.R.I.B.A., Dundee, has been selected by the St. Andrew's Provincial Committee for the Training of Teachers to prepare plans for a new training college and demonstration school. A site has been purchased for 13,700*l.* in Park Place, Dundee, near University College, and possession of it will be obtained in May, 1911. The buildings will cost over 40,000*l.* At a meeting of the committee on the 17th inst. a proposal that a competition should be organised was withdrawn after discussion.

## THE INCORPORATED CHURCH BUILDING SOCIETY.

The Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels held its usual monthly meeting on the 16th inst., at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W., Lieut.-Col. the Hon. G. H. W. Windsor Clive in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Caversham, St. Andrew, Oxford, 150*l.*; Coventry, St. Margaret, 200*l.*; and East Cowton, All Saints, near Northallerton, 70*l.* Rebuilding the churches of Lydgate, St. Anne, near Manchester, 50*l.*; Taplow, St. Nicholas, Bucks, 120*l.*; and The Bourne, St. Thomas, Surrey, 50*l.* Towards enlarging or otherwise improving the accommodation in the churches at Barton Hill, St. Luke, near Bristol, 25*l.*; Llandrindod Wells, Holy Trinity, 50*l.*; Llanelly, St. Elli, Breconshire, 40*l.*; Penrieth, St. Christiolus, Pembrokeshire, 25*l.*; Wittersham, St. John the Baptist, Kent, 25*l.*; and Slade Green, St. Augustine, Kent, 100*l.* A grant of 10*l.*, making in all 45*l.*, was also made from the Special Mission Buildings Fund towards enlarging the Mission Church of the Good Shepherd, New Charlton, Kent. The following grants were also paid for works completed:—Llanbabo, St. Pabo, Anglesey, 25*l.*; St. Albans, St. Paul, 200*l.*; Dover, St. Barnabas, 30*l.*; Uplands, All Saints, Glos., 150*l.*; Whatcote, St. Peter, Worcester, 15*l.*; Eastleigh, All Saints, Hants, 200*l.*; Milton, St. Cuthbert, near Portsmouth, 20*l.*; Holloway, St. Padarn, Middlesex, 50*l.*; and Washford, St. Mary the Virgin, Devon, 30*l.* In addition to this the sum of 130*l.* was paid towards the repairs of ten churches from trust funds held by the Society. The grants voted at this meeting have nearly exhausted the funds at the disposal of the committee, and an earnest appeal is made for liberal subscriptions and donations from Church people to enable the committee to meet more adequately the many pressing applications for aid which are being continually brought before them.

## SANITARY ASSURANCE ASSOCIATION.

The twenty-ninth annual meeting of the Sanitary Assurance Association was held on June 10, when the annual report was adopted, and Mr. Walter Butler, M.Inst.C.E., re-elected president. Reference was made to the late Professor George Aitchison, a member of the original Executive Council of the Association, whose death was recorded with regret. Up to his death Professor Aitchison remained a member of the Honorary Council. The Association has accepted an invitation to be represented at the International Congress of Social Insurances to be held at The Hague in September next.

The annual report concludes with the following retrospect:—The advance made by science generally during the past half-century has been nowhere more thorough and manifest than in the domain of sanitation and hygiene. It is not easy to exaggerate the deplorable state of things that existed even twenty-nine years ago when the Sanitary Assurance Association was founded. Some of the arrangements then accepted were so far removed from what obtains to-day—even where the highest standard is not attainable—that it is hard to credit some of the early reports on property surveyed by the Association. It is not too much to say that the Association has been largely instrumental in raising the standard of sanitation to that which fortunately to so great an extent now holds good in all classes of buildings. At the time the Association was founded hardly any standard was recognised and the most primitive methods of sanitation were too often thought adequate. That there was then urgent need for reform in the matters most intimately affecting the amenities of home-life and the health of the individual was very evident. Even with all the advance that has been or will be made, constant vigilance will always be necessary for the maintenance of health, and the Association will continue to enforce the fundamental principles it was founded to maintain, and urge upon everyone the importance of sanitary efficiency, whether in the home, or in the buildings only occupied during working hours.

Messrs. Wallis & Smith, of Basingstoke, have been appointed consulting architects to the Basingstoke Board of Guardians.

The Standard Music Hall, opposite Victoria Station, Westminster, is to be entirely rebuilt; there will be seating accommodation for 2,500 to 3,000 people.

The "Paris in London" scheme, at a cost of about 750,000*l.*, is to be proceeded with. Mr. Ernest Gerard, of Piccadilly, W., is the architect.

## TRADE NOTES.

The Birtley Literary Society have given instructions to Messrs. Wm. Potts & Sons, Ltd., clock manufacturers, Leeds and Newcastle-on-Tyne, to erect a new public clock with two external dials at the Birtley Institute, at an early date.

Messrs. Sterlings, Ltd., boot and shoe manufacturers, Chesterfield, Derbyshire, have given instructions to Messrs. William Potts & Sons, Ltd., to erect a clock on their new premises, Chesterfield, Derbyshire, which is now in hand.

A new cork flooring has been invented and patented by Mr. F. W. A. Gruen, of 154, 155, and 156 Finsbury Pavement, E.C., who claims that the material is proof against fire, vermin, rot, and damp, will not crack or blister under any conditions, and is sound deadening. The colour is said to be everlasting, and the variety of designs endless. It has been used extensively in Germany, 30,000 yards alone having been laid at Messrs. Krupp's Works, at Essen. This should in itself prove a very good test.

Messrs. R. Waygood & Co., Ltd., held the tenth ordinary general meeting on the 16th inst. The report states that more work has been done than before, though owing to unprecedented competition the profits are slightly reduced. However, a further dividend was declared at the rate of 7 per cent. per annum for the six months ending December 31, 1909, making, with the interim dividend already paid, 6 per cent. for the year on the Ordinary shares. The Directors are considering plans for the rearrangement and enlargement of the factories as well as the introduction of up-to-date tools.

Our attention has been called to a new patent reinforced concrete tile which will no doubt be largely adopted. One of our principal contracting firms has predicted a prosperous career for it, and is prepared to adopt them. A syndicate is being formed to work the patent, with a view to placing it upon the market. The tiles are made under 40 tons pressure shield shape, and of Broseley thickness. No nailing is required, and they are claimed to be absolutely rainproof. The weight is 5 cwt. per square, and they can be made to any colour. The tile will be known as the I.D.L., the initials standing for impervious, durable, and light. From what we have seen of this new tile we think that the claims of the patentees should be in every way verified.

Our capricious climate has long been the remark of the visitor from less severe or more equable climates. And yet there was a time when England was called "merrie," and the seasons came and went at their expected times. Fifty years ago, if tradition is to be trusted, you could rely upon snow on New Year's Day, primroses in April, roses in June, strawberries in July, and pears in October. Of late years, however, the seasons in Britain appear to have changed their order. You may, perhaps, walk about comfortably without an overcoat at Christmas, where not infrequently the last week in May brings a snowstorm. All sorts of reasons are advanced for these changes. Some astronomers say the earth has altered her angle to the sun. Others blame the Gulf Stream. We are not concerned with the reasons, our business is to meet the circumstances and to bring solid comfort into the home, no matter what the weather without. The fact is obvious that even in the height of summer we may get raw mornings, damp afternoons, and chilly evenings. The thought of lighting a coal or wood fire conjures up a sort of curious feeling that we are contemplating something wrong, violating a household rule, or ignoring the tradition that summer is not the time for a fire. There is the inconvenience of laying a fire, which the servant often accomplishes in a half-hearted way that is enough to deter a sensitive housewife from ordering a fire at all. Maybe the grate is decorated with flowers or some other form of ornament which has to be removed. The gas fire is the solution of the whole difficulty. Turn on the tap, apply a match, and in a few minutes the room is cosy; just at the right heat which you can regulate exactly to your requirements.

The Rawtenstall Corporation have instructed the Town Clerk to make application to the Local Government Board for sanction to borrow a further sum of 11,000*l.* for electricity purposes.

The Council of the London Master Builders' Association last week considered the Bill to amend the law relating to Trade Unions now before Parliament. As the Bill proposes that the funds of the Trade Unions, which have been subscribed solely for trade purposes, shall be utilised to contribute to the expenses of some Members of Parliament, the Council decided to protest against the Bill.

## VARIETIES.

SIR WILLIAM QUILLER ORCHARDSON, R.A., of 13 Portland Place, W., left net personalty 6,243*l.*, and the gross amounted to 7,476*l.*

THE Housing Committee of the Nottingham Corporation recommend that a housing department for the administration of the law relating to the houses of the working classes should be established, with a chief inspector at a salary of 200*l.* a year, and an assistant at 115*l.* per annum.

MESSRS. HENRY YOUNG & SONS, of Liverpool, will shortly publish a brochure by Mr. J. E. Gerrard, a Liverpool architect, entitled "The Principles of Gothic Mouldings," illustrated with examples taken principally from Lancashire and Cheshire churches.

THE Durham County Council propose (1) To provide a new public elementary school for about 280 children at or near Blackhall Mill, in the parish of Chopwell; and (2) to enlarge the Council school situated at Ushaw Moor, in the parish of Esh, by providing additional accommodation for about 130 children.

SPEAKING last week at a representative meeting of the Dunfermline and West Fife builders, Bailie Stewart, the principal partner of the leading firm of contractors in Dunfermline, said that he had recently had an interview with Sir George M'Crae, Vice-President of the Local Government Board, who had told him that the Government intended to have an establishment of 5,000 men at Rosyth. That number with their families would make a population of at least 20,000. Then there would be an outside population of probably another 20,000, and provision for that large population would have to be made. He indicated that there was an impending boom in the building trade of West Fife.

A CIRCULAR has been issued calling attention to the work of restoring Iona Cathedral. It is pointed out that a good deal still remains to be done. The central tower has to be roofed, in accordance with the original design; the cloister with its arched wall has to be restored and roofed, in order to complete the north wall of the nave, and appropriate furnishings have to be provided for the whole interior. There are other ancient buildings of great historic interest, including the Monastery, the Nunnery, and St. Oran's Chapel, which require repair to ensure their preservation. For the work now in hand, and in course of completion, a sum of 1,274*l.* is required. For the purposes above indicated, a further sum of 3,276*l.* has to be provided. The amount already expended on the work of restoration to May 30, 1910, has been 7,330*l.*

AN important point affecting local authorities and electrical companies was decided on Monday in the Chancery Division by Mr. Justice Neville. The action was brought by the Attorney-General, at the instance of a ratepayer of Leicester, to restrain the Leicester Corporation from carrying on what was called the business of electrical contractors. The Corporation claimed the right not only to supply electrical energy, but also to do the wiring for their consumers and supply them with fittings, &c. His Lordship held that the Electric Lighting Act of 1882 drew a clear distinction between supply and consumption, and that the powers of the Corporation only referred to supply. The wiring and fitting on consumers' premises if "incidental," were "incidental" and necessary to use only, and not to supply. In his opinion supply by the Corporation was to be completed at the consumers' terminals, and that the wiring and fittings were a wholly distinct and separate business. The Corporation had misconceived their powers, and had carried on business in excess of them. The injunction asked for was granted.

THE dispute in the Nottingham building trade with regard to the labourers' working rules has now been settled. The local Conciliation Board having failed to come to an agreement on this matter, the rules as proposed by the Labourers' Society were referred to the Board of Trade, who appointed Mr. A. A. Hudson as arbitrator. Mr. Hudson attended at the Nottingham Exchange when representatives of the Nottingham and District Association of Building Trades Employers and of the Labourers' Society laid the case before him. The arbitrator's award determining the working rules has been received, the principal points of difference between the new rules and the old ones being:—Rule 1.—Wages. Is the same as the old rule except that labourers are to carry nine common bricks, eight facings, and eight blues. Rule 2.—Working hours. Is the same as the old rule with the addition of a clause by which the labourers undertake to agree with any change of the working hours of the bricklayers. Rule 4.—Walking time. This rule is now omitted. Rule 8.—Conciliation. This rule contains an additional clause referring any question, failing agreement by the meeting of six a side, to the local Conciliation Board, and failing settlement by that Board, to Board of Trade arbitration. The other rules have not been altered. The new rules take effect as from the date of the arbitrator's award, viz., June 13, 1910.

THE Great Central Railway Company have issued a twenty-page illustrated pamphlet entitled "An Unique Opportunity." Its object is to bring forward North-East Lincolnshire as the industrial centre offering the most favourable opportunity for the establishment of successful enterprises. The area is bounded on one side by Grimsby, and on the other by Hull, with the great Immingham Docks lying in between. With this eleven-mile coast-line as a base there lies a large area, which offers striking facilities for the establishment of factories. On its borders are the great coal fields, it is linked by railway with the industrial centres of the north, and has water communication *via* the Humber with the great canal systems; along the base line it has a deep water channel which is available for the largest vessels afloat at all tides for the greater part of its length; while the district includes an invaluable iron-ore field. The important industries of the country are gradually cutting adrift from crowded cities and are seeking fresh homes elsewhere. The advantages of north-east Lincolnshire must not be overlooked by inquirers. Copies of the pamphlet can be obtained from Publicity Department, Great Central Railway, 216 Marylebone Road, N.W.

THE Association of Burgh Officials of Scotland held their annual meeting in Glasgow last week. The chairman in moving the adoption of the report said:—Two of the more important Bills passed that affected the Association were the Town Planning Bill and the Finance Bill. He regarded the former as a very objectionable measure—a Bill framed for England alone, and then by a reference clause at the end extended to Scotland. He thought it would have been immensely better if it had been confined to England, and after some experience of its working there a Scottish measure had been passed to attain the same ends. Not only was the Bill very difficult to understand, and the machinery exceedingly complicated, but the regulations that had been issued for its administration were extremely numerous and involved. He had some doubts of the measure being of actual benefit in Scotland, at least in the immediate future. In regard to the Finance Bill, he stated that it introduced the principle of taxing land values for public purposes. The burghs had been looking forward for years to that new source of revenue, and it was to be hoped that they would get a not unimportant share of that revenue, and that they would get it for burgh purposes.

THE annual report of His Majesty's Consul at Vladivostok contains some interesting information with regard to the prospects of an export trade in timber to European markets. Competent persons, he says, are of opinion that the trade has already passed the experimental stage so far as certain species are concerned, and that there should be a possibility of finding a steady market in Europe for Siberian oak, ash, and walnut, which are generally admitted to be superior to the Japanese varieties. It is also hoped that the "kedr," which is a soft fine-grained timber of a light yellowish rose colour, will be able to take the place of the higher grades of yellow pine. Matters to which local lumbermen will have to give serious attention, if they wish the export trade to expand, are the cutting and grading of the timbers. An interesting departure has lately been made in the erection at Okeanskaya, some 15 miles from Vladivostok, of works for the manufacture of veneer, three-ply, and match sticks. Veneers, for furniture making, will be cut from the various local ornamental woods, and, with the three-ply, will be sent to the United Kingdom.

THE annual report of the Deputy Keeper of the Public Records states that during the past year modifications have taken place in the regulations respecting the public use of the records. The date anterior to which public records are considered to be historical has been extended from 1760 to 1800. At the same time the practice of giving the general public unrestricted access to the records having been found to be attended with a certain amount of danger, the Master of the Rolls has directed that in future students wishing to consult them for literary or historical purposes should be granted tickets of admission to the search rooms on giving satisfactory evidence of their respectability and good faith. Holders of such tickets will be permitted to inspect any records in his statutory custody of an earlier date than the year 1801 free of charge, but from all other persons the payment of a search fee will be required. The date down to which the records of several departments of the Government deposited in the Public Record Office are open to public inspection has also been extended. The number of registered applications for the production of records, State papers, &c., in 1909, was 78,561.
